The language of the Libyanitc inscriptions is an early form of Arabic. Some differences with Classical Arabic are easily observed. The assimilation of words like *gazal* (cf. Classical Arabic *gazal*) and *'ajib* (cf. Classical Arabic *'ajib*) shows that the Libyanitc phonemic system comprised the vowels a and ä. After nasals, ä may have been realised as th and is occasionally spelled conformingly, e.g. *buth* instead of *but*-daughter. The article has the form *il*-Anbelore, and, optimally, *il*-occurs in one inscription. The dual pronominal suffix -huny (cf. Classical Arabic *-sun*) did not end in -d because, in Libyanitc orthography, final long -d is written with the letter *t*. The nominative plural *stuctures* is also spelled with final -y and, for that reason, cannot have ended in -d. The perfect, third person n. sg. of the causative stem of verbs with identical second and third radicals is frequently not contracted, *ilt* or *hill*; but contracted forms are also found on occasion. A systematic analysis of the inscriptions will undoubtedly reveal other peculiarities of Libyanitc Arabic.

2. In Islamic sources. The Islamic historical and genealogical sources consider the Arab tribe of Läthyan to be a branch of the Hudhavl [?].v., and genealogists such as Krenkow, in RSO, viii, 145, no. 125, with bibli¬

SBM'SAW, = cciii, no. 4

they are mentioned apart from them, e.g. in their origin home, sc. now in the country to the north-east of Mecca, we cannot tell, on account of the complete absence of documents. Muslims tradition has lost all memory of them and confounds them apparently under the general designation of Thamud [q.2] with the Thamud proper and the Nabataeans of al-J¿dîr; a memory, but a very vague one, of the old kingdom of Läthyan may perhaps have survived in the isolated mention in a tradition that the Läthyan were "remnants of the Dhîhimm", who later became part of the Hudhavl (Tabari, i, 749, 71-72 [see s.gumma]), following Ibn al-Kalbi, Tadé al-Lordi, 3, 244, K. al-Mutana, probabbly in al-Diraj, since the passage is not found in the text of the (Diraśal al-Arab).

In the period just before and after Islam, the Läthyan do not seem to have had a history independent of their brethren of Hudhavl, it is only rarely that very few persons of note belonging to this tribe: Abd Allah b. Sufyan b. Khalid b. Nubayh by Ibn 'abakat al-nufidt, 223/838 (cf. nl-Zubaydi, 1927. 31), »>. 6x4, of a battle with the Khuzai. The mission which the Hudhavl made to Islam (see Ishtihdk, ed. Wiistenfeld, rop; Ibn al-Kalbi, jasr, vii, 229; Ibn al-Kalbi, Castel, Ganahar an-nasab, i, Tab. 58, ii, 7, 37; Ibn Hisám, Sina, ed. Wistenfeld, 658-44, 981-7; Wájidi, tr. Wallhausen, 158-60, 224; Tabari, i, 143-7; Caetani, Annali dell’ Islam, i, 577-8, 582-1 (year 4, 3-14, 7).

(G. LEVI DELLA VIDA )

LIM, LIMON [see MUSLIM/ARAB]

LIMASSOL [see KUROUT]

LIMINI (Turkish form of the Greek Λιμνος, in older Ottoman historical works Limos and Limni, in older Greek sources also Λιμνος. Stalimene in medieval western sources, Limnos in modern usage) an island in the northern part of the Aegean Sea. 80 km west of the entrance of the Dardanelles (Çanakkale Boğazı [q.e]) halfway between Mount Athos and Tenos (Baudja-Ado [q.e]). The island, of ca. 270 km², has been virtually treeless since long before Ottoman times. Agriculture is of local importance only. Its famous export product since antiquity is a sort of volcanic earth which had reputedly medicinal power, terra limnica, linni makk-fen, which used to be dug once yearly with some ceremony. Lemnos today has a Greek population of about 25,000 which is constantly decreasing. Myrina (formerly Kastro, Turkish Limini) on the western coast is the capital of the island that forms a part of the province of Lesvos of the Republic of Greece. There is a military air base at Nodos. The large harbours of Purnia in the north and Fort Mudros in the south, almost cutting Lemnos in two halves, are not much used any more.

Lemnos in the Middle Ages was part of the Byzantine Empire. It suffered the dependences of corsairs, Arabs from Crete (jëlipli [q.e]) in the 10th century, and those of Saldjuks from Anatolia in the 11th century. With the partition of the Empire after the Latin conquest (1204), Stalimene became an imperial fief granted to Filocalo Navigaious and to his descendants in 1207, Byzantine rule was restored by the Emperor Michael Paleologus between 1267-8. Prisoners of state were held in the island, e.g. the Ottoman pretender Djuame Mustafa in 823-4/1419-20. Shortly before 1453, Dorius I Gattilissi (1426-55), Lord of Lesvos (Turkish Midilli [q.e]), acquired the whole of Lemnos as a fief. After the fall of Constantinople (29 May 1453), the Byzantine authorities fled. Thanks to the diplomatic activities of Crito¬lus, the Byzantine-Ottoman historian, who was a judge in nearby Limnos (Imroös [q.e]), the Gattilissi dynasty of Lesvos was granted Lemnos and Thasos (Taschos [q.e]) as fiefs by Sultan Mehmed II, subject to a tribute of 2,325 gold pieces a year. Domico Gattilissi, son and successor of Dorius I, was in 1455 granted Lemnos only. In 1456, however, the inhabitants appealed to the sultan to be directly governed by him. From this time, the first khwan¬nîme of Limnos, Lemos and Thasos must be dated, and this was confirmed by Selim I in 1759 cf. Durrà, Kâmûlûl, 133-40.

A papal war fleet commanded by Ludovico, Cardinal Scarampi, captured the island in 1457, but in 1459 the Ottoman admiral Khudanz Isma'il Bey retook it. Crito¬lus intervened once more to maintain its special status, which led to the grant of Lemnos (plus Limnos and Imnos on the mainland...
Lemnos and other islands. With Samothrace (Turkish Semadirek), Imroz (Göksa-Ada) and Tenedos (Bozđa-Ada), the last two having been restored to Turkey, Lemnos formed part of a demilitarised zone. The 2,500 Muslim-Turkish inhabitants of Lemnos had already left their island in 1920, and Greek refugees from Anatolia took their places in 1923.

LIMITS [see KATTAN]
LINGA — LIPKA

LINGA. a minor seaport, modern Bandar-i Linga, on the northern shore of the Persian or Arab Gulf, lat. 26° 34' N. and long. 54° 33' E., to the south of Lārīstan [see Lār, Lāstatra] and facing the islands of Khīshkūn and the Qāmshū. Linga has a harbour of some depth, allowing traffic by dhows and coastal craft; behind the town lies a salt marsh, and then the Band-i Linga mountains, which rise to 3,900 ft. (1,190 m). The population, formerly largely Arab, is now predominantly Persian, but with strong admixtures of Arabs, Baluchis, Indians and the descendants of black African slaves, these comprising both Sunni and Shī`īs.

The old port was at Kung, 8 miles (13 km. to the east, where the Portuguese retained a footing till 1721, long after they had lost Hormuz (q.v.). In 1760, the Kawāsim Arabs (q.v.) under Shāhryār Sālīh came from Ra‘ī’s al-Khānyā and established footholds at Linga, which they seized from the Khān of the Džalangkū district, at Shīrāz and on Khīshkūn island, till they were in 1765 expelled by Karim Khān Zan‘d (q.v.). In 1809-10 the British naval expedition from Bombay which attacked the Kāmil pirates at Ra‘ī’s al-Khānyā were on their way to take Linga and other Khīshī ports on both the Arab and the Persian shores of the Gulf. In 1887 the Persian imperial government extended its control over Linga and deprived the last hereditary shāykh of Khālid, carrying him off in chains to Tehran.

Linga was at this time still a flourishing port, a centre for pearl-fishing, with Indian merchants engaging in various activities such as waggon-driving, trade with the East and tanning, a craft traditional with Turkish peoples. Certain of the Lipkas also provided some dispatch-riders sent to the Crimean Tatars who since the 14th century inhabited Lithuania, and later the eastern and south-eastern lands (Belorussia, Volhynia) of old Poland up to Podolia, and after 1672 also partly Moldavia and Dobruja. Derived from the old Crimean Tatar name of Lithuania, the record of the name in Oriental sources (in 1926-1920, later in 1932) by V. Velimirovitch-Zernof, Mâtiériaux pour servir à l'histoire du khânat de Crimée, St. Petersburg 1884, 3. 4. 729; also Édouard Ribberr, Istambul 1928, 615, 618, and C. Orhonlu, Lipkades, in JAF, xvi (1971), tables i, vi) permits to infer an original Lībă > Lipka, from which Pol. Lipka was formed (contamination with Pol. Lipka "small fenezes"); this etymology was suggested by the Tatar author S. Tuman-Baranowski, Słownik geografii historycznej Polski (Warsaw, iii [1932], 96-9). A less frequent Polish form, Lodka, is corrupted in (Lūbka > Lipka), the Crimean Tatar name of the Lipkas up to the end of the 19th century (Ewyta Cebeli, Kresy wojny, ed. by A. S. Tveritinova, Warsaw 1921, 254, n. 3).

In 1760 the Kawāsim Arabs (q.v.) under Shāhryār Sālīh came from Ra‘ī’s al-Khānyā and established footholds at Linga, which they seized from the Khān of the Džalangkū district, at Shīrāz and on Khīshkūn island, till they were in 1765 expelled by Karim Khān Zan‘d (q.v.). In 1809-10 the British naval expedition from Bombay which attacked the Kāmil pirates at Ra‘ī’s al-Khānyā were on their way to take Linga and other Khīshī ports on both the Arab and the Persian shores of the Gulf. Velimirovitch-Zernof, Mâtiériaux pour servir à l'histoire du khânat de Crimée, St. Petersburg 1884, 3. 4. 729; also Édouard Ribberr, Istambul 1928, 615, 618, and C. Orhonlu, Lipkades, in JAF, xvi (1971), tables i, vi) permits to infer an original Lībă > Lipka, from which Pol. Lipka was formed (contamination with Pol. Lipka "small fenezes"); this etymology was suggested by the Tatar author S. Tuman-Baranowski, Słownik geografii historycznej Polski (Warsaw, iii [1932], 96-9). A less frequent Polish form, Lodka, is corrupted in (Lūbka > Lipka), the Crimean Tatar name of the Lipkas up to the end of the 19th century (Ewyta Cebeli, Kresy wojny, ed. by A. S. Tveritinova, Warsaw 1921, 254, n. 3).

The Tatar settlements in Lithuania date back to the first quarter of the 14th century. Lithuania was also to provide a refuge for various exiles from the Golden Horde in later years. However, Tatar colonisation on a mass scale in Lithuania is commonly associated with the person of the Lithuanian Grand Duke Witold (r. 1325-1348), a supporter of the Khan Tolguhammad and his sons in their struggle for power within the Horde. Witold's expedition to the battle of the Don in 1357 gave a rise to a voluntary and long-lasting immigration of large masses of Tatar population from the steppes to Lithuania. The newcomers, who were brought to settle at the very centres of power (Vilna, Troki and others), while maintaining their tribal organisation and freedom of the Islamic cult, were enlisted to do military service in separate units, and were endowed for this with land and exemption from the taxes. The nobility came in time to be put on a par with the Polish nobility. Nevertheless, they were exposed to the envy of the magnates and nobility and of the Lithuanian and Polish nobility, whereas the former támrâgas performed the function of coats-of-arms (S. Dziedulewicz, Herbarz rodzin tatarskich w Polsce, Vilna 1929). The poorer part of the Tatar population engaged in various activities such as waggon-driving, trade with the East and tanning, a craft traditional with Turkish peoples. Certain of the Lipkas also provided some dispatch-riders sent to the Crimean, and official interpreters for mutual contacts with Turkish and Crimean embassies. The privileges granted to the Lipkas by Witold were to be later re-affirmed by the successive Grand Dukes of Lithuania and Kings of Poland. Nevertheless, they were exposed to the envy of the magnates and nobility and of the Roman Catholic clergy as well, which in turn provoked the first manifestations of ill-will among these Muslims towards their adopted land. Their complex situation was adequately depicted in the anonymous Risâle-yi Tātar-i Lek by one of the Lipkas who, during a stay in Istanbul in 1557-1560, on his way to Mecca, wrote his account for Subhânîl the Magnificent [from a 16th century copy thereof, no longer extant], the Turkish text with Polish translation and commentary was published by A. Muchniński, Zdanie sprawy o Tatarach tatarskich ... , Vilna 1838).

The rule of the fervent Catholic Sigismund III (1587-1632) and the Counter-Reformation movement brought a number of restrictions to the liberties granted to non-Catholics in Poland, the Lipkas
among others. To this can be attributed the intervention by Sultan Murad III with the King in the matter of liberty of religious cult for the Lipkas, undertaken in 1600/1591 upon the request of two Muslims who had accompanied the King's envoy to Istanbul (Z. Abrahamowicz, Katalog dokumentów tatarskich, Warsaw 1959, p. 236). In 1609 the mosque at Bar was built under the supervision of a master of the Tatar craft, in which the Lipkas were accused of witchcraft and burnt. P. Czyżewski, in retaliation for his father's death at the hands of a Lipka, published a pamphlet, Alferkhan tatarski pracoedzieś (1610), abusive towards the Muslim creed and its believers. It gained wide popularity (republished 1646, 1653) despite the Apologia Tatarum by Anuliewicz (1630). The Lipkas who had defended their new land in the wars against the Teutonic Order and Muscovy, and upon the borderland territory of Poland against the attacks of Crimean Tatars, on the other hand, as early as in 1653/1657-8, having the author of the Rysie for their mouth-piece, had expressed their wish to be re-integrated with the world of Islam and even of having their land subjugated by the Pilgrish. Now, estracised as they were and in view of the material difficulties in the Polish army, they partly joined the Turks when the latter invaded Poland in 1672. Kopruliszcze Fadl Ahmed Paglia made Poland, by the Buczacz treaty of 1681/1682, refrain from putting any obstacles to their emigrating to Islamic lands; however, their pro-Turkish enthusiasm was soon to abate. A. Kryczynski, who had once served in the Polish army, and later was made commander (masjid) at Bar, the centre of one of the four sandjaks within the new millet of Podolia, and a fervent promoter of the idea of serving the Ottomans, perished at the hands of the Poles in October 1673 (sildabas a’laihi, i, 531; S. Kryczyński, Urodziny barczak, in RT, ii, 229-310). Some of the Lipkas available themselves of the Amnesty Act and returned to Poland (K. Grygjański and J. Janecz, Pourquoi Lipkés sous l’autorité Roussiie polonaise, in Sobhata, 1980/2, 181-9). They also took part in the battle of Chocim on the Polish side under the command of John Sobieski (1673). They also took part in the battle of Chocim on the Polish side under the command of John Sobieski (1673). The reign of John III, a protector and patron of the Lipkas, was also noted in their history by a wave of conversions to Roman Catholicism, a fact which, however, supported by the Polish state, has focused on religion, contacts with the Muslim world, history, mosques, burial grounds and other monuments of the Lipkas in restored Poland (after 1918). An important part was performed by the Cultural and Educational Association of the Tatars in the Republic of Poland (established 1926) and personally by Dr. J. Szylniekiwicz, mujaff after 1926, an orientalist who was in close contact with the Polish Islamist T. Kowalski (Cracow) and two Karaim Turcologists, S. Sapszol (Vienna) and A. Zajaczkowski (Warsaw). In Vienna, where the mujaff had his seat, a Tatar National Museum was founded in 1929, and the Tatar National Archives in 1931. Several journals were published: Przeglad islamski (1930-31), Zycie tatarskie (from 1931), and the Rocznik Tatarski (RT) dealing with scientific research (iii: Vilna 1932, Zamość 1935, Warsaw 1938; vol. iv, destroyed by the Nazis, was never published). In 1936 a Tatar cavalry unit was formed within the Polish Army; they wore the traditional horse-tails (bugž). The forms of Muslim religious activities in Poland were finally established by the Islamic Act passed on 24 April 1936. The outbreak of the Second World War did not permit completion of the building of the mosque in Warsaw. Tatars participated in the Polish resistance movement and fell victims to the Nazis during the occupation. The westward shift of Poland's frontiers after the war, and the emigration of the Mujaff Szylniekiwicz, who had not left any followers of his stature, were detrimental to the general situation of the Lipkas. Some of the Tatar intellectuals, however, supported by the Polish state, continued their activities on religion, contacts with the Muslim world, history, mosques, burial grounds and other monuments of the Tatar past in Poland (M. Kono-packi, Les musulmans en Pologne, in REI, 1968/1; A. Miśniewicz, Tatarsz pod polszczy w latach 1918-1929, in Niew, 1956/1957, 195/197). The author of the Rysie reckoned that there were a hundred settlements of the Lipkas, with a corresponding number of mosques, in Poland, and numbered their population at 200,000, which seems greatly exaggerated. İbrahim Pêçelvi, quoting the statement made by a messenger of the mujaff to the mujaff at Aĥ澶man, mentions sixty villages with mosques (TaRîh, i, Istanbul 1283, 472, quoted by A. Michlifiszki, Islamszcr ön naplókében i csomóponti litográfiai tatar, St. Petersburg 1857, 60-1, and Orhodou, op. cit., 65). In 1933 there were about 9,000 Muslims in Poland, with 16 mosques and one under construction, and two prayer-houses (RT, 1, 323). At the report of the Polish census, it appears that the number of Muslims in Poland exceeds 2,000. There are only two mosques, in the villages of Bohenkin and Kruszyniany (Koĥołmak, Kuršyn among the Tatars), of which the former, devastated by the Nazi troops, has been rebuilt on a government grant. Since the 19th century there has also been a Muslim community in Warsaw
with an old burial ground; two new ones were established after the last war in Gliadz and Szaczyn, where the Tatar repatriates from the East had come to settle.

The author of the *Árida* reports that the *imitans* were brought by the Lipkas partly from the Crimea and to the Horde. Pallid's account of religious and legal matters were submitted by them to, e.g., the *mufti* at Akterman (loc. cit.). Their contacts with the Muslim clergy in Turkey (also attested by the references in contemporary Turkish authors; Orhonlu, op. cit., 66) are recorded still in the 18th century (Czarotycki Library, Cracow, no. XVIII.180). The author of the *Árida*, a fervent Muslim himself, had deplored the fact that some of the Lipkas assumed the Christian creed, that the knowledge of Arabic was dying out among them and that, still worse, they tended to forget their own language, so that yerčīl insānī te sęklemeyu baghdāda and nobody but the newcomers knew the "Ottoman" language. Pečewski's informant had equally stressed that the Lipkas on copying the Kur'ān *arabi khíši útil* commented upon it *Leh referes isliši útil* (loc. cit.). Ewliyā Celebi had at first called them soberly *Leh brālina tēṉe 'a'rûmeti* Muhammed ben *Lība khaymu*, and numbering them into the "Tatar" nations, justly regarded their language as belonging to the Slavonic family (*Syzabal-nınče*, ii, 99; v, 138, 140). Later, however, when the name of the Lipkas was cited to him at Ujjar-Neuhausen (Nové Zámky, in Slovakia) by the Crimean Tatar adversaries of the Swedes in Poland in 1656 [*cf. Rtsale*, i, 120, 121], he wrote how in that "Swedish" which he had allegedly visited along with the Tatars in 1663, he found 800,000 (vi, 368) or rather 200,000 (v, 368) people (see in fact that they did not know Tatar at all and spoke among themselves only *fılyan isliši útil* (vi, 368). In fact, the Lipkas, as a result of these intermarriages with the Poles and Belorusciani, abandoned completely their native language; however, though Polish and Beloruscian became their predominant languages, even in religious writings, they were still in Arabic alphabet (such texts in both languages are quoted by Musiol, "Przeciwko..., ii, 99; iii, 256-7). Consequently, A. K. Autourovich, Belorusciani tıkəlī, pisaniye ar- ęškim piłłam, i iňğ grafike orografiełesnaya sistemə, Vilna 1968, with detailed bibliography). Furthermore, the Polish and Beloruscian as spoken and written by the Lipkas were enriched with many loan-words taken from the Muslim creed, community life, and everyday activities, of Arabic, Persian and Turkic origin (A. Wronicz, Szawatz jeyzhow Tatarów Łubiańskich, in *RT*, ii, 353-67, with a vocabulary listing similar words and phrases). This cultural ambiguity can also be observed on the tombstones of the Lipkas, where the half-moon and the *şehitlenen* formula in Arabic are usually followed by the text proper written in Polish or, formerly, sometimes in Russian. In recent times however, even the knowledge of the Arabic alphabet has been dying out among the young generation. Hence when J. Sobolewski wrote his *Wykład wiaru* musulmangu "Zastosowania islamskiego" ("Exposition of the Muslim or Islamic creed"); Vilna 1933), with an explanation of the religious rites and prayers, he did it in Polish only; the book was destined for his many co-religionists who were unable to read the traditional *kitab* in the Arabic alphabet. The Polish translation of the Kur'ān by Jan Mirza Tarak Buczeki (Warsaw 1838) was founded not upon the original only, and was provided with commentaries derived from the French translation of the Kur'ān by Kazimierski, which, to cite J. Szynkiewicz, "were often offensive to the religious feelings of a Muslim" (*Literatura religijna Tataros literackich i jej pochodzenie, in *RT*, ii, 140). The Tatar national and cultural revival in inter-war Poland was however, largely due also to some of the Roman Catholic Lipkas (S. Drindulewicz, S. Kryczyski and others). Lipkas converted to Christianity were also among the ancestors of the celebrated Polish writer H. Sienkiewicz (1846-1916; Nobel Prize for Literature 1905). The Tatars, who since the 14th century had been settled on Polish territories as war prisoners, were soon converted, with just a vague memory left of their origin (the names "Tatar", "Mohammedan", etc. "derived from Turkish ोह "shepherd", as in the surroundings of Chrzanów near Cracow) and their traditional occupations (tanning and horse-breeding).

**LIŚAN AL-ARAB** [see IBN MANŻEF]

**LIŚAN AL-DIN** [see IBN AL-THATIȘ]

**LISBON** [see BURÚGHAM; AL-UGHRABA]

**LIŚS** (A., also libă, lubă, pl. lubă, with masdars *libāsyya, iltârâya* [see L.A. viii, 353-6, and Lane, *v*, 195], one of the two ethnonyms of the Lipkas, i.e. the other one being *sârî*; in Persian we have *dūš* "thief", *dudż* "thief", and in old Turkish *oğrî*, Ottoman *kahyrsi*, modern karsı. Arabic *lišt* and the unassimilated variants *frâš* must have appeared in the language during the Byzantine period, presumably via Syriac *lišt*, whilst there exists the form *lišt*, closer to the Greek original *ληστής*, in Mishalne Hebrew and Palestinian Jewish Arabic (see S. Krauss, *Grchische und lateinische Lehrwörter im Talmud*, Maderzak and Targum, Berlin 1949-9, ii, 315; Framfeld, *Die aramäischen Fremdwörter im Arabischen*, 284; J. Schacht, *An introduction to Islamic law*, Oxford 1964, 91, 150, etc. do not appear in the Kur'ān, where we have *sârî* and *sârīka* [v, 54, 131], but nevertheless they are found occasionally in pre-Islamic poetry (Ibn' al-Kays, *Labbîd*, and then quite frequently in the Umayyad period (for full documentation, see the forthcoming entry s.v. in W.KA).

In general, the pre-Islamic Arabs did not recognise theft as a highly reprehensible crime, and it was not condemned unless the victim was a member of the kin-group or a ādar within it (hence Damīr al-+#frîh) could satirise a man’s father as ‘“the one who stole a guest’s cloak”, *Hamânia* of Abd Ta’nâmîn, 155); the injured party was normally left to secure redress himself and recover his property (see G. Jacob, *Aitarabise Beduineleben nach der Quellen ge-
Within the Bedouin life of pre-Islamic and early Islamic times, the *lisg was in many ways hardly distinguishable from the outcasts and desperadoes of the desert known as *sâfîlîk and *futâthîk (see sâlîk, futâthîk) (see sâlîk, futâthîk), who lived outside the tribal system with every man’s hand against them; the poetry of these *sâfîlîk and *futâthîk attracted the attention of philologists of the ‘Abbasid period, and more recently, has attracted that of modern western and oriental scholars (e.g. Yusuf Khalîf, al-Ṣârâ‘ as-Sâbî al-futâthî fi l-‘uṣra al-‘ubbâjîbî, Cairo 1959; Ezzîn, GÅ.sI., ii, 223-45; and arts. Al-shâfîbârî, Ta’arrîs shârîbîn, ‘urwâ h. al-wārî). But the activities of those described as *lusg proper seem also to have been isolated for study by the philologists and compilers of adaîl works. Thus we have mention in the literary sources of an ʿAbî al-maṣrî, containing poetry of well-known bedouins and brigands amongst the Arabs, by the pupil of al-ʿAṣmî, Abû Sa‘îd al-Ḥasan b. al-Ḥusayn al-Sâkîrî (252-573). See Brockelmann, i, 108-9; Ezzîn, ii, 63, 133, and of a Kâḥ al-satt wa l-sârîsîa of Abû Muhammad al-Ḥasan b. Ahmad al-ʿAṣmî, called al-ʿAswad al-Ḥandajînî (d. ca. 428/1036-7, see Ezzîn, ii, 68, 88). The contemporary Syrian scholar ʿAbî al-Maṣrî al-Mâṣîlî has collected the names together of some 30 *lisg poets of the Islamic period, together with their surviving verses, see his ʿAgâr al-luṣgîs wa- ṣâdārānîn, in Râd, xlix (1974), 356-57. With the awakening, from the 3/9th century onwards, of a distinct interest among Arabic authors in low life and in the criminal and semi-criminal underworlds of the burgeoning Islamic towns, we find a certain amount of information on the activities of those thieves and brigands in the urban environment, although there are few continuing references to criminal activities in the countryside and deserts (e.g. the depredations of the fabled white horses and camels, the thieves of the latter being known as *kharîb, sing. khârîb, see C. E. Bosworth, The medieval Islamic underworld. i. The Baal Sebal in Arabic life and lore, Leiden 1976, 118) to show that rural crime and brigandage never disappeared.

A writer of such varied interests as al-Diḥîjîs shows a special interest in the tricks and stratagems of the sophisticated criminals of his time, and he seems to have written a special work on the *kâlîl, loosely patrolled and cited in subsequent adaîl works (e.g. possibly in al-Bayhakî’s K. al-Mahdsîn wa l-mâṣâfîl, ed. Schwally, 521-4, without explicit mention of the title here; cf. C. E. Bosworth, Gûdîsîn. III. Essai d’inventaire de l’œuvre gûdîsîne, in Arabicu, iii (1956), 164, no. 65). The compilers of collections of anecdotes were eager to include tales about clever thieves, and in the opening of his Nîṣâḥir al-muḥâdâra al-Ṭâmîjî lists among the interesting tales which he had heard in the course of his career those of fanatically-inspired assassins using knives (kâhî al-muṣâbîyn wa l-sâkîhîn), of brigands and thieves, and of profugals and rowdies (al-khāṣâs al-ḥâsîn wa l-sâyâdîn) (ed. A. Shâhîj, Beirut 1931-7/1971-3, i, 4). Several of the succeeding anecdotes do in fact deal with the races of crafty evildoers, see e.g. i, 150-6, nos. 79-80, vii, 96-102, 250-2; iv, 57-9, 144, viii, 218-28, nos. 95-98. One of these tales actually deals with a body of thieves and bandits in India called the Bânû-Wâyiyya, whom al-Ṭâmîjî equates with the Arabic sources, follows them, andsteals up behind a person to rob him, and from whose activities Muslim traders in India suffered (cf. also the Bânûanîn al-‘Adhâjî, cited in Bosworth, op. cit., i, 271) Muslim authors seem to have been aware of the existence of organised groups or castes of dacoits and thugs in India, prouning these criminal bodies with the Bedouins of Arabia and predatory Iranian peoples like the Kurds, the Kaôtî and the Kôfîs (see yûrâ) as examples par excellence of violent and uncontrollable brigands. One should note also the connection in certain sources of gambling (see kîmân) and theiving, seen in the not-infrequent phrase *lisg muṣârîm “thief and gambler” (see F. Rosenthal, Gambling in Islam, Leiden 1975, 114, 153). The authors of *makâmî (q.v.) and other works of the picaroque genre likewise found here material around which they could weave incidents involving their respective heroes. Thus Badî’ al-‘Amânî al-Ḥandajînî wrote several of the subsequent anecdotes which follow, “Thief and gambler” from the ranks of prostrate worshippers during the salat, those who ascended house walls and used grappling hooks for purloining articles inside the houses, and those who burrowed into cellars and vaults from the outside or from adjacent houses (the mukhâmûn or aṣhâb al-
LISIŠ—LITHÂM

The word litthân and its derivatives was very much used in figurative language, especially by poets.

**LITHÂM** (a.) (sometimes also pronounced litthóm, the mouth-veil, is a piece of material with which the Bedouins concealed the lower part of the face, the mouth and sometimes also part of the nose (see the commentary on al-Harîrî, ed. de Sacy, Paris 1821, 374, 2). According to the LA, litthâm is a mouth-veil which also covers the nose top (tombat al-sanf) and is worn by women. It served the practical purpose of protecting the organs of respiration from heat and cold as well as against the penetration of dust (cf. Bih d'Ummâna, no. 5, 43, also no. 39, 24 and 73, 16; and the commentaries on al-Mutanabbî, 464, 27, and al-Harîrî, 374, 4). It also made the face more or less unrecognizable, and thus formed a protection against the avenger of blood (Goldzihèr, in JD, xli [1887], 101). The language was therefore also some¬

The custom of wearing a litthâm was generally disseminated among the Sanûsî tribes ([p.]) in north-west Africa, who are therefore described as litthâm wearers, mulâthîmân or aslîd al-munâthîmân; as the Almoravids originated in one of their clans, the Lamtûnîs ([p.]), the litthâm thus came to have a certain political signification. The custom of wearing a litthâm below the wikûd, see al-Bakîrî, 170; the litthâm is also mentioned by al-Yâ'âshî, Ibn Hâskal, Ibn Barîsî, Ibn Khaldûn, etc., cf. Corso, 152, was found in other parts of Africa also, e.g. in Kûn (al-Makrî, i, 193, 33 f.) and still prevails among the Tuaregs. The Tuareg veil has been the object of several special studies (see [book]). Amongst the Tuaregs, it is not called litthâm, but takmût or qîdâm ('muslin'). Its origin seems to be pre-Islamic and perhaps even prehistoric. Among the Abûn, absent painting on their faces is known. In North Africa there are human figures without mouth and nose, but with only two eyes. The primary motive for a veil seems to be magical, to protect the ways of life from evil forces. These Africans retained their veils even on journeys into the eastern lands of Islam, where it was not the fashion, while their women went unveiled. A tradition of late invention explains these remarkable customs by a story that on one occasion during an attack on a village, where there were many women but only a few men, the men put on veils and the women took up arms in order to deceive the enemy as to their real numbers (Goldzihèr, in ZDMG, xlii, 101); another story has it that after the fall of the limayyads, 200 members of the Umayyad family and their clients escaped to Africa disguised as women and that the veeners of the litthâm are descended from them (Wisentfeld, Der Tod des Husayn, p. vii). According to al-Bakîrî (text, 170, fr. 321), they never took off the litthâm, and if one of them fell in a battle and lost the litthâm, not even his friends could recognize him till the litthâm was put on him again; they also called other men who did not wear the litthâm "fly-mouthed". The Almoravids, particularly Ibn Tâmûrît, opposed the veiling practised by the Almoravids. They continuously insisted that it was forbidden for men to imitate the dress of women, but they did not succeed in abolishing the custom of wearing the litthâm (Goldzihèr, in AL, 192, 102). Among further passages where the term mulâthîmân occurs in this sense may be mentioned 'Abd al-Latif, ed. de Sacy, 483, 48 (with other references); Fleischer, Kleine Scarijten, ii, 243 (discusses several passages); Mar¬

**LITERATURE** [see adab; 'arâmîyya; gizal; ma'dîn; marâmî; marthîyya; sîrî; ta'ârîf, etc.]

**LITHÂM** (V), see further, Bosworth, Op. cit., i, 100-3. Especially valuable evidence on this type of activities is to be found in the chapter on tâlaffût and associated malfeasances in al-Râziq al-Ishfârî’s Mudahharât al-ndoûbî (ed. Cairo 1287/1802, ii, 108-14, ed. Beirut 1961, iii, 189-99). Al-Ishfârî’s sites as an outstanding figure amongst successful criminals on 'Ughîm al-Allâh, the leader of a slave revolt himself (called al-Khayyât), because his original profession was that of tailor, but because he 'sewed up', thâbû, the holes bored into houses (fictional purposes so neatly that they were almost undetectable) had apparently become something of a semi-legendary figure by al-Râziq’s time (the Dârid al-Calâz: Library in Mêdîn—whose contents are now dispersed and their location largely unknown—contained a Bihâdîkh 'Ughîm al-Khayyât fi 'thâbûj ne-ar-şamâ, see Pellat, loc. cit.; and one wonders whether there is some connection with the hero of two anecdotes given by al-Tâmûrî, named as zâbâb b. Khayyât and described as a supposedly clever thief of Buṣra, see Nisrâdî, vii, 97-102, nos. 58-9). According to this 'Ughîm, there were five main categories of thieves and brigands: (1) the miskâlî or 'trickster', who worked by stratagems and who did not look down on mere crimes and was therefore looked down on his more desperate and violent con¬

**LITAMQRA**. Die Bemäusammlung, Index, s.v.}
From expressions like "to kiss the lips of the beloved one, which are under her lihtham" (Dozy, Vilemurus, 400; cf. ma 1abi al-luhthamun - "the face" in al-Mutanabbi, 564, 27) developing the meaning of lihtham "to kiss" (Umar b. Abl Rabi'a, ed. Schwarcz, 6, 207; Ibn al-Faraz, Darya, Masnadis, 135, 195, 1 from below) and especially luhtham - "to kiss one another"; malhtham, the place which is kissed (al-Farazak in Dozy, Supplement). A girl is given a luhtham woven out of her own hair (coor Night, Brussels edition, ll, 52, 2); the camel has a luhtham of foam around its mouth (Diu 4-Rumma, 76, 17); the wolf is abانم al-luhtham - "black in the region of the muzzle" (al-Tirinnab, 4, 35; of the wolf, we find it said in Hamida, 1, 762, 17; lam yutbihiha); the wine-jar has a luhtham, i.e. a piece of cloth over its mouth (Malhtham; Majaddadis, ed. Lyall, no. 1725, 2; also al-Akhalt, ed. Sihah, 85, 2 and 8; Alkama, ed. Socin, ill, 43, on jars); the sun is darkened by clouds of dust and is thus given, as it were, a mouth-veil (its uisinn, al-Mutanabbi, 601, 13); "as the day (nahr) doffed its luhtham" is a description of dawn in Ibn Arabshah, ed. Golius, 64, 3, from below; cf. the commentary on al-Hariri, Mafshnelt, 240, 27; bahhafa (al-suh) al-luhtham; many titles of books also begin with bahh al-luhtham, ed. Brockelman, III, 715, 937 (eight titles with bahh al-luhtham and one with imdhat al-luhtham); the luhtham is to be taken from the walls of buildings, i.e. they are to be exposed (itsmd al-Din, ed. Landberg, 65, 12); to doff the luhtham of one's origin - to cloak it freely (al-Hariri, Mafshnelt, II, 426, 3); the archangel Israil has one of his four wings veiled like a vast mouth-veil (itsuah) from heaven down to the seventh earth (al-Kashwali, ed. Wustenfeld, 11, 56, below); to veil the moon, a term common with the Formula of the formula in the Qur'an 770: to kiss, to kiss the lips of the beloved one, which are under her luhtham, in the Qur'an 770: the mouth-veil (itsuah); the mouth-veil of the archangel Israil is said to have "ceaselessly regretted" (Pelliot, nos. 4093, 629, 4003), 12th/18th century Chinese Muslim scholar (translator, theologian, philosopher, biographer of the Prophet Muhammad), the most prolific Chinese Muslim author and probably the best-known literary figure yet produced by the Chinese Muslim community. A. Hui (Chinese-speaking) Muslim, Liu Chih was born in Nanking ca. 1681/1690. Little is known of his class background or early childhood, but it is safe to assume that he was from a well-to-do family. His father Liu Han-ying (Matthews, nos. 4093, 2039, 7489) is said to have "ceaselessly regretted" (Pelliot, op. cit. in Bibl., 415, n.1) the paucity of Islamic works available in Chinese, and indeed, some sources have credited Liu Han-ying (under the pseudonym Liu San-chih, Walters, nos. 4093, 5435, 774) with the authorship of two short Islamic tracts (Pelliot, ibid); certainly, Liu Chih seems to have manifested an early interest in the study and translation of Islamic works. Liu tells us that he prepared himself for his life's work—the propagation of Islam through the medium of the Chinese language—by undertaking prolonged linguistic and philosophical studies. At the age of 25 he began a study of the traditional Chinese classics and histories which lasted for eight years. This was followed by a six-year study of Arabic and Islamic religious literature, a further three years study of Buddhism, and finally, one year studying the Taoist classics. Liu completed his universal education by reading 137 Hsi-yong (Western) books of which Ford, 150 (see Bibli), writes: "this may seem a large number for that period, but it was over a century since Matteo Ricci had arrived in Peking (1601) and he and his successors, together with the Chinese scholars associated with them, had produced a whole series of works on geography, astronomy, mathematics, mechanics and religion, including some touching on Confucianism. It is therefore quite possible that there was a concentration in the number at Nanking and that Liu had seen it".

From the age of 33, Liu was to concentrate on making Arabic and Islamic works available to his Chinese co-religionists. It is clear that he also wished to make Islam philosophically acceptable to the Confucian Chinese establishment. As Ford (ibid.) points out: "his leaning towards Confucianism was more marked than that of any other Muslim and it has sometimes been questioned whether he did not compromise his Muslim principles. After ten years of study, he wrote, it came on him like a flash that the guiding purpose of the Qur'an was similar to that of Confucius and Menelus. 'The Sacred Book', he wrote, 'is the Sacred Book of Islam, but it (the Confucian concept of moral propriety) is the same in which exists everywhere under heaven'." In Liu's attempt to reconcile Confucianism and Islam, the traditional dilemma of Chinese Muslims—geographical and cultural isolation—was to be solved. Though the Chinese were rapidly-deteriorating Han Chinese—Hui Muslim relations), whilst at the same time strengthening the Islamic affiliations of the Chinese Muslim community.

Liu Chih tells us that after completing his preparatory studies, he wrote several hundred manuscripts, of which only about one-tenth were published. His first major work, Tien-fang hsiang-lu ("The Philosophy of Arabia")—preface dated 1100/1701) deals in some depth with questions of cosmology, creation, the nature of man and the unity of God. In the preface to this book, a contemporary non-Muslim mandarin, the Vice-Minister of the Board of Ritual, wrote: the ancient Confucian doctrine has been undermined at different times, and in different ways, by Buddhism, but the Chinese, however, in this book Liu Chih we see one more the way of the ancient sages, Yao and Shun, King Wen and King Wu, and Confucius. Thus although his book explains Islam, in truth it illuminates our Confucianism." Similarly in the preface of Liu's Tien-fang t'ien-lu ch'ia-yao-chiai ("A selection of important Arabian [i.e. Islamic] rules and cere-
monies"—praise dated 1122/1710, the Vice-

Minister of the Board of War was to write that after discussing the Muslim religion with Liu he had

found that it upheld the traditional Confucian values of loyalty to the sovereign, filial piety and

brotherly love—in short, that Islam was not to be equated with "heretical and vicious sects" which

were opposed to the established (Confucian) order (Ford, ibid). This early Ch’ing attitude to Chinese

Islam was to change radically by the latter half of the 19th/20th century. In 1881, it was noted that the

tomb of Sayyid Wakkas, by

the Chinese government.

tradition the father of Chinese Islam, was restored

whether the tomb still exists today, but It should be

Liu Chih’s tombstone obituary is

in M. Broomhall, Islam in China, London

1910, 73-5. An analysis of Liu Chih’s work may be

found in A. Vissière, Analyse d’ouvrages coïncis-

Masokendias, in D’Ollone, Recherches sur les

musulmans, Paris 1911, 389-417, 421-5; also in

REMI, xiii (1911), 30-63. A number of Liu Chih’s

works are listed in C. L. Ogilvie and S. M. Zwemer,

A classified bibliography of books on Islam in

Chinese and Arabic, in the Chinese Recorder,

xviii (1911), 625-9, see nos. 6, 7, 13, 20 (?), 21 (?),

43, 77, 24, 53, 55. Liu Chih’s translation of

Shi-kum-long (‘‘Chinese three-character classic’’) by

F. L. M. Cotter and K. L. Reichelt, see MW, vili

(1918), 10-15; also in the Chinese Recorder, i (1919),

655-52. [This is the same work as Liu Chih’s

T’ien-fang san-liu-ching (‘‘Arabian three-character

classic’’)] mentioned by Mason in JNCBRAS (1925),

cited below.] For a preliminary examination of

Liu Chih’s T’ien-fang shih-lu-nien-p’u, see L. Mason in Journal of the North China Branch

of the Royal Asiatic Society, ii (1920), 159-80, under

the title A Chinese life of Mohammed. Certainly

the most interesting English-language work on Liu

Chih is Mason’s The Arabian Prophet: a life of

Mohammed from Chinese and Arabic sources,

Shanghai 1921; this work is an extensive

(though not full) translation of Liu’s T’ien-fang shih-lu-shih-lu-A.

A list of some of Liu Chih’s works also appears in Mason’s Notes on Chinese Mohammedan

literature, in JNCBRAS, ixi (1925), 175-215, see nos.

250, 264, 274, 277, 279, 285, 297, 312. The fullest

treatment of Liu Chih’s work in primamacy is

in Japanese; see Tanaka Ippei, Tempo Shisei

Hakushi Kohi Kettei Toyo-shi

(‘‘Islam in China’’), Tokyo 1930. Also in Japanese, see

Kuwata Rokuro, Liu Chih no ts’ai-cihing shu-mu ni

tsuite, in Ichimura hakushi kohi kinen Teyo-chi

renso (Iehimura Festschrift), 1933, 335-53. A short

notice may be found in Fu T’ung-hien, Ch’ang huo

chi-chien shih (‘‘A history of Chinese Islam’’),

Shanghai 1940, 160-1 (Taipei reprint 1970; Japanese

tr. Akira 1942). Also in Japanese, Kadono Tatsuji, Kaigō Ryōsei [sc. Liu Chih], no “Tenkō Tenrei yōkō hoshu” (‘‘The Muslim scholar Liu Chih’s Selective of important Arabic

rules and ceremonies’’), in Shina Bukkyo Shigaku,

JNCBRAS, vi (1940), pp. 13. See also the monumental

work on Chinese Islam of Taraka Kōdō, Chikōku ni

oheru Kaikyō no densai to sono gendai (‘‘Islam in

China: its introduction and development’’),

Tokyo 1964, 170-91. The most recent English

language notice is J. F. Ford’s Some ChineseMuslims

in the seventeenth and eighteenth centuries,

in Asian Affairs, iv (1974), 144-56, see esp.

143-52. D. D. Leslie, in his Islam in China to 1800:

a bibliographical guide, in Abr-Nahrain, xvi (1970),

r6-48, states that Liu Chih’s tombstone obituary is

to be found on pp. 11077-12080 of the 1970 edition

of his T’ien-fang tien-h, see Leslie, op. cit., 55.

(A. D. W. FORBES)
LIVADYA (Λήμνος), a town in central Greece on the slopes of Mount Helicon, bordering the vast fertile plain of Boeotia. Nearby is Lake Kopra, the site of the battle of Lefkadia in 1453. The town was called Eghriboz (from Euripos), and was captured in 1460 when the district became an Ottoman province. The Catalans of the Grand Company occupied Livadya in the 14th century, living in the shade of the mighty Thessalian Mountains. The origins of Livadya go back to the remote antiquity. Since the 8th century B.C., it was one of the most important centers of the Duchy of Athens. In Ottoman times (1460-1829) it developed into a prosperous urban center and grew into the largest city of central Greece, after Athens, with the highest number of Muslim citizens to the south of Thessaly.

The Muslim community, consisting of 427 Muslim families who had been ousted from Epirus by Carlo Tocco. The reign of Antonio Acciaiuoli, an Ottoman vassal, was more or less uninterrupted only by the plague of 1348, 1372, 1374, and 1388. The Ottomans seem to have settled mainly in the minor Boeotian towns, living in the shade of the mighty Thessalian Mountains. The Muslim community, consisting of 90 households, was apparently the oldest preserved Ottoman register containing information on Livadya. In the mentioned year, the town was a village inhabited by Albanians ("Arravoul") and a garrison of a few dozen soldiers. This source also states that the Jews had come from the West and that their number could be so low because the city was safely situated in the interior of the country and had little to fear from an enemy attack (Chalkis and Athens, etc.).

In this same year the administrative district of Livadya contained 47 Greek ("Rum") villages and 30 houses inhabited by Albanians ("Arravoul") in 1472, Livadya was entrusted to 22 soldiers of the garrison of Egriboz, soldiers bearing Muslim names and coming from a number of places in the Balkans (Pirıae, Fanari (Thessaly), Nigibolu, Herakleia, etc.), thus giving an indication of where the first Muslim settlers of Livadya came from.

During the 16th century, Livadya shared in the general expansion of the cities of the Ottoman empire. The census registers of the sandjak of Egriboz, preserved in the Baybakan archive in Istanbul, give exact information on the fast-growing number of inhabitants as well as on the number and scope of the Islamic institutions founded in the city in that period. The Mufti's register of 1506 (T.D. 5) records some of the inhabitants of the sandjak of Egriboz (but not the population of Livadya), mentioning a musulmân-âhâne of Hasan Beg b. Musa in the city and a zâwiyâ of Ayas Dodê, which provided lodging for travellers. Both foundations were maintained from the rents of some shops, watermills and gardens in or near the town. According to the Toral defter (no. 307) of 1526-28, Livadya numbered 427 households, 295 of which were Christian, divided in 24 bachelors as well as a Muslim community of 37 households and 23 bachelors. The Christian group should be regarded as the autochthonous population of Livadya, the relatively large Muslim group as the product of a deliberate policy of colonization after the town had been annexed.
During the Greek War of Independence, the town was several times plundered and burnt and at the end nothing but ruins remained. After 1829, Livadya was rebuilt gradually. In 1839 there were 4,990 inhabitants; in 1857, 7,089; in 1878, 12,585, more than during the last century of Ottoman rule (approx. 10,000). In 1938 the expansion virtually stopped (in 1961 there were 12,059 inhabitants), but in recent years there is again some growth. No traces of Islamic buildings are preserved except for a fine vaulted stone bridge and a 18th century clock tower. The Catalan castle, wrecked through an earthquake in 1711, still exists in ruined condition.
The town of Livno is an Ottoman foundation from the early 16th century, whose expansion was greatly promoted by various members of the sandjak administration residing there. The castle of Livno, now a ruin overlooking the town, is much older. It is mentioned by Constantine Porphyrogentius (10th century), who called it "Grad Hlivanjski" and situated on the border between the Serbian and the Croatian lands. In the later Middle Ages, Livno belonged to the kings of Bosnia. It is mentioned as "Grad Hlivanjski" in 1400 (Milutin, Monumenti, 248-9). In the first half of the 15th century, it was ruled by the family of Vukčić. King Tomas resided in Livno in 1444 (H. Sabanović, tr., Evžena Celebija.popeli, i, Sarajevo 1937, 154). The castle is again mentioned in 1466 as being guarded against the Turks by Vladislav Hercogović, a son of Duke (Hercog — Hercogovina) Stjepan (one of Vladislav's brothers) became the later famous Grand Vizier of Bayezid II and Seifulli, a Cretan Ahmed Pasha. The Ottomans captured the castle of Livno between 1466 and 1485. The exact date is not known, and is an object of controversy. The Taburt defter no. 8 of 890/1485 mentions Livno as a centre of a nahiyye it possessed then a civil population of 73 families and 207 temporary residents.

In the first decades of the Ottoman period, there was only one mosque in Livno, the Klisar Džamija, or Starogradska Džamija, in the castle, serving the needs of the garrison. In the first decades of the 16th century, a Muslim suburb grew up around the Balagiana Mosque (Balagiana), built according to its Arabic inscription in 930/1524. This building, still preserved, is the first of the domed mosques of Livno. Soon afterwards, the Džumana Mosque of Sinan Čavuš from 931/1525-9 was erected, also a domed structure (destroyed in World War I). The open town of Livno sprang up below the castle on a sloping ground, with the older quarters at the foot of the castle and the newer ones further down the hill. Livno remained a nahiyye of the bābūli of Neretva until some time in the first quarter of the 16th century. After the conquest of Skradin in 928/1522 (Paleček 'Peček', 1, 72), Livno was included in a newly-formed district, and the old Livno had the status of a sanjak. In 930/1524, preserved in the Gennadius Library at Athens, contains a mass of information on the political, social and economic situation of Levadya, Salona, Vostitsa (Aeghiion) and Corinth for the late 15th century. An edition and a critical study of this singularly important manuscript was given by Σκέδος Α' Αθηναίος [Skiadas Andreas] in the periodical Εποχή [Epochi] of May 1958.

(L. Krei.)

LIVNO (in pre-modern Slavonic texts, often written as Hlvno; in older Ottoman texts variously written as Hlven, Hlvne, etc.), a town in Bosnia situated at the spur of a mountain at the eastern edge of the homonymous pepo or plain in a very dry and stony karst landscape on the approaches to Dalmatia. Today, it is a small local centre far off the main thoroughfares and little-visited, but in the 16th and 17th centuries it was a centre of Ottoman power, seat of the sandjak beg of Klis, and bulwark of Islam on the western frontiers of the empire. Until World War II, Livno boasted five domed and lead-covered mosques from the classical period of Ottoman architecture, thus ranking second in Bosnia, immediately after Sarajevo, in this aspect, demonstrating the importance which the place once had as a centre of Islam.

Bibliography: A history of Livdyia based on Ottoman sources remains to be written. Modern Greek literature deals mainly with the events of the War of Independence and recollections of the Greek part of the population. Very informative is I. Papatheodi, Η Συνεργασία Ελλήνων της Σερβικής Ελλάδος κατά την Κοινοκύκλου της Θουρκοκυβερνήσεως του Δούκα Ι. Παπαθεοδούλου, Ph. D. diss. Athens 1971 [J. Giammou­čou, The administrative organisation of Storied Hellas during the Turko-Hellenic]. For the pre-Ottoman period, see K. M. Setton, The Catalian domination of Athens, rev. ed., London 1975; J. Koder, F. Kluid, Tabula imperii Byzantini, Hellas und Thas­salia, Vienna 1976 (both with extensive bibli.) and W. Miller, Essays on the Latin Orient, Lon­don 1925; for the Catalian fortress, see A. Bon, "Forteresses militaires de la Grece centrale," in Bulletin de correspondance hellénique, lx (1937), 187-206. The Ottoman documents used here have not been published, except the waft-name of Ümer Beg, a Greek translation of which can be found in Epanoméndes Pharmakidis, Ι. Λαρία, Vol. 1926, 283-310. The official Ottoman list of bābūli of Livno was published by Ωζογια in Orb. Prof. Ισμαν Ησάκι Ονμανζί, Ankara 1975, 150-75; H. Holand, Travels in the Ionian Islands, Albania, Thessalia, Macedonia, etc., 1812-18, London 1815, 305; J. A. Buchon, La Grece Continentale et la Londe, voyages, séjours et études historiques en 1840 et en 1841, Paris 1843, 220-6; A. Philippson, Die Griechischen Landschaften, Frankfurt 1937, 1/1, 449-66; Baedeker's Griechen­land, 2nd ed., iv, Paris 1826, 75. For travellers' accounts, see Jacob Spon and Georg Wheler, An edition and a critical study of this singularly important manuscript was given by Σκέδος Α' Αθηναίος [Skiadas Andreas] in the periodical Εποχή [Epochi] of May 1958.
with 19 Muslim and nine Christian age of Islam. Livno ended in 1686 when, during World War II, Livno was three-quarters of the number given were family men and had 1,100 stone-buildings. The castle was maintained throughout the 18th and the greater part of the 19th centuries. In 1833 it still had 34 guns. The Ottoman period ended in 1878, when the Austrian-Hungarian army captured Livno after an obstinate defense. The town continued to flourish until the beginning of the present century as a small centre of grain and live-stock trade and silver filigree-work, until a great conflagration in 1904 swept away more than 500 houses. Before that date it had, according to the Encyclopaedia Briandiana, 1911 edn. (xvi, 816), about 3,000 inhabitants, but this recovery was temporary. After 1918, when it was incorporated in the kingdom of Jugoslavia, a large part of its Muslim population departed. When René Pelletier visited it in the early thirties, Livno had but 2,500 inhabitants (Pelletier, Sarajevo et sa région, Paris 1934). During these events, all the latherto- preserved mosques but one (Balaguia Dzamija) were deliberately destroyed or heavily damaged, together with the whole town. The ruins of the Glavica Dzamija and the adjacent Clock Tower, together constituting the landmark of Livno, were restored in 1963-4. The Beglik Dzamija of Sokolnica-zade Musafija was restored in 1953-4, and the Zavita Dzamija and Zavita Dzamija, both wood-covered halls, in the seventies. In 1953 Livno numbered 3,672 inhabitants, among whom is a small Muslim minority. The centre of gravity of the post-war town has shifted to the flat grounds of the plain below the totally-ruined Ottoman town. In the old parts, now under the protection of the Service of Ancient Monuments of Bosnia, only construction in local style is allowed, thus creating a harmony with the preserved Islamic monuments.

The material for the work of the Arabic and Ottoman Turkish were published by Mehmed Muheljčević in Prizren, Il-iv, Sarajevo 1953, 455-84. The tapa depth from 560 and 582 are published in the Bašćankul Arhiva, Istanbul, and are not yet published. (M. Kiel)

LIWĀ' (A.), in Ottoman liwa'.

1. For the meaning banner, flag, standard see 'alam.

2. In the Ottoman empire the word indicated a province, several of which were at a certain moment joined into an eyalet, later vilâyet [see wilāya]. The term liwa', synonymous with Turkish saqalı [see sâqalı], was mainly used in official documents. Accordingly, mit liwa' (from Arabic umr al-liwa') stood for saqalı baghi [see sâqalı], the governor and military commander of a liwa' or saqalı. From the middle of the 19th century onwards there was also used the term milletliyâfi [derived from the title milletliyâfi], of all the states issued from the Ottoman Empire's Hercegovine knjiga XIV, Odjeležnica Istoriskih Filoških Nauka 10, that is, to indicate a province. In the army of 'Irāq, liwa' indicates a brigade, umr al-liwa' brigadier (as in Egypt until 1939).

Bibliography: Gibb and Bowen, Islamic society and the west, London 1930, 2, 137-73; A. Birker, Die Provinzen des Osmanischen Reiches, Wiesbaden 1976. For further literature, see saqalı. (A. Birker)

LIWĀN [see livān].

LIWĀT (A.), sodomy. There does exist in Arabic a verb liwa' meaning "to attach oneself, to join oneself to", but liwāt appears to be rather a nasab of liwā' or liwāna, denominative of Līt [f.v.], i.e. Līt. In modern Arabic there are also the terms liwā'a, muluq, saqalı, balal, etc., as well as a large number of euphemisms. "Blind allows a certain ambiguity: the homosexual is called liwā' or liwāt (pi. liwāt), or muluq, when he is the active partner, although the distinction is often difficult to establish; the passive is mūlūn, and his perversion, mūba; among the synonyms, the most common is muluq, generally translated as "ellipticate", although in normal usage it refers to the genuine hermaphrodite (see A. Bouhida, La sauvagerie en Islam, Paris 1975, 55-7). In the Muslim West in the Middle Ages, a special term, liwāt [pl. liwāt] was used in reference to professional male prostitutes (see below).

In a number of verses of the Qur'an relating to Lot and his people, the word šākhs, which may be rendered as "depravity", is clearly an allusion to the vice in question, but this is even more strongly indicated by the pejorative nature of the remarks and questions attributed to this prophet: innā kum la-tūm la-ta'tūn l-ridajal min dīnī, min dhikrī, mal anum la-ta'tūn liwa't la-ta'tūn l-ridajal (XXVI, 17, LXXVI, 19). The statements inflicted upon the people of Lot, in the Qur'an as in the Bible (Gen., xix, 1-23) leaves no doubt as to the way in which sodomy should be regarded by Islam, even though it is not explicitly condemned by the Prophet. Only the holy book has the final say. The Qur'anic passages where the believers are promised that in paradise they will be attended by maidservants (Khimān, LIII, 24; wādīs, XVI, 17; LXXVI, 19).

The statements of ḥaddh are, on the other hand, perfectly clear and particularly harsh, as is noted by al-Nuwayrī who, in his Ni+hāya fi, (ii, 204-10), has conveniently collected them together, with the addition of the opinions of the Companions and the tahtāb on the subject. The latter, although referring to Arab and Ottoman Turkish, were published by Mehmed Muheljčević in Prizren, Il-iv, Sarajevo 1953, 455-84. The tapa depth from 560 and 582 are published in the Bašćankul Arhiva, Istanbul, and are not yet published.

The word ḥaddh, rendered as "depravity", is clearly an allusion to the mode of sexual intercourse, probably the bone of contention, in the statements of al-Nuwayrī who, in his Ni+hāya fi, (ii, 204-10), has conveniently collected them together, with the addition of the opinions of the Companions and the tahtāb on the subject. The latter, although referring to Arab and Ottoman Turkish, were published by Mehmed Muheljčević in Prizren, Il-iv, Sarajevo 1953, 455-84. The tapa depth from 560 and 582 are published in the Bašćankul Arhiva, Istanbul, and are not yet published.
preston about sin Diih, making the last word ("bear") into a proper name; similarly al-Dihib (Muykalat al-jawahir wa l-ISlam, in Rassul al-
Prophet, ed. Hâkim, ii, 136-7) quotes a Hâkim proverb, about sin Diih, in which Diih ("cock") would also be the name of a person; these expressions are quite curious, to say the least. Whatever the case may be, animals are not exempt from this vice: al-Dihib himself (Hâkim, iii, 294) cites the example of a nashîn horse, perhaps castrated at an early age, which pursued male horses, mules and donkeys. The same author seems to have been led to speak (ibid., vii, 278) of a fabulous animal, the 'nâlî, which was in the habit of assaulting the men whom it encountered, even if they were infected with the dangerous disease and died as a result (cf. al-Mas'udi, Marâjî, iii. 319-20 § 1205). In his Mykalat, he also mentions a nashîn of Khurîn, Maymûn b. Zayd b. Tharwân, who was a 'âlî in Kîta and who became proverbial under the nickname of Siyâsh, but was apparently viewed with an indulgence that spared him any punishment.

However, in the course of the 8th/7th century, a number of precise cases of lâfîfis are reported, especially by al-Dihib and al-Nu'mayrî. Abd Bâlii condemned a homosexual to be burned beneath the dibab of a wall, and prescribed burning alive as the penalty for all those guilty of such practices; in this respect he was followed by 'Abî Abd Allîh b. al-Zubayr and Hishâm b. 'Abî al-Mallîk. For his part, 'Abî b. Abd Thîb ordered the stoning of a lâfîf and had another thrown head first from the top of a minaret; according to Ibn 'Abbas, this last punishment must be followed by stoning. 'Abî Abd Allîh b. 'Umar went a step beyond the condemnation predicted by the Prophet, reckoning that these people would be resurrected in the form of monkeys and pigs. The famous letter from an Unayyîdînî caliph (see Sâfî, iv, 307b) ordering the governor of Mecca or of Medina to "hold a census" of the muhâmânîn of the town corresponds to a real situation, even if the tradition itself is contrived.

In fact, the increase in prosperity brought about by the war of spoils brought in from the conquered lands was accompanied, paradoxically, by the corruption of morals in the two holy cities. As regards the subject which concerns us here, information relating to the development of music and song reveals the presence of musâhîmatîn, who were apparently for the most part of foreign origin. It may thus be assumed that from this time homosexuality became less of a rarity as the result of a rapid process of acculturation. A defender of paraphilias, of lovers of female names in their titles (c.g. Kâliba, al-Hâshiyya, 116 of al-Mu'addî, depicted in the Mykalat (ii, 116) of al-Dihib, observes in effect that natural love is a feature of Bedouin culture and of simple morality and that if the ancient Arabs glorified woman, this was because they knew nothing of the refined pleasures of this world, which are only to be encountered in a highly civilized society.

All the same, it is not impossible that the decisive impulse came with the arrival of the 'Abbâsîd army from Khurîsî (ed. A. Moe, Renaisance, Eng. tr., 352) that homosexuality subsequently spread more widely under the new dynasty. In fact, tradition attributes to al-Mu'addî tastes so depraved that his mother, Umm Diibar, was obliged to procure for him slave women with the physical characteristics sought after by lîfîn among boys and to dress them in masculine clothing, in the hope of inducing him to adopt more conventional morals (al-Mas'udi, Marâjî, viii, 370-80 = S 3451-2). It was no doubt such episodes that gave rise to the fashion for "masculine girls" ('zâdîyat), a trend widely reflected in literature (see H. Zayyâs, al-Mu'addî al-qamîsîyya fi l-Islâm, in Muqadd., 1956). In lîfîn, the Aghlabî caliph 'Abd al-Malik II was surrounded by some sixty catamites whom he treated in a most horrific manner (see M. Taibî, Études qâhidîs, 306, 317). At Cordova, 'Abd al-Rahmân III had executed a young lad from Léon who was held as a hostage, the future St. Pelagius (Pelaios), because he had refused his advances (Simoën, Histoire des Motarabes, 542; see also Ch.-E. Dufourcq, La vie quotidienne dans l'Europe médiévale sous la domination arabe, Paris 1970, 112), which homosexuality tended to spread in this part of foreign origin. It may thus be assumed that in all cases the culprit must be put to death by stoning, while the other schools are in general content with flagellation, with or without punishment. If the man is not musâhî, it should be noted in addition that it is sometimes recommended that the prescribed penalty (one hundred strokes) should not be applied in full, and Ibn Hâzn goes so far as to reduce the number of strokes to ten. These variations correspond to the uncertainties surrounding the definition of the penalty to be imposed for fornication (see S 216, for details), but also betray a tendency towards indulgence; moreover, since proof is always difficult to establish, there is little likelihood of the punishment actually being applied. These circumstances do not prevent moral panilists from considering illegal a lustful glance in the direction of a handsome youth (umaylî), and the Muslim forbids men to walk in the street with women or with adolescents (Mea, Renaissance, Eng. tr., 353). The latter's opinion is that these pruderies are justified by a large extent theoretical, since homosexual relations have always been tolerated. They were common in religious brotherhoods and in educational institutions (see A. Bouhdiba, op. laud., 146), and schoolmasters had an unenviable reputation in this respect, as is shown by many anecdotes. The notion of the public baths did nothing to discourage such practices, and the paragraph devoted by H. Peres (Pou customize, 341-5) to homosexuality in al-Andalus refers specifically to the baths.

As regards women, the Aghlabî (ed. Berait, i, 110) mentions a love affair between a certain Hind (named, incorrectly, as the daughter of al-Mu'addî b. al-Mu'addî by S. al-Munadîdî, al-Hayâl al-qâhidîyya fi al-Arab, Beirut 1958, 14; see Mas'udi-Pellegrin, index, under Hindî and Zâhî al-Yamanî, which would be the oldest example of Sapphism among the Arabs, but in this particular case we have a work of imagination, called moreover Kûbî Hind un-batî al-Nâzîmî, by Ibn al-Nâzîmî (ed. Cairo, 427), who cites a dozen love romances with female names in their titles (c.g. K. Râyâya munifâda, K. Sâmîa mârûdîdî, etc.). Although information is scarce, it is likely that sâbîbî al-qâhidî masâhîm, while not widespread, existed no less than male homosexuality, since according to the relevant hâdîth it is also identified with zâdî (alâh al-umâra, zâdî bâyi-n-hamam). These practices, which al-
Djihād (Hassassin, vii, 26) knew well, spread in parallel with sodomy, at least in the least severe cases of Arab-Islamic society, if we are to believe the rather late works of eroticism which will be mentioned in due course; in any case, at the end of the 3rd/9th century, Abu 'l-Anbas al-Saymārī (p. in Suppl.) wrote a Kitāb al-Sahābāt, of which apparently no traces remain. In addition, the sodomisation of women, although formally forbidden by the Prophet (see above, p. 233), is thus accorded the same status as the people of Lot.

In any case, the presence of professional deviants (mudhāfārūn) in the larger towns has been frequently attested by travellers (see G. H. Bousquet, L'Éthique de l'Islam, Paris 1933, 59). Mention has been made of transvestites, for example in Dougie (Idris, Žirides, 329, 392), in Tunis (R. Brunschvig, Hafridun, ii, 173), where Leo Africanus (tr. Epaulard, 385) saw young boys prostituting themselves, in Fez, where the same author encounters what he calls chena (= chained, a term of particularly common usage in Spain; see Dozy, Suppl., s.v.) living with men in hostgeries. Such statements cover such a broad expanse of time that they cannot but be a reflection of a permanent situation which has, moreover, persisted into the present day (see, e.g. Bouhdaiba, op. land., 233). It need hardly be said that the authors of works of jisba utterly deplore these deviants and the moral corruption for which they are responsible, but not one of them is so severe as to demand for them the capital penalty ordained by the afore-mentioned hadhrātāt. According to Ibn 'Abdun (Lévi-Provencal, Risdla fi ittihar al-baln, 1957, 70), the basā is to be expelled from the town and severely punished if they return, since they are accused of Allah and of the whole people; al-Sakātī (Manuel hispanique de l'islam, Collin et Lévi-Provencal, Paris 1931, 68, and gloss., 26; Spanish translation by Galmate, in L'âl-dinah, 1906 ff., p. 161) speaks only of mudjilīn-mudjahān (singers disguised as women), whom he forbids to wear their hair long over the temples or to attend banquets and funerals (see also Lévi-Provencal, Trois traités hispanique de jisba, Cairo 1953, 123). Although the repression of jisba, in the strict sense of the word, forms a part of the general censorship of morals, these works contain few specific references to it.

It should be said that this phenomenon, while provoking the disapproval of a number of moralists loyal to the tradition of the Prophet, has for the most part been viewed with indulgence—if not actively condoned—ever since the 15th century onwards, glorified homosexual love quite shamelessly, often in terms of intolerable obscenity; in the interminable list of these poets, the first place belongs without doubt to Abū Nuwas who, even without the dedication of the zu'ur Nights (see N. Elsèy, Œuvres d'élite, 1910) plays a role of unassailable eminence in this regard. His master Walīb b. al-Hubbāb, who is thought to have debauched him, Husayn b. al-Dabbāb, Mu‘īn b. Iyās and a great number of others, were initiated and sometimes overtaken by exponents of mudjahāns (p.v.) and of sakhīs, which Ibn al-Hājjījājī made his speciality, as well as by Ibn Būrān in his celebrated muqaddimāt.

On the other hand, there are a great many poets who have not hesitated, at some point or other in their career, to sing the praises of a youth, in many cases no doubt, less from personal taste than from the desire to conform artificially with a general trend. In fact care should be taken not to accuse all such writers of libertinism, for it was conventional practice to glorify wine, women and favourites, without becoming personally involved in debauchery or violating the rules of Islamic ethics. We may cite, as a simple example, the theme of datib, "crawling", appropriate perhaps for an Imām al-Rayyī who lived in a society where it was possible to crawl under the tent in order to approach a woman, but purely conventional in the case of a city-dweller like Ibn Shāhīdī who, unlike the pre-Islamic poet, attested by travellers (al-‘Arabī, al-ṣunūn, x, 244), in a poetry of a high standard of sophistication, the masculine form to designate the person in question, whose sex thus remains undefined. Leaving aside the mystics, who frequently adopt an equivocal posture, the use, by poets whose morality is not suspect, of the masculine form in their love poems, derives less from a desire to shock than from a sense of modesty and from respect for a tradition that was reckoned to be harmless, a tradition maintaining an ambiguity universally accepted and appreciated. In the sphere of prose, the most significant, if not the oldest writing, is certainly the Muṣṭafārī ḥaṣānam wa l-jismān of al-Djihādī who, always prone to cultivate the genre of ṣūraṣ, a debate, of which he is one of the pioneers in Arabic literature, presents in the form of a stylised dialogue arguments exchanged between homosexuals and men of normal sexuality. As already stated, the desire to conform artificially with a general trend, to leave no doubt as to his own tastes, sometimes overtaken by exponents of mudjahān, which testify to the popularity of stories of lātā from the 3rd/9th century: these were to find a place in collections compiled in later times for the entertainment of what were, in appearance at least, the most puritanical sections of society. A characteristic manifestation of this somewhat perverse taste is encountered in the work of al-Tawbīlī, who devotes a chapter of his Jisba, the 18th night (ii, 50-66) to mudjahān and naturally tells the story of a lātā (tr. Bouhdaiba, op. land., 58). The example set by al-Djihādī in his Muṣṭafārī has been followed by quite serious authors who have left analogous writings, among which we may mention al-Walīf b. al-Mardīn wa l-jīmāʿa by Ibn Ḥūdī (see Brockelmann, S, 1, 426) and the Kitāb al-Hīkāyāt by Badr al-Dīn al-Ayāl (see S. al-Munajjīdījī, in RIMA, LIWĀT
In addition, the vice in question inspired a specialised literature all its own, notably consisting of advice on techniques of seducing young men (see S. al-Munajjid, al-Dhali, al-Shaykh bin al-Makkiyya, 52-4). The writers of works of eroticism (see 2128 and add to Bibliography, A. Dowdibah, op. cit., 171 ff.) mostly devote some space to sodomy; on this point, the most characteristic works are without doubt the Nuzhat al-alab fī-mā lā yinjād fi khulū (Brookehann, I, 495, S I, 964) of al-Tifjy and the Nuzhat ar-rasūlīn of Muhammad Sadbik Hasan Khān (Istanbul 1296/1878; see Boudhida, 178).

In the Muḥājara of al-Dhali, which has nothing in common with the preceding works, the advocate for the žanāri claims (II, 104) that there has never been a case recorded in which love for a youth has proved fatal, while tradition is full of examples of heterosexuals who have pined away, lost their reason or died for love. However, there are apparently authentic accounts which contradict this assertion. Al-Dabī (Baghā, no. 462; tr. L. Provençal, En renaissance des Cailloutis de la colonne), in al-Aldā, arī. (1930), 393-9) relates, after Ibn Hazm (albeit the text of the Fawā ib Al-Banāma, ed. and tr. L. Bercher, 301, in quite perceptibly different terms), "the incredible adventure of a certain Ahmad b. Kulyah, poet and grammarian of Cordova who, in 426/1035, died of grief because one of his fellow-citizens, a member of the Andalusian patrician class, persisted in rejecting his advances" (L. Provençal, Hist. esp. mus., III, 443); the same story is told by Yāqūt: (Iyghād, ii, 19 ff. = Uṣūl, iv, 109 ff.; cf. Mez, Ressam, Eng., tr. 395-60) who also relates (ii, 25 ff. = iv, 175 ff.; cf. Mez, 366-1), after al-Sa'īd, the story of a bookseller of Edeessa (al-Rūh) named Sā'd, whose shop was a literary salon frequented by poets and in particular by a young Christian called ʿĪsā. He had developed a violent passion for the latter, and did not cease pursuing him and dedicating poems to him; ʿĪsā became a monk, and, finally denied access to the monastery, Sā'd set fire to all his possessions and became a vagrant. He died eventually of consumption, but the governor of the town accused the monks of having killed him and condemned the latter. Punishment was averted following the payment of a large sum of money, but when ʿĪsā went to visit his parents, the local children pelted him with stones and called him an assassin. A third story (Yāqūt, Iyghād, ii, 25 ff. = Uṣūl, iv, 132 ff.) tells of a poet in love with a young monk who pines away with grief and dies the very moment that he meets the object of his infatuation.

From anecdotes such as these one gains the impression, on the one hand, that the authorities and the people did not regard the inclinations of these homosexuals as immoral, and on the other, that monasteries and monks played an inauspicious role. It is quite clear that poetry and works such as the Dīvān al-Shahīd regard monasteries [see above] as places of debauchery frequented by lovers of forbidden delights. One must, however, proceed with caution, because once again we are faced with a poet whose treatment is analogous to that of the one we have just quoted by poets who are influenced more by respect for a tradition than by any desire to become personally involved in the acts to which they refer. In this context, the adventure of the Andalusian poet al-Ramādī, the account of which is borrowed by H. Pèrsé (Poesie andalouse, 276-9) from a work of dubious authenticity, the Matn aft al-fanṣ of Ibn Khākān, seems to us no more authentic than the braggings of Ibn Shuhayd, in a poem composed in imitation of Abū Nuwas (H. Pèrsè, op. cit., 277-8).

The fact remains that in the Middle Ages, many attacks on Islam by Christians were based on the frequency of homosexual relations which, in their view, were permitted by the Qurʾān and which characterised the behaviour of Muslims; they based this opinion on verse 20-16 of Sūra IV which they misinterpreted as referring to sodomy, without taking account of the condemnation of "depravity" which it contains (see N. Daniel, Islam and the West, the making of an image, Edinburgh 1960, 141-5).

It is indeed difficult to measure precisely the extent of the phenomenon, but it should be recognised that the separation of the sexes, which is a particular feature of Islam, has played a significant role in promoting it (cf. Brunschvicg, Histoires, ii, 173), among women as much as among men, and the precautions taken against such behaviour (al-Nuwayrī, for example, entitles the chapter cited above al-taḥlīl al-ṣināʿa min al-mulūd) did not succeed in preventing it. It is now known that homosexuality, once regarded as a punishable offence, is caused as much by genetic as by social and psychological factors, but it seems that in medieval times the latter had a stronger role in the proliferation of what remains, to a large extent, a vice.

Bibliography: Given in the article. (Ed.) LIYĀKAT 'ALI KHĀN, honorary secretary of the All-India Muslim League from 1936 to 1947 and prime minister of Pakistan from 1947 to 1951, was born in the Karnāl district of east Punjab on 1 October 1895. He was the second son of a well-to-do landlord, Nawāb Rūstam 'All Khān of the Mandā family, which claimed to have migrated 500 years previously from Iran and to descend from the Sāsānian king Anōghirāwī (Khurshād 1, 531-79 A.D.); British officials on the other hand considered the Mandal family to be of Pathān origin, or perhaps Ḥaṭīs hailing from Samān in Panjāb. Liyākat 'Ali Khān's grandfather, Nawāb Ahmad 'All Khān, gave powerful support to the British in the Mutiny uprising of 1857-8, for which he was handsomely rewarded in the bestowal of honours and the remission of rent.

From 1904 to 1919, Liyākat 'Ali Khān attended the Muḥammadan Anglo-Oriental College at Aligarh, where he was notably successful both on the games field and in the classroom. After graduating, he read law at Exeter College, Oxford, getting his degree in 1921, and was called to the Bar in 1922. At Oxford he began to display political promise as a prominent member of the Indian Māljī. On returning to India he settled down on the family estate in the Māqaf-farnagar district of the western United Provinces and, despite family pressure to enter government service and his own training as a lawyer, aimed at politics. In 1923 he joined the All-India Muslim League, the organisation of Muslim separatist politics, and when in 1927 the League split over its response to the Simon Commission to inquire into India's constitutional progress, he supported the Djinnah group which boycotted the Commission. In 1928 he joined those representing the League at the Indian National Convention which discussed the Nehru Report. From 1936 to 1940 he was a member of the United Provinces Legislative Council, in which he quickly came to play a prominent part, organising and heading the small but influential Democratic Party and acting as deputy president of the Council from 1935 to 1936.
Liyakat 'Ali Khan played the leading role, after Muhammad 'Ali Djinah, in generating the revival of the All-India Muslim League. In the early 1930s the League was scrambling, needing only supplanting full session between 1931 and 1935, while visiting London on its second honeymoon, Liyakat 'Ali Khan helped to persuade, and according to some was decisive in persuading, Djinah to return to India to revitalise the organisation. In April 1936 he became honorary secretary, a position he held till 1947, even though from July 1935 to early 1938 he was associated with the landlord party in the United Provinces, the National Agriculturist Party led by the Nawab of Cattari; the Muslim League leadership in the province, he declared by way of explanation, was too close to the Indian National Congress. In the early 1940s Liyakat 'Ali Khan prepared the League's organisation, and Muslims more generally, for the overwhelming victory of the 1945-6 elections. He sat on the League's major committees, he was chairman of the Central Parliamentary Board, he toured India to spread the League's message, he directed the Dawn newspaper which was founded in 1942 as the League's mouthpiece, and from 1940 he led the League's party in the Central Legislative Assembly, which was often called upon to deliberate on constitutional and administrative matters, and which were quite frequent. So highly did Djinah value Liyakat 'Ali Khan that in supporting his re-election as honorary secretary in 1943 he described him as his "right hand".

In the two crucial years before the partition of India, Liyakat 'Ali Khan was at the heart of events. In late 1944 and early 1945 he attempted to come to an agreement with Bhulabhai Desai, the leader of the Congress in the Central Legislative Assembly, which included the Congress and the League party in the Congress and the League to participate in forming an interim government, although he may have gone too far on his own initiative, as Djinah disavowed the project. He was also closely involved in two further attempts to solve the constitutional deadlock, the Simla conference of 1945 and the Cabinet Mission discussions of 1946. When towards the end of 1945 the interim government was eventually formed, Liyakat 'Ali Khan led the Muslim League bloc, defending Muslim interests with vigour. When that government's quasi-Cabinet offices were distributed, the Congress apparently trusting in the north Indian belief that Muslims were unskilled in financial matters, encouraged him to take the Finance portfolio, which gave him a say in all the activities of the interim government and enabled him through a masterly budget to impose his will on the political situation. Indeed, it is said that he used his powers to such effect that leading Congressmen, among them Sardar Patel, came to see partition as the only solution to their difficulties. After partition was finally agreed on 7 June 1947, Liyakat 'Ali Khan was marked out to be the first prime minister of the new state of Pakistan.

When Djinah, governor-general and presiding genius of Pakistan, died on 11 September 1947, Liyakat 'Ali Khan came forward as the unchallenged ruler. He faced enormous problems: the state was divided into two parts separated by 1,200 miles of hostile territory; there were millions of refugees; there were divisions of language, race and religion (15% of the population was Hindu); there was no administrative centre, efficient bureaucracy, political tradition or economic focus. That Pakistan survived these problems, in addition to the premature death of Djinah, owed much to the wise leadership of Liyakat 'Ali Khan. He responded firmly to the threats levelled by an India still not entirely reconciled to the dismemberment of the subcontinent, and through his statesmanlike approach to international affairs did much to establish Pakistan in the eyes of the world. When in June 1949 India imposed a total trade boycott because Pakistan refused to accept the rupee alongside the Indian rupee, Liyakat 'Ali Khan was unmovable, and eighteen months later India relented. When in both 1950 and 1951 India massed her forces on Pakistan's borders, he combined a staunch reply with a readiness to seek an immediate resolution of differences by negotiation. It is sometimes thought that he need not have accepted India's offer of a ceasefire in Kashmir in 1949, but it is difficult to see, in view of the condition of Pakistan and her resources at the time, what choice he had. In the world at large he maintained a determined policy of non-alignment: he attended the conferences of British Commonwealth prime ministers but quickly made it clear that Pakistan should not be "taken for granted", he made a personally successful official visit to North America in May and June 1950 but made no foreign policy commitment. He did, however, make commitments in the Muslim world and emphasised Pakistan's independence of any of the under-represented East Pakistanis as possible and removing the remaining foreign officers. Brushing aside suggestions that, now Pakistan was won, the Muslim League had performed its task, he tried to mould it into a party of national construction. "Pakistan is the child of the Muslim League", he declared, "it is the duty of the mother to look after the child till it grows up", and to emphasise his point he became president of the League on 8 October 1950 and urged others to follow suit in drawing together and promoting his party. Most important, he endeavoured to create a framework for politics in which all Pakistanis would be happy to work. There were great problems: autonomous provinces had to agree to surrender power to the centre, a fair place had to be found for non-Muslim minorities, while the 'balanced', who knew that all sovereignty flowed from God and that they alone were equipped to interpret His law, had to be reconciled with those who believed that the people were sovereign and that power in politics should rest with their representatives. Liyakat 'Ali Khan's first step towards creating a constitutional framework was the Objectives Resolution brought before the Constituent Assembly on 7 March 1949. Although no more than a statement of intent, it marked out enough apparently common ground, particularly on the questions of sovereignty and minorities, for Pakistanis to be able to proceed with constitution making. There followed the publication of the interim report of the Basic Principles Committee in September 1950 which contained basic, and it seemed unassailable, opposition; the East Pakistanis were the most vociferous, fearing that their majority in the Constituent Assembly would be reduced to a minority, although they were more numerous than the West Pakistanis. Liyakat 'Ali Khan responded by...
LíYÁN and LÍYÚN

postponing consideration of the report and deciding to hold general elections before grappling again with the constitutional issue. He has been criticized for this move, indeed for mishandling the issue altogether. On the other hand, his attention to the family, the electoral campaign, and general elections which would be more firmly under central control. To this end, he used his powers as Muslim League president to vet all applications for candidacies. He had just completed the task in the Punjab, and was about to proceed to the North-West Frontier Province, where on 16 October 1951 he was assassinated by an Afghan while addressing a meeting in Rawalpindi.

As a person, Líyáns's Ali Khan was noted for his moral integrity, his incisive judgment, his sharp, laconic attitude probably due in part to the fact that political and military activity there passed at an early date, and therefore almost exclusively, into the hands of the people of Kashalá. It is a populous town, whose business, commerce and stock-raising are carried on. The people there are bellicose and touchy. Líyánand Líyún

The geographers and historians knew perfectly well that there existed a kingdom, with a capital (bá'ída), which opened up all the Galicia-Asturias-León region. It was at that time probably a small, unimportant place, without a Muslim governor. The Arab texts are indeed silent about it, and agree with the Chronica de Alfonso III in making Astorga and Oviedo the seat of 'Múmán', the Muslim governor of the region at the time of Pelayo's revolt.

The town must have been more or less officially abandoned at the time of the great rising of Berbers who emigrated from northern Spain in the years after 127/741. According to the Chronica Alfonso(n) de Alfonso I, 'FrucJa, brother of Alfonso I, entered Léon', and the Chronica de Alfonso III (619-66) specifically says that "Abd al-Rahmán to besieged, bombarded, pillaged and burnt Léon, without however being able to destroy the 17-embled high walls". The Chronica Alfonso(n) mentions under the reign of Alfonso "a campaign by al-Mungbir which opened up the recruiting for the 17-embled high walls". The town was the objective of two raids by al-Mansur b. Abi 'Amir, one in 325-326 and the other in 327-328, leading to the sacking and burning of the town (Líyún, 80).
Ibn 'Uthayr (Bayan, lv, 801), as well as 'Abd al-Wahid al-Marrakushi al-Mu'addal fi taklifah al-habbar al-Maghribi, 235, 268) consider Lübín solely as an urban centre since they make Alfonso VII "the Shu-beren" lord of Ciudad Rodrigo, Avila, Léon and Zamora, more information also reproduced by Ibn Khaldun in his K al-'Ibar. As opposed to this view, Ibn al-Khatib (K. Al'mall al-'Adi'm, ed. Beirut 1936, 74, 241) speaks of it as a kingdom and not as a town ("the Christians of Kashf ala and Lübín"). He has preserved for us an additional piece of information by including in the curious Dhabar al-'Azavim ba'd am nada' sin min mu'mim al-na'-asal bi 'l-Andalus, which comes at the end of his Am'mal, material which the Christian chronicles mention about the physician-ambassador Yusef b. Wakkár al-Isra'il al-Tulayty, this chapter uses phonetic transcriptions of Christian names and titles, giving also the Christian equivalent for hidjra dates; it is interesting to compare with this Ibn Khaldun, who, in his K al-'Ibar, also changes at approximately this time bamiis [X] into bamiin. Ibn al-Khatib reports thus that "in 1248/1249 [error for 1248], Anuelo, brother of Freifa, governed the territory of the Asturias, Galicia, Portugal and part of Léon"; "in 1249, Malik al-Hadi, governor of Léon, moved to the Great transferred the dahr al-mulk of his father to Léon and styled himself King of Léon"; and "Castilian separatism began under the reign of Garcia in 1279/1280 [correctly 1281-1282], a period corresponding in fact to one of the phases of Castilian expansionism [see gaiti]. Ibn al-Khatib then mentions the birth of the kingdom of Castile under Fernando Sanchez, and his struggle against the Léonese state before its merging into the kingdom of Castile and later, as well as the origin and the succession of Portugal. The information given by Ibn Khaldun in the chapter of the K al-'Ibar called "Notice on the Dhaibalba Banu Idhifnsh, kings of al-Andalus after the Goths...", although very similar in fact to that of Ibn al-Khatib, is not a mere piece of plagiarism but seems rather to come from a parallel source of Information. LIZARD (see DARE). LODIS, a North Indian Afghan tribe and dynasty, 855-932/1398-1424.

1. History. Afghan tribes from the mountainous Sulayman region regularly migrated to the plain of the Indus; they joined the invading armies as auxiliaries in war, and came as traders or herdsmen during peace. They moved to the hills in summer and to the plains at the onset of winter. Among these emigrants were the ancestors of the Lodi sultans of northern India. For the Afghans in India generally, see PATHAN and BODHA.

The Lodis are related to a clan of the Ghilzay tribe of Afghanistan [see CHALMERTA] and ruled over parts of north India in the late 12th century. Afghan name to the Indus plains from Khy [97], as early as 934/1237-12 with the army of Muhammad b. Kásim, the conqueror of Sind, and allied themselves politically with the Hind-Shah [97] rulers of Lahore, and receiving part of Lumban [see LUMBAN] for settlement, built a fort in the mountains of Peshawar to protect the Pandjáb from raids. During Alptigin's government at Ghazna, when his commander-in-chief Sebúktigin raised Lumban and Multan, the Afghans sought help from Rádža Djaypáli who appointed their chief, Sháykh Hamíd Lódi, viceroys of Lumban and Multan. Sháykh Hamíd appointed his son as governor, and thereby the Afghans gained political importance; their settlements stretched southwards from Lumban to Multan, incorporating the tracts of Bann and Sardar Lódi.

Later, a family of the Lódi tribe settled at Multan, which was ruled in 1269/1290 by Abu 'Fath Dádvid, a grandson of Sháykh Hamíd. There was also a strong Afghan element in the forces of Sultan Mubammad of Ghasan and Sháykh al-Din of Ghiz. The latter on his third campaign to India [see ÖZKÜL] had 12,000 experienced Afghan horsemen in his army, and he defeated the Rádajjus under Rádža Pitháwará Dádhi. On his return journey, he settled in the hills of Róh, the Sulayman mountains, Ashaghatar and Badawara—a tract extending from Kábul to the Indus—and appointed Malik Mubammad al-Din Ghurá al the head of 20,000 men to transplant the Afghans from Ghiz to the new settlements, thereby paving his way for the conquest of Hindustán. Each clan was granted on 964/1459 in the environs of Nífáb and the Indus.

Serving thus in the army of Sháykh al-Din Ghurá, the Afghans rose to power and settled over a large tract of land. Their leader 'Ali Kirmákhák was appointed governor of Multan in 582/1385-7. Sultan Balbán of the slave kings posted them as garrisons in Bándur, Kámpala and Páfáví against the Hindí rebels in the Dún. During the reign of Mubammad b. Tughluk, they rebelled under their leader, Malik Sháh Lódi, in Multan at some time in 781/1379-80, and killed its governor. Since the time of seizure of the Pandja by the Khánzáwas, the movements of Afghan merchants increased considerably. They started participating actively in the politics of northern India from the time of Muhammad b. Tughluk and particularly after Firúz Shah Tughluk's death (790/1388), during the decline of the Tughluk dynasty (Fidal, vii, Espaá cristiana: crisis de la reconquista de la reconquista y luchas civiles [by L. Suarez Fernandez, J. Regia Campistol and R. d'Abadal]).

During the invasions of India by Timár [97] in 801/1398, Afghans fought on both sides, Malik Khudr Lódi, Malik Bahram al-Din Djilán, Malik Yosuf Sarwát and Malik Habib Niyáz joined the army of Timár at the head of 20,000 Afghan mercenaries. About this time, Sultan Sháh's father Malik Bahram had come as a warrior-trader to Multan from Bálúti, a pargana in the Búrid-pandjaur sarkar on the border of Bahúkástan, according to the AfsÁ Ahbári. He quarrelled with his two brothers Malik Mahmód and Malik Maqul, and took service under Firúz Shah Tughluk's governor at Multan, namely Malik Mardán Dáwlat, entitled Malik al-Sháh Násir al-Mulk (Tabakät-Á Ahbári and Taríkh-i Mubárák Sháháti). Malik Bahram organised a tribal militia. After his death his sons Sultan Sháh Lódi, Malik Firuz, Malik Muhammad, Malik Khudr and Malik Káli stayed on in Multan while the city passed, during political confusion and unrest, into several hands. After the death of Malik Mardán Dáwlat, Malik Káli's son Malik Yusef and his adopted son Malik Sulayman were appointed after his death governors of Multan in succession by Firúz Shah Tughluk. Malik Sulayman was succeeded in the governorship by his son Khán Sháháni, the founder of the Sayyíd dynasty at Dádhi [see DÁDHI SULTANATE], who had been appointed governor of Multan and the Pandja.
by the Tughluqs in recognition of his military service, but later betrayed the Tughluqs and joined the invading Mongol force under Tümen.

Sultan Shah Lodî, who succeeded his father Malik Bahârîn as chief of the Afghan mercenaries, distinguished himself in the service of Khîlân Khân and helped him in overpowering the Tughluqs. He succeeded in killing Malik Khâlib Khân, the de facto ruler of Dihll and the staunch supporter of Mubâhîn Tughluq, in the battle of Aqsojan fought on the banks of the Sâtâl (18 Dhu‘l-Hijjah 808/11 November 1405). Thus Muktân, together with the Pandjab, escaped from Dihll, and Sultan Shah Lodî was put in charge of Sindh with the title of Islâm Khân. During the time of the Sayyid Sultan Muḥârâk Shâh, sons of Khîlân Khân, the Afghan chief Sultan Shah Lodî obtained power and held Sindh with the neighbouring districts in gāḏâr (i.e.). He settled there with his four brothers and gathered a strong contingent of 12,000 horses, mostly of his own tribe. Malik Khall married his uncle’s daughter, received Daurâla (Sindh rankâr) in gâḏâr and served under Nâṣîr Khân, who held Muktân as governor on behalf of the Sayyid Sultan Khîlân Khân. His child was named Bahlul, the subsequent founder of the Lodî dynasty at Dihll. He died in a struggle against the Niyaţî emigrants in the Indus valley, and the child was brought up by his uncle Malik Sultan Shah Lodî at Sindh. Finding him a soldier of promising character, Sultan Shah Lodî gave him his daughter, Shânâ Khîlân, in marriage. Once in Sâmâna he visited a local holy man, Sayyid Abbaân, with two companions, (Tu‘bâ‘i-Shâh, 3; Tu‘bâ‘i-Dinâlî, Sârka ka, 4); the Sayyid demanded 2,500 lâms in exchange for the throne of Dihll if any one of them was willing to hazard for it. Bahlûl Lodî had with him only 1,300 lâms which he instantly offered, and was congratulated as the future ruler of India. Although he was taunted by his companions for this transaction, he drew inspiration from the Sayyîd’s proposal and had no ease to regret either the tirole of Dihll or his gift.

Sultan Shâh Lodî nominated Bahlûl as his heir-apparent in preference to his adult son Khîlân Khân. On his father’s early death in Radiâq 824/March 1431, the Afghan military became divided into three camps under Khîlân Khân, Malik Firûz (son and brother of Sultan Shah Lodî = Islâm Khân) respectively and Bahlûl Lodî; the latter won over his uncle Malik Firûz to his side against the confederation of his rivals Khîlân Khân and Muḥârâk Shâh, the Sayyid ruler of Dihll. The latter sent a force under his nami Malik Sîkandâr Tubaîn and Dârârî Khokar to drive the Afghans out of Sâmâna and to deprive Bahlûl Lodî of his gâḏâr. The Afghan, defeated, fled to the hills. Malik Firûz was made captive and his son Malik Shâh Khân was killed. Bahlûl escaped, and, on Dârârî’s return to the Pandjab, he managed to re-gather his scattered army. Malik Firûz escaped from Dihll and joined Bahlûl. The contra Khîlân Khân Lodî also joined Bahlûl’s camp. Thus reinforcing his forces, Bahlûl Lodî recaptured Sâmâna in 841/1440. The Sayyid Sultan Muhammad Shâh sent a large force under one of his chiefs, Hârûn Khân, to drive Bahlûl Khân out of Kârlân (which was defeated at Karâ (Khârîn in Ambalî district?) near Khîdrâbâd Sâdûrâh, and Khîlân Khân escaped to Dihll while Bahlûl established himself firmly in the Pandjab.

In 841/1440, when Dihll was threatened by Malâm Khâlîqî I [q.v.] of Malâw, the feeble Sayyid Sultan of Dihll appealed to Bahlûl, who agreed to help him on condition that Husaîn Khân the prime minister was to be replaced by his nominee Hamîd Khân. The Sultan acted accordingly, without taking into account the implications, and Husaîn Khân was killed. Bahlûl Lodî took the field with his contingent of 8,000 Afghan and Mughal militia and 20,000 of the royal army against Malûbîrî, who after a day’s desultory fighting sued for peace, and retreated to deal with a serious riot in his own capital, Mandû (58a), and an invasion by Sultan Attâr of Gujûlrât. This retreating Malâw army was waylaid by Bahlûl. Dihll was saved for the Sultan, and Bahlûl was awarded the title of Khâlîf-î Khânîn, and confirmed in his gâḏâr at Sâmâna, with Lahore and Dihllîpûr as his hereditary fiefs.

Muhammad Shâh and annexed Sûna and Hîsâr Frûzî and other districts of the Pandjab. Twice he made unsuccessful attempts to capture Dihll, once during the time of Muhammad Shah (839-1445), and again during that of his son and successor Sultan ‘Alî al-Dîn. ‘Alâm Shâh (848-855/1443-55). Circumstances were in his favour. ‘Alâm Shâh’s rule extended from Dihll to Dârârî (‘Alâm Shâh’s rule extends from Dihll to Dlârâ). The Bahlûl advised the Sultan to kill his prime minister Hamîd Khân, who escaped from Bâdûn, occupied the palace of Dihll and invited Bahlûl to take over. The latter came, but cleverly declined the offer as the time was not ripe. Subsequently seizing an opportunity, he had Hamîd Khân arrested by Khîlân Khân Lodî and occupied Dihll. He offered the throne to Sultan ‘Alî al-Dîn ‘Alâm Shâh, who, however abdicated in favour of Bahlûl, preferring himself to live a life of ease and seclusion at Bâdûn. Thus upon, ascended the throne of Dihll with the title of Abu ‘l-Muzaffar Bahlûl Shâh on 17 Rabi’î 1 855/1 April 1453.

After the capture of Dihll, Bahlûl extended his territory over north India up to Dâwânpûr [q.v.]. The last decades of the 15th century witnessed a fluctuating struggle between the Shâhî dynasty of Dâwânpûr and the Husaînî-Shâhî dynasty of Bengal, and the Lodîs’ control of north India had remained throughout a bone of contention. At first, Bahlûl succeeded in driving out Husaîn Shâh from his capital (Dâwânpûr) to his eastern possessions of Cûmâr, Cawmî and Bihâr. The Lodî Sultan proposed to maintain the status quo, provided that Husaîn Shâh did not harbour his enemies, but the latter was bent on recovering his lost territory. (An inscription confirms the control of Husaîn Shâh over Bîhr in 842/1445-6, but it was annexed by Sîkandâr Lodî and put in the charge of Dârâ Shâh in 840/1446-7, as is evident from another inscription.) Husaîn Shâh Shârî was driven to Kahâlgûn, 23 miles east of Bâhâgûpûr. The Dîbî army crossed the Ganges from Pînhâ, while another contingent marched from Dâwânpûr via Kûthûhpûr near Mînâr Shâh, against the Bengal Sultan ‘Alî al-Dîn. To out the Lodi troops, Prince Dânîyûl was sent by his father at the head of Bengal army towards Mûngîr (Mûnhîr). The two armies stood facing each other for some time and ultimately a non-aggression pact was signed at Bîhr to the west of Mûnhîr. Even after this, the boundary remained fluctuating. Bâhâgûpûr was perhaps, the western extent of the Bengal sultanate during the height of Lodî power; Sîkandâr Lodî’s bounds definitely extended up to Bîhr in the east (cf. J.B.R.S [1955], 355-69).

Bahlûl considered himself a chief of chiefs rather
than an absolute autocrat. The Afghan chroniclers speak highly of his simplicity, sense of social equality, bravery and generosity. He followed strictly the Skaita and spent much time in the company of learned and pious men. He died in Qaiwan 892/July 1488 at Malwali near Saket, a short distance from Afgath [s.d.]. His body was brought to Dhihil and buried in the Baghi Dhihil.

Before his death, he ensured Lodí dominance in north India by placing his second son Bahlúl on the Djawnpur throne and assigning Mankopur to Aīam Khán Lodí, Bahrayí to his nephew Kála Fáhir, Lakháhú and Kálpí to Áfza Humáyún Lodí, and Bátún to Khán Dishán Lodí, while Náím Khán held the Pánjáb, Dhihil and most of the Díaáb.

He was succeeded by Náím Khán as Sultan. Síkandar Lodí, who reigned until 922/1517-18. Bahlúl was a chief of chetas; Síkandar Lodí considered himself a fully-fledged Sultan. He was a good administrator, a just ruler and a good poet. He was able to control the unruly Afgháns by introducing the system of inspection, auditing accounts and registering a jéla (descriptive roll) [See Dágání in Suppl].

Síkandar Lodí was succeeded by his son Ibrahim Lodí at Agra on 8 Dhu l-‘Ihád 922/22 November 1517. To establish himself, he had to fight against his rival brother Sultan Dújal al-Din Kálpí and other rebels. After nine years, he had to fight a defensive battle at Pánjápí [ag]. Against the Moghul invader Muhammad Bábúr of Fargáná, the Afghan invaders, Muhammad Íbbár of Fargáná and Aīdul-Din of Kalpl and 

dÁc u$asii,ia (descriptive toll) [see in Suppl].

A correct use of the wealth was his repression of the powerful nobles of the NOI.ianI, which shifted from Dhihil to provincial capitals until the establishment of the Lodí dynasty. Síkandar Lodí’s reign witnessed a renaissance of learning and culture in Dhihil. Hindus began to take interest in Muslim learning and Dúngar, a Hindu poet, taught in a Muslim college. Síkandar patronized music, and gathered poets and musicians in his court. The Súlán’s cultivation of music led to the compilation of a rare work, the Lohfújí Síkandar Lodzi wa-l-latifiyi fi-mumtábil, a ma of which is preserved in the Tágor library of Láhijáta University.

There was some rapprochement between Muslim Súfís and Hindus yógu, the Bhakti poets and some contemporary instances of social intercourse between Muslim saints and Hindu yogis, and of Muslim followers of Hindu saints, and vice-versa. See further in Daghán, Láhijáta Súfís; J AğÁ in Suppl.

LOMBOK — LÔDÌS

Tensions between the Sasaks and the kings of Sumbawa during the 17th century finally led to the intervention of the Balinese kingdom of Karangasem, which established its supremacy on Lombok at the beginning of the 18th century. Mataram, close to eastern Lombok, was defeated and thus in neighbourhood to eastern Bali, developed as the most influential centre on Lombok. Its king was counselled by Balinese nobles, and the districts, too, were governed by Balinese, whereas their decisions were executed by Sasaks officials who were often descendants from the old indigenous nobility.

In 1849, Karangasem lost its supremacy over Mataram, which maintained closer contacts with the Dutch at that time. But the Balinese nobility still tried to develop western Lombok into a second Bali, and by court decisions Sasaks were eventually made slaves and had to serve in that role. Finally, the Sasaks asked the help of the Dutch Indies government, which organised in 1894 an expedition against Lombok "to protect the Muslims", to abolish the dynasty, and to turn Lombok into a Dutch colony. Besides its political consequences, this expedition resulted in the discovery of the manuscript of the Nagaşātjagama, a chronicle of the kingdom of Majapahit from the 14th century.

Although the Sasaks are usually considered to be Muslims, old customs, beliefs, and rules (adat) are still dominant. Especially during the 19th century, two parallel movements brought some change into the traditional social structures: the attempts of certain circles of the nobility to exert a greater degree of power, which they justified with adat convictions, and which was based on the eventual support of the Dutch; and, on the other side, the attempts of mainly commoners to gain some influence too. For them, Islam with its more democratic concept of society, provided sufficient motivation, and at the same time was consonant with the anti-Balinese feelings among the people.

It was the latter group, however, who in the course of time proved to be more influential than the former one. The features of this development are similar to those in other rural areas in Indonesia. The traditional nobility, which as descendants of the original semi-divine hero has a strong attachment to adat, disqualified itself by its affiliation to the foreign powers who ruled the area, whereas for the Muslim preachers, lacking those affiliations and usually themselves originating from the lower strata of society, it was much easier to convince the commoners that they were defending their interests. Externally, they were opposed to the habits and convictions of traditional Sasak culture. But as they were usually oriented towards Islamic traditionalism, a number of Sasak cultural and ceremonial notions were in effect absorbed into their understanding and practising of Islam. Besides the questions of leadership and social control, it was especially in regard to the matrimonial customs and kinship relations where a discrepancy between adat and Islam was felt, and this caused internal tensions in Sasak society, which on the whole is moving towards a gradual acceptance of the customs and habits of traditionalist Muslims.

This happens mainly through intermarriage between adat-obeying and Muslim partners, where the former one adapts himself to the Muslim partner. But the transition from adat to Islam is much less a matter of changing doctrines than of changing practical behaviours, and it is mainly obedience to certain demands of the Shar'īya which serve as the criterion for considering someone as a Muslim or not.

LOT [see LOT].

LUBAN (libban, labbanis) is frankincense, the dried-up sap produced by notching some kinds of Boswellia, obtained in Somalia and South Arabia in the form of yellow resin-grains. As is well-known, the term is Old Semitic: Assyr. libbanu, old South Arabian Lib-n, Hebr. Bonâ, Aram. lebona (lebota), Eth. liban, from which have been derived the loanword λβάνως, λβανώς, Latin olibanum, with derivations in the Romance languages. The name can be traced back to the original meaning “white” (Hebr. liban), after the colour of the fresh, milk-white gum-resin, excuded abundantly from the dotted wounds and, after some time solidified into yellow grains, which are then detached from the trunks or gathered from the soil. At least as often as luban, there appears in Arabic the synonym kundur, according to most authors of Persian origin, but perhaps to be derived from χόνδρος “grain”; this term may have become an independent form, derived from the combination χονδρος λβανως “frankincense-grain”.

The frankincense trade is extremely old and has been treated repeatedly—but at times inadequately—in comprehensive descriptions. In the first place, frankincense—together with myrrh—formed the richness of the old South-Arabian states of the Mi-
naeans and Sabaeans; the loss of the frankincense mo-

nopoly was one of the main causes of the collapse of this commerce fundamental for their existence, and consequently of cause of their downfall around the middle of the 6th century A.D. (see the good survey by W. W. Muller, Al-Sudan und al-Maghrib, in Thecl Quartalschrift, cxlix [1969], 350-56). The Arabic sources point in the same direction. According to al-Ashâ'ir, three items were found only in the Yemen, and indeed abundantly there: al-ears (eucunea, a dye-plant), al-lubân and al-saf (Peter-
num) (cited in al-Dhafari, The book of plants, ed. B. Lewin, Wiesbaden 1974, no. 627). According to a Bedouin from 'Uman (in al-Dhafari, Le dictionnaire botanique, ed. Hamidullah, Cairo 1973, nos. 971, 972), the resin is only found in al-Safir, in al-Shir 'Uman, in fact, as a small briar which reaches up to two cubits high and which grows only in the mountains; its leaves resemble those of the myrtle [see as in Suppl.], as do its fruits, which have a bitter (read marâda instead of harâda) taste; its resin, also used for chewing and called kundur, wells up in some places struck with the hatchet and stays there until harvest. According to al-Dimashkel, Nélhóh, ed. Mehren, St. Petersburg 1856, 57, frankincense is obtained on Sulûsrâ (Socotra) and in some regions of the Yemen. After Matt H. H., 11, al-Tâbarî i, 720, 4, reports verbatim that the Magi brought gold, frankincense and myrrh. Lic estixture is caused by two different things: by taking excessive delight in dried figs and by burning frankincense (Ibn Khayyâ,
Rûyûn, iii, Cairo 1930, 204).

The best frankincense comes from the male plant (libban ghâbar = the λβανωτος ῥηγήν of Dioscorides); it is white and firm and has round grains which are gummy when broken open. The white frankincense (libban alayd = λβανωτὸς λευκός) is also named as a noble variety; finally are to be mentioned the Javanese (in fact, Sumatran) frankin-

ce (libban jëdû), i.e. benzoin, obtained from various kinds of styrax-trees whose fumes are said to remove a cold in the head, and the reddish, Indian frankincense. When, however, the geographers speak continuously of the frankincense of Arabia, this statement is based more on a literary topos than on knowledge of things on the spot. The critical Marco Polo remarks explicitly that he does not want simply to repeat these literary accounts, but to report the personal information of the frankincense-traders. According to these last, frankincense was particularly cultivated in two regions of South Arabia in “Escler”—apparently al-Shîr—and “Dûsar”, the ancient Zafrî. In al-Shîr, he further reports, the lord confiscates the entire harvest, pays the cultivator a low price, and sells it to the traders at a seafold price (for this report, see W. Heyd, His
toire du commerce du Ixvant, ii, Leipzig 1839, 614-16). Some other places named by the geographers which produced frankincense were Dufar, in southern Arabia, and Basra, long to the region of Mahr [p.]. The fact that at times scanty production of frankincense could not always satisfy the sustained and high demand in East and West, led to numerous adulterations (S. Labbr, Handelsgeschichte Agyptens im Spätmittelalter, Wiesbaden 1925, 334). Nahray Ben Nessim, a Jewish scholar, merchant and banker, called al-âfîjir, al-

maghribî and well-known from the Geniza documents, carried on a widespread trade in frankincense in the Mediterranean area in the 5th/11th century (S. D. Goitein, A Medianer society, i, Berkeley and Los Angeles 1967, 154).

The medicinal use of frankincense, described ex-
tensively by Ibn al-Baytâr, goes back for the greater part to Dioscorides, from whom was also borrowed without examination the enumeration of several kinds, together with their Greek names. According to him, frankincense has a heating, drying and astringent power, expels darkening of the pupils, causes wounds to scar over and checks haemorrhage. It softens virulent abscesses and, applied in combina-
tion, with vinegar and pitch, removes warts and erup-
tions. It is good for earaches and, combined with other medicines, for illnesses of the trachea and of the intestines. For healthy people, it can be dangerous, for it may cause madness and, if drunk with wine, even death. Frankincense is burned by putting it in a mussel-shell and setting fire to it. Shortly before it is fully consumed it must be covered up so that the fire is smothered completely in order that the frankincense is charred and not reduced to ashes; it can then more easily be pulverised. Various supplementary observations were made by the Arab physicians, such as the following: frankin-
ceense "burns" pathological phlegms, dries up excessive humours in the breast, strengthens the stomach and warms up a cold liver. Dissolved in water and taken daily, it increases the reasoning power and eliminates powerlessness; it relieves headache and distended stomach, calms palpitation of the heart but can also lead to mental disturbances. When chewed, it strengthens the gums. Its bark is good for haemor-
rhages and intestinal ulcers. The bark of the frankin-
LUBNAN—LUBNAN

The modern State of the Lebanon was proclaimed on 26 November 1920, by the French Mandate Commission of the Paris Peace Conference, when the Lebanon as "a sovereign and Independent State". It was a Maronite Christian, the Presidency of the Council of Ministers, which was to be regulated by a sectarian division of responsibilities, conferring on the government affirming, with all the ambiguity necessary to a compromise, that "the Lebanon is a homeland whose countenance is Arab, which will benefit richly from the civilisation of the Arabs." It became a member of the Arab League on the foundation of the latter in March 1945.

Greater Lebanon had taken the name of the Lebanese Republic when it was endowed, in 1926, with a constitution establishing a parliamentary and liberal régime. In 1943, when the Lebanese Government, with the support of public opinion, took its own destiny properly in hand, it set the seal on these institutions by means of the National Pact (al-Mishāq al-mu'assas), a verbal accord which, in particular, defined the division of the responsibilities of power between the Christians, Shiites, and Sunnis. Since it had done so, it had helped to create the Presidency of the Republic to a Maronite Christian, the Presidency of the Council of Ministers to a Sunni Muslim, and the Presidency of the Chamber of Deputies to a Shi'ite Muslim. Herein lies the heart of the problem. Under the cover of a constitutional régime inspired by the French Third Republic, Lebanese political and social life was to be regulated by a sectarian division of responsibilities, conforming to the development which it has experienced since the beginnings of Islam [see 'ilm al-'usūl] and the changes that it had undergone in the Ottoman Empire in the period of the Tanzimat [q.v.]. If the declaration of 1943 stated that the Lebanon is a "homeland" (al-umrān) of Arab countenance, the Constitution made it a "nation" (al-nasra). To which structure was the action of the state therefore to respond?

Social culture imposes its norms here, digging its root into a very distant past; there is more of history in this than in all the "Phoenician" justifications put forward today by the Christians, or in the majority of civilisations to which the Muslims lay claim.

Populated from the very dawn of history, the coast accommodated active ports, the memory of which has been perpetuated by the Biblical texts, and of which contemporary archaeology has revealed...
Fig. 1. Stages in administrative unification (after D. Chevalier, "La société du Mont Liban à l'époque de la révolution industrielle en Europe," Paris 1971).

the stages and the levels of habitation, such as those superimposed on more than three millennia of glories and disasters in the remarkable site of Byblos (Dhibayl). Under the Roman domination and the rise of Mediterranean traffic which accompanied it, 30,000 spectators could be accommodated in the immense hippodrome constructed in Tyre (Sur) and recently brought to light, excavations having begun in the 1960s.

Shrouded by its forests and its rocks above the narrow coastal strip, the mountain was also penetrated by man at a very early stage, as is shown by its Canaanite and Aramaic toponyms; its inhabitants, probably fairly dispersed until the end of the ancient period, made a living through the exploitation of timber, transporting it on the first stage of the long route which led from Tyre and Sidon (Saydā) to Asia, and through brigandage. The haunt of the gods worshipped by the cities of the coast, it also attracted pilgrims to shrines adjoining the ruins of temples built in the Roman period.

After the mission of Muhammad, the Arab conquest, by modifying the horizons and the nature of power, gave rise to a different exploitation of resources. While the narrow coastal plains, open to the sea and giving access to all ventures coming from

---

the West, formed a passage hardly favourable to the
prosperity of a sedentary life in the absence of se-
curity, the Lebanon range became one of the marches
of the Syrian heartland. It was the object of Muslim
and Byzantine adversaries confronted one another, per-
haps through the intermediary action of unruly local inhabitants with
an aptitude for warfare. Furthermore, the virtual
autonomy enjoyed by those who had established
themselves there was favourable to the maintenance
and development of heterodox and minority religious
tendencies.

On the western slope of a mountain already
densely deforested, between its first escarpment dis-
sected ravines and its exposed peaks, the terrains of the north or its ridges to the south, con-
ditions for agriculture and human settlement were
particularly favourable at altitudes between 500 and
1,500 metres, since here erosion had uncovered soft
and fertile strata of chalk. Sandstone, marl, clay
and basalt rock provide a more open relief in this
area, where the climate is temperate, the air salu-
brious and water plentiful. Annual rainfall at this
altitude in fact reaches levels of between 1,000
and 1,500 mm, which the mountain people are obliged
to absorb over the winter in the form of snow.

The Lebanese mountain range is well-irrigated at a
latitude where water is rare, because it stops the
humid air currents coming in from the west; it forms a
barriage between the sea and the steppe. Behind the
sheer eastern face, the inland depression of the Bik
corries becomes much more dry; climatic contrasts are
accentuated; the Mediterranean littoral is replaced
by the Syrian plains which stretch beyond Anti-
Lebanon. The Bik was the wheat-growing region
to which the mountain people came in search of
part of their cereal requirements; as a result, it
became a disputed territory because, as an enclave
also penetrated by nomads, it became a prey to the
rival and destructive aspirations of distinguished
families who sought to impose their control on the
mountain region, and of those who governed in
Damascus.

Over the centuries, the mountain people con-
structed and maintained walls of dry stone to retain
the arable soil on the slopes, thereby establishing
narrow fields which were arranged in successive
and horizontal layers; these were put to full use
when the farmers became capable of developing the
cultivation of the vine, the olive and the mulberry.

This remarkable and intricate system of terracing was
constructed and maintained walls of dry stone to retain
narrow fields which were arranged in successive
and horizontal layers; these were put to full use
when the farmers became capable of developing the
cultivation of the vine, the olive and the mulberry.

This remarkable and intricate system of terracing was
constructed and maintained walls of dry stone to retain
narrow fields which were arranged in successive
and horizontal layers; these were put to full use
when the farmers became capable of developing the
cultivation of the vine, the olive and the mulberry.

The men who constructed and cultivated these
terraces were organised according to the two modes of
grouping fundamental throughout this historical
milieu: the patriarchal family and the religious com-
munity. Social life was at first determined by a sys-
tem which sanctioned marriages of the other frame-
work of paternal parentage to form a patriarchal family which was turned in upon itself and of which the
identity was established through a patrilineal genealogy and through references to a more or less
legendary ancestor. Within this context, the family
group found expression for its defensive reflexes
("my brother and I against the son of my paternal
uncle, my paternal uncle's son and I against the
stranger"), its obligations towards neighbouring
family groups and its dependent relationships with
more powerful families. In fact, the nature of its
internal constitution did nothing to prevent, in the
field of exterior contacts, the forging of links of solidarity and the establishment of hierarchies;
the role of the latter was still significant in the 19th
century among the families of the mountain region.
This system, largely pre-Islamic in its origins, was
adapted to different types of economic and political
organisation, arriving progressively at its fullest
expression during the Islamic period, in this moun-
tainous context of which the maintenance of the whole.

Thus it was not confined to one religious community,
but common to all, even though it underwent evolutions and variations in the course of the cen-
turies: furthermore, the identifying marks of social culture which it entailed, and the experience of
which was vigorously maintained through the every-
day vocations of the mountain people, was shared by the mountain people with their entire human
environment, with the inhabitants of the interior
as with those of the coast, and with those of the towns
as with those of the plain.

However, the higher collective consciousness
relayed for its support on something beyond this or-
ganisation, which could only engender unstable coal-
litions between separate and rival agnate groups;
it became crystallised at the level of a religious
community which ascribed itself to a universalism of
divine essence and thereby corresponded to a unitary
aspiration where the social body ideally expressed
its instinct for survival in its cultural identity
through its willingness to transcend personal
interest. Islam was the perfect response to this need,
while allowing the survival under its protection of
other revealed religions which had proved satisfac-
tory. While each religious community transcended the
divisions of the family groups which composed it
by uniting the latter in a common faith, the different
communities became juxtaposed in their turn in a
hierarchy imposed by Islamic law, analogous, in fact,
to that which proceeded from the structure of society.

The effects of this situation were to a great extent
accentuated by the schisms and heresies provoked by
the fragmentation of each of the great monotheistic
religions into tendencies, different interpretations,
communions, liturgies, doctrinal and judicial schools,
which themselves formed (sing. id'ifa), possessing
their own distinctive characteristics in the service of the one God, and even exacerbating them
in the course of continual confrontations between the
communities. The historical ambiguity of the Leba-
non, as compared with other groupings of the region,
consists in the fact that it was constructed on the
banding together of minorities to form a majority.

How did the distribution of those who fostered
their idiosyncracies in this mountain refuge develop?

The reply to this question is one of the keys to the
progressive definition of "the Lebanon" by its
own inhabitants. It is not at all surprising, however,
first because our information on the popu-
lation during the medieval period is still fragmen-
tary and uncertain, furthermore because hypotheses
on this subject have been exploited to develop falla-
cious or emotional claims which have served to jus-
tify community and political choices in contemporary
Lebanon, with consequences that have not been
of the mountain, constitute for their part evidence received as an uninterrupted chain of events, also led population to be regarded as allogenous or indigenous in relation to Islam and to the "Arabs", which this even though these last were tarnished by heterodoxy. Opposition to the Muslims, and Maronite authors considered mysterious people which he believed could thus the Jesuit priest Henri Laminens had taken up again the study of the "Mardaltes" (cf. , people of dissent" or "re- cursants", as Ibn Taymiyya condemned them, that they launched in this way direct and victorious and devastating campaigns. This dispersion of the Shi'is was favourable to an influx of Maronite population, moving in from the north, and to an extension of the authority of distinguished Druze families (see ) around the Ghurab and the Shof. The chronicle of Shihb b. Yalay, written in the 15th century, clearly shows how the hierarchy of the family groups became established on the mountain by means of the fiscal and military organisation of the Muslim states (the system of the mamluks, to be replaced by the under the Ottomans). It was in this encounter between a population of settlers and an authority which derived its administrative legality from the centre of Sunni power and its structure from social culture that there was established the "Government of the Druze" which European travellers discovered in the Ottoman period, and where one of the axes of the modern Lebanon progressively took shape. With the dangers posed by the Franks and Mongols removed, the Ottoman conquest of Syria in 1516 was, in fact, a decisive moment for this mountain region. It had ceased to be a disputed frontier; it became a centre for access which, for all its undoubted difficulty, was situated at the meeting-point of the great land and maritime communications routes of the vast imperial Ottoman federation. Its inhabitants found in this the opportunity to develop their own activities, and thereby, also the means of 10 a -tions of the Shl's was favourable to an influx of the local centres of manufacture and consumption, Damascus and Aleppo being the leading customers. Major commerce radiated from these inland terminals, with indoor routes and towards the coastal ports, Tripoli, Beirut, Sidon, which put them in contact with those of Damascus rich exchanges in the south. Their outlets were initially with cabotage traffic plying between Palestine and Anatolia and with Egypt, the Maghrib and the ports of Christian Europe, Marseilles in particular, whose merchants, consuls and agents joined together in conducting their business under the system of capitulations (see ).

As a manifestation of the power of the sultanate which was maintained through control of the towns and the plains, Sunni society first the town its roots in the centres for the radiation of religion, justice and authority. In the zone studied here, the Sunnis were located principally in the ports, the coastal plains and the Bika'at; the dignitaries of Sidon undertook with those of Damascus rich exchanges in the form of merchandise, marriages and spiritual brotherhood, while Moroccans were to be recorded in the genealogies of Beirut families. The old communities
of their predecessors and on the basis of the ethnic distribution; the north belonged to the tilliet and the olive plantations of the Ktura, to the south of Tripoli, and, on the other hand, the agricultural development which grew up around the "Greek Catholic" monastery of Tripoli. Dahr al-Jabal, Sawadi, land dominated by the Nabulusi family, these two rites also maintained monasteries such as that of Shuwayr, where a printing press was installed during the first half of the 18th century, in this centre of Christianity which the Kisrawan and the Ma'an were to become.

Between the Djabal Lubnan to the north and the Dahr al-Jabal to the south, the movement of Maronite population towards the south of the mountains, effectively turned this region into a religious focal point, an agricultural zone accessible to commerce, and formed musba'as1 administered by families of Maronite shaykhs within the context of the "Government of the Druzes", the bakhum Djabal al-Shajf wa-Kisrawan of the local chroniclers. Forces which came into contact here also clashed. The Jesuits had sent their first missionaries to the Levant two decades after the Council of Trent, and they had assumed direction of the seminary founded in Rome, in 1584, for the training of young Maronites. It was therefore no paradox that the communities of oriental rite attached to Rome were among the first to feel the impact caused by the renewal of religious activity in Europe and contributed to its repercussions. Under the influence of the Holy See, the Maronite Church underwent a movement of reconstruction which affected monasticism and the hierarchy, and a number of synods, including that of Lavrayza in 1735, had to be convened for the new rules to be discussed, accepted and imposed. Where the monasticism was well established, it acquired material strength through the donations and waqfs of which it was the beneficiary; monasteries became institutions of education where, alongside liturgical Syriac, the Arabic language was cultivated as a "naturalised" its western elements. By virtue of the authority of its patriarch and the work of its monks on the popular level, its influence in the community grew in comparison to that wielded by the musba'as1, the title born by members of families responsible for the levying of a contractual tax on a district, musba'as1.

Among the dignitaries (al-yawm) of old Maronite stock, some advanced in the echelons of the ecclesiastical hierarchy, whilst others acquired the title of honorary consul in dealings with the representatives of the king of France but the latter, their power derived from their role in the Ottoman fiscal system. After their conquest of Syria in 1516, the Ottomans had retained the administrative divisions of the mountain region, following the example of their predecessors and on the basis of the ethnic distribution; the north belonged to the edlaiyet of Tripoli, the centre and the south, where the "Government of the Druzes" held sway, to that of Damascus.

In 1669, in the wake of campaigns which the Porte had been obliged to conduct in order to suppress the rebellious ambitions of the Druze amirs of the leading family of the Ma'an, a new ba'ish, whose governor resided at Sidon, was created to ensure the control of the Druzes and the Maronites. Detached from that of Damascus, its territory included the central and southern part of the Lebanese range and northern Palestine; however, the pasha of Damascus retained seniority over those of Tripoli and Sidon. The latter made no attempt to exercise direct authority over a mountain range that was difficult of access and inhabited by well-organised groups; in common with the usual practice of the Ottoman administration, they relied on a structure of local hierarchy, of the distribution of the tribute, the most tangible sign of the sultan's power. In doing so, they were obliged, on the regional level, to adapt themselves to the structure and hierarchy of this society so as to utilise it in a manner favourable to the maintenance of their control, expression and assurance of the sovereignty of the Porte, even though the latter was far away and incapable of applying consistent coercion.

The principal tax, the waqf, was linked to the princely of agricultural production; it was therefore levied on produce. It was farm out and the leaseholder was subject to annual confirmation: the 'amir—a sometimes two or three 'amirs simultaneously—entrusted with this role belonged to the family of the Ma'an from the time of the Ottoman conquest: to the last quarter of the 17th century, than to that of the Shihab. The delegation of this authority consequently led to the pre-eminence of one family over the others, and of one amir over his kinsmen; the latter was obliged to lead a life of constant duplicity in order to reconcile the rules imposed on him by his social milieu with the obligation to hand over revenue to the imperial financial chest and thus retain his post. According to the total sums determined by the Porte and demanded by the pasha, each year it was his duty to divide the amounts to be levied between the musba'as1s responsible for collecting the tax from the musba'as1 under his jurisdiction. The "Great Prince", the traditional home of European travellers for the title of al-'amir al-habib, also took the title of al-habib in to assert his authority in the bakhum Djabal al-Shajf wa-Kisrawan. Following the example of the controlling family, those senior families which exercised authority over others, and whose members were the most important landowners, took responsibility for the collection of rents in the musba'as1, where their social and proprietorial power was thus guaranteed; but in the effort to exert and retain their authority, the musba'as1s wore themselves out in internal rivalries, which were the visible results of the division of society into juxtaposed and opposing groups, and which were revived by the ambitious and intrigues of the sultan's representatives. Thus in 1711, near the village of 'Ayn Dar'a, the Kaydi faction of the 'amir HaydAr Shihab crushed the Yemeni faction; in order to establish more firmly the supremacy of the Shihab, 'amir Haydar then proceeded to make a new division of the musba'as1s in the Druze region, making some of them and weakening others. But the Porte was also capable of dismissing 'amirs [see KAYS 'AYLIN]. Kays and Yaman in the Ottoman period.

School textbooks appeal to the consciousness of present-day Lebanese through the history of two "heroes", the 'amir Fakhr al-Din II Ma'an [26.] and the 'amir Rashid II Shihab [27.], who contributed to the vision of independence for their country in
a unitary fashion that transcended divisions and sectional interests. Both of them, once at the beginning of the 17th century, the other at the beginning of the 19th, exercised authority of a power and extent that had hitherto been unknown in the region; while exploiting the weakness and rivalries of the Turkish governors, they also looked for support to those states which, in the Mediterranean basin, testified to the regenerated power of Europe. But on each occasion, the Porte succeeded in frustrating their ambitions. When the Druze Fakhr al-Din, with this son Ali, took steps to expand his amirate and to render it autono-

mous, the Ottoman resistan him with the same deter-
nation that they had shown in suppressing Shiism in the interior of their empire and in combating Safavid Persia on their eastern frontiers. Fakhr el-

Din, forced to take refuge at the court of the Grand Duke of Tuscany in 1812, returned in 1818, but was finally captured near Dzirnin and sent to Istanbul where he was executed in 1835. In a totally different historical context, the next Bagh a II Shihab also died in Istanbul, in 1830, but of old age, after he had been forced to abdicate his power in 1829, when the Ottoman government, undertaking a programme of political reform and driving the Egyptian governor Muhammad Ali out of Syria, refused to receive his appointment. However, for more than a half-century, from 1788 to 1840, he had thrown all the force of his strong personality into giving the people of the Lebanon a range of purpose. To this end, he followed the policy of his predecessors which consisted in adding to the territory of the "Government of the Druze", belonging to the pasha of Sidon, that of the land of Dahrnay, north of the river Mod-

arayn, which was a dependency of the pasha of Tripoli; he demoted the leading marzeh, like the Druze shaykh Bashir Duneibal [see Druze], and made use of the support of the Maronites, who had become the largest community in the mountain region. But as the intermediary of a fiscal system which became more and more oppressive, and subject to the coerences of Muhammad Ali during the presence in Syria from 1832 to 1840 of Ibrahim Pasha's Egyptian army, he left his country in a state of full-scale revolt on the part of the mountain people. This led to the exclusion of the greatest of the "old style" dignitaries, since the central Ottoman power, in seeking to reassert its control, struck at the leadership first; his departure spelled the dissolution of a system.

What situation was discovered by the Porte, when it re-established its authority with the support of a British military expedition and reformed it through its policy of Tawallum? Since the beginning of Ottoman domination, the centre of Syria had shifted from the east towards the west; Lebanon overtures towards Mediterranean Europe and the demographic growth which had enabled the Maroni-
tes to spread from the north to the south of the mountain had worked in favour of this orientation and had benefited from it. However, in this material, human and religious context, arboiculture, pro-
ducing timber in commercial quantities, had been considerably developed to the detriment of edible crops; at the beginning of the 19th century, the cereals which the mountain people harvested from their soil were sufficient to feed them for only three or four months of the year, the remainder having to be bought. The need to guarantee their subsistence thus put them into still further dependence on the Turkish governors who controlled the fertile plains; although the marzeh attempted to remedy this necessity by a permanent extension of their influence over the Druzh, their efforts were in vain. On the other hand, commercial exchanges turned the mountain range into a zone of monetary circulation, and its economic development favoured considerably its population growth; but, at the end of the 18th century and during the first four decades of the 19th, increasing pressure of taxation, linked to the effects of Ottoman monetary manipulations, had caused a massive deprecation of financial resources and led to an impoverishment which was all the more powerfully felt because the cultivable areas of the mountains had reached a peak of demographic saturation in terms of the density of the population of the peaks. This in turn led to social tensions be-
tWEEN, on the one hand, the marzeh, themselves impoverished and weakened by the policies of a marzeh Bu-Shagh II and by their own numbers and rivalries, and on the other, the tenant farmers who found it increas-
ingly difficult to cope with increasing taxes and rents on contracting land space. On the Maronite side, the ennoblement of the nobility, which led to a regrouping in the framework of the community under the leadership of the cleavages, with resulting profit to the land owners, had not experienced the same demographic increase, and who therefore were subjected to the continuing influx of Christian population simultaneously with the renewal of economic and political activity in Lebanon, there was a contrary regrouping behind the major traditional families, the social backbone of the community; a migratory movement; it also took place towards the Syrian interior, towards the Haw-

ars. Social tension thus also led to community regroupings in the interior, which were inhabited by Druzes and Christians; the clashes which ensued were a part of the general unrest which affected Syria in this period.

When the regulations of 1842 and 1845, the Porte imposed a new administrative system which gave preferential terms to the Christian population but re-
tained the division of the mountain, the northern part being entrusted to a Christian bi'tinquatn and the southern to a Druze bi'tinquatn; both were functionaries placed under the authority of the Turkish governor who was now resident in Beirut, and were assisted by a council "like those which already exist at all points of the empire". It was the renewal im-
plored by changes in Europe that was manifested behind these modifications, behind new forms of inter-
vention by representatives of European powers in Lebanon, especially behind the activities of the consuls of France and Great Britain posted to Beirut. This port was regularly visited by steamships after 1835; although the major cities of the interior underwent a crisis in their activities, the "inland" regions which were inhabited by Druzes and Christians; the clashes which ensued were a part of the general unrest which affected Syria in this period.
thereby contributing further to the decline of the latter. These economic changes, while favouring the prosperity of those who were the intermediaries, chief among whom were the Christians, had an adverse effect on the disadvantaged communities and led to aggravation of social and religious tensions. In 1859, an agrarian revolt saw peasants in conflict with sheikhs in Maronite Kfardebian. However, the Christians benefited overall from these transformations, while Muslims and Druzes were, overall, prevented from playing any part; claiming the "equality" promised by the reforms, reinforcing the status of the community with the support of France and of the Roman Church, profiting from a European expansion which both rivalled and dominated the traditional economy of the Near East— all these activities on the part of the Christians were in the eyes of the Muslims crimes committed by a people whom they had never ceased to despise, in opposition to their past supremacy and to their present existence. An incident in May 1860 touched off conflict between Druzes and Christians, and was followed by massacres of Christians in the "mixed areas" and in Damascus. To limit intervention by the European powers, the Turks restored order in the most brutal fashion; however, this did not prevent the arrival in Beirut of a French expeditionary force, which Napoleon III had also sent for the purpose of furthering the Mediterranean and Arab aspects of French troops until June 1865, and of the negotiations held between the Porte, France, Great Britain, Austria, Prussia and Russia, was the creation of a province of Mount Lebanon. Administrative unity was thus confirmed by law. Although it was nothing more than a sanjak or mukhtara, the agreement signed at Perpignan on 9 June 1861 made it clear that: "The Lebanon will be administered by a Christian governor appointed by the Sublime Porte and responsible directly to it." The Porte laid down the condition that this Christian governor be chosen from among the non-Lebanese subjects of the Sultan. The majority of the population of the new province was Christian; order was maintained by its own police and ideas. The economic expansion introduced from the 1925 revolt. However, a compromise was devised, of showing where their feelings lay at the time of their territories. In 1920, the French military intervention against the Arab Kingdom of Mtir Faysal permitted the creation of the State of Greater Lebanon which was placed under a mandate entrusted to France. This state was established around a Christian, mainly Maronite, nucleus, which constituted a majority, although all the other lands of Arab culture were populated predominantly by Muslims. But the former province of Mount Lebanon was expanded with the addition of Béqaa, Saida, Tripoli, Akkar, the Bikâr, the Wâdi al-Tayni and the Djabal nahr where Sunni and Shî'î Muslims were present in large numbers. This situation aroused two principal attitudes: on the one hand, the Christians had no intention of accepting a position of inferiority in a Republic of which they considered themselves the architects; on the other, the Muslims speculated as to what their states was to be within a political entity which had not been founded according to their aspirations. Numerous factors came into play in this context, in particular: the nature of groupings and relationships in the community frameworks or the political parties; demography, increasingly favourable to the Muslims; the question of ability to cope with all the necessities of the modern world; and the economic role and the place of manual labour, not only in terms of the different social levels but also in terms of the communities. While some Shî'î leaders were quite prepared to throw in their lot with the system, the ruling circles and the population of the Sunni community expressed strong reservations and they took the opportunity of showing where their feelings lay at the time of the 1925 revolt. However, a compromise was devised, of its principal Sunni initiators being Riyâd al-Sulâh; in 1936 it was agreed, following Franco-Syrian...
and Franco-Lebanese negotiations, that the Lebanon would continue to exist within its present frontiers and would retain the representation of the communities which had been confirmed by its parliamentary constitution. In 1945, the National Pact, already mentioned, was a decisive factor in the Muslim adhesion to the Lebanese identity. In March 1945, the Lebanon was among the founders of the League of Arab States.

Under all the presidents of the Republic who have succeeded one another since independence (Bishara al-Khuri 1941-52, Kamal Shamoun 1952-58, Fuad Shihab 1958-64, Charles Hilla 1964-70, Sulayman Farajlyya 1970-76, Ilyas Jarida 1976-82), each seemed to have understood the impossibility of the communities, but has also revealed the growth of a Lebanese consciousness among the majority of a population which has become accustomed to living in the framework of the Lebanese State. In February 1958, many Muslims greeted with enthusiasm news of the foundation of the United Arab Republic; but while bloody civil unrest engulfed the country between May and September of the same year and provoked, in the international and Arab context, the landing of American troops on 17 July in application of the Eisenhower Doctrine, the programme of reforms instituted under the presidency of General Fuad Shihab was accompanied by the emergence of a genuine Muslim Lebanonism. At the same time, Kamal Dhemball, as much in his capacity as an aristocratic Druze of the Shih in his role as leader of a socialist movement, appealed to a fundamentally Lebanese patriotism in his effort to bring the country into the bosom of Arab solidarity. The Sunni leaders and the Muslims as a whole were placed in the reality of the Lebanese state as a cadre for the future, but they demanded institutional reforms which would give greater recognition to their numbers and to their talents in the control of the Lebanon. In a state where all civil life is defined by the fact of belonging to a religious community, this claim was supported on the basis of modifications arising from the demographic separation. It is, in fact, the Muslim populations that have increased most rapidly; this development is most clearly marked within the Shia Muslim community, the most disadvantaged in the country, which has become the most numerous. The Shia labour force has therefore tended to leave the impoverished rural zones of eastern and southern Lebanon, the precise areas where Israeli raids have contributed to the acceleration of the migration, to seek work in the expanding industrial zones of the Beirut region. A social problem has thus prolonged the process of political demand and demographic change; this has been reflected in the actions of the political parties of the Left, who have also sought, in a similar manner, to channel the discontent of the peasants of the north whose agitation, since 1970, has been directed against the major landowners and has called into question the authority of the state. They have also acquired, through their new militancy, a stronger "Muslim aspect".

This evolution has come about in a period of economic growth whose profits have been most unevenly distributed. Since 1967, the ascending curve of the Lebanese economy has followed that of the increased wealth of the Near East as a whole; petrodollars, "Arab" assets which are essentially the property of Muslims, have been invested in Lebanese banks, of which the majority are controlled by Christians. At the same time, the Lebanon has not only counted on the resources deriving from its "services", but also on those produced by its industry, which has undergone a vigorous expansion in the suburbs of Beirut and Tripoli, exporting 80% of its production to Arab markets. While Lebanese technicians and businessmen, including Christians at the higher levels, have taken the opportunity of practising their skills in the developing Arab countries, the contracted labour force in the construction industry of Beirut is of Syrian origin; thus, through its recent economic development, the Lebanon has become still more integrated into the life and destiny of the Arab world.

Paradoxically, this situation has been cruelly underlined since 1973 by the internal consequences of the recession of the western economy, for the Lebanon has followed that of the Lebanese economy has followed that of the Western states which, as a result of repeated Israeli incursions; but, besides the members of the front of progressive parties, all Muslims have felt sympathetic to their cause and have often offered them support in internal political action.

The resentment at this situation felt by the Christians, and especially by their Maronite majority, has been channelled by the Lebanese Phalanges. Although of Arabic language and culture, the Christian population has developed and rediscovered an isolationist complex in an Arab world where the movements of Arab society, and while they have exploited the liberal Lebanese regime to act, as independently as is possible, towards invoking the solidarity of the Arab nation, they have none the less remained very distinct from the remainder of the population, since they lay claim to a land which is not the Lebanon. The sovereignty of the Lebanese state has suffered as a result of their military activities in the frontier regions of the south and, consequently, as a result of repeated Israeli invasions; but, besides the members of the front of progressive parties, all Muslims have felt sympathetic to their cause and have often offered them support in internal political action.

After February 1975, the repression of political and social unrest at Sidon illustrated the limited capabilities of the Lebanese army, itself a multi-religious organisation. On 13 April 1975, a coach carrying Palestinians was machine-gunned by Phalangeists near Beirut; twenty-seven passengers were killed. Since then, the authority of the government has progressively disintegrated. At the beginning of 1975, the whole generation of students had dreamed of a fraternal future for the Lebanon, to be achieved by the erosion of community divisions; this dream has been shattered. While the sovereignty of the state has been called into question, and the ancient...
structures of the familial group have been damaged by modern urbanisation and industrialisation, religious segregations have shown themselves to be all the more active at the level of collective consciousness, since they have remained the principal touchstone of identity and therefore the principal framework for community solidarity. In the agony of the civil war, political and social conflicts have been kept alive by the most ancient segregational structures of Near Eastern society; the polarisation of passions according to religious allegiances has been the most symptomatic expression of this at the conscious level. How is one to contemplate the idea of the partitioning of the Lebanon as envisaged by the minorities, the constitution of semi-autonomous fraternities of combatants, principally within the popular Muslim milieu, the conflicting claims of fragmentation and unitary ideologies, or the unequalled violence of the fighting since September 1975, without reference to this conglomeration of sociological and historical data?

The Lebanese crisis which began in 1975 owed its seriousness to internal causes which in their turn reflected the changes in the Arab world and the social, cultural and political tensions which had become acute throughout the Near East. At the beginning of the war, two powers with an interest in the existence of the modern Lebanon made official approaches to the different Lebanese parties: Syria, with repeated missions on the part of its Minister of Foreign Affairs, France, with the fact-finding missions of Maurice Couve de Murville and Georges Gorse. In June 1976, Syria sent a massive force into the Lebanon under the cover of the Arab Peace-Keeping Force in order to restore calm. In spite of truces, the sound of gunfire is still to be heard, across alliances and the reversal of alliances (especially after the Camp David Accords), across struggles for hegemony within each politico-religious faction. The continuing prosperity of the banking sector has no doubt compensated for the massive destruction of property and the aggravation of social disparities. From 1810 to 1938, civil disorders in Lebanon had been resolved only by the intervention of Western armies. Since 1976, the presence of the Arab Peace-Keeping Force has shown that a
solution should be found through Arab negotiation, but having regard to international repercussions and to the conflict with Israel which led, in 1978, to the dispatch of a United Nations Interim Force in the Lebanon (U.N.I.F.L.).

It is estimated that the Lebanon has close to three million inhabitants. It is they, residents or temporary emigrants, who ensure the existence of their country. Though each continues to feel part of a minority in relation to his compatriots, the adhesion of the majority of the Lebanese to the Lebanon is symbolically represented by the celebration of the Day of the Flag; but, while they are aware of belonging to the same entity and are determined to maintain it, they do not share the same national vision.

The felts came from various regions and countries: from China (refined and rare felts, in the Muslim world, al-Dhibhī, loc. cit.; al-Thāfi'ilī, *Lašīfi*, tr. C. E. Bosworth, 142), from North Africa (al-Dhiba'ī, loc. cit.; al-Iṣṭāghī, 125; Ibn Hawḵābī, *loc. cit.*, 223; al-Thāfī'ilī, loc. cit.; Ibn al-Zubayr, *loc. cit.*, 471), from Armenia and Khurasan (al-Dhiba'ī, loc. cit.; Ibn al-Zubayr, *loc. cit.*, 50); al-Hamadānī, *Tamašāy*, 22). The Turks, in common with other peoples of Central Asia (A. Miquel, *op. cit.*, ii, 136, 234), used large quantities of felt, for clothing as well as for the making of tents, but there is no evidence to show that felt was exported from these regions to the centre of the Muslim world. Felt from Tīliḵān (in Khurasan), strong and resilient, was used possibly for the weaving of a kind of rope rescue-ladder (al-Muṣallī, *Muruš*, vi, 247—§ 2799). In Samarkand (Transoxiana) and Damascus (Syria) there were specialised quarters in the suburbs or in the city, for the manufacture and sale of felt (Vāšī, iv, 345).

(J. Sadan)
During the whole of the Second Temple period, the city was one of the major Jewish centres, although in the Hellenistic and Roman periods it occasionally remained outside Jewish domination. The Seleucids ceded it to Jonathan Maccabaeus in 125 B.C., and 85 years later, Pompey detached it from the Jewish state. In 48 B.C. Julius Caesar restored it to Jewish rule. In 44 B.C. after the murder of Caesar, Cassius, who appeared in the country with a large Roman army, sold its population as slaves when the town failed to pay the high tribute imposed on it (Josephus, Wars, I, ch. xi, 2). The city revived and even flourished as a centre of Jewish learning and a home for Jewish spiritual leadership after the destruction of Jerusalem in 70 A.D. (Smith, 121 and n. 2).

Once Christianity was proclaimed the state religion by Constantine, Ludd instantly assumed an important place in Christian thought, mainly because of the healing miracle which St. Peter performed on the paralytic Annas (Acts, 5, 30-3). It has been compared to Jericho in the Gospels (Matthew, 21, 19) and to Cana in Galilee (John, 2, 1-11). The name Ludd in the context of the Christian story can also be seen as a reference to Ludd (Lydda), the name for the city in the Latin alphabet since the time of Constantine, given to the city by Constantine the Great. The name Ludd appears in the Christian Gospels as a place of origin for Christ and as the place where He first appeared after the Resurrection (Mark, 16, 14). The name Ludd is also found in the apostle John's vision of the city of the new Jerusalem in the Book of Revelation (Revel, 21, 14).

The area of Ludd is a flat, alluvial soil, very good for agriculture. It enjoys an extensive area of flat land, some 40-50 m. above sea level, which came to be known after it as the "Valley of Lod" (cf. Pal. Topogr., loc. cit.). The area enjoys a very good amount of winter rain (annual average of above 500 mm.), and its alluvial soil stores large quantities of excellent water which have rendered the environs of the city extremely fertile in all times; this, in addition to the rich soil and generally warm climate, made the town famous for its agriculture. It was always described by travellers as being encircled by olive groves and vineyards (and in modern times, citrus plantations). Cotton grows very well in the area, and in the later Ottoman period it was cultivated extensively as a major cash crop. The cultivation of cotton ceased during the British Mandate, but it was renewed in a most extensive form in Israel. Plants used in the dyeing industry, for which the town had also been very famous (until the building of Ramla), must have also been grown around the city. The virtually unlimited possibilities offered by the natural conditions explains the place's attraction for settlers, who repeatedly restored it after the frequent calamities, whether of human or natural making, which befell it throughout its exceptional long history.

Its position made Ludd from ancient times an important station on the eastern and more frequented branch of the Via Maris which runs from Gaza via Yavneh (Ar. Yubná) and Ludd to Antipatris (Ra's al-'Ayn) and thence via Wadi 'Ara (ancient 'Iraq) to the Valley of Jezreel. This route running along the eastern slopes of the hills of Samaria, though longer than the one running parallel to the coast, was deemed easier and safer. It attained especial importance in the post-Crusader period (mainly under the Mamluks), and has since served as one of the major traffic routes in the country. The road connecting Jerusalem to Jaffa also passed via Ludd, thus making it into an important crossroads, a position which the city regained in modern times after the construction of the Jaffa-Jerusalem railroad at the end of the last century (see below).

Early Islamic history. According to al-Bakrī's tradition, Ludd was conquered by 'Amr b. al-Āṣ after the conquest of Nablus and Samaria (Fust, 138/5). Al-Tāhirī relates that the city was established in 15 A.H. and quotes the agreement made with its inhabitants. It is the standard formula of capitulation treaty known from other places in Syria which were reportedly taken without war (stūdīm), and stipulates 'amān (protection) for the conquered inhabitants' life and property, guaranteeing the safety of the religious institutions in return for a payment of an unfixed sum of āqām (al-Tabarî, i, 250/7). Very soon after the Islamic conquest the town was represented during the Byzantine period, mainly due to the growth of Ramla as a major administrative, economic and cultural centre in the Dīwand Filastīn (the Byzantine Palästina Prima).

Ramla was built by Sulaymān b. Ṭāhir with the intention of serving as the capital of the province, after a long period in which the Dīwand Filastīn had been devoid of a proper administrative centre. Having discarded, for obvious reasons Caesarea, the Roman Byzantine capital of Palæstina Prima, the Muslims made Ludd into the permanent seat of the administration. The city was, however, too Christian in ethos for the taste of the Umayyad rulers, especially after the inauguration of 'Abd al-Malik's Arab-Islamic reforms. When Sulaymān was nominated by his brother al-Ṭāhir I as governor of Palestine, he took up residence in Ludd, but immediately embarked upon the grand scheme of the building of Ramla (Fust, 143; Yākūt, s.v. "Ramla"). Once the new capital was established, Ludd almost instantly fell into oblivion. The Islamic traditions
unanimously confirm this by saying that the building of Ludd was the reason for the destruction of Ludd. Some traditions even say that Sulayman destroyed the homes of the inhabitants of Ludd in order to force them to move to his new capital, al-Mahdi. Other traditions state that the destruction of Ludd, emphasizing that in his own time it was already in ruins (Buldun, 328). The traditions relating to its deterioration are all intensified by the Islamic accounts of its past glory. Thus Ibn al-Fakhr speaks about the splendid buildings of Ludd, which impressed the Muslim beholders so much that they believed that they were built for Solomon by the djinn (Mushfik, 127). This tradition must refer to the Byzantine basilica of Ludd, which had been built over the tomb of St. George. It is believed to have been destroyed by al-Hajjaj in 397/998 and rebuilt by King Stephen I (St. Stephen) of Hungary (997-1038). However, by then the church of Ludd had already been celebrated in the Islamic ecclesiastical traditions, al-Mukaddasi, in the second half of the 10th century, mentions the church as the most prominent feature of the city. This tradition must refer to the Byzantine basilica of Ludd, which had been dedicated to the Saint, because of its location on the main route from Egypt to Syria (cf. Robinson, 365). When peace negotiations began between Saladin and the Franks in 1188, the former suggested that the King of Jerusalem should receive Ludd to compensate him for his losses in the disintegrated Acre (Abu Shama, ii, 203). The strategic importance of Ludd as an inland station on the main route from Egypt to Syria (cf. Mudhir al-Din, ii, 195; i, 47, Zettersten, 235). It is very possible that the tradition grew somehow out of the idea connecting St. George and the dragon, which can be traced to the 6th century, (see Abu Shama, i, 203). The feast of St. George on 23 April continued to be celebrated under Islam, and its ceremonies at the church were also attended by Muslims. Three verses by al-Mutawakkil, the caliph al-Mahdi's poet-singer, indicate that he talks about his "coming intentionally to Ludd on the feast of nasiir sidqis (the) where he saw "ladies like gazelles in their covert", attest to the popularity of the feast, at least in the pre-Crusader period (Buldun, s.v. "Ludd").

The Byzantine church is described by all the early Christian travellers. On the eve of the invasion of the Crusaders in 1099, the Muslims destroyed it at once. The Crusaders found Ludd and Ramla deserted, and thus were easily able to establish a corriander from Jaffa to Jerusalem, whence they could mount their attack on the Holy City as well as widen their hold on central and southern Palestine. In Ludd they built in 1150 a new cathedral with much splendour and magnificence, over the remains of the previous Byzantine church and the Saladin's tomb. They dedicated it to the Saint, because of its location as well as because of the then prevalent belief in his intervention in their favour during the siege of Antioch. The new cathedral "was a great pile, capable of use as a fortress" (Smith, 122). Toward the end of the 12th century, the cathedral attained even greater attention and significance when St. George was adopted by Richard Coeur-de-Lion as the patron saint of England, in addition to the veneration he already enjoyed as the patron saint of Eastern Christianity (it was, however, only under King Edward III that St. George actually became the patron saint of England, 1322 a.d.). Moreover, under the Crusaders, the name of St. George replaced the name of the town, so that during the whole period of their presence it came to be known as St. George, and pilgrims call it by this name until the 16th century (ZDPV, x, 214; xi, 195). Even the Jewish traveller Benjamin of Tudela speaks about his visit to St. George, erroneously identifying it with the Biblical Luz (Early travels, 87, 88).

In 394/1003, following the battle of Hittin (q.v.), Saladin conquered Ludd (Abu Shama, ii, 89), but the effect on the town of this conquest was felt only three years later. In the framework of Saladin's policy of dismantling the main coastal fortresses, he demolished Ascalon (Askaliy) and proceeded to dismantle on 3 Ramadan 587/24 September 1098 the fortress of Ramla. On this occasion he also demolished the Cathedral of Ludd (Abu Shama, ii, 214; Ibn al-Athir, xi, 47, Zettersten, 235). It is very possible that the tradition grew somehow out of the idea connecting St. George and the dragon, which can be traced to the 6th century, (see Abu Shama, i, 203). The strategic importance of Ludd as an inland station on the main route from Egypt to Syria (cf. Mudhir al-Din, ii, 195; i, 47, Zettersten, 235). It is very possible that the tradition grew somehow out of the idea connecting St. George and the dragon, which can be traced to the 6th century, (see Abu Shama, i, 203).
The name of Ludd appears in the sources again in connection with the peace treaty of 625/1229 between al-Malik al-Kamil of Egypt and the Crusaders under Frederick II. In this treaty, which provided for the cession of Jerusalem to the Franks, Ludd was also handed over to the Crusaders' sovereignty, together with some other villages which were part of the territorial corridor between Jaffa and Jerusalem, which came under Frankish domination (SuCeh, iii, 230; al-Kalāshmand, ii, 429). In 665/1267-8, Ludd was conquered by Baybars, who must have dismantled whatever remained of the church (SuCeh, 3, 5), though it is possible that some of the columns which served to build the bridge to the north of the city in 671/1273.

The development of the inland branch of the Cairo-Damascus route (or the eastern branch of the Via Maris), in the course of which the great engineering enterprise of building the monumental bridge of Ludd was undertaken, was part of Baybars' policy to demolish completely the coast of Syria and Palestine. This policy began in fact, with Saladin and was later used by the subsequent Muslim rulers. In view of the Mamluk weakness on the sea and their inability to prevent the free naval activity in the Mediterranean, Baybars and his successors followed the strategy of abandoning the demolished shore and creating a strong line of inland fortresses. The unprecedented attention paid to the inland route to Damascus passing via Ludd was part of this overall Mamluk strategy (cf. Ayalon, BaraHyay, ii, and Idem, The Mamluks and rural power, 7-10).

Clermont-Ganneau, who studied the bridge as well as the church of Ludd, remarked that whole parts of the Crusaders' cathedral were used for building of the bridge (EA01, i, 270-1; cf. Prawer, ii, 424; modern Islamic art historians, however, doubt this theory. The bridge is known as Dībar Dīdās, after the name of a neighbouring village, and has been in constant usage since the time of its building until this very day. Two almost identical inscriptions on both its façades commemorate its building: it was ordered by Baybars and executed by al-'Asīd al-Dīn 'All al-Sawwālī and Umar in Ramadan 671/April 1273 (Clermont-Ganneau, loc. cit.). On both sides of the inscriptions Baybars' famous heraldic symbol, the leopard, is carved in relief with its paw raised to strike a miserable animal resembling a mouse, believed to represent the king of Jerusalem or the Crusaders in general (cf. Prawer, ii, 461-2).

Ludd revived as a consequence of the development of this major traffic route, especially since the early Mamluk sultans paid great attention to the orderly and secure movement of the royal postal services or barid (cf. between the imperial capital of Cairo and the major provincial capital of Damascus. In the Mamluk administrative division, Ludd was made into a centre of a subdistrict, 'anad al-Ludd (al-Kalāshmand, lv, 100). Ibn al-Furat (vii, 225) speaks in 890/1486 about mawāya al-Ludd wa l-Ramlā. After that, Ludd is mentioned as an important station on the road between Cairo and Damascus (e.g. in SuCeh, 1, 344-5; Ibn Fajrur, Durur, i, 522). Nevertheless, it was not until a few years after 581/1186 during the Mamluk period also, it was overshadowed by Ramla. Muhammad al-Dīn describes the place in this time, namely the very end of the Mamluk period, as a pleasant village with an active Friday mosque. The singing-out of the mosque of Ludd and the traditional congregational prayer took place at the mosque during the Mamluk period as well. Muhammad al-Dīn adds that to the east of the city there was a maghād venerated as the tomb of the famous companion 'Abd al-Rahmān b. 'Abd al-Malik. There is no question that the maghād and the local traditions around it were a post-Crusader invention; its actual fact, Ibn al-Dīn died in Medina and was buried in the cemetery there of al-Bakī (cf.), Ibn 'Abd al-Baqī al-Sīdābī, ii, 850; Muhammad al-Dīn, 419).

The Grand Mosque was also built at the order of Baybars, in part over the sites of the Byzantine basilica and the Crusaders' cathedral, with the building material taken from the ruins of both. On one of the columns of the mosque a 6th-century Greek inscription which had belonged to the Byzantine church can still be seen. The mosque built by Baybars is called al-Dīmālī al-Umari. The long inscription in early Mamluk naskhī script over its entrance is the only detailed source concerning its building. It runs as follows:... ordered the building of this blessed Friday. Mosque our lord the Sultan al-Malik al-Ahmar Rukn al-Dunyā wa M-Dīn, Abu 'l-Fath Baybars al-Sāhīb, the amir, ordered the Commanders of the army to God make his victories glorious and forgive him. This was done under the direction of the servant, yearning for the mercy of his divinae Master, 'All al-Dīn al-Sawwālī al-Sāhīb, may God forgive him, in the month of Ramādān 666 (begun 13 May 1267). The name of Ludd appears in the Mamluk administrative division, Ludd was part of this overall Mamluk strategy (cf. Ayalon, BaraHyay, ii, and Idem, The Mamluks and rural power, 7-10).

Baybars, who studied the bridge as well as the church of Ludd, remarked that whole parts of the Crusaders' cathedral were used for building of the bridge (EA01, i, 270-1; cf. Muhammad al-Dīn describes the place in this time, namely the very end of the Mamluk period, as a pleasant village with an active Friday mosque. The singing-out of the mosque of Ludd and the traditional congregational prayer took place at the mosque during the Mamluk period as well. Muhammad al-Dīn adds that to the east of the city there was a maghād venerated as the tomb of the famous companion 'Abd al-Rahmān b. 'Abd al-Malik. There is no question that the maghād and the local traditions around it were a post-Crusader invention; its actual fact, Ibn al-Dīn died in Medina and was buried in the cemetery there of al-Bakī (cf.), Ibn 'Abd al-Baqī al-Sīdābī, ii, 850; Muhammad al-Dīn, 419).

The Grand Mosque was also built at the order of Baybars, in part over the sites of the Byzantine basilica and the Crusaders' cathedral, with the building material taken from the ruins of both. On one of the columns of the mosque a 6th-century Greek inscription which had belonged to the Byzantine church can still be seen. The mosque built by Baybars is called al-Dīmālī al-Umari. The long inscription in early Mamluk naskhī script over its entrance is the only detailed source concerning its building. It runs as follows:... ordered the building of this blessed Friday. Mosque our lord the Sultan al-Malik al-Ahmar Rukn al-Dunyā wa M-Dīn, Abu 'l-Fath Baybars al-Sāhīb, the amir, ordered the Commanders of the army to God make his victories glorious and forgive him. This was done under the direction of the servant, yearning for the mercy of his divinae Master, 'All al-Dīn al-Sawwālī al-Sāhīb, may God forgive him, in the month of Ramādān 666 (begun 13 May 1267)." (I. A. Mayer, Muslim religious buildings, 34).

This means that the mosque was built shortly after the conquest of the city. The work was executed by the same 'All al-Dīn al-Sawwālī who was later charged along with the building of the bridge but of whom nothing else is known (Mayer, loc. cit.). Another inscription on the grand mosque, hitherto unpublished, bearing the name of Kāṭibī and dated 13 Ramadan 892/2 September 1487, commemorates the abolition of certain unjust taxes upon the inhabitants of Ludd. Of special interest is the fact that the name of the powerful local leader of Diwāl Nābulūs, Khalīl b. Imāmī, hitherto known from literary sources only, appears in this inscription as officially participating in the affairs of Ludd. This may be explained by the fact that Fatimid times, which rendered the city of Jerusalem, Muḥammad al-Din, 056, 059).

The Bedouin element, which during the Fatimid period was predominant in the coastal plains of Palestine, and particularly around Ramla and Ludd, reappeared as a major factor in the history of the country in the post-Crusader period, again easily establishing itself around Gaza (Ghazza) on the one hand and around Ludd and Ramla on the other. These areas have always been within easy reach of the nomads, who took advantage of the weakness of the Mamluk and later also Ottoman military and administrative hand on the country. The environs of Ludd in both periods were completely at the mercy of Bedouin tribes, mainly of the Sawwālīna, the Kushtāq and the Sawtariyya, who replaced the Banū Djarrāb of Tārīf—the predominant tribe of the Fatimid period in Palestine. According to Oppenheim, the Sawwālīna and the Kushtāq arrived in the Ramla-Ludd region from Lower Egypt at the beginning of the 11th-12th century; but the Sawwālīna, the leading tribe of the area,
definitely arrived earlier, for in 1822 they took part in a coalition (with Bedouins from the Nabuluss area and others) which aided Ahmad b. Turabty, the Bedouin amir of Lajdhun [q.r.], in his war against Fakhr al-Din II (Sharon, The political role of the Bedouins in Palestine ... , 289).

The Ottoman period and modern times. Throughout most of the Ottoman period, Ludd was completely overshadowed by Ramla. It was a small village, which in judicial matters fell under the jurisdiction of the district of Ramla (Heyd, 55-6). In spite of its small size, it retained some of its importance as being situated on the central postal route of the empire. When in 1551, Rosekalna (Khurrees Sultan [q.r.]), the favourite and later wife of Sultan Sulayman the Magnificent, established her famous endowment (‘imāra) in Jerusalem, Ludd was one of the many villages which were made waqf for it (ibid., 143, n. 1, doc. 90, and n. 71, QDAP [1944], 170-94).

The European travellers who visited the town in the Manil and Ottoman periods are of little value for the history of Ludd until the 19th century, when the systematic research of the Holy Land began. They all repeat the same description of a small village in the midst of a fertile environment, emphasising the impressive ruins of the Crusader cathedral. At some time during these periods, an altar was built by the small Greek Orthodox community who used to assemble at the place for regular prayers. In spite of Ludd’s fertility and favourable location on a major commercial route, it was not until the second half of the 19th century that it began to revive. In the middle of the century the number of its population, according to the 1851 census, was only 1,545 (the number for the neighbouring villages being 4,100, SWP, ii. 279). The increased attention paid by the Ottomans to Syria and Palestine in the second half of the century, which entailed improvement in the internal security, mainly in the central parts of the country, and the keeping of the Bedouin in closer check, had an immediate influence on the fortunes of the town. The systematic European scholarly investigation of Ludd, which began with Edward Robinson in 1838 and continued particularly in 1852, and was followed by the Palestine Exploration Fund (Conder, Kitchener and others), drew European attention to Ludd and its past. In 1871 and again in 1873-4 Clermont-Ganneau prepared a most detailed study of the town and its environs, which included a detailed study of the Byzantine basilica and the Crusaders’ cathedral. At this time work began on the rebuilding of the present church of St. George, partly on the foundations of the ancient basilica and the Crusader cathedral. The study of the Byzantine basilica and the Crusaders’ cathedral in all its periods, which entailed improvement in the systematic research of the Holy Land began.

An earthquake on 12 July 1927 damaged the town very badly, destroying 500 homes and killing 40 people. Secondary earthquakes had occurred formerly in 1893 and 1946 (PEF, QS [1927-7], 272).

On 11 July 1948, in the course of the Arab-Israeli War, Ludd was conquered by Israel. Out of its former Arab population, only 1,056 remained in the town. Very soon modern cut-offs grew up around it, and by 1958 its population reached again the figure of 19,000, most of them Jews from the Arab countries. The rapid growth of the airport and the Israeli air industry have in the subsequent 20 years doubled the town’s population (the latter standing at 40,000 in 1970).
LUDD — LUGHA

LÜDHANNA, a district and town in the Dihandhar division of the Punjab state of the Indian Union. The tract is an alluvial plain, covering 3,573 km² and bounded on the north by the river Sutlej. Generally, it has been a frontier area. On the high road from Central Asia, it has been crossed by successive waves of conquest or immigration, while over the last 250 years it has seen struggles for supremacy between the Durrani Afghans and the Moghuls, between the Sikhs and the British and, more recently, between India and Pakistan. In 1809 Ludhiana town became an important British frontier cantonment, and the district gained most of its present form after the Anglo-Sikh war of 1846. Since the partition of India in 1947 it has been close to the Pakistan frontier. Before partition, nearly 38% of the district's population were Muslims; now they form less than 16%, 300,000 Muslims having migrated to Pakistan. The town of Ludhiana stands on the Grand Trunk Road and is an important junction on the Northern Railway. It appears to have been founded in the 9th/10th century by the Lüd rulers of Diblí, from whom it took its name. In the 19th century it became an important Wahhabi centre, and in the great uprising of 1857, Shâh 'Abd al-Kâdir, a prominent Wahhabi and friend of Sayyid Ahmad Barelî, led the town against the British. In the 20th century 'Abd al-Kâdir's family remained prominent in the resistance to the British, a great-grandson, Muhammad Habib al-Rahîmî, leading the Khuja agitation of 1919-23 and, as President of the District Congress Committee, the civil disobedience movement of 1930. In the 1930s, the town was the centre of the Ahrar, religious idealists, Indian nationalists, and for a time the leading Muslim party in north-west India. Consequently, Ludhiana returned the only Muslim Congressman from the whole Punjab in the 1937 elections, although by the next elections of 1946 the Muslim League was able to capture the seat with ease. Since 1947 the area has seen striking industrial and agricultural growth; it is one of the most prosperous regions in India.

LUGHA (A.), "speech", "language" in current usage.

The term does not appear with this sense in the more ancient texts. In the Kur‘ân it is exclusively ḥisām which is used to express the concept of "language" and not lugha, which is completely absent from the Kur’ânic text: bi-ḥisām al-lARABIH NH MUBIN ("in clear Arabic language"), XXVI, 195; and ma-ma

oralna miv rasâlî ihă bi-nisâmi fi-rānmi ("all the messengers whom We have sent [to Mankind], We have made them speak in the language of their own people"), XIV, 4. According to J. Füek and Nödeke, it seems that this term is non-existent in the ancient poetry of the Bedouin (see Füek, ‘Arabiya, French tr., 155) but this cannot be asserted because there is not yet available an exhaustive inventory of the vocabulary of those ancient poetic works which have survived. Lugha cannot have acquired the sense of "language" or 'speech" until the end of the 2nd/3rd century. Before this date, the term always appears with the very specialised sense of "manner of realising an element of language" particular to an ethnic group, a tribe or a locality; whence the meaning of regional or tribal "variant of realisation" which it possesses in the works of the grammarians Siba‘awî (d. 870/93). It is appropriate to stress the fact that, in the writings of this author, and of his contemporaries, lugha does not denote the full range of linguistic particularities associated with an ethnic group, in other words a local patois or a dialect, but only a local variant. Thus in the common expression lughat al-hdldj (Kûfî, i, 26, 35, 187, etc.), lughat Hudhayl (ibid., ii, 191), it concerns the special "manner" of the Hudhaylians of treating the particle and like the forms of the verb we- and of the particle ma. In the same fashion that you study the Qur‘ân true, is the modern Arabic expression lughat ammâl (from the root l-g-h) of which the essential meaning is precisely the idea of digression from a certain norm of expression, whence the very strong sense of a "deviation and often also as an incorrect expression". Thus in the common expression lughat ammâl (from the root l-g-h), this sense of "variant" or of "regional variety of realisation" is clearly illustrated in the use, by Arab grammarians and lexicographers, of the dual or plural form of the word lugha in expressions such as ammâl Mu‘âshîrî fi-fâshî lugha ("as for the name of Ma‘âshîrî, there exist several variants"), Kûfî, ii, 39 and the like. Hence, the expression lughat fi-râsâlî (lugha fi-râsâlî) in view of the fact that a "regional or tribal variant" is always regarded, by those whose own speech does not include this variant, as a deviation and often also as an incorrect expression in terms of their speech, it comes as no surprise to find that the word lugha is derived from a root l-g-h which of which the essential meaning is precisely the idea of digression from a certain norm of expression, whence the very strong sense of a "deviation and often also as an incorrect expression". Thus in the common expression lugha in the texts collated by researchers into Bedouin culture (see Lahn AL-‘Alma), for example, this remark is reported by the disciples of the eminent Abû ‘Amr Ibn al-‘Alî, as made by one of his informants, Abû Ma‘âshîrî, lâsaj hâdij min lâbî min lâfîn ba‘alî "this is not my manner of speaking nor that of my tribe", al-Kâli, ii, 39, repeated by al-Zaqîjî in his Maqâtîs al-Shâma‘î, 3). In his Awdah, al-Kâli is quite explicit: "Lâbî also signifies lugha according to al-‘Alma‘î and Abû ‘Amr, and it is in this sense that it is to be understood in the saying of the qalîf Umâr ‘Study... the lâbî in the same fashion that you study the Qur‘ân
The attitude of Arab lexicographers and grammarians towards linguistic data—the Lugha—has not always been properly understood by contemporary authors. The norm, the "norm" of the linguist E. Cowie is the "idiom" of the linguist J. Gagnepain is for them the result of a choice, but this involves the choice of the native locutors themselves (Fusahā al-'Arab, the "native speakers of 'Arabiyā"). When this choice emanates from the greater part of these speakers, Sibawayh refers to hasl al-'inna as the "way of speech of the majority" (Kitāb, i, 262, ii, 263; variants: hasl 'ammat al-nās, ibid., i, 262, 293; hasl 'ammat al-'Arab, hasl al-'Arab hulūn "the manner of all Arab speakers", ibid., i, 477, ii, 303). Ibn Dīnārī for his part, was to use the expression lughāt al-hājfat as the "manners of speaking of the majority" (Kitāb, ii, 15). It could also be the case that this convergence of usages was lacking; each lughāt was then considered a norm in itself. "All the lughāt", declares Ibn Dīnārī, "may be regarded as probative references (jadiysa— with regard to the norm), and when two different lughāt have the same range of usage and are equally accepted by the jiyās (Ibn Dīnārī speaks in this context of two lughāt, i.e. two different systems). When two lughāt are in competition, it is not permitted to prefer one of them at the expense of the other" (Ibid., ii, 16). Attention should also be drawn to the remarkable insistence with which Sibawayh (in common with his masters and disciples) urges the reader to rely upon sanūs, upon attested facts only and above all "to accept among these [types of expression which Sibawayh calls] the jiyās, only those which the Arabic speakers have themselves accepted and to treat them in the same fashion (cited in addārī al-lughāt min al-lughāt an-Nādsī, Kitāb, i, 262). Ibn Dīnārī also asserts (Munṣif, ii, 240), "Sanūs can annul the action of jiyās". This assumes, as this author explicitly states, that "everything which jiyās permits is not necessarily actualised in reality" (Kitāb, ii, 117).

In fact, the only criterion of normalisation which has been retained by the Arab scholars is that of the maximum extension of usage; in the domain of 'Arabiyā (the hasl Samud al-'Arab cited above) and of the most widespread inter-comprehension. Whence the degrees of "clarity" applied to lughāt: façh al-fāṣab. The Kitāb of Sibawayh is also full of these appraisals: façh sanūs kāthīr kāthīr is "this Arab of widespread usage"; façh al-khāṣ this is more widespread"; and kāfūr umārīf—"more widespread and better known" (see Kitāb, i, 27, 54, 71, 28, 258, etc.). When two lughāt, or more, were in competition, some were described as being 'Arabī and basāna or nāṣirī ("good"), others as aṣṣān or nāṣirī ("better") or naskī or nāsadī ("bad") here it is no longer a question of value judgments, but of acceptability applied solely to the subjects of speech and on the basis of the most widespread usage (cf. the expression arabi faṣyālī kāthīr, al-qaf al-khāṣ, ibid., i, 27, 60). The geographical recurrence of a lughāt was assessed with the aid of the following scale: mutanādi—perfectly uniform, recurrent or general (100%); faṣhī al-prudominant (85%); kāthīr widespread or frequent (45-85%); less widespread or frequent (15-45%); and nāṣir—rare or isolated (4%) (see Mushā, i, 234). It may be noted that this scale is applied equally to the frequency of an element or linguistic form within one group; see in this context the contrast between mutanādi faṣhī "general in usage" and...
LUGHA

805

mudurid fi 'l-biyas "general in terms of biyas", in Khursi, i, 96 ff. and Hadj-Salah, Linguistique arabe et linguistique générale.

As opposed to nahw, lugha is the very essence of language, in other words that part which is not constructed (by induction), inconsistent with the rules of grammar or non-predictable or non-deductible by means of rules. It is primarily a matter of "sanaa", that is of crude identifications. Thus the entire range of data recorded from the mouths of speakers of 'Arabiyya constituted the lugha (taken as a collective: the ensemble of all the lugha's duly identified). Analyst in groups of items, it is vocabulary opposed to grammar; included in it, necessarily so, were not only the lexical units effectively in use—along with their regional variants—but also colloquial expressions, in the form of idioms or anadh (pl. of anadh) in the very broad sense of "stereotyped figures of speech" or "reiterated of widespread diffusion". Cf. the first compilations of anadh which have survived to the present, comprising collections of idiomatic figures, and not only of maxims and proverbs; see e.g. al-Fikhārī by al-Mu'addād b. Sa'āba, Cairo 1950).

The non-predictable character of lugha (as crude fact and/or as vocabulary of a formal system, that of nahw) has been well described by Ibn Dżimāl: "the language of the Arabs comprises two sorts of elements: those elements that one is obliged to accept as such, with their configuration, for example, and not on the basis of a rule; such elements are: hadār (stone), dār (house) . . . and another type that may be apprehended through biyaas. (Khursi, i, 42). "Hadār may be analysed in a root (b-di-r) and a system (C*a C*b C*c), but the fact that these units combined in hadār arrive at the meaning of "stone" is a fact of secondary nature; what does it mean is to remember it (yab-fas). It also appears in the same sense, with::$_11 this remark which the lexicographer Ibn Fāris (d. 394/9904) is to be interpreted: al-lugha là 'tābbadh biyasāt niqašikāt naḥwā l-aḥn—"the data of the language cannot be obtained, in our era, as far as we are concerned, through biyaas" (Sandall, 33).

Lugha, initially "regional variant of realisation" or "datum of the language", comes to designate the entire speech of an ethnic group and even to be identified with the word hadār which signifies "concrete" or "language". This identification is however absolutely unknown to the first generations of grammarians (up to and including Sibawāy), it appears sporadically at the end of the 2nd/8th century (see the use of it made by the jurist and leader of the law-school al-Shāfi'i in his Kitāb 'al-Nuṣūṣ, where he employs the word lugha with the sense of hadār only once (p. 584) and hadār in all other cases). It was probably in the period of the great controversies of the 3rd al-kalām that such a usage came into being: al-Dżubbī in fact uses lugha, still as a manner of speaking, but enlarged to cover the entire language of an ethnic group (regional speech types, 'Arabīyya, languages other than Arabic; see Bayān, i, 181-2 and Haywāna, v, 299). The sense of regional variant applied to a single linguistic element or item is, however, retained until a very late period.

The science of lugha, which became the science of the entire corpus of the language, underwent a prodigious development following major researches initiated by the very founder of this branch of science, Abu 'Amr Ibn al-'Alīk (153/770), that is, in the period when his immediate disciples such as al-Aṣma'ī (d. 213/828), Abu 'Ubayda (d. 209/826), Abu Zayd al-Anṣārī (d. 215/831) and the Kifāsam al-Mu'addād al-Dabābī, Ibn al-'Arabī, Abu 'Amr al-Shaybānī, etc., made immense journeys of investigation across the Arabian peninsula. This gigantic effort of collection and codification of data (which continued until the total disappearance of the spontaneous mastery of 'Arabiyya—al-jāhāb, at the end of the 17th century) in the composition of innumerable monographs on the lughāt al-khāṭībīl "the variants of realisation specific to the Arab tribes", on anadh or "clichés", nāwda'īr or "hapax legomena", lexicology, the vocabulary of flora and fauna, onomastics, types of verbs, nasādās, the extension of use of schemes, etc. (on this subject, see H. Nayār, al-Mu'ājdīm al-'Arabi, Cairo 1950). To this, there is added the collection and codification of variants in reproduction of the Khurāmī text which were drawn from those who had belonged to the school of the Thā'fīs or from their disciples. All Arabic lexicography of later centuries is based on these monographs.

Lugha as a datum constitutes, for early grammarians as well as for philosophers, the product of a wādī, that is of an institution. The same furthermore applies to the rules of grammar themselves because they are different from one language to another (cf. Maxiher, i, 48) and, above all, because they do not result from the application of more primitive rules, but by induction from the acts of discourse of Arabic speakers (nasādās mustawātān min isāshī hádīl al-‘Arab; Abu 'Abīl al-Fāris, al-Tahāneela, fol. 1). The difference, as has just been observed, resides in the fact that lugha is the non-inventive ensemble of idiomatic items. "By the wādī of an articulated sound" declares al-Rāzī, "is meant the pristine assignation of an articulated sound (tawbīf, usfīf) or at least inspired in men by God (tawbi'īh, isfīf), or social institution, while (nadh) follows the use of this significant (mawdi) with the intention of seeing this significance become the object of conventional usage within a community" (Sahr al-Kitāfa, i, 3).

Thus everything which is not imposed by institution (mawdi) as the symbol of something is outside the scope of lugha, outside wādī. Among other examples of this are the following: sās, kāh, hadī, etc., which have not been retained by the founder of the language for reasons of phonetic incompatibility (tawbīf, usfīf; see Khursi, i, 54). Lugha is, from this point of view, an isfīf or social institution tacitly accepted by its users; but a distinction is also drawn between these two terms, because it is considered that lugha is always a primitive institution, while isfīf can be an innovation, a technical neologism (cf. Bayān, i, 139-40), whence the pairs asl al-wādī or asl al-lugha/islāfī language/metallanguage and wādī al-lughātītāhī third primary institution/secondary institution (cf. al-Rāzī, ibid., ii, 126; al-'Idji-dāndi, Dalā'īl, ii, 14, 193, 580; and al-Fāvšā, Khālid al-Faruq, 143). It is also in this context that a distinction is drawn between wādī al-lugha as an organisation and code established by social institution and wādī al-kalām, which is the arrangements of discourse and the choice of its elements by the individual speaker (al-Diurjānī, cf. al-Wādi, 51, 69, 79, 81).

Wādī constituted for the majority of the Mu'tazilīs a purely human convention (mawdi'ītāh—code), and for other thinkers, an institution which is divine, or at least inspired in men by God (isfīfīh, islamīh; see in this context Maxiher, i, 8-28 and Losee, L'origine du language après les grammairiens arabes, in Arabicum, x-xii). It does not seem, however, that these two positions were so clearly stated in the works of the major Arab linguists and philosophers. In fact, al-Shā'īrī (d. 321/936-9), to whom is attri-
buted the idea of the divine institution of the language, has a rather inconclusive attitude to the subject, which is not entirely inappropriate because the significance has had, and still has, the sense of lexicology. A different term exists to denote this concept: *ilm al-itidān (often abridged into *tāsāyyd), which al-Fārābī employs in his works and in particular in his Ḥidā' al-shīdūm, where he envisages in a very distinct fashion the possibility of constructing a general linguistic extension to all languages and no longer to one particular language ([8-23]).

The enigma is generally in verse, and *rāghiyya, *hāridī, *badī'ī, is attributed to Ḥāshim b. Ahmad, the inventor of prosody, while the Persians of course attribute it to Ḥāshim b. ʿAlī b. Ṭabīb.
The following is an example of muhammad on the name Ahmad: auwa'ainuhu thalthe* tuffuhüm # wa- mihi lanah al-thalith * saqiqah li-badsh* "its first is the third of [the word] tuffuhum (apple) - A; and the fourth of [the word] tuffuhum (apples) is its second - H; and the first of [the word] misih (mask) is its third - M; and the last of [the word] ward (roses) is the remainder of ward.

The term was used by many poets (in particular by Abü Nawâs; see E. Wagner, Abü Nawâs, Wiesbaden 1965, 362). As for the ughiyiya, this term denotes a simple guessing game (e.g. "Guess what I have in my hand"); but can also mean a type of enigma fairly close to the ughiyiya. Thus for salasti ("win"): wafl râfd fi kai: uflh jârkh* What is the alternative sense meant by the person setting forth a riddle when he says: ask ( = salat) the way ( = salati)?

When Affonso d'Albuquerque entered the Red Sea in 1515, he called at al-Luhayya (Luya in the Portuguese sources). The port then belonged to the territory of the Imâm of Sân'â', to whom tribute was paid. Previous to the 16th century, al-Luhayya, like other ports on the Arabian coast such as al-Hudayda, Kamaran Island, al-Makbî (Mocha) and Zâbîl, had been in the power of the Rashîdîs [q.v.], and their envoy was Band Tâhir, whose last monarch, 'Amîr b. Abû al-Walîd, was defeated in 1515 by the firearms of the Mamlûk forces under Salâmân al-Râsî and Husayn Turkî (Serjeant, The Portuguese, 39), sent by the sultan Kânwaw al-Ghawrî [q.v.]. The ruler of al-Luhayya, Œâbû Bakr b. al-Makbûl al-Zâyâlî (of Zayla' [q.v.]), supported the Egyptians, made the Mulhâr for al-Ghawrî and, after the Mamlûk forces had damaged the port of al-Hudayda, opened up the road leading inland. With one hundred men armed with muskets (handâkh), he then advanced against Musw. Abû Mâhîmîn (Schumann, Political history, 19) and Yahyâ b. al-Husayn (Ghâyât, ii, 644) remark that this was the first time firearms were used in the Yemen; see however Schumann, op. cit., ii, 18, 92. After Sultan Selim I had conquered Egypt, Ottoman suzerainty was quickiy recognised by the Egyptian forces in the coastal towns. According to the Tâkârî al-Sâhidî (Serjeant, op. cit., 51, 570), the Portuguese, after an unsuccessful attempt made by the Christians to land near Massawa, turned back to Yemen, pursued by Salâmân "or one of his men" who took a Portuguese grab (Ar. ghâwalh: "brigantine") near al-Luhayya. This story, confirmed by João de Barros (Decades, iii, I, 6), refers to Lopo Soares de Albergaria's expedition in the Red Sea.

In 1656 the Ijîlm al-Manûsh bi'llâh al-Kâmisân (Muhammad [q.v.]) succeeded in expelling the Turks, and al-Luhayya again came into the possession of the Imāms of Sân'â*. Around 1650, ships sailing between Massawa and al-Mukha on behalf of Banyans settled in the latter port apparently used to anchor at the port of al-Luhayya (Van Donzel, Foreign relations, 134-6, 139). On his return from Ethiopia to Yemen, Ahmad b. al-Raïmî, the envoy of (mûm al-Mustawâlîkî | al-dîlîh (1054-97/1644-76) to the Ethiopian king Fâshâdîs (1602-87), disembarked at al-Luhayya. During his stay at al-Luhayya between 29 December 1762 and 20 February 1763, C. Niebuhr was amenabley received by 'Amir Farhân, a black African, appointed as governor (da'în) by the Imâm of Sân'â*. He was told that the town was not older than three hundred years and that its foundation, as is the case with Bayt al-Fakhî and al-Mukhâ [q.v.], was connected with a local Muslim saint, (Sâlih) | Sâlih, around whose cell and later tomb the original settlement grew. The descendants of the Sâlih | Sâlih were still revered in al-Luhayya in Niebuhr's days. The town had no circular wall then, but on the landward side there were some twelve towers, armed with a few cannon and lying at a distance of 150 double steps from each other. The highly-placed entrances were accessible only by a ladder. The towers, however, were not worth much as defence works: the Hâshid and Balî tribes [see hâshid wa-balî] [see also Niebuhr, Beschreibung, 536-61, and Robin, Les hautes tours] maneuvered across them and burned the town, and, on a carryover of another attack, the inhabitants fled to al-Umarîa. C. Niebuhr was bravish, it had to be fetched at some distance. The people, among whom were some forty Banyans, lived off commerce and fish. Although the coffee was of inferior quality compared with that of Bayt
al-Fayha, it was cheaper, since transport to the more important port of al-Djidda was inexpensive. In al-Lubayya merchants bought it for customers in al-Djidda, Egypt and Turkey, and some Cairenes used to come over in order to acquire it in person. Lime was made by burning coral in the open air, and rock-salt was cut in the neighbourhood. Although Niebuhr describes the town as rather poor, al-Lubayya had to pay monthly 2,000 thalers to the Imam of San'ā', and during the massacre (April-June) when Indian vessels were calling, 3,000 thalers, more than al-Hudayda had to bring in. The arrival of Indian vessels at al-Lubayya around 1770 is confirmed by Bruce (Travelcs, i, 323). Niebuhr also relates that one of the rich merchants of al-Lubayya had obtained several kinds of aphrodisiacs from "engländischen Wundärzten" (Reisebeschreibung, i, 304, note 4 "Wunderärzten" as in Th. Hansen, Reise, 246, or "miracle doctors", idem, Arabia Felix, 221), so English ships must have called at al-Lubayya around 1760, at least occasionally.

In the 12th/13th century, the power of the Imamate of San'ā' declined sharply, and many towns declared themselves independent, while the Shirifs of Abū 'Arish [q.v.] grew more powerful. In 1730 only the coastal land between al-Lubayya and al-Mukhā remained in the Imamate's possession, and by 1790 the coasts between al-Kunāfīya [q.v.] and Bayt al-Ma'sār, including al-Lubayya, was under the authority of the Shirifs of Abū 'Arish (Baldry, Al-Yaman, 158). At that time, the monthly revenue of al-Lubayya was roughly computed at £600 (Bury, Arabia Infelix, 151).

The rise of Wāhidh power at the beginning of the 12th century forced Sharif Hamūd Abū Mīnār of Abū 'Arish to give allegiance to Abū al-Wahhāb Abū Nuṣūr, whom Sa'id II had appointed governor of the Tīhāma (Philby, Sa'tūr, Arabia, 85). In 1808 he revoked his allegiance and restored the revenues of the coastal towns to Ahmad b. Mansūr "Alī, the Imam of San'ā' (Salt, A voyage, 285; Playfair, A history, 129), the Wahhabīs despatched an army by sea to Djayzān [q.v.], from where it advanced southwards, looting and burning al-Lubayya and al-Hudayā. Under Wāhidh rule, an attempt was made to develop the port of al-Lubayya, and negotiations were opened with the English East India Company to start a factory (Lord Valentia, Travels, i, 385, quoted by Ritter, Erdkunde, 884). When Ehrenberg visited the port in 1825 (Ritter, Erdkunde, 192 n. 485) a Persian ship was blockading the harbour in order to force the disa Farh Ḩālīth to pay a debt. By then the walled town had been deserted. Abū Mīnār was forced to give allegiance again to the Wahhabīs, but shortly afterwards he associated himself with Muhammad "Alī, the viceroy of Egypt, and in an agreement, authority in the Tīhāma was surrendered to Muhammad "Alī, who restored that territory to the Imamate of San'ā'; in return for a payment of 20,000 bohars of coffee (El Batrik, Egyptian-Yemeni relations, 282). When in 1832 the Ottomans rewarded the Albanian Mebren Ali for the governorship of Ḥidajah for having mutinied in al-Djidda against Muhammad "Alī, he occupied several coastal towns, but by 1837 the whole of the eastern shore of the Red Sea was in Ottoman hands (El Batrik, op. cit., 286), although Husayn Efendi from Belgrade was governor of al-Lubayya when the French botanist Botta visited the port in 1836 (Ritter, Erdkunde, 756). When the Egyptian troops moved southwards, Great Britzla, having occupied Aden in 1837, exercised pressure on Muhammad "Alī to evacuate the Arabian peninsula. The Egyptian forces accordingly left the coastal towns in 1840 and the territory was surrendered to Husayn, the Shirif of Abū 'Arish. In 1842 the latter admitted his dependence on the Ottoman Sultan and was created a Pasha and governor of the sea coast (al-Khazrajī, History of the Realidity dynasty of Yemen, ed. Redhouse, i, Introdc., 33). In 1844 the Imamate of Abū 'Arish was forced to surrender that territory and, after his deposition in 1848 his successor occupied several coastal towns and imprisoned Shirif Husayn. But the latter escaped and re-established his authority over the Tīhāma (Redhouse, op. cit., i, 39). In 1849 Ottoman troops under Tewfik Pasha occupied the Yemen, and after the latter's untimely death, Abū 'Alī b. Muhammad ʿAwā of Mecca was appointed governor of the whole of the Tīhāma. Opposition to Turkish rule continued, however, among successive Zaydf Imamāt, Shirifs of Abū 'Arish, tribal shaibah and occasionally the Shirifs of Mecca. After subduing the Shirifs of Abū 'Arish, the Širdī family in ʿAbyā (see ʿAšrī, i, 709b) became fierce opponents to Turkish rule, so that the Ottoman forces were compelled to withdraw to the principal garrison towns. The opening of the Suez Canal in 1869 enabled the Ottomans to despatch troops rapidly to Yemen, and in 1871 they subdued ʿAsrī. In 1872 ʿAmān became the centre of the Ottoman government in Yemen and served as bases for expeditions against the "state of almost chronic rebellion" (Baldry, op. cit., 169) in ʿAsrī and Ḥidajah, and served as bases for expeditions against the rebellious inland tribes. In 1890 even the garrison of al-Lubayya came under attack. When a telegraph line was constructed between al-Lubayya and the capital at Ta'izz, the English East India Company wished to underwrite the telegraph, but before the workmen were attacked. Al-Maydī, north of al-Lubayya, was captured by tribesmen loyal to the Imamate and became a centre for the illegal import of arms. In 1906 the Turkish troops were withdrawn from al-Lubayya and al-Maydī, but not for long, because in the same year they marched from al-Lubayya to Ḥidajah, accompanied by Boon Pagha, a shaibah of the pro-Turkish Banū Ṣayd who inhabited the region east of al-Lubayya. Shortly afterwards, Turkish soldiers in the al-Lubayya garrison joined others from Diyarzān, Zubīd and al-Mukhā in their march on al-Hudayda in order to demand their discharge papers; many had served seven years in Yemen but had received less than one year's pay (Baldry, op. cit., 178-9). In 1899 Sayyid Muhammad b. ʿAlī al-Idrīsī of Sābīyā came to the assistance of tribes living to the east of al-Lubayya who had been forced to pay illegal taxes levied by Boon Pagha. He occupied the post, but it was soon recaptured by the Turks, for in the same year two gunboats, two transports and nine battle-ships were sent from Istanbul to al-Hudayda and al-Lubayya. The latter post became Rifāṭ Pagha's base for launching attacks against the ʿIdrīsī tribesmen. In 1911 the Rāʾīm-makām of al-Lubayya set out with 200 troops against the inhabitants of al-
Zubra who had captured a caravan of eighty camels. He was, however, defeated and besieged in al-Zubra. Later that year, the Banū 'Abs seized the wells outside al-Lubayya, but due to dissension among the Arabs, Hamdil Bey, arriving from Kamarān, was able to regain them. Shortly afterwards, however, Hamdil Bey suffered a severe reverse in al-Lubayya itself. At the time, Sayyid Muhammad, Hamdil Bey having 2,500 troops ready in the port. But the advance was postponed because of the outbreak of the Turkish-Italian war in 1911 (see Green, Italian relations). In 1912 the Italian navy bombarded al-Lubayya and extended the blockade of the coast to a point 15 km. north of the port, while 6,000 followers of Sayyid Muhammad moved against al-Lubayya. The whole coast between al-Sanūfah and al-Lubayya was now under the effective control of Sayyid Muhammad.

On the eve of the First World War, the Ottoman government desired to settle the difficulties in Yemen. Imām Yahyā of Ṣan'ā and Sayyid Muhammad (see al-Khāṣṣī, Imām Yahyā) agreed to observe a truce. Most of the Turkish troops were withdrawn from Yemen, only small garrisons remained in the main towns of the Tihama. During the War, Sayyid Muhammad signed a treaty with the British Resident at Aden (May 1915) and overran much of the northern Tihama. He did not, however, succeed in taking al-Lubayya because of the Turkish artillery. In 1339/1920 Sayyid Muhammad concluded a treaty with Ibn Sa'qād (sic), Berlin 1894; C. Niebuhr, Reise nach dem Inland von Arabien, 2 vols., Copenhagen 1774, repr. Graz 1969, 210, 228; idem, Schreibung von Arabien; Copenhagen 1772, repr. Graz 1969; A. Sprenger, Die arabische Geographie, Berlin 1896, 88z-6; A. H. Phylly, Arabia, New York 1930; A. Hanfí, Around the coasts of Arabia, London 1930. An extensive bibliography of official publications, books and articles in Arabic and European languages is found in M. W. Wengen, Modern Yemen, 1978-1996, Baltimore 1967, 234-8. For more recent publications, see R. P. Kyropoulos, Area handbooks for the Middle East, The American University, Washington 1977, Foreign Area Studies, pp. 242-9. LUKATA (a.), an article found (more precisely: "picked up"). The leading principle in the Muslim law regarding articles lost and found may be said to be the protection of the owner from the finder, sometimes mingled with social considerations. The picking up of articles found is generally permitted, although it is sometimes also said to be more meritorious to leave them. The finder is bound to advertise the article which he has found (or taken) for a whole year unless it is of quite insignificant value or perishable. The particulars of this advertising are minutely regulated by special rules. After the termination of the period, the finder, according to Mālik and al-Shāfi‘i, has the right to take possession of the article and do with it what he pleases with it, but according to Abū Ḥanīfa, only if he is "poor"; but the use of the articles as religious alms (zadaka) even before the expiry of a year is permitted in a preferential clause by Abū Ḥanīfa and Mālik. If the owner appears before the expiry of the period, he receives the object back, as he does after the expiry of the period if it is still with the finder; but if the finder has disposed of it in keeping with the law, he is liable to the owner for its value; Dāwūd al-Zahhrī alone recognised no further claim by the owner. The establishment of ownership is facilitated, compared with the ordinary process in Millī and Ahmad b. Wanbal, by the law of sadaka, the use of the articles as religious alms (zadaka). See also the bibliographies of the articles "Asīr and Djawzā'. (E. Van Donzel)
jered animals and more numerous when they are not included. Aillik and Abshir Dagh and Jabal have been specially mentioned for articles found in the Haran, the sacred territory in Meccah, which at bottom go back to the old idea of a special right of ownership by Allah in the Haran and articles found in it.

These prescriptions of the fiqh are based on certain hadiths which have been handed down with several variants (cf. Al-Bukhāri, Lukaša;Muslim, Ḥadīth al-ṣanānī, 576 B., v. 143) which need not be quoted in detail here as they agree with the principles in all essentials. But it may be mentioned that in a very old stratum, later worked over, there is mention of a two- or three-year period. In the conception of the primitive jurists, the article found is sometimes described as deposited (waḍīḍh); further, out of special religious scruples, one is careful not to pick up found dates and eat them, as they might belong to the tāḥār; finally, there is a hadith which forbids the Meccah pilgrim (ḥajjī) to pick up found articles at all. From the superscription by Bukhārī to Lukaša, bīh 11, it is evident that found articles might be handed over, or used to be handed over, to a government office; but their retention in the finder’s care is justiﬁed by quoting a special tradition.

None of these traditions can be considered historical; at most, the prohibition by the Prophet in his oration after the occupation of Meccah from keeping the freight of goods from the people of Meccah and the articles found in it. Without advertising them (cf. above) may be genuine on account of its antiquated terminology. Lukaša is not mentioned in the Kur’ān.

Bibliography: In addition to the pertinent sections in the §§8 and hadith collections, cf. Th. W. Juyonbil, Handwörterb. de kennis van de moslimmedefluiwe, p. 369; E. Sachau, Muhammedanisches Recht, ii, 517 ff.; D. Santillana, Istituzioni di diritto musulmano maschile, i, 528-9.

(J. Schacht)

AL-LUKKĀM, Djabal, the name which the medieval Arabic geographers give to the mountain chain which is situated in the northern part of Syria and for long formed the frontier between the Islamic and the Byzantine lands. In classical times it was known as the Amanus/Amanus (Khainat), Djabal Almān (Khamāna in its more modern sense, but by the Turks as Alma Dagh) (Elma Dagh in modern Turkish), since it has not been treated under Lukaša, it has seemed useful to consider it here, even though the Djabal al-Lukkām does not correspond exactly to these ramifications of the Taurus Mountains, which detach itself from the dolomite massif of the Karadāch Dagh in the region of Marāfij, to the south of the Pyramus (Baybān), running parallel to the chains of the Taurus Mountains (Ahmek) north of it and in the western ridge of the Gulf of Alexandretta, and falling steeply into the sea to the south of Ra’s al-Khānāzir (5,100 ft.), together with the Djabal Mūsā or Djabal Almuār (5,750 ft.).

The deep transverse valley of the Orontes and the branches of the ʿArik (z. A.) separate the Alma Dagh from the Lebanon chains, which differ also in their geological formation (mostly limestone) from that of the Taurus system. With its off shoots, the Alma Dagh cuts off Cilicia entirely from Syria and the Mesopotamian hinterland; apart from a few passes that are mere mule-tracks, the pass of Baybān (921) is the only connection between Asia Minor and Syria and has always been much frequented. The heights of the several mountains are not yet accurately known; the average height is said to be 3,650 ft., and some peaks reach 7,400 ft. or more; as the highest point, Djabal Barakat, given by M. V. Balak at 7,450 ft.

In the northern part, jagged and steep peaks prevail; in the southern, more rounded outlines. The Alma Dagh with its fresh verdure is an attractive sight, for its sides are thickly overgrown with trees, out of which the bare dolomite peaks project. The ridge of the Alma Dagh north of Iskandarum formed in Ottoman times, together with the sides sloping to east and west, an administrative unit, the Sandjak Djabal Barakat (cf. Sachau in SBPr. Ak. W. 1852, 31–2).

Locally, no common name is used for the whole of the Amanus; in the reports of European travellers and in the maps based on these, this fact has caused considerable confusion as to the nomenclature, because the same name is sometimes used for a part, sometimes for the whole. For the northern part of the Amanus we find the name Gwawr Dagh or Gwawr Dagh, i.e. the mountains of the infidels; H. Kiepert in his Carte générale de l’empire Ottoman (Berlin 1892) makes the Alma Dagh reach about as far as Işlîhiyye (Nicopolis, lat. 37° N.); the continuation of this mountain-chain as far as the neighbourhood of Mar’ash he takes as Gwawr Dagh; cf. also H. Kiepert’s map for Sachau’s Reise in Syrien und Mesopotamien (Leipzig 1883). In K. Riepert’s map for von Oppenheim’s Von Mittelmeer zum persischen Golf (Berlin 1900), Alma Dagh only appears as the name of one single mountain massif to the north of Baybān, the name Gwawr Dagh does not appear at all on it, in its stead we find Sur Dagh, Adj Dagh and Goydje Dagh as names of single peaks between Mar’ash and Işlîhiyye. The northern Gwawr Dagh is connected, according to E. Reclus, with the southern mountains by a mountain plateau in the depth of which is situated the Gwawr Göi (i.e. lake of the infidels). The name of Gwawr Dagh is occasionally extended to the whole of the Amanus (e.g. on the map of Favre and Mandrot). Reclus does not call the southern Amanus Alma Dagh, but, in accordance with a number of travellers, Alma Dagh. Benzinger is evidently mistaken in calling the southern part of the Amanus Gwawr Dagh and the northern part Alma Dagh. Czernecki seems to stand quite alone in calling the Amanus Gura Dagh; this name is evidently the Turkish translation of Djabal al-Ulkm and Ulkm (‘black’), from the Ulkmama, a single peak on the mountain range, and Ulkm (‘black’), from the Ulkmama, a single peak on the mountain range. Işlîhiyye of the Arabian geographers of the Middle Ages, the ‘aqqāf of the Byzantines; for the name al-Lukkām designating nearly the same as Amanus, cf. Sachau, op. cit., 325. By a misnomer, the Alma or Alma Dagh in its more limited sense (north of Baybān) is also often called Nawm Dagh by travellers, which name according to Kotsch (cf. also the map by R. Kiepert, mentioned above) belongs only to the northeastern part of the Djabal Areqa (south of Baybān).

The birds turn out to be twelve vultures, signifying parallel in the interpretation given by Sidomus (s.v.). He finally dies, however, and with him Lukmin. pp. li-lii; cf. Ps. ciii, 5, where the Heb. cognate choices offered him, he chooses the duration of the life. (According to later Muslim tradition, this was 1 hurād (e.g. al-Mas'udi, iii, 366).)

In Islamic times, he is considered second in longevity among the Arabs (most) of voices is that of the ass", and Abikar's maxim: "Incline thy head downward, soften thy voice, and be courteous. For if a house could be built by a loud voice, the ass would build many houses each day" (Harris et alii, The story of Abikar, p. lxvi; cf. Ar. text in id., 4, 41). Even though vv. 20-34 no longer cite Lukman, they partially reflect the same genre. Thus v. 27: "If all the trees on the earth were pens and the sea were replenished after it with seven seas [of ink], the words of God would not be exhausted" can be traced back to Jewish wisdom literature, where it is found in numerous variations (R. Kohler, "Und wenn der Himmel nach Tagen", in Oriental, v. Occident, i, 1964, p. 22; Immanuel Boni, La Syria Topographique, pp. 22, 441; idem, in Ethnologie, Mitteil. aus Ungarn, i, 231-23, 441-53; H. I. Strack and P. Billeter, Kommentar zum Neuen Testament aus Talmud und Midrash, Munich 1956, ii, 557). However, this verse is later than the rest of the sura and was revealed in Medina during a dispute with the Jews. Its inclusion indicates that it was considered appropriate to the general tone of the sura.

Once the Qur'an had consecrated Lukman as the wise utterer of proverbs, everything that was thought pious or sensible could be attributed to him. Wahb b. Munabbih is credited with saying that he had read 10,000 chapters (hab) of Lukman's wisdom (Ibn Khatayba, K. al-Maṣārid, ed. Wüstenfeld, Göttingen 1850, 37). The Arabic collections of proverbs (notably that of al-Maydānī) attribute much to Lukman (see Basset, e.g., pp. 334-34). Al-Tha'lībī devotes a chapter of his Kifās al-adābih (Berlin 1864, 37-37) to the wisdom of Lukman. Many sayings seem to link up with the Sūra of Lukman. v. 14 advises reverence for parents, but warns against being led astray by them to worship false gods. Al-Tha'alībī's authority makes Lukman say: "Be amenable to your friends, but never so far as to act against God's laws". There is much that is reminiscent of Abikar. For example, Lukman teaches: "A father's beating his son is like water for a crop." The parallel maxim in Abikar states: "Spare not thy son, for beating his son is like water for a crop." The parallel of Abikar. (Lukman's) wisdom literature; and the word "fear" used in the verse is a hendiadys meaning "enduring" or "remaining" (Horovitz, Korānische Interpretationen, 133-5).

To be "as wise as" or even "wiser than Lukman" are standard compliments in paeans. Because of his proverbial wisdom, Lukman was credited with being the architect, or one of the architects, of the famous Mecca (al-Tabari, i, ii, a). In ancient Arabian legend, Lukman was al-Maṣār ("the long-lived"). He is granted a long life. (According to later Muslim tradition, this was a reward for his piety, in contradistinction to the wickedness of his people.) From among several choices offered him, he chooses the duration of the lives of seven vultures, the vulture (nasr) being the most popular symbol of longevity among the Arabs (Goldziher, in Abh. zur arabisch. Phil., Leiden 1899, ii, 1 mean by the stamp of ancient Near Eastern wisdom literature. Three times, he begins with the formula "O ray dear son" (yal bannathya) that prefases so many of the aphorisms of Abikar (At. Hayyān). R. Harris has pointed out the parallel between v. 18: "Be modest in thy gait and lower thy voice, for the most hateful of voices is that of the ass", and Abikar's maxim: "Incline thy head downward, soften thy voice, and be courteous. For if a house could be built by a loud voice, the ass would build many houses each day" (Harris et alii, The story of Abikar, p. lxvi; cf. Ar. text in id., 4, 41). Even though vv. 20-34 no longer cite Lukman, they partially reflect the same genre. Thus v. 27: "If all the trees on the earth were pens and the sea were replenished after it with seven seas [of ink], the words of God would not be exhausted" can be traced back to Jewish wisdom literature, where it is found in numerous variations (R. Kohler, "Und wenn der Himmel nach Tagen", in Oriental, v. Occident, i, 1964, p. 22; Immanuel Boni, La Syria Topographique, pp. 22, 441; idem, in Ethnologie, Mitteil. aus Ungarn, i, 231-23, 441-53; H. I. Strack and P. Billeter, Kommentar zum Neuen Testament aus Talmud und Midrash, Munich 1956, ii, 557). Many sayings seem to link up with the Sūra of Lukman. v. 14 advises reverence for parents, but warns against being led astray by them to worship false gods. Al-Tha'alībī's authority makes Lukman say: "Be amenable to your friends, but never so far as to act against God's laws". There is much that is reminiscent of Abikar. For example, Lukman teaches: "A father's beating his son is like water for a crop." The parallel maxim in Abikar states: "Spare not thy son, for strokes of the rod are to a boy like dung to the garden." Lukman says: "When thou seest people who remember God, join them; if thou hast knowledge, it will be useful to you with them, and they will increase it; if thou hast none, they will teach thee; and when thou seest people who do not remember God, do not join them; for if thou hast knowledge, it will not avail thee with them, and if thou art ignorant they will increase your ignorance".
Abú～: "Join the wise man, then thou wilt be come as wise as he, but join not the brawler and babbler, lest thou become associated with him".

Luhmân gives excellent advice for one going on a journey, and also adds that he should be armed. So too does Abú～. Al-Maṣarawi (al-Maṣarawi, i, 97) attributes to Luhmân the dictum: "Consult the physician before thou fallest ill?" This corresponds to the advice of Ben Sfr: "Honour the physician before thou hast need of him" (Ecclesiasticus, xxiii, 1).

It may be that many of these proverbs that belong to the general treasury of Near Eastern wisdom literature had already begun to penetrate into the Arabian Peninsula in the Djahl period. The Christian Arab poet Al-B. Zayd (p, 4) of Al-Hira knew of Abī～, to whom he calls Abī～ (see Nöldeke, Untersuchungen zum Aesop-Rein-Roman, 25; also Götting, The present-day Arabic proverb, in Idem, Studies, 371, 376 ff.). Already at this early time, the dicta of foreign sages may have begun to accrete to the indigenous Luhmân al-Halāmī.

Muslim legend is fond of making the sages and wise men of the past into prophets. But since the Kur'ān merely says that Luhmân received wisdom from God, all of the traditional scholars with the sole exception of Rûmî agree that he was not a prophet (al-Tha'labī, K. 1, p, 199). Nevertheless, he receives mention in most of books of the kasas al-anbiyât genre (q.v.). Most accounts tell that God offered Luhmân the choice between becoming a prophet or a sage, and that he chose the latter. He even becomes vizier to King David, who tells him: "Blessed art thou, O Luhmân. You have been given wisdom and spared tribulation, while David has been given authority and has suffered trials and rebellion" (ibid.). Many of the traditions give him a biblical genealogy connected variously with Abraham, Job and even Balân (see 4, below). He is said to have lived down to the time of the prophet Jonah. He is also called judge of the Jews (ibid., 275, citing al-Wâkidī). Some accounts make Luhmân the author of a book. Supposedly, Muhammad was shown the scroll (manṭilla) of Luhmân and asked if the books in his possession was comparable to it, to which the Prophet replies: "These are indeed fine words, but what I have heard better is the Kur'ān revealed by God" (Ibn Hishām, Sfr, Cairo 1275/1555, i, 477; also al-Ṭabarī, i, 1260).

3. Luhmân the writer of fables. At some time during the Middle Ages, Luhmân came to be regarded as the author of fables as well. This is perhaps due in part to the fact that amāliḥ means both proverbs and fables in Arabic. Luhmân thus became the Aesop of the Arabs. Much was transferred to Luhmân that was told in Europe of Aesop. The tendencies to this can be traced quite early. The Kur'ān commentators already relate traditions that he was a "thick-lipped, flat-footed black slave" of Ethiopian or Nubian origin (al-Tha'labī, K. 1, p, 199). He is also said to have been an Egyptian, a carpenter, a shepherd, and to have had deformed legs. These features are obviously modelled on the story of Aesop. So too are several of the anecdotes about Luhmân. For example, Luhmân's master orders him to butcher a sheep and then, when the latter has been butchered, gives him the tongue and the heart. His master then orders him to slaughter another sheep and bring him the worst parts. Once again Luhmân sets a heart and a tongue before him, for there is nothing better than a good tongue and a good heart and nothing worse than evil ones (in Maximus Plancudes, Vita Aesopi, only the tongue is mentioned and not the heart; see Eberhard, Fabulae Romanenses Graece concipit, Leipzig 1872, 259). On another occasion, Luhmân's fellow-slaves eat his master's figs and accuse Luhmân. At Luhmân's suggestion the master makes them all drink warm water. Luhmân vomits only water, the other slaves figs and water. Once, Luhmân's master in his cups had wagered he would drink up the sea. Sobered, he asks Luhmân about it. The latter demands of those who had taken up the wager that they should first dam up all the rivers flowing into the sea, as his master had promised to drink up the sea only but not its tributaries. This last motif is widely disseminated in folk tales of the type of the Emperor and the Aibott (Aeme-Thomson, Type no. 922; the follicles and its parallels are discussed at length in W. Anderson, Kaiser and Aib, ECC no. 42, Helsini 1975, especially p, 159, where reference is made to Luhmân; also Chauvin, Bibliographie, viii, 60-2). These anecdotes are also found in the biography of Aesop by the 14th century monk Plancudes, who drew upon earlier material. The story of the wager to drink the sea is known as early as Plutarch's Dinner of the seven wise men (Plutarch, Moralia, 1518-E) and the Midrash (Levítim Rabbi, 313). The older Arabic literature does not know fables of Luhmân. They first appear in the later Middle Ages. The Paris manuscript published by J. Dembern is dated 1299 and is from Christian circles. It contains 41 fables. These fables have been published frequently and discussed in detail, especially by Dembern, Basset and Chauvin. Out of the 41 fables, only no. 22 has no clear parallels: the thorn bush begs the gardener to tend it so that kings may delight in its flowers and fruits; the gardener waters it twice a day, and the thorn bush overruns the whole garden. Basset (Legendes Biblique, 98, n. 2) posits a possible connection with Jotham's parable in Judges, 12, 8-15, while H. Schwartzbaum has suggested a link with the tales of Proverb-fable about the thorn and the cabbagge (The Middle Shulamim of Rabbi Berekiah ha-Nadlan, Klon 1979, p, xvii, n, 80, citing Er Babu Qumān, 92a-b). All the other Luhmân fables with the exception of the thirteenth (the goats and the bull) are found in the Syriac fables of Sophos (= Aesopus) published by J. Landesberger (Die Fabellumen des Sophos, Posen 1859). The only fables of Luhmân not found in the Greek Aesop are no. 9 (the gazelle in the well), no. 29 (the thornbush), no. 91 (the wasp and the bee) and no. 40 (the man and the snakes). It has further been observed that in these fables, a number of important animals that were indigenous among the Arabs, such as the ostrich, the ibex, the jackal and the camel, play no part. As these fables first appear in the later Middle Ages, and on the basis of other evidence, there can be no doubt that we have here a translation and adaptation of the Syriac version of Aesop originating in Christian circles in Mamlûk Syria.

4. Luhmân and related legendary figures. Luhmân is a composite, and hence a many-sided figure: he is a mušamm, hero, sage, master of proverbs and author of fables. It is no wonder then that he has often been compared and identified with legendary heroes, such as Prometheus, Lehman, Lucian and Solomons. Muhammad b. 'Abī al-Zawsaiil makes Luhmân the teacher of Empodocles (Tafshîh al-Hukmân, in M. Amari, Bibliothek Arabo-Sicula, Leipzig 1857, 614). Three of these equations deserve closer examination: (1) with Baham, (2) with Abi～
and (2) with Aesop. The identification with Balaam is old. Al-Tha'labi and al-Baydawi (although not al-Tabari apparently) give the following genealogy: Lukman b. Bâydr b. Nāṭhir b. Tāriqī. It would seem that he is the same warm weather Japhetic ascetic who, according to his name, was sometimes also called the "wise man" corresponding to Lukman in the Bible. They found this in Balaam, as the roots b-l-ā and l-b-ār both mean "to swallow". This identification may have been reinforced by the talmudic tradition that Balaam (and also Job) was one of the seven gentle prophets who preached to the nations of the world (PT Baba Erus, 15b). This became a Muslim tradition which entered the Hebrew Mish'ēh Sannah, where Lukman is one of the seven wise teachers of the king's son (ed. and tr. M. Epstein, Philadelphia 1967, 34-9), and also the Disciplina clericalis of the Spanish Jewish apostate Petrus Alfonsi (ed. A. Hilka and W. Söderhein, Heidelberg 1911, 3), where it specifically states: "Balaam qui lingua arabica vocatur Lucaman". It is clear that for Muhammad and his contemporaries, there was no confusion between Lukman and Balaam. Neither is there any confusion in al-Tabari, who does not make Lukman the son of Bâr and who relates the story of Bâlām b. Bâydr in its proper place and with the correct details (al-Tabari, i, 508-10). On the other hand, al-Tha'labi makes Lukman Bâr's son, while at the same time devoting a full narrative to Bâydr b. Bâydr (Kisās al-anbiya', 186-9). Al-Tha'labi and others like him were probably aware of the inconsistency, but wished to connect Lukman with the Bible at any cost. Horovitz has suggested that perhaps early Muslim traditionalists' Jewish informants connected Lukman with the Edomite king Bela son of Bâr in Gen. xxxvi, 32 (Jewish proper names and derivatives in the Torah, in HUCA, ii [1925], 173 f.), and that this was the source of the confusion.

Lukman's similarity to Ahikar was also noticed long ago, but it was only in the early 20th century that the identification found a vigorous champion in Rendel Harris, who devotes ch. vii of his Story of Ahikar to it. He bases his identification on the agreement of Sūra XXXI, 28, with Ahikar's warning about the voice of the ass, the formulation "O my son" in both, and the Arab hypotheses which compare Lukman with other figures in legend and history, notably to the relationship of Lukman, Ahikar and Aesop. The arguments, however, are not convincing. The Ahikar legend was known in the Arab world, and a considerable number of Arabic and Karshân manuscripts have survived. Many of the apohorisms attributed to Ahikar, like those attributed to Lukman, were part of the common stock of Near Eastern lore and may be found in the Bible, the Apocrypha and elsewhere. The use of the introductory formula "O my son" was standard in admonitory literature of this sort, and is found in Proverbs and Ben Sira, to mention only the most outstanding examples. Any real relation between the personalities of Lukman and Ahikar comes through Aesop. The story of Aesop shows originally a close relationship to that of Ahikar. The later legend of Lukman has borrowed much of the story of Aesop and thus become obliquely like the Ahikar story, but in reality Lukman is not directly connected with Ahikar but with Aesop.

5. Lukman in Persian and Turkish literature and lore. Lukman was a fairly popular figure in Persian literature. A lengthy chapter is devoted to him in the 5th/6th-century Persian Kisās al-anbiya' of al-Nisibîn (ed. H. Yaghma'i, Tehran 1340/1962, 333-8), which contains anecdotes found in the Arabic Kisās as well as some new material. Rûmi devotes several stories to Lukman in the Mathnâwī. In addition to the well-known anecdote of Lukman's innocence proven by drinking wine, we owe to him the tradition of the Japhetic ascetic who is a pure slave (handa-yi pahâ) to his earthly and heavenly masters and thus is master of himself and free from sensual passion (khabādīya bâd sa az hawâ' asad bâd). In this story, Lukman is the true master and his master the slave. He exchanges clothes and roles with Lukman when they travel. He would gladly set him free, but knows that Lukman has found true freedom in servitude (ibid., 336-9). In another anecdote, Lukman's master will only eat food from which Lukman has partaken and is enraptured even with the scraps. One day upon receiving a gift of a melon, he gives Lukman slice after slice. The latter eats it as if it were honey. When the master himself tastes the final slice his mouth is blistereed by the sourness. He asks Lukman how he could eat such poison. Lukman replies that he had received such bounty from him that he could not do otherwise. The love of the giver makes the bitter sweet (ibid., 320-3). Sa'dî relates a story in which Lukman is once again an idealised ascetic in the Persian mould. By mistake, he is placed into cruel slavery for a year, bearing all in silence. When the mistake is realised, he harbours no grudge and says that he has learned compassion from the experience (buat, in Kolhiyyâl-i Sa'dî, ed. M. A. Farûqû, Teheran 1914, 349).

Lukman is known to the Turks from both Arabic and Persian literature. In addition to his standard roles, he also appears in Turkish folklore as an Arab physician by extension of his title hakim (see W. Eberhard and P. N. Boratav, Typen türkischer Volksmärchen, Wiesbaden 1953, 349). In one tale, Lukman teaches the adventurer Mehmèd the Mad how to cure the wife and daughter of the king and the wife of the grand vizier, all three of whom had grown horns (W. S. Walker and A. E. Ursal, Tales alive in Turkey, Cambridge, Mass. 1966, 33).

praised as his benefactor in one of his works (Rieu, Catalogue of the Turkish manuscripts in the British Museum, 53b, and H. Schrader in Der Islam, xvi [1970], 292). In 1369 Selim II appointed him as Şahbədxmədəfi (official historian-panegyrist; for this were partly treated in the various works almost at office as court poet, whose task was to extol the

Bibliographie: given in the text. (H. SCHRWEIDE)
Dünne 11 1727/2 January 1760. His works, very few of which seem to have been preserved, deal with the history of the dun'na in India, biographies of dun'na dignitaries, Isma'ili doctrine, and the refutation of dissonant groups. In his youth (c. 863/1457-8, Wall Muḥammad) was also a distinguished scholar, while his grandson ʿAlī ʿAlāʾ al-Dīn, the mentor of the forty-third dāʿī, ʿAlī ʿAlāʾ al-Sayf al-Dīn, was considered one of two learned men of his time, the other being ʿAlī b. Saʿd al-Hamādānī. For a while, ʿAlī ʿAlāʾ al-Hamādānī supported the son of al-Maḥmūd ʿAlī, who had claimed to be al-ḥudūdī al-ḥālī of the hidden imām with whom he was in contact. In 1350/1351-2 he was honoured in the dun'na by the forty-second dāʿī, ʿAbd al-Muʿīmin al-Dīn. He died probably 1351/1799-1800.

**LUKBURGAZ** (in old texts variously written as Birgchos, Bürghos, Bürghis, Catal Burghaz, etc.; the form "Lulebürgaz" is of recent date and related to the industry of pipe-making), a town of more than 25,000 inhabitants in Turkish Thrace and a minor administrative and agricultural centre on the highway from Edirne to Istanbul, 75 km. south-east of Edirne. It is situated on level ground in a wide valley on the southern bank of a tributary of the Ergene River. In the past it was one of the largest caravan halting-places on the Belgrade-Edirne-Istanbul highway, the chief artery of Ottoman Europe. In addition, it was an administrative centre; in the 15th century, a katmandn, and from the 16th century, the seat of a bālā in the livā of the Paša. Háḍī al-Dīn al-Khaṭṭārī (Rumeli und Bosnien, Vienna 1812, 20) mentions it as a bālā of the sandhāj of Vizye, Ewliya Celebī as belonging to Kirklı, the 16th century, it belonged (once again?) to Vizye. In the second half of the last century, it belonged still active, the sandhāj to the sandhāj of Tekfurdagli (Tekfurdag), in which Vizye was incorporated (Sād-nāmes of the Edirne vilâyet of 1283/1864-6), later, it was incorporated in the sandhāj of Kirklı (cf. Sād-nāme for Edirne 1330/1849-50).

Today it is a part of the il (ilıdes) of Kirkkalei. Lulebürgaz goes back to a Byzantine stronghold, Archaeopolis (Tomaschek, Histom-Halbinsi, 224; Jireček, Heersurasse, 133). The name Burgaz is a corruption of the Greek Pyrgos "tower", thus giving a hint of the size of this castle. The Ottoman chroniclers (Crūrū, ʿAshīlī-paşa-zade, Anonymus-Giese, Neshri, Saʿd al-Dīn) unanimously place its conquest between 759/1358 and 761/1360, and all of them noted that the castle was deserted when the Ottoman gāzīs took it. They burnt it down, according to the first three sources, demolished it from one side to the other according to Saʿd al-Dīn, and levelled it according to Neshri. When Bertrand de la Broquière passed through it in 1433, he noted "a town which they call Burgazi who has also torn-down walls and where no others reside but Turks". The accounts of 15th century Western and Ottoman travellers, as well as the extant monuments, allow us to reconstruct the resurrection of Lulebürgaz. Arnold van Harff, passing through it in 1499, is still silent about it. De Schepper called it in 1533 already "la ville de Bosgais", but had to pass the night in a local school. By then it must have been a small borough with a Friday mosque and a hanānī. The latter is mentioned by Meḥmet-i ʿAshīlī. The mosque, the Eski Dīnak, or Kāf Dīnak, is still extant and situated near the bridge. It is a work of the early classical phase of Ottoman architecture, from the time of Bīyazīd II or from a few years later. When Hans Demschwam (ed. Babinger, 247) passed through "Burgaz" in 1555, he still saw the gate and walls of the old castle and noted a stone bridge over the river; but he still had to spend the night in Kirkkalei, a settlement 10 km. to the south-east of Lulebürgaz, which possessed three caravanserais. A few years after Demschwam's visit, the Beglerbeği of Rumeli and later Grand Vizier Şekülle Meḥmet Paša laid the foundations for the total reconstruction of the town and its transformation into a caravan halting-place of the first order. A new step between Kirkkalei and Baha ʿeski was a necessity because the distance between the two was far too great (43 km.) to cover in one day. In 967/1559-60 he completed his exquisite domed mosque and vast madrese with 34 student cells. A long inscription, still preserved, gives the date in the form of a chronogram. Seven years later he completed the erection of two spacious caravanserais, with separate stables for camels and horses, separate rooms for female travellers and state officials, an imaret, a double hamam, a school and street lined with 65 stone-vaulted shops between the madrese and the caravanserais. The whole complex covers an area of 170 x 150 metres and is one of the most harmonious civic centres ever erected by the Ottomans. The works were designed by the famous architect Sinān and appear in various places on the lists of his works drawn up by his friends and contemporaries. The date of completion of the two caravanserais is given in the extant inscription in the form of a chronogram, whose numerical value gives 973/1565-6, the first year of Şekülle's Grand Vizierate. The chronogram also found its way to the work of Ewliya Celebī (iii, 301, of the printed edition). This date is further corroborated by the notes of the Italian traveller Marc Antonio Pigafetta, who saw the worksmen at work.Ģ."
and adds that all travellers, Turk, Jew or Christian, received three times a day a dish of rice and meaton, this for three days in succession. The most detailed description of this Turkish "Grand Hotel" is from Ewiljy Celebi, who visited the town in 1067/1657. It was then a bagdah in the sandjak of Kirk killese; a township of 700 houses, divided into six mahalles. It had five places of prayer, of which three were Friday mosques, 500 shops and seven medreses. All travellers, regardless of their religion, received twice daily a dish of soup, a loaf of bread, a candle and fodder for their horses. On Fridays they got stewed rice with meat and onions and sweetened saffron rice (kesir). A number of other travellers mention the buildings and the free distribution of food, but add hardly any new details.

Luleburgaz continued to function as a caravan halt throughout the 17th and 18th centuries, but it seems to have remained a relatively small place. This period of prosperity ended abruptly in 1225/1799-1800 when a gang of Krellahi under the robber baron Kara Feyd captured it and burnt it down, together with the two caravanserais. When, under Mahmud II, order was restored, the caravanserais had to be rebuilt on from their foundations. An inscription with a long eulogy on the works of Mahmud, placed above the old inscription of 559/1559-60, still reminds us of this work. The vaulted shopping street and the two caravanserais, as they appeared just before the fire, are depicted in two very accurate drawings by Luigi Mayer. Luleburgaz remained a small place throughout the 19th century. The Sub-dar of the Edirne vilayet of 1282/1865-6 gives it the centre of a bahs with 32 villages, and 2,956 male Muslim inhabitants and 3,489 male non-Muslim inhabitants. The town itself numbered according to the Sub-dar of 1285/1867-9, 984 houses with 834 male Muslim inhabitants and 7,528 male non-Muslim inhabitants. There were three Friday mosques, two mezquitas, one church, one synagogue, 282 shops and one hamam. The size and shape of the town had thus remained basically the same as in the time of Ewiljy Celebi.

With the Russo-Turkish war of 1877-8, all territory beyond the Danubian border suffered an eclipse. The two caravanserais of Luleburgaz and the Sub-dar were taken by the army and transformed into a barracks for the cavalry and the fourth battery of gunners. The old Krellahi Dzabam was turned into an ammunition store. The Sub-dar of 1301/1883-4 gives the same number of buildings in the town, but adds the name of a two tableks, one of the Gullhaneiyah [see Gulagali, Ibrahim] and one of the Nalghbandiyyah [g. p]. Order. This source also gives detailed information about the composition of the population of the district of Luleburgaz. The total number of inhabitants had augmented considerably, from about 10,000 in 1270 to 25,013 in 1835. The Muslim population had grown faster than the non-Muslim element. The Muslims now numbered 7,079 males and females altogether, and there were 6,450 Greeks (Rom), 720 Bulgars, 220 Jews, 662 Gypsies (largely Muslim), and 38 Armenians, besides some non-permanent residents, also largely Muslim.

During the First Balkan War, Luleburgaz was occupied by the Bulgarian army, but the Turks took it back in 1913. From 1918 till 1923 the town and all of Thrace were occupied by the Greeks. After Thrace had returned to Turkey and the Greek population had been exchanged for Turks from the now Greek Macedonia by the provisions of the Treaty of Lausanne, Luleburgaz recovered slowly from the blow which it had received. The town was to profit greatly from the decay of Edirne in the forties and fifties, and did not cease to develop when Edirne recovered. In 1938 Luleburgaz numbered 13,000 inhabitants; today this number has reached the 25,000 mark. It is still a prosperous and relatively well-built town, almost entirely Muslim Turkish. The two caravanserais and the Sub-dar of Sokollu Mehmed Pasha disappeared in the troubled times around World War I; but the mosque, medresah, hamam, shopping street and medreses are still standing, and rank among the best of all extant monuments of Muslim architecture in European Turkey outside Edirne.
of Kirmān. Edmonds notes the existence of a Luri (?) clan in Kirmān in the Dashtān division of the Bayrūwand group. In Kirmān there is a clan Luri-Kirmānī (see supra).

Still more confusing is the fact that some Lurs follow the profession of acrobats, bear-leaders, ropedancers (cf. Cirikov, 277). As early as the 8th/14th century, Shillāb al-Dīn Ibn Pādī Allah al-Umarī mentions the talent of the Lurs in these directions, and in our own day we find wandering troops of Lurs as far north as Tabrīz, where there is a permanent colony of Kārālī gipsies, professional actors and singers. It is possible that the special qualifications of the gipsy player are reflected somewhat; the Sāmūnī of Kirmān (cf. SARPUI ZOHAR AND SENNA), who excel in singing and dancing, are not acrobats. But we must first of all wait till a special investigation settles to what precise section the wandering Lur artists belong.

There is nothing impossible in a gipsy infiltration into Luristan. Whatever was the ethnic entity covered by the name Zūṭ (on the confusion of the Zūṭ with the Luri, see above: Hannza, Taghībābī) the existence of Zūṭ of Luri origin in Luristan as early as the time of Hājīdādī (q.v.) (cf. Hawmat al-Zūṭ between Arťaūjān and Rām-Hurmūz; the modern town of Hinduān ("the Indians") may have a similar origin. According to al-Balūdhurī, 382, when in the second quarter of the 1st century A.H. the Zūṭ had apostatised from Islam, they were joined by the local Kurds, which provoked the punitive expedition of ʿAbd Allāh b. Amīr b. Kuraṣ (q.v.) to Idhādī (q.v.) (= Mālarū, the future capital of Luri-Buzurg). The alliance of the Zūṭ and Kurds (Lurs-Qūr) at so early a date is curious. Under al-Rūr, Yakkāt, ii, 831, mentions two places in Sind and a small district (nakhīya) under Ahwāz in Kūrāshān. Schwarz, Iran im Mittelalter, v, 665, identifies this Rūr with the district of al-Lūr (cf. LURISTAN). In the light of what has been said above one might suppose the existence in al-Lūr of a very ancient Indian colony. But as our sources contain no positive confirmation of this hypothesis (cf. Ibn Ḥawāṣil, 176, the "Kurds" were predominant in al-Lūr), the question of the origin of the name al-Lūr in Kirmān, of the identity of this al-Lūr with al-Lūr and of the remoter origin of the name Luri must for the present be left open. In any case, even if the name Luri came from the town of al-Lūr, the origin of the name would not necessarily settle the question of the ethnic origin of this people.

As to the general question of the gipsies in Persia, their names in the provinces other than Kirmān and Balūdān were in the early years of this century: in Astarābād: Kirmānī (in which a fantastic popular etymology sees gāyē-gānūr, interpreted as "innumerable"; in Transcaucasian Turkish dialects birkhūmā means "rascal"; cf. the comedies of Fath ʿAlī Akhūndov [see AGQORDZADA]; at Kord-e Badgird, in the south-west of Multān in the Dashdān division of the Kirmān, Edmonds notes the existence of a Luri (?) clan in Kirmān, in the Dashtān division of the Bayrūwand group. In Kirmān there is a clan Luri-Kirmānī (see supra).
The gipsies of Persia (Sykes, de Morgan) has taken its morphology from Cirikov, they were called Dumnil, which must correspond the fact that the Lori of Bakristan jargon. Denys Bray (quoted by Ivanow) in any elements. Longworth Dames out of 96 words in modern Persian; its vocabulary also is full of Persian words: "stone", "boy". A Kurd tribe in the east of Bokār bears the suggestive name of Sind/Sindilyan (the "Sindle"). According to the Sharaf-nama, the chief of the Kurdīkhan clan (of the Zokh) had married a gipsy woman. In discussing the relationship of gipsies and Kurds, it should be remembered that in 220/835 a section of the Zūţ settled in Kūshān, i.e. at the gates of Kurdish territory; cf. de Goeje, Mémoires, 30, Tabriz, in 1856, 309.

According to Sampson, two categories of gipsy speech may be distinguished, according to the laws of the primitive Indian aspirated mediae: one changes them into aspirated tenues, i.e. Prakrit, bhīnī > phen (Armenia, Europe), the other deprives them of aspiration, bhīnī < ben (Persia, Syria, Egypt). The interest of the Persian dialecors lies in the fact that Persia was the first country in which the gipsies sojourned after leaving India (probably in the Sāsānī period). In the gipsy dialects of Persia, as yet not adequately studied, we may expect to find traces of a rather archaic phonetic system. Ouseley, for example, found among the Karāči of Tabriz the word behn "sister" which must be older than phen or ben (cf. also gābir in Gobineau).

Literary references to the Lûfûdya or Lûriya are to be found in many classical Persian authors, including Badãj, Mûsã, Firdawš, Mânûššã, Hâfiz and Ubayd Zâhâd, who variously describe them as musicians and dancers, vagabonds, thieves and prostitutes.

In modern times, the general term for the gipsies in Iran is hašči, but a wide variety of names are used locally. Apart from those listed earlier, the following may be mentioned: abūgã, gurîzadat, gurîzâ, hârci, kullûndi (Zanjan), kownd, gâbûnd, yûd and zanâng. No up-to-date population statistics are available, but such information as there is suggests that the figures quoted by Sykes must by now be considerably reduced. The main centres are still Fars, Arak and Adharbâygân. Dûčû speaks some notes by Sir Robert Draper who zâda on a group of kowld settled in Kût 'Abd Allah (20 km. south of Awâz) since the turn of the century. According to Mughdâm, the gurîzûts of the Wa's area (between Hamâdân and Arâk) spend five months on the land and seven travelling (dawra-garî). They do not give their daughters in marriage outside the tribe, but apparently may take non-hašči wives.

The main present-day occupations of the gipsies of Iran, as elsewhere, include basket-making, tinkering, singing and dancing, magic, fortune-telling and making of spells and charms.

In the Akfanl, in Wiedemann, it changes quickly because it is of animal origin (al-durr, however—as is still the case in our days—with the pearls). The word "lu" (pis. lam, Lalli, lalliy, passim) is often used as a synonym of "W.

The authors mentioned above also describe in fair detail the various kinds of lu according to colour (white, yellow, lead- or ivory-coloured), form (globular, oblong, oval or tumi-shaped, conical, flattened, almond-shaped, notched), size, structure (various shells), compactness, consistency, weight and value, its changes by means of external influences (oil, all acid reagents, in particular still lemonade, and further, the heat of fire and friction against coarse objects), and finally the colour and dating and trade. Al-Biruni, op. cit., 134-7, moreover, has an interesting chapter on causes and elimination of worthlessness or faultiness of pearls. On the innermost layer of the pearl-oyster's shell, the so-called mother-of-pearl, see 82ar. All those qualities of the pearl have their own very specific nomenclature, based on close observation. The calculation of the specific gravity of the pearl was amazingly accurate (according to al-Khazin in Ullmann, Die Natur- und Geisteskunde im Islam, Leiden 1972, 122). Even the formation of the pearl is explained correctly, namely by the infiltration of parasitic foreign bodies, bringing about growths which then solidify into pearls. At the same time, however, the curious fable held currency according to which pearls originate in the pearl-oyster from rain: every year the Southern Sea—the Indian Ocean—is agitated by heavy storms which force the pearl-oyster to emerge at the surface, where its two valves open and take in the rain. After that, the oyster muscle contracts, the valves close and denne dives to the bottom of the sea; from the rain-water, a precious stone grows like an embryo in the womb (al-Tamimi, Murshid, 32-3; Das Steinbuch aus der Kosmographie des...—z-Kemirini, Tr. J. Ruska, Beilage zum Jahresbericht 1859/66 der prov. Oberschule Heidelberg, 21 f, s.v. durr), or, according to the majority of the scientists, like the egg in oviparous animals (al-Ashar, Nuqab al-Baghdari, fi athli al-da`wah, in Wiedemann, Afsat, 845). For the finding-places of pearls and their recovery, see al-Biruni. Plentiful material is also to be found in the extensive lemma lu in WKS, ii, 45-50, containing a well-arranged synopsis of pieces of evidence for the metaphorical use of the word: the pearl is compared with teeth, tears, dew- and raindrops, small bubbles, with the goblet, with words and poems, letters, wisdom, boys, girls or women, with a face, with gazelles, flowers or blossoms, stars, currents, etc. The word appears also extraordinarily often in book-titles with ornamental, metaphorical or metonymic meaning, mostly as "head title" before the real title, which is introduced with fi, see G.A.S. 661, 970 ("84 al-lu, 941 (la`all, 945 (lu`in, 1289 f; s.v. lu`in); the indexes to the separate volumes of Segin, G.A.S.; Hadij Jallali, Kasha al-tunin, ed. Yalktaya, ii, 1534 f, 1576 f; Ismail Bajji, Idak al-maknun, 596 f, 415 f.)
LU\LP

Apparently a word for pearl-trader cannot be derived from durr, but only from inveh: la'l\d or la'a\b (WKSAS, ii, 46).

LU\LP ("pearl"), a noun often given as proper name to a person of servile origin, a guard or an officer or a leader of a special body of ghulāms (ghulām) who, by his energy and (ghulām) at the instigation of Lu'lu'. Lu'lu' presents the image of a slave who, by his energy and ability, and favoured by external events, succeeded in hoisting himself up to a position of supremacy over an emirate, admittedly an emirate of secondary importance. It could be said that he prefigures in the eleventh century what various of the Mamlūk of Egypt were later to become on a larger scale.

LUPLU, BADR AL-DIN—LUR

LUPLU, BADR AL-DIN Abu 'l-FadLl al-MALIK AL-SAHIJ, a freedman, possibly black, of the last Zangids of Mosul, whose régime he prolonged. Designated by Arslân Shâh I on his death in 607/1210 as reagent of the principality for his young son Kâbir, then by the latter (d. 615/1218) for his infant son, Arslân Shâh II, he was officially designated, with a caliphal diploma, as lord in 629/1232. The chronicles mention him especially for his interminable minor clashes with the lesser surviving Zangids and their Murzafrid allies from Erblî; he had, on the other hand, the support of the Ayyîbîd al-Ashraf, all this interfering with the intrigues of the Khârazm-Shîhs and first Mongol detachments. Later, he fought with al-Sûlih Ayyûb in Diirazra and then with al-Nâsir of Aleppo. In all these clashes, he appears far less as a successful military leader than as an astute diplomat. This ability and his longevity had, on the other hand, the support of the Ayyîbîd period: Ibn al-Athîr, Sibt Ibn al-Dîawsf.

The chronicles tell us nothing of Lûlî's internal administration. We know, however, that Mosul attained in this period a notable role as a market (copperwork), commercial and cultural centre. The people from Mosul who are several times mentioned in Acre under Latin domination are possibly Christians, a large number of whom survived in Upper Mesopotamia. In 615/1218 al-Dîn Ibn al-Athîr (4 vols. published), al-Mâlik b. al-Amâd, Ibn Shaddâd (al-dîawsf), section on al-Dîazra published Damasques 1879), the Christian Abu 'l-Fârâbî Bar Ilaykh, published), Ibn Shaddâd (4 vols. in Arabic; cf. A. Mitchiner, The World of Islam, 205, 1135-2).

LUR (in Persian Lur or short), an Iranian people living in the mountains in western Persia. As in the case of the Kurds, the principal link among the four branches of the Lurs (Maslînî, Kûhî-lî, Baikhîrî, and Lurs proper) is that of language. The special character of the Lur dialects suggests that the country was Iranianised from Persia and not from Media. On the ancient peoples, who have disappeared, become Iranianised or absorbed in different parts of Kurdistan, see Kurdistan.

The name. Local tradition (Ta'rikh-i qâvida) connects the name of the Lurs with the defile of Mîn-rûd. This tradition is perhaps based on a memory of the town al-Lur mentioned by the early Arab geographers (al-Ittâ haciendo, 195, etc.), the name of which survives in Sanûr-yî Lur (to the north of Dîdîh). There are several other place-names resembling Lur, namely Lîr, a district of Dînawarî.

Sâbîr (Schwarz, Iran im Mittelalter, 666; cf. the Kûhî-lî tribe: Lîrâîî), which may be to Lur what pul in Luri is to full “money” in Persian: Lûdân (Yâkût: Lûdânqân, now Lûdânqân) according to Ishâjîh, capital of the canton of Dîdîh (between the Kûhî-lî and the Baikhîrî) and lastly there is a place called Lûr (Lîrî) near Sarî-Asadûr. At-Mas'ûdî alone, in his list of “Kurd” tribes speaks of the Lûryaya tribe (which may mean the Lurs connected with the district of al-Lur). In the 7th/13th century Yâkût uses the names Lûr, Lûrî, to mean the “Kurd tribe living in the mountains between Khâzînî and Ishâjîh”; he calls the country inhabited by it bîdîh al-Lûr, or Luristan.

These facts may show in the stages of evolution of the geographical term (perhaps pre-Iranian) into an ethnic name. If however we seek an Iranian etymology for the name Lûr, its connection with the first element in Lûhrasp (already proposed by von Bode) at once suggests itself. According to Justi, Iranisches Namenbuch, 183, Lûr is explained by *rudra* “red”. The place-name Rûr in Yâkût may supply an intermediary form. The Ta'rikh-i qâvida gives a popular etymology Lûrû “red mountain” in Luri.

Ethnology. If the linguistic data connect the Lurs with Fars, local tradition only regards as true Lurs the tribes who came from the defile of Mîn-rûd. According to the Ta'rikh-i qâvida, 539, 547, there is in the wâdiyat of Mîn-rûd a village called Kûrî, near which there is a defile. The place called Lûr is situated in this wâdi (the word means in Luri a “little ravine”, cf. O. Mann). The name Mîn-rûd much resembles that of Mîdâyân-rûd (the word mîdâyân is found as manîrîn in Luri; Zhukovski, iii, 158) but certain historical considerations make us look for it near Mûngarra-Mûngarra (cf. Ta'rikh-i qâvida, 548, on the place lying between Mîn-rûd, Sanûr and Mûngarra). The clans (gûrûh) of the natives of Kûhî Mîn-rûd were later called after the places where they had settled, like the Dîijadîrî (Cangûrî, Dîjandîrî) and the Dîrî (Axtârî). The governing family of the Axtâbegs of Little Lûr belonged to the Dîjandâfî (the name of their clan is Saltûfî, Saltûfi; the names Salwârî in Alam-dari, 369, Salwârî in Axtârî, 135, and Salwârî in Hourûsmî- Schindler are to be corrected). The Ta'rikh-i qâvida concludes by enumerating the 8 clans (shû'ab) of the two principal gûrûh and the 8 other tribes (aštâmî) of the Lurs.

A few names (Mûngarra, Anârârî, Dîjandîrî) correspond to modern names. Finally, four clans are mentioned: Sâhî (Sambî), Arslân (Asbân, Asîn), Akrî and Bibî, who, although speaking Luri, are not Lurs; the people of the other villages of Mûndûd were peasants (rûðûdî).

In ca. 505/1105, a hundred (or 400) Fadjâlî Kurd families arrived from Syria. They came by the north (Shaturna-Kûhî) and settled at first on the lands of the Kûhî-lî tribes (see Luri kûhî; and cf. Nauhî al-kâlanî, 70, under the word gîrdàhî). At the beginning of the 7th/13th century, new tribes flocked to the standards of Hamzârî of the Great Lûr. Among them were two Arab tribes, *Ukâyî* (Akkî; cf. the place of this name below Sheikhtâr), a *Bîdîhî* one, and 8 different tribes (mûnîfârîhî), among whom we find the Baikhûrî (Mûkhûtârî), the Dîjandîrî (Marâsînî), the Gûtâwînî (the village near Shûptar), the Dîdîh, the Lîrâîî, the Mûndûtî (Maslînî?), etc. According to the Sharîf-nâmâ (1, 20), all these tribes also came from Syria. These waves of immigration must have had a considerable effect on the ethnic composition of the Great Lûr.
It is probable that the immigrants were Kurds and that traces of them still survived among the Kurds whom Ibn Battûta (ii, 21-30) found at the beginning of the 14th century near Bahbāhān and Rūm Hūrnūs when on his way to the capital of the Grand Lur. There has long been a village of Kurdistān on the river and it is said that this name came from the river. Sīhāb al-Dīn al-Umārī (in Notices et extraits, xii, 330-2) mentions the existence of Lurs in Syria and Egypt and tells how Sālahūdī (564-917/1170-93) alarmed by their dangerous ability to climb the steepest ramparts, had them massacred en masse. This anecdote throws a light on the causes which produced the arrival in (?) return to) Luristan about 600 A.H. of numerous Iranian tribes.

The southern part of Little Lur was exposed to infiltration by Kurds, especially through the valley of Karīgh (cf. LAK; just to the north of Susa is a tree dār-i Bālw, bearing the name of a clan of the Kurf tribe of Ḍuqrūnī, celebrated in the history of the Hasān va 'llakā (q.v.; cf. Ibn al-Qāhirī, ix, 146, 210) and exposed to Turkish and Mongol invasions (cf. the desperate fighting of the Aṭlābs of the Lur-i Kūhīk against the Bāyāt and Aywā (= Bahārūn) Turks).

In the Ṣawāfīd period, Turkish tribes were introduced into Luristan from the direction of the Kūh-Ġūr (where traces of them still exist), and Georgian and Armenian colonies to the north of the Bahkūṭīyār country. On the movements of the population under Nādir, the Zands and Kūfīk, see below. The ethnic situation gradually stabilised at the beginning of the 19th century.

The names of the Lur tribes and groups are now quite well known and as we have seen going from 981 to 1927, a comparison enables us to note the changes that have taken place meanwhile. Regroupings seem to be taking place more rapidly among the Lurs than among the Kurds, but the general framework of the tribal groupings remains essentially the same.

In 1881 (Curzon, ii, 274), there were 428,000 Lurs, of whom 170,000 were Bahkūṭīyār, 47,000 Kūh-Ġūr, and 210,000 Fayālī. According to Rahīfī, this last section numbered in 1910 3,590 (or 130,000 individuals) in Pīsh-Kūh, and 15,000 tents (or 50,000 individuals) in Pāsh-i Kūh (this last figure seems too low).

The Mamāsānī (Mamassanī) group includes four main tribes: the Bakāsh, Dākwālī (Dākwālī, Dushmanziyārī and Rustamī, see shīristānī ī LĪF). The Kūh-Ġūr group (Kūh-Ġūrī) includes three large tribes (Afghā, Bawīl and Dūlānī). The first of these tribes (cf. the name of the old Turkish tribe of Agōḏāqārī) is of a composite character, for of its nine clans four (Agfār, Boshdālī, Cagātayā and Karā-Bāŋīlī) are Turkish (evidently the remains of the Shāh-Sowān, to whom the government of Kūh-Ġūr had been given under the Sāfāwīs) and a fifth clan (Tilakūlī) bears the name of a district in Kurdistān of Sūna (q.v.). Concerning the second tribe, Bawīl, O. Mann notes that it bears the name of an Arab tribe of the neighbourhood of Ahwāz; but there is also a mountain called Bawīl to the south of Khūrānābād. The third tribe, Dūlānī, is purely Lur and is composed of two main sections: Čārinbālī and Lārawā with very many subdivisions. This three-fold composition of the Kūh-Ġūrī group is typical of many of the Lur tribes.

As to the Bahkūṭīyār, Sawyer as long ago (1894) said that their territory was "thoroughly surveyed on a scale of 8 miles to the inch, nearly every tribe visited in their own encampment, every-thing appertaining to the Bahkūṭīars may now be said to be known". But Curzon's tables (1890) are still the last word available to the student. Of the two Bahkūṭīyār groups, Chār-lāng and Haft-lāng, the latter is the more important at the present day. The Chār-lāng, who used to be in the south, are now mainly in the districts of the same name and in the northern barrier (between Durajjīd and Gulpāyāgān).

The main groups of Lur are: Tarkhān, Dīffān, Silīsī (cf. LAK) and Bālkā-giwrā. The tribes of the last group are the Lurs par excellence and have important subdivisions: Dirgawānd, Sagwand etc. It is possible that the Dirgawānd are the real nucleus of the Lur race. Their chiefs are called mir.

In contrast to what we find among the Kurds, where the individual members of the tribe are usually much attached to their hereditary chiefs, the Lurs proper (Bālkā-giwrā) are distinguished by a more democratic feeling. The power of the hereditary families of bāhānī is based on their "guard" (bayānt), but this power is considerably reduced by the authority of the chiefs of the clans (budhnā). The bāhānī are forced to court the favours of these wild, petty chiefs (Edmonds: "smooth headmen"); the latter are amenable to the solicitations of their neighbours, and in this way the tribes are broken up and new groupings take place.

Little is known of the ethnology of the Lurs. The names of Dubois-Sossel (who commanded a Lur regiment in 1859), Études sur la population de la Perse, 23, of Khanikoff, Mair, sur l'éthnographie de la Perse, Paris 1886, 2, 110, 118, and of Dandīvī, only touch the surface of the subject. Dubois-Sossel particularly notes the peculiar (compressed) form of the skull of the Lurs. Edmonds emphasises the difference between the Lurs and the Laks; the latter are taller, have purer features and aquiline noses. Their women are more beautiful than those of the Lurs. The hair of the Lurs is often chestnut-coloured; very heavily bearded men are found among the Lurs (the Persians call Kurdistān maḏamí, bīnān, "mine of beards"). The women do not seem to have such liberty among the Lurs as among the Kurds. According to Edmonds, there are no cases among the Kurds of women acting as chiefs of tribes. But von Hammer (ii, 239) mentions under the year 1725 the warlike exploits of the two daughters of the Wallāi Allārdūnā Khān.

The domestic life and manners of the Bahkūṭīyārs have found enthusiastic panegyrists in Layard, Mrs. Bishop and Cooper in his Grass, New York 1925. On the other hand, the Lurs have been very severely judged by most travellers, cf. Edmonds, in Geogr. Jnrl. (1922) (ibid., the speech of General Douglas, who was wounded by the Lurs in 1904).

Bibliography: for the Mamoṣaṣ (cf. shīristānī ī LĪF) and the Kūh-Ġūrī, cf. especially Haan Fassāḥ, Fārs-Dāvar-a ma Nūjīrā, on which are based Demorgny, Les tribus du Fars, in RMM, xxii (1913), and B. Miller, Koçeytê plêmena Parsa, in Vost. Sbornik, St. Petersburg, ii (1916), 213-18. Cf. also the lists in Bode, Layard, Shirr, Baring etc. (summarised in Curzon, Persia, ii, 327) and those of O. Mann, Die Mundarten d. Lur-Stämme, pp. xx-xii. For the Bahkūṭīyār: H. Rawlinson, A march from Zobāt, 102-6 (cf. Ritter, Erdkunde, ix, 210-15); A. H. Layard, Description of Khuzastān, and especially Early Aramavie; Curzon, Persia, ii, 286-9. For the Lurs: the lists of Rawlinson [Ritter, Erdkunde, iv, 215-29], Bode, Layard, Cirikov, Houtum-Schindler, O. Mann, op. cit., p. xxiii, and especially the articles by Robino, in
Religion. The Christian and Jewish colonies (cf. the evidence of Benjamin of Tudela) settled in the village of Karkhā since the Sassanid period may have left some traces in the country. A very stormy controversy [37] (p. u.) has raged in the history of the conversion of the Bakhtiyāris to Christianity in the time of Constantine the Great? (Hanway, ii, 168). A mention in the Tāriḵh-i Diḵān-yuḵā, CMS, xvii, 216, shows that in 690/1295 the mulkāhs (Ismāʿīlīs) had gained a footing around Gird-Kūh. The Hūrī and herey had probably also a following in Luristan, for the Murid of its founder Fadl Allāh, who attempted the life of Suhrā Shāhrukh (8/593), was called Abūd Lūr (Browne, Lit. hist. of Persia, iii, 366). In the 8th century, the 'erels of the Lūr discussed descent from 'Abdāb, son of the kalīb 'All, whose tomb is shown near Sīrwān (Māsābaghān); cf. Rawlinson, in Ritter, iv, 402. The esoteric doctrines of the extremist Shīʿa are widespread in Luristan. The great majority of the Lūr are Ahl-i Ḥakī (barely); the Saygān, Pāpī and Bahār tribes are also followers of this secret religion. In the belief of the Ahl-i Ḥakī, Luristan is the scene of the activities of the third avatar of the divine manifestation who is called Eshā Khōshbīn and numbers among his "angels" Bābā Tāhir (q.v.). An important sanctuary of the sect, the tomb of Shāh-zāda Abūl (the alleged son of the imām Mūsā Kāšīm), is in the district of Kān near Bālāw (territory of Kālāwand) and is kept by Sayyids of the Pāpī tribe; these Sayyids wear red turbans which recall the predilection for red of the old Mūsannēm = Khurramīyān [br.], whose flags were of this colour.

The religion of the Lūr was so little orthodox, even from the Shīʿa point of view, that at the beginning of the 19th century prince Muhammad ʿAbd Mīrād had to send for a māglāhīd to convert the tribes to Islam (Rabino, 24). All the Lūr and Lūk tribes are officially Shīʿa (contrast the attachment of the true Kurds to Sunnī orthodoxy).

Language. Down to the beginning of the 20th century, our knowledge of the Lūr dialects was confined to the texts collected by Rich, to four Bakhtiyāri verses in Layard and to some thirty words collected by Houtum-Schindler. As late as the Grundriss d. iran. Phil., i (1885), 1898-1901, 249, we find the thesis stated that Lūr is closely related to Kurdish and may even be described as one of its dialects. The materials of Zhukovskii (collected in 1880-5) were finally published after the death of the author (d. 4 December 1928). The merit therefore of having first established the important fact that Kurdish and Lūr are quite separate ("eine tiefgehende Schiedung des Kurdischen vom Lūr!") is due to O. Mann. This scholar has shown that although there are Kurd tribes in Luristan [see LAK], the true Lūr speak dialects which belong undoubtedly to the south-western Iranian group (like Persian and the dialects of Fārs) and not to the north-western group (like Kurdish and the "central" dialects.

The Lūr dialects which have none of the asperities of Kurdish [see STARS] fall into two categories. To the first belong the dialects of the Great Lūr: Māmāsan, Khūghīl and Bakhtiyāri (the latter has a few insignificant peculiarities of its own); to the second belong the dialects of the Little Lūr, i.e. of the Fāyl Lūr.

Even the first group possesses very few special features compared with modern Persian. From the point of view of phonetics: -əm at the end of a word becomes -əm, -ən (mēhmān, bahām; dādām, dādām); ə changes into ə: pāfīf; intervocalic d gives d (vādīmān); the combination -bīl gives bādī and -hī: bākhtūl (bākhtūlī), rīfīl (rīfīlī); initial bākhtūl; Abūd. Bakhtiyārī are the change of intervocalic m to ə: dāmə > dāmə and the occasional change of ə to: əa > əīm. It is remarkable that some of these phonological peculiarities were long ago noted by Hām Allāh Mustawfi (Tāriḵh-i gūrātā, 537-8). He says that Lūr (although full of Arabic words) does not have the peculiarly Arabic sounds, like əh, əh, əf and ə. Inflection: Plural in -al, -al, -i: e.g. šādāb, dāmān: instead of rīdāna yāt = inādīq: formation of the present: instead of Persian -e: first Persian plural ending in -e (inām): əiynāmə = məqālēn. Lūr usually forms the pretense of active verbs as in Persian with the help of personal endings (active construction) and not like Kurdish and the majority of Persian dialects (including those of Fārs) which give the pretense a passive construction. Vocabulary. In the present and pretense stems, Lūr usually follows Persian, but we find sters and words unknown in Persian: ḫūsām, wadān, "to throw"; ṭārām, ṭārām, "to be able"; əa, "eye", etc. From the Mongol period, Lūr has kept several expressions like tuḫmāl, "chief of a clan", in Mongol, tuqūmā, "official"; ḫaytul, "guard of the khan", in Eastern Turkic "camp, laager", etc. From the 9th century, our knowledge of the Lūr dialects was considerably increased by field work and collections in 1883-6, vocabularies Bakhtiyāri-Fārs (texts collected in 1883-6, vocabularies Bakhtiyārī-Russian and Russian-Bakhtiyārī) by G. Hadalk, in the Preface to O. Mann, Kurdisch-Persische Forschungen, Berlin 1922 (texts collected in 1888-6, vocabularies Bakhtiyārī-Russian and Russian-Bakhtiyārī) by G. Hadalk, in the Preface to O. Mann, Kurdisch-Persische Forschungen, Berlin 1922.

Literature. The Lūr tribes and especially the Bakhtiyāris have a rich popular literature, fairy tales, epic fragments, celebrating the exploits of their heroes (like Muhammad Taḵī Kān Car-Lang and ḥakī Kīnum Haft-Lang), lyrics, songs sung at marriages (mēsināk) and cradle-songs (ʾabārkī). These pieces are often pretty and full of sentiment; cf. the collections by O. Mann and Zhukovskii (the latter published an article on Persian and Bakhtiyāri ballads in the Emirates, Min. Nāsīr, Proses (Jan. 1889)); D. L. R. Lorimer and E. O. Lorimer, Persian
tales, London 1919, 157-351; idem., Bahkhtari tales (translations only).

There are also Luri poets writing in the established literary forms: Husayn Kuli Khán Nát-Láng (killed in 1889), Na’dám al-Khán, Na’dám al-Safar, ‘Alí ‘Abdár, Sayf al-Dín Máhímd whose family had been prominent in the earlier period; he was the last of the Kuh-Gilí tribe, which the Tarbi-yi guzida mentions among the Luri tribes. The rest of Luristán was ruled by a family of Luri princes (independent of the Sháh), of whom Bahr ruled in the Great Luri and his brother Manšür in the Little Luri. Their dates are uncertain. Bahr’s successor was his grandson Na’dám al-Dín Muhammad b. Kháíl b. Bahr (according to the Ta’rikh-i guzida, Na’dám al-Dín was a nephew of Acharáng [Rúmá] b. Muhammad b. Kháíl), Na’dám al-Dín was succeeded by the Fadlwání Kúns, who founded the dynasty of the Aṭábegs of the Great Luri and relied on support on tribes who came out from outside Luristán (cf. above, under Ethnology). The same Fadlwání drove the Sháh out of their settlements.

We know nothing of Manšür, brother of the above-mentioned Bahr. The tribes of Little Luri were directly under the caliphs, and in the north were subject to the invaders. The founder (in ca. 980/1574-5) of the native dynasty of the Aṭábegs of Luri Kháíl [q.v.] had to dispose of a rival Sáráhání b. ‘Ayár (probably a scion of the dynasty of Abu ‘I-Shawk which was called ‘Ayár’ání) ‘Amáz (see Ašxa’ís).

The history of the two dynasties of the Aṭábegs is filled with feuds, murders and executions, but in domestic affairs the state of the country was fairly prosperous. The Aṭábegs built bridges and madrasas (Bín Báttáš) and secured a peaceful existence for the inhabitants (cf. Ta’rikh-i guzida, 550). The revenues of each of the two Aṭábegs were estimated at a million dinár, while each of them paid to the Mongol treasury a tribute of 91,000 dinár only (Nuzkát al-julúb, 78).

In the interval between the Mongols and the rise of Timúr, the two Aṭábegs were vassals of the Muzáfárids. In 788/1386 and 795/1393 Timúr ravaged Little Luri, but treated the Lord of Great Luri mercifully. In 837/1433-4 the last Aṭábeg of Little Luri, pledged himself to supply annually to the Sháh 10,000 mules. In 974/1566-7 the Sháh, under the guarantee of Shih Rustám of Shiráz, sent a message to the Lord of Little Luri, and in 937/1534-5 the last Aṭábeg of the Great Luri disappeared.

The Ábadí period. The Lords of the Little Luri maintained their position, and by intrigue even succeeded in extending their power over the plain to the west of the mountains of Pacht-i Kháín. After the execution of Sháh-wáríd Kháín, Sháh ‘Abábs installed in his place a man descended from a distant line of the old family. The possessions of this man, Husayn Kháín, were, however, somewhat reduced.

After the disappearance of the dynasty of the Great Luri, the power had passed to the chieftains of the tribes composing this federation. Under Sháh Táḥmásb we find the title of Sardár of the local ulás conferred on Tád-Má, chief of the principal clan, the Ástárád. Tád-Má, having neglected his duties, was executed and replaced by Mir Dáhidrá Bákhtí-áráy (the Ástárák and Bákhtí-áráy had come to Luristán after 500/1103-4; cf. Ta’rikh-i guzida, Dáhidrá under the guarantee of Sháh Rustám of the Little Luri, pledged himself to supply annually to the Ásáfáwíd treasury 10,000 mules. In 974/1566-7 the governor of Hamadán was sent to remind him of his obligation (Sháfárat-námá, 1, 48). Henceforth, the Bákhtí-áráy tribe becomes of the first rank and, as usual, gives its name to the whole confederation. As to the Kuh-Gilí territory, it was governed by
Khnān of the Turkomani tribe (Shah-Seven) of Afghān settled among the Lurs. In 986/1576 a dervish impostor claiming to be Shāh Ismā'īl II had a considerable success among the Dākhān, Dāvandān and Bandīn tribes, who killed several Afghān governors. In 1065/1654-5, as a result of the excesses committed by the Afghān as well as by the Lurs, the governor of Fārs, Allāh-wardī Khān, established the direct centre of his government in Khūsh-Gūb (Taḥḥīk-i ʿĀlam-ārī, 156, 336).

We do not know under what circumstances at the end of the ʿĀlam-Ārī dynasty (Fārs-nāma-yi Nāṣirī) the group of Mānasūn tribes, who had migrated into the Great Lur (after 600/1203-4) occupied the ancient Shīkhānistan (q.v.).

After the Afghāns: During the troubles provoked by the appearance of the Afghāns before Isfāhān, the wīlāt of Luristān, ʿAll Mardān Khān Faylī (a descendant of the Husayn Khān appointed by Shāh ʿAbbās), played a considerable part. With 5,000 of his men he took part in 1113/1703-4 in the defence of the capital. He was even appointed commander-in-chief of the Persian troops, but the other Khānīs refused to take orders from him. When the Turks invaded Persia in 1137/1725, ʿAll Mardān Khān abandoned Khurramshāh (which was occupied by Ahmad Pāgān) and retired to Khūsh-Gūb (Taḥḥīk-i ʿĀlam-ārī, 156, 336).

About the same time, several Bakhtānī khanīs (Kāsim Khan, Ṣafī Khan) are mentioned as resisting the Afghān and Ottoman invaders, but they did not agree well with ʿAll Mardān Faylī. In 1137/1724 ʿAll Muhammad Husayn Khān Bakhtānī, who had been his supreme commander, overthrew him and became prince Shāh Ṣafī. The latter's headquarters were in Khūsh-Gūb (Kūsh-Gūb); he was not taken till 1140/1727-8 (Hanway, iv, 115, 135, 145; Malcolm, History of Persia, London 1899, ii, 115-16, 185-6; Samuel, Ancient Persia, London 2829, ii, 171-2; von Hammer, Toʿrikh-i ʿĀlamī, 231, 253; Malcolm, op. cit., ii, 171 ff.).

After the events of 1113/1703-4, the Bakhtānī country enjoyed virtual autonomy under the Safawid dynasty (Pdr-ar-dar-yi Mardān). A summary of the history of the Bakhtānīs in the 19th century has been given by Curzon in ch. xxxiv of his Persia and the Persian Question. At the first the Khurram family, descended from the brother of ʿAll Mardān Khān (see above), came to the front, but the assassination of the governor of Isfāhān Manṣūr Khān Mūsāmad-din-dawḥān (whose real name was Yenikolov; he was an Armenian from Tiflis) in 1841 put an end to the career of the Khurram Mūsāmad-takī Khān of the Chārā Lang group, and the family did not recover. In 1846 the Bakhtānī (or Baydarwānd, a family which claimed to be descended from a shepherd named Faqī) rose to prominence in the Ĥafi-lang group, and in spite of the assassination in 1882 of its chief Husayn Kūlt Khān (Hādīḏī Khīḥān) by order of the governor of Isfāhān, Naṣr al-Dīn Shāh's eldest son Manṣūr Mīrzā Šīlī al-Saltān, under whose reign the Bakhtānī country fell, the family held on to its wealth and importance. The tribal Khānīs did, however, now fall into a period of prolonged dispute over the succession of the Khurram family of the Khurram Mūsāmad-din-dawḥān and Hādīḏī Khīḥāns on one side versus the Ilbegī family on the other. Eventually, a basic principle of power-sharing between the two families was established which was to endure until 1936, when Rīdā Shāh Pahlāvī placed the Bakhtānī country under standard Persian civil jurisdiction; until this time, the country enjoyed virtual autonomy under the

was several times invaded, but the main blow was directed against the little-explored country south of Shurūrān-khān. ʿAll Mārūd was captured and executed. The Bakhtānī detachment were decimated and deported to Dūšān and Langar (in Khūsh-Gūb). A little later, a Bakhtānī detachment distinguished itself in the assault on the fort of ʿAllābād. The example of Khūsh-Gūb, 1736, contains interesting geographical details (v. Jones, i, 185, ii, 18; ʿAll Ḥādī, 231, 253; Malcolm, ii, 21).

The deported Bakhtānīs returned from Khūsh-Gūb immediately after the death of Nādir (Taḥḥīk-i bād Nādirīyya, ed. Mann, 26), and when the dynasty of the latter was extinguished, the Bakhtānī chief ʿAll Mardān Khān (who is not to be confused with the two ʿAlīs of Luristānī Faylī) attempted to play a big part. In 1165/1776, along with Kāzin Khān in Zand, he set up at Isfāhān a sultan of the lateral line of the Safawids (ʿAlī Dūmdū, under the name of Ismāʿīl III). The career of "guardian of the sovereign" acted by Nādir seemed to be certain for him also, but Karim Khān gained the upper hand; the troops of ʿAll Mardān, who included Lur of the tribes of Kalābūr and Zendan, were defeated in 1165/1776; he escaped to Baghdad, but died there by the hand of an assassinating group (Nāṣirī Shāhī, Taḥḥīk-i bādī-gūbān, quoted by Malcolm, ii, 61 and note 9, 171). Von Hammer, GGR, iv, 475, 477; R. S. Poole, The coinage of the Shahs of Persia, London 1888, p. xxxv; Curzon, ii, 289.

Karim Khān (q.v.), who had disposed of his Bakhtānī rival, was himself a Lur of the tribe of Zand, settled in the immediate neighbourhood of Luristānī Faylī. On the movements of population in his time, see Kords and Lahr. In 1200/1785, when Dīdar Khān Zand had to fall back on Shirāz, a number of Lurs and of Turks assembled at Isfāhān under forger of Isfāhān. Manṣūr Khān Mūsāmad-din-dawḥān (whose real name was Yenikolov; he was an Armenian from Tiflis) in 1841 put an end to the career of the Khurram Mūsāmad-takī Khān of the Chārā Lang group, and the family did not recover. In 1846 the Bakhtānī (or Baydarwānd, a family which claimed to be descended from a shepherd named Faqī) rose to prominence in the Hāf-lan group, and in spite of the assassination in 1882 of its chief Husayn Kūlt Khān (Hādīḏī Khīḥān) by order of the governor of Isfāhān, Naṣr al-Dīn Shāh's eldest son Manṣūr Mīrzā Šīlī al-Saltān, under whose reign the Bakhtānī country fell, the family held on to its wealth and importance. The tribal Khānīs did, however, now fall into a period of prolonged dispute over the succession of the Khurram family of the Khurram Mūsāmad-din-dawḥān and Hādīḏī Khīḥāns on one side versus the Ilbegī family on the other. Eventually, a basic principle of power-sharing between the two families was established which was to endure until 1936, when Rīdā Shāh Pahlāvī placed the Bakhtānī country under standard Persian civil jurisdiction; until this time, the country enjoyed virtual autonomy under the
rule of the Ilkhani and the Ilbegg. The Ilghanšı-
Hâdji Iskander Ilkhan group in fact enjoyed a superior
financial and political position, in part because from
1299 onwards they drew an investment income from
Mosses. Lynch Bros, when the Bakhtiyarlı Road,
connecting Abāzgān, Shēkāsūr and Isfahān, was
opened, and from 1309 onward from the concessions,
where Persia families received subsidies from the
British government during the First World War in
return for Bakhtiyarlı support. The Bakhtiyarlıs also
played a considerable role in the Persian Constitu-
tional period, in alliance with the Shi'i Shīa and
the urban-based constitutionalist reformers, achieving
prominence in national as well as local affairs; by
1912 Bakhtiyarlı khanš held the governorship of
seven cities in Persia, including Kirmān, Isfahān and
Kashān, and one was Prime Minister (Sāmān al-
Salāma) and another Minister of War (Sādžār Asad).
The centralising efforts of the Ikâds had more
effect in Lurisht-i Fayl (formerly Luri-i Kūčk) in
as much as, as a result of the governorship in Kirmān-
shāh of the energetic prince Muhammad ʻAll at the
beginning of the 19th century, the old family of the
Aštafs of Lurisht found its rights reduced simply to
the possession of Pusht-i Kūsh (see Čīrīk, 227).
The Pāsh-Ḵūkh became the Persian province of
Luristan, ruled by a Mirzā with troops and
artillery marched through this province. In 1856
Rawlinson followed him at the head of his Gūrān
regiment. After the famous expedition of Mānnūrī
Ḵān (1847), his nephew Sālāmān Khān Sahām al-
Dawla, governor of Kūstān, maintained order in
Lurisht, but for the second part of the 19th century
Lurisht was plunged more or less into a state of
anarchy. It was not till 1900 that prince ʻAyn al-
Dawla was able to restore order in Lurisht, and at
that time several tribes stationed freely in the
disturbed province. But in November 1904 two
British officers (Col. Douglas and Capt. Lommer) on
their way to Khūramshād were attacked and
wounded by Lurs. A considerable agitation was
stirred up among the Lurs (and in western Persia
generally) by the appearance among them of the
rebel prince Sālār al-Dawla (several times after
1905). In spite of the efforts of the Persian govern-
ment, Lurisht remained closed till 1912, when with
the help of foreign representatives several caravans
went from Dīzful to Būrjujād. About the same time,
the Persian government conferred the rank of vālī
of Pāsh-Ḵūkh on Nazar ʻAlī Khan Amrārī (see tack);

The advent of Rūdān Khan, later (1924) Ṛdā Shāh
Pahlāvi, meant a declared policy by the central
government of bringing the Bakhtiyarlı country into
the normal framework of administration in Persia,
part of which involved the forcible sedentarisation
and semi-nomadic tribesmen; but with Ṛdā’s
deposition in 1941 and the period of weaker rule
during the earlier years of Muhammad Ṛdā Shāh’s
reign, many Bakhtiyarlıs and Lurs reverted to the
semi-nomadic way of life they had been accustomed
to, and this last still prevails amongst an appreciable
section of the estimated 500,000 Lurs and Bakhtiyarlıs.

LUR-I BUZURG, a dynasty of Abāsaghs
[see Arak] which flourished in eastern and
southern Lurishtan between 550-525 and 827/
1423, the capital of which was Ṣarbad [q.v.] or
Mālāmīr.

The ayyūnous founder of the dynasty, also
known as Fadlūr (1847-90), a Kurdi chief of Sīrāj
Pāvār. His descendants (the Buzurr-dīn)
continued to gain power through Musārūkhīn and
Ḵūrštābādī (where they made an alliance with
the Amīrā Dībādī [?] of Gilān), they arrived about
900/1500 in the plains north of Uṣurtān-Kūh
(Lurishtān).

Their [4] chief Abū Tūhār (b. ʻAll b. Muham-
mad distinguished himself in the service of the
Salghūrs Sūnrūr (543-50/1248-61?) in an expedition
against the Shabānīs [q.v.]. As a reward, Sunkūr
gave him Kūsh-Gūlā and agreed to send him to
conquer Lurishtan. He succeeded in this. Abū Tūhār
assumed the title of Atībāgh, and later married
with Sunkūr and made himself independent (ca.
550-5115). (The Madīnāt al-スーユdī seems to confuse
several individuals under the name Kūsh ʻAll, to
whom it attributes the following successes: the
deposition of Nāṣir al-
Dīn, last descendant of Bāhr, ruler of Lurishtan, and
the defeat of the Kūshī troops commanded by the
Turk Eshāk.)

Under the son of Abū Tūhār, (3) Malik (sic)
Hazarār (900-60 or 902/1504-6 or 1525?), Lur-
ishtan prospered, and new Arab and Iranian tribes
flocked into it. Hazarār drove out of Lurishtan the
last remnants of the Shīfs and invaded Lurishtan
proper. The Shīfs moved to Fārs. Hazarār disputed
with the Salghūrs the possession of the
fortresses of Mānūgh (Mānūgh, south-west of
Mālāmīr). The possessions of Hazarār were extended
up to a distance of a farsārā from Isfahān. The
caliph al-Ṣāfār (575-612/1180-1229) confirmed to
Hazarās the title of Atībāgh. On the other side,
Hazarār maintained friendly relations with the
Khurram-Shāh Muḥammad and gave him (d. 1925)
(see Tābūnī, ii, 381, 471). (The Buzurr-dīn mentions
two sons of Hazarār: ʻīmād al-Dīn (d. 649/1252-3)
and Nusret al-Dīn Kūhā (d. 650/1252-3); the former
became Šarbagh Kūhā, where several members of
the family were afterwards interred.)

(3) Tikla (955-6/1527-8), son of Hazarār and his
Salghūrī wife, successfully withstood four attacks
on him by the Salghūrī Atībāgh of Fārs, who
was indignant among other things at the expropriation
of the Šīfs from Lurishtan. Tikla took from Muḥānān
al-Dīn Khānī (d. 649/1252-3) certain districts of
Lur-i Kūch. He defeated the generals sent against him
from Khurramistan by the caliph. During the
Buzurr campaign of Ḥūlāgū Kūsh (655/1257-8), Tikla
accompanied him in Kītāb Noyān’s division
(lūţehā). He did not, however, conceal his feelings
about the treatment inflicted on the caliph and
Muslims. Ḥūlāgū took umbrage at this, and Tikla
fled to Lurishtan and shut himself up in Mānūgh.
(See also Tikla, iii, 489, 571.) Tikla was buried at
Zardā Kūh.

(4) Shams al-Dīn Alp Ārghān succeeded to his
eleutherous son and ruled for 15 years. He led a
nomadic life. His winter residence was at Ṣarbad and
at Sūr (probably Sāvak on the Kūrān above Shākīrāt)
and his summer one at Ilam (on the upper waters
of the Zardā-ḵānd and at Bāzūf (source of the
Kūrān).

His son 5 Yūsuf Shāh had spent his youth with
Abaka Khan (663-680/1265-82) and even after being appointed in his father's stead, remained at the Mongol court with 200 horsemen. He took part in the war against Burak Khan [p.135] and distinguished himself in a skirmish with the Dayamis. To the possessions of Yusuf Shah, Abaka added Kuhistan, the ruler of Kuh. Afrasiyab shut himself in a temple (a *fardad*) above Isfahan and *Djurbugdka* (Gulpayagan). Yusuf Shah went to Kuh-Ghila and attacked the *Sial* settled in the modern Mamasani country east of Kuh-Ghila. After the death of Abaka, Yusuf Shah was forced against his will to go with 5,000 cavalry and 1,000 head to the help of Ahmad Takhtdar. The latter was defeated (683/1284), and the Lurs retreated from Tabas to Neman across the desert, where the majority died of thirst. After the accession of Arghun, Yusuf Shah went to pay him homage and interceded on behalf of the former vizier *Huseyn Shirvani* (Shirvani), who had taken refuge in Luristan (cf. d'Oozean, iv, 5).

His son (6) Afrasiyab sent his brother Ahmad to the court of Arghun while he himself remained in Luristan, where he put to death the members of the former vizier's family. Their relatives having taken refuge in Isfahan, Afrasiyab sent his kinsmen in pursuit of them. At this moment arrived the news of the death of Arghun (680/1281). The Lurs killed the Mongol governor of Isfahan. Afrasiyab appointed members of his family to govern in Hamadan, Fars and in the territories reaching to the Persian Gulf, and even began to march on the capital. The Mongol general Amir Turak was defeated at Kuhurd or Kuhrud (p.135) near Isfahan. Gayguy Khan sent Mongol troops against Afrasiyab and troops from Lugas and Khurramia and the troops of the *Shahram* (Shudja) to Tushar and to the mountains, but after some time went to Gayguy who pardoned him. Returning to Luristan, Afrasiyab massacred his own relatives and a number of the notables. Ghazan Khan (694/1295-1304) at first showed himself favourable to Afrasiyab, but in 695/1297, on the complaint of the Amir Hurkudak of Fars, Afrasiyab was tried and executed at Mahilvan (5) of Farahân.

The rank of Atibeg was then conferred on his brother (7) Nusrat al-Din Ahmad (695-738/1297-1340), who had spent most of his life at the court of the Shahs. According to the *Madjma* al-anvwab he introduced Mongol institutions (*ispand-i-mughul*) into Luristan. Hamid Allah Mustawfi praises his able and prudent administration, which repaired the damage done by Afrasiyab. He was a friend of men of religion and several books were dedicated to him, like the *Tarikh Madjma al-anvwab* of 'Ali Allah Khazwin. The *Madjma* al-anvwab gives him the title of *pîr*. According to Ibn Battuta (Râla, ii, 29-30, ir. Gîb, ii, 289-8), he built 150 *madrasas* (here = "hermitages"), of which 44 were at Isfahan, and he had roads cut through the mountains.

His son and successor (8) Rukn al-Din Yusuf Shah II (737-40/1335-40) was also a just ruler. His lands, according to the *Madjma* al-anvwab, extended from Bajara and Khuzistan to Lâlamistan (7) and Fars. He was buried in the *madrasa* of Ruknabad. His successor was his son (succeeding to Ibn Battuta, his brother) (9) Muzafer al-Din Afrasiyab II (Abad). Ibn Battuta, travelling via Midjût-Râna-Tustar, visited the capital Isfahân (p.136) or Mâlamîc. He found the prince addicted to wine. The Arab traveller describes the peculiar customs of the Lurs, which he witnessed at the burial of the son of the *sultan* (p.137). The latter's possessions included Tustar (*Shîghstar*) and extended to Garwâra-
His brother (6) Badr al-Din Mas'ud went to the court of Mongol and returned in the train of Hulagu. This devout man, an authority on Shafi'i law, ruled till 698/1298. He showed great kindness to the family of Sulaymân Shâh when the latter was executed at the taking of Baghdad. The sons of Mas'ud were executed by Abâlân, who appointed as Atabeg (7) Tâdji al-Din b. Husâm al-Din Khalil, also executed by Abâlân in 697/1297-8.

He had two immediate successors, the two sons of Mas'ud of whom (8) Falak al-Din Hasan ruled a part of Luristan (âdâr, sâl, will) and (8 bis) 'Izz al-Din Husayn called the crown domains (indâ), the number of their troops was 17,000. They chastised the Bayât and reunited under their control all the lands between Hamadân and Shâsh and between Isfâshân and the Arab lands. Both died in 697/1297.

Gâyghâî appointed as their successor (9) Shâhâl al-Din Hâšt b. Tâdji al-Din, who was killed in 693 near Khurramâbâd by (10) Husâm al-Din Umar b. Shams al-Din "Darmâtî" b. Shârâl al-Din b. Tahântân b. Badr b. Shuqîâ, who relied for support on the Mongol tribes settled in the lands adjoining Luristan. The other rulers did not recognise this usurper and he had to make way for (11) Sam- sâm al-Din Mâhmûd b. Nûr al-Dîn b. Shâ'âl al-Dîn Garshâsp, who slew a certain Shâhâl al-Dîn 'Uthâm and in turn was executed by Gâyghâî in 695/1296.

(11) 'Izz al-Din Muhammad b. 'Izz al-Dîn (8 bis) was a minor, and his cousin Badr al-Din Mas'ud (son of 8) obtained from Qâlid the title Atabeg and ruled over a part of Luristan (âdâr), but later 'Izz al-Dîn fully established his authority. After his death (716/1316 or 720/1320) his widow (12) Dawlat al-Khâsân retained a semblance of authority while the real power was in the hands of the Mongols. Such was the state of affairs when Hâsân al-Murdawî was writing his Ta'rîkh-i guzata (ca. 730- 
1330-9). Later, the nûshân (who according to the anonymous historian of Mirzâ Iskânard became the wife of Yûsuf Shâh of the Great Lur) found herself forced to surrender the throne to her brother (14) 'Izz al-Dîn Husayn who received investiture from Abû Sa'id and ruled for 14 years. His son and successor (15) Shuqî âDin Mâhmûd was killed by his subjects in 715/1315-6.

(16) The Malik 'Izâl al-Dîn b. Shuqîâ 'Iz al-Dîn was only 12 when his father died. The vicissitudes of his life are known from the record of them in the Zafar-nâmâ. In 785/1383 the Muqaffarî Shâh Shuqîâ with his army visited Khurramâbâd and married the daughter of 'Izz al-Dîn. Another of his daughters was married to Âlî Mîdâr b. Ubayy Dâjâr. When Timûr arrived in Persia in 788/1386 he was told of the deprivations of the Lurs of 'Izâl al-Dîn. Setting out from Firuz-khâb, Timûr by forced marches reached Lurîstân. Bûrûjârd was laid waste, and the fortress of Khurramâbâd razed to the ground. The ringleaders were thrown down from the tops of the cliffs. The fate of 'Izz al-Dîn is unknown and we do not know if he was one of the Atabegs of Lurîstân to whom in 786/1387 Timûr granted an audience at Shiraz, but according to the anonymous historian of Mirzâ Iskânard, 'Izz al-Dîn was captured in 786/1386 in the fortress of Hûmâyûn (Armiyân, Wâmiyân, situated near Burûjârd) and deported with his son to Turkestan. At the end of this three years both father and son were released. In 791/1391 'Izz al-Dîn played a part in the aggiandism of the Muqaffarî Zayn al-Abîdîn, son of his old suzerain Shah Shuqîâ. When in 795/1393 Timûr returned to Persia, he went
from Buruqird to Shâhward. Luristan was overran by piece by piece and laid waste by the troops of Mirza 'Umar, but 'Izz ad-Din escaped his pursuers. In 798/1395-6 prince Muhammad Sultan, governor of Fârs, extended his authority over all Luristan and Khûristân. In 803/1402-3, we find a mention of the restoration of the fortress of Armaânî (1) near Buruqird ordered by Timûr, and under 806/1404-5 the Zafar-nâma mentions the arrival in Bahsâjiân from Nîhwâwâd of a courier bearing the head of 'Izz ad-Din, whose skin had been stuffed with straw and publicly exposed. His (17) Shîd Âbâmad, whose irregularity in the payment of tribute seems to have provoked the punishment of his father, regained his possessions, after the death of Timûr in 807/1405 and ruled till 812/1412-13 (or 823/1423-4). (18) Shâh Husayn ("Abbasî", i.e. descendant of 'Abbas b. Ali b. Abî Talîb), another son of 'Izz ad-Din, took advantage of the decline of the Timûrids to extend his territory. He plundered Hamsânâd, Gulpâyâkân, Isfâhân, and even undertook an expedition to Shahward, where the Bahârî Turks slew him in 811/1409-10. His (19) Shâh Rustâm supported Ismâ'îl I; at this period, the lords of the Little Lur had already adopted the theory that they were of 'A'id descent. The son of Rustûm (20) Oghûr (or Oghûz) accompanied Shîh Tâhmasb on his campaign of 933/1529-30 against 'Ubâyd Allah Khân, and during his absence his brother (21) Dîâhângir seized power. He was executed in 949/1542-3. The governor (lala) of his (22) Shâh Rustûm Shâh handed over the latter to Tâhmasb Shâh, who imprisoned him in Alâbût while Shûhâbîndid, another son of Dîâhângir, was in power. He was restored, but he was not long in hand over a third of it (do dzân) to his brother (23) Husein Mûhammâd, son of Shâh Rustûm. At the instigation of the wife of Shâh Rustûm, the governor of Hamadân seized Shûhâbîndid, who was shut up in Alâbût. The sons of Mûhammâd plunged Luristan and the adjoining provinces into great disorder. Ten years later Mûhammâd escaped, and conquered Luristan while Shûh Rustûm took refuge at the court of the 'Oghûr. Mûhammâd estab-

lished himself with Tâhmasb and Buruqird (24) but after their death submitted to the Ottoman Sultan Murad III (986-1001/1574-95), which earned him an extension of his territory by the cantons west of Pusht-i Kûh: Mandal, Dsia, Badîrât and Tarsak. But relations with the Ottomans soon became strained, and Mûhammâd became reconciled with the Shàfawids. (24) Shâhward b. Mûhammâd, who had escaped from Bahsâjiân where he was living as a hostage, received investiture from Shûh Muhammad Khânâbâdî after his father's death. At the time of the occupation of Nîhwâwâd by the Turks, Shâhward showed signs of independence. In 1007/1597-8 Shàh 'Abbas took the field against him a second time. Shâhward was besieged and slain in the fortress of Cangula (in Pusht-i Kûh), Husayn Khân b. Mûsamur Beg Safarî (?) was given Luristan, except Sayûn, Hûmânî (?) and Fughtî-Kûh, which were given to Tâhmasb Kûlî Khân. This may be regarded as the end of the dynasty of the Little Lur, although the dynasty of Ënts of Luristan (later of Pusht-i Kûh) claims descent from Husayn Khân, who was a cousin of Shàhward. Bibliography: Mustawîl, Ta'rikh-gunda, facs. text, Leiden-London 1910, 547-57; 700; Zafar-nâma, i, 305, 436, 470-8, 394, 205, 411; ii, 345, 375: anonymous history of Mirzâ Iskandar, grandson of Timûr (utilised by Howorîn); Khân Ahmad Shâhî, Dîshân-dîrî; Zafar-nâma, i, 385; 'Alam-dar-yi 'Abbasî, Tehran 1374, 320, 242, 470-70; Dîshân-nâmî; Mûndîdîm-bashî, ii, 598-600; d'Osslon, Histoire des Mongoles, iii, 550-64; iv, 121; Hammar, Gesch. der Ilhâne, i, 161-3; Howorîn, History of the Mongols, iii, 134, 364, 735 (V. Minorsky). LURISTAN, "land of the Lurs", a region in the south-west of Persia, in the Mongol period the term "Great Lur" and "Little Lur" roughly covered all the lands inhabited by Lur tribes. Since the (7) Safawid period, the lands of the Great Lur have been distinguished by the names of Kôh-Gûlî and Bahgîyârd. At the beginning of the 18th century, the Mamâsân confederation occupied the old Shâhînât (p.e.) and thus created a third Lur territory between Kôh-Gûlî and Shîrâz. It is however only since the 12th century that Lur-i Kûh has been known by that name (for greater precision it was called Luristân-i Fayûl). In the 19th century, Luristan was divided into two parts: i. Pîsh-Kûh, "country on this side of the mountains" (i.e. east of Kâbor-Kûh) and ii. Pusht-i Kûh (country beyond the mountains), i.e. west of Kâbor-kûh. At the present day, the term Luristan usually means Pîsh-kûh, while Pusht-i kûh means the Fayûl country. The Mamâsân territory and the Kôh-Gûlî form part of the province of Fârs. The capital of the Mamâsân is at Fâhlîyân. Kôh-Gûlî (Kôh-Dîlâyâ, Kôh-Gûlî stretches from Bâgî (west of Fâhlîyân) to Bihbân; this last town is the main centre for the tribes of Kôh-Gûlî. To the south, the Kôh-Gûlî tribes descend as far as the Persian Gulf. The mountains of Kôh-Gûlî and the frontier between its tribes and the Bahgîyârd are not yet well-known. The chief rivers of Kôh-Gûlî are the Ab-i Shûrân which is formed by the junction of the Khûrâbîd and the Zohra, and in the lower course runs via Zayûdân and Hindîyân, and the Abî Kûrûstân or Djarâbî, one branch of which later runs into the Kûrûn (p.e.) and the other towards Davor. On Kûh-Gûlî, see the valuable Fârs-nâmâ-yi Nârîsîn of Hasan Fârûqî (p.e. in Suppl.), the itineraries of Stoerqueler, Hausknecht (Routen im Orient, Map iv), Wells and Herzfeld, and the general account in Bode, i, 251-89; ii, 347-98; Ritter, Erdkunde, ix, 152-44, in now very much out of date. The Bahgîyârd lands stretch from Çahar-Majâlî (west of Isfâhân) to Shûhât, to the south, the Bahgîyârd march with the Kôh-Gûlî, and to the north they go beyond the northern barrier of Luristân (Şhûtrûn-kûh, etc.). They are found at Farây- dan, Burûrûd, Dialâpagh, and in the cantons around Buruqird (even before 1840 many villages had been purchased here by Muhammad Tâh Khân.)
ancient history. The lands now occupied by
the province of Kirmanshah.

The chief left bank tributary of the Karaghan (Rawlinson: Kahaghan) which is formed by
two sources, the northern arm with its tributaries
drains the beautiful plains of Hūr-rūd, Ashgarh and
Khāvā. The southern arm, separated from the
northern one by the Yāftā-kūh range, takes the name of
the town of Khurramabad (q.v.) near which it pos-
ses. After the confluence of the two arms, the Khash-
gan, running south-westwards, receives on the left
bank the combined waters of the Kawgan and Tuyan,
which flow from Koh-i Haftād Pabī (south of
Khurranābād) and the northern slopes of the Kūh-
Gird. These two ranges are at right angles to the
mountains which follow the right bank of the Ab-i
Diz, which separate from the valley of the Karkhā.
On the right bank the Kashgān receives the
Mādiyān-rūd, "river of the mare". Above Kashgān,
the Khādī receives on its left bank several tributaries
of less importance still little known (Robār, etc.). Below Kashgān and also on the left bank, the
Khashgān receives the Šal, Layūm (Lehum) and
Ab-i Zāl. This last river with its tributaries, Anšar,
etc., rises in the southern slopes of the Kūh-i Gird.
The topography of the right bank of the Ab-i Diz is
not well-known. The sources of the Balad-rūd and its
right-bank tributary the Kīr-ab lie a considerable
distance to the north. The Balad-rūd flows into the
Ab-i Diz between Dīzōl and Susa. The Kīr-ab receives on its right bank the waters of the Kūh-i-
Diz which come down from the high valley of Munga-
rra, which with the peaks that surround it form a kind of
tactical post and separate the basin of the Balad-rūd
from that of the Ab-i Zāl. The Saiphery-i Lur
plain, formerly well-irrigated, lies north of Dīzūl and south of Kīr-ab ("pitch-water"), whose naphtha
spring has been known since ancient times. It was
probably here that Darius settled a colony of Greeks
(Ritter, i, 202).

The interior of Luristan presents a series of moun-
tain ranges, which stretch north-westwards to south-
eastwards, the direction usual in Persia, and rise one
behind the other between the plain of Susiana and the
northern barrier (height about 9,000 feet).

Ancient history. The lands now occupied by the
Lur tribes have been inhabited since the period
before the arrival of Iranians in them. This region,
being at a considerable distance from Assyria, was
mainly under the influence of Elam; Susa, where
there have been found traces of occupation going
back to the third millennium B.C., lies just at the
entrance to the mountains of the Little Lur. The
purer traces of the local culture and of this alone are
found more to the south-east. Just as the Atabegs of
the Great Lur had for their capital [Kargān (q.v.) or
Mālaman; probably early times, the lords of this
district, the kings of Alapat and other successive
rulers had their relations with the rulers of Susa, had
control at least of the Kārūn valley. The site of
Mālāmān (cf. de Bode, Layard, Jequier in de Morgan,
Délégation en Perse, 1924, ii, 133-143, and Häussig,
Das Zagos und seine Völker, Leipzig 1903, 49-50),
with its purely indigenous [Elamite, non-Semitic]
scriptions and bas-reliefs, is an important point.
The discovery by E. Herzfeld ([Reiseberichte, in ZDMG
123, 3-31) ofFlatir-Šīrāz in the Kūh-i Rūmān
region (cf. Layard, Sawyer) is valuable as indicating
the extent of Elamite penetration into the Lur mountains. Kūh-Gīlān lying between Susiana and Persia may correspond to the
still-unknown region of Anshān (Aznar), out of
which came the ancestors of Cyrus the Great. On
the survival of this name near Shūqart, cf. Grundr. der
iran. Phil., ii, 418 (according to Rawlinson: Assān).

The antiquities of the valley of the Upper Kārūn (the two districts of Susa, Kermān, the mounds of Salm, the
and Iraq) are insufficiently known (Layard, Sawyer).
According to Sawyer, the higher Elāghī-Lurlands are
"singularly devoid of any ancient landmarks".

Mention should be made of the great importance
of Luristan, from at least the later fourth millennium
B.C., as a centre for metal-working, with an industry
distinguished from other local ones by its greatly-
varied and richly decorated range of bronze
ware, made by the cire-perdue process. This bronzework
has some sub-human decoration, but is especially
notable for animal motifs. This zoomorhophic deco-
ration probably stemmed originally from Elam, which
much influenced Luristan till the destruction of
Elamite political power by Nebuchadnezzar I (ca.
1124-1103 B.C.) of Babylon, after Babylonian
influence is visible in Lurisitan art. The bronze
industry continued until the 7th century B.C., in
association with equally fine ironwork; see P. R. S.
Moorey, Prehistoric copper and bronze metallurgy in
Western Iran (with special reference to Luristan), in

The western part of Luristan in the strict sense of
the word is known as Masābāghān and Fūšht-i Kūh.
No monuments of very great antiquity have yet
been discovered in Fūšht-kūh except the caves
(Median?) of Sa-darān between Mānjarra and
Khurramābād, see Čirčok, 129. The early inhabitants
of Luristan were the Kakhui = Kassanian, who
imposed their rule on Babylon between 1760 and
1670 B.C. The Achaemenids paid the Kassanian for
the right of passage by the Babylon-Sebastsāne route.
These highlanders were temporarily subdued by
Alexander the Great. Antigonus, pursued by Eu-
menes, traversed the heart of the Kossaian country,
according to Rawlinson on the route Pul-i-lang-
Rakīn pass-Khurramābād (Ritter, Erdkunde, x, 335).
The Kassalian (who should perhaps be distinguis-
hed from the Kūrūn = Osqūs = Uwadā = Kūlā) spoke a language different from that of their
neighbours to the north, and it was already distinguish-
borrowed from Indo-European, cf. E. Meyer, Geset,
der Altenwesen, ii, Berlin 1913, § 455; Häussig, Das
Zagos, 24, and Autrun in Les langues du monde,
Paris 1925, 283. (The name Kakhui has perhaps
survived in that of the river Kashgān.)

It is also probable that northern Luristan was
more or less dependent on the land of Ellīf, often
north of Dizful (now in present-day Iran) and forsakes through uninhabited country. The site of which should be sought in the plain of Sdb£-yi-§abr£-yi.

There may be noted the following: the town of al-Lur, 2 stages from al-Diz to al-Lur; the town of L$htar, now near §nliljab from al-Lur to al-Diz, two stages, from there to Susa—al-Lur. Al-MukaddasI, 418, also makes one farsakhs. The complications of distance by al-Muljaddasl, 401, who gives the following i, 353.

I<$fa|£hrl, 196, reckon* from al-Lur to Shapur-Kh 7th century.

I<$fa|£hrl, 196, reckon* from al-Lur to Shapur-Kh 7th century.

The knowledge of the Arab geographers about the Lur country is very summary, although they describe the routes between Khuzistan and Persia (cf. Schwarz). Among the inhabited places in modern Luristan, where there are flourishing villages, the Lur territories inhabited by nomads or semi-nomads only export the products of their cattle rearing. But the fortunes of the part of Luristan lying along the northern rim of the Ahwaz plain have been transformed by the development of the oilfields of Lali, Masjiddi-Sulayman, Naft Safid and Haft Kel from the time of William Knox D'Arcy's oil discoveries at Masjid-i Suleyman in 1895 (Mann, Die Mundarten der Lurstdmnu, 157), and was destroyed by the Pahlavi of Pu*ti-iKoh in 1906 and the subsequent development of these oilfields by the Anglo-Persian Oil Company (see Cambridge history of Iran, i, 258 ff.). Also, Luristan is now crossed by the Trans-Persian Railway, and by the end of 1929 the southern section from Bandar Shapur to Andamak had been completed, that one through Luristan being completed in the 1930s. Luristan has thus continued to play a significant role, as it did in ancient times, as a region crossed by routes connecting the main urban centres of western Persia.

**Lûrka**

Lûrka, a town of Eastern Spain lying between Granada and Murcia and having a population at present of 38,600. It is the ancient town of Elam and in the Bible is described as the city of the Levante, the place where the river Guadalentin. Under Arab rule it usually shared the fortunes of Murcia, and reverted to Christian rule in 1266. Its fitjâw was one of the chief places of the Murcian kingdom. Its territory included the fortress of Burudjîrîd, which was a powerful city, which is not identified by name, simply described as *al-mawtafik,* (pl. *al-mawtaflût,* a transitive of the Biblical word *maflaipa* ("overturning"), used in the Bible in reference to the
Indian Muslim, A mystical interpretation of Prophetic tales by an rumus al-anbiyā*.

The "traditions" passed on by Kurān’s commentators, historians and compilers of cautionary tales, rely for the most part on Biblical details which are not found in the Revealed Book, on elements borrowed from the Jewish and Zend traditions, on pictures and sins imputed by the inquisitive judgments of the people of Uthmān (Sodom), on the theme of the bed of Procrustes, on emphasis on the wickedness of Lūt’s wife, names attributed to anonymous characters in the Scriptural account; for details, see the article by B. Heller in EJ1; summary of Jewish legends, with sources, in Ginzbarg’s The legends of the Jews, Philadelphia 1909-36 (and re-impression) i, 245-7, v. 241, n. 175, not forgetting M. Grunbaum, Philadelphia’s summary of Jewish legends, with sources, in his ‘Ahsāṣ al-din, tr. K. Jahn, Ya’kubl) follows the Biblical text quite closely, by contrast to S. Nadjaf 1384/1964, 347, and by J. Horovitz, Die Kur′anicke U nUrtuchungm, Berlin 1926, 21, 26, 49 ff., 54, 136.

Bibliography: In addition to the sources mentioned in the main article, see J. Horovitz, l-ahdāb al-ahbāb, Berlin 1926, 21, 26, 49 ff., 54, 136.

LUT B. YAHYA [see and MINHĀJ].

LUTE [see al-LEJT].

LUTF ([A]), the opposite of abbihādī ([a.]), derivatives of the root l-t-f are used in the Kur′ān in two senses, as ([a.]) kind (e.g., XXII, 18) and ([b.]) subtle (XXIII, 15; VI, 103; XXXIII, 14; LXXVII, 14; XXII, 62). Sense ([a.]) and ([b.]) are linked by the idea of God organising matters in such a way as to bring about a beneficial state of affairs. It is this religious notion which is applied in the Arabic translation of Alexander of Aphrodisius’ Fi madāḥī al-abībī to refer to ideologically directed in nature (295), and by Mūsā b. Maymūn to refer to God’s stratagem in the hardships which he obliges his creatures to endure (iii. 32, 328).

The term is applied theologically to the notion of divine grace, favour or help, being developed by the Mu’tazila to deal with an aspect of human freedom and its relation to divine omnipotence. Divine favour makes it possible for man to act well and avoid evil (‘Abd al-Diabbar, Sharh, 215). It is not granted to the sinner, whom God neither prevents from acting well nor directs to commit evil. ‘Abd al-Diabbar, who provides the most systematic treatment of lutf in the volume of his encyclopaedia of that name (Mugānī, XII), says that for the Mu’tazila, divine grace is all that is capable of helping the agent carry out the duties set for him without interfering with his freedom. If a person believes only because he has received a lutf, he is not as deserving as if he did not require it. A person who will do the right thing does not require a lutf, which is then not necessary. It cannot be true that God necessarily helps all men, otherwise it would not be possible to sin (Sharb, 500) and there would be no free will. But if man acts well, he is rewarded and helped by God as a consequence; if he sins, he is deprived of God’s help (Sharb, 520).

Taken more broadly, the description lutf may be applied to many aspects of human well-being, e.g., health (Mugānī, XIII, 22), wisdom, the use of reason, the development of prophecy and the provision of holy books (Nihāya, 418). These all help to direct man in the right direction without compelling him (Mugānī, ii. 744).

Hence a rational is provided also for punishment, God could turn unbelievers into believers, but His favours do not interfere with voluntary belief and so God does not grant favours which directly convert unbelievers into believers (Mugānī, 447, 575). A list of alief is provided in Shahrastānī, 53.

Another sense in which lutf is obligatory (wadābī) is that where God is “obliged” to provide as much lutf as possible to whomever is responsible for his actions. This doctrine was of course strenuously opposed by the Aḥṣāṣīya, who apply the term lutf to all God’s acts, bad as well as good (Irshād, 173-4, 265). But for the Mu’tazila, God is morally obliged to send to earth prophets and to arrange for the laws which man ought to follow to be communicated to them. Similarly for the Shafi’-al-Hill, the institution of the imām, like prophecy, is a “necessary grace” which is imposed on God. Since God has created the world only in the interests of man, he is obliged by a lutf to guide his creatures by sending them on occasion mediators to make plain His will. The Mu’tazila thought that man would be capable of social existence without the gift of a prophet or imām—nevertheless, they hold that God is obliged to

Encyclopedia of Islam, V
organise the world well, hence due to a luff width, has to provide mankind with guidance.

LUTF ALL BEG B. ṬĀHĪ ḤĀN, Persian antiquarian and poet, who is also known by his pen-name ʿAḡār which he adopted after having used the names Wālī and Ṣafāhī previously. He was descended from a prominent Turcoman family belonging to the Begdzī tribe of Syria (Begdzī ʿṢamīla) which had joined the Kūhīlāwī movement [297] in the 9th/10th century. Afterwards, the family settled down in Ṣafāhī, Many of his relatives served the Naṣīr Shāh as administrators and diplomats. Lutf All Beg was born on Saturday ʿṢaḥīl 1134/February 1722 (the date mentioned in the two Bombay lithographs of the Alṭahkāda is erroneous). The invasion of the Afghāns occurring in the same year forced his parents to flee to Kūm, where they lived till his father was appointed to the post of governor of Lūr and the coast of Fārs in the year 1148/1735-6, and they moved on to ʿṢafāhī. When his father died at Bandar ʿAbbās two years later, Lutf All Beg undertook the pilgrimage to the ʿIffājīs and to the holy shrines in Iran. During a subsequent journey to Maḥhadh he entered the service of Naṣīr Shāh, whom he accompanied on a campaign in northern Iran. He continued to work for Naṣīr's successors, but retired in the early years of the Zand period to a life of study and literary pursuits, succeeding on the revenue of a small estate near Kum and living at Iṣfahān, where peace had been restored to royal poets. Three further chapters (called *ahkhar* and subdivided into *ṣharās*) deal with the poets of Iran, Tūrān and Hindūstān according to the districts and towns of their provenance. An appendix on female poets (*furđēf*) has been added to it. The main source for this part of the Alṭahkāda was the Khūṣūṣ al-ʿāṣr wa-zubdat al-ʿaṣr of Taqī al-Dīn ʿAbbāsī. The second *mīyānā* divided, into two parts, contains the lives of contemporary poets, many of them personal friends of the author. It is preceded by a dedication to Karim Khan Zand and a sketch of the troubled history of Iran from the time of the Afghan invasion onwards. A short autobiography followed by a selection from ʿAḡār's own poetry concludes the work.

The Alṭahkāda was often copied in the early 17th-19th century. Lithographs appeared at Calcutta 1249/1833-4, and at Bombay 1277/1860-1. An annotated edition by Hasan Ṣādiq Naṭīṭ, of which three volumes were published at Tehran (1336/1957, 1339/1959, and 1340/1961), has remained unfinished. N. Bland edited the opening section, the *ṣhārs* on royal poets (London 1941), and gave an account of the entire work in *JRAI*, xiv (1843), 345-92. An abridged version, the Taḥkīra-yi Ṣabāhī, containing the poems only in the alphabetical order of the rhymes, was made by a brother of the author, Ṣabāhī Beg ʿUṭdhī (cf. A. ʿAbūl-ḥānī, *Ṭaḥkīra-ṭaḥkīra*, 1, 182 f.). The existence of a Turkish translation, mentioned by J. H. Kramers (*EL*, s. v. Lutf All Beg), has been questioned by Tashīn Yāzī. For a complete inventory of the manuscripts occurring in the Alṭahkāda, see E. Sachau—H. Eithe, *Catalogue of the Persian manuscripts in the Bodleian Library*, Oxford 1889, cols. 262-93.

As a poet, Lutf All Beg was also held in high esteem by his contemporaries. Much of his early work was lost when the Bahg̤īyārī chief ʿAlī Mārdān sacked Ṣafāhī in 1164/1750. He became a pupil of Mīr Sayyid ʿAlī Shīrāzī (d. 1171/1757-8), who was one of the initiators of the "literary return" (mughrāż al-adā) to the stylistic standards of early Persian poetry which manifested itself among the poets of Ṣafāhī and Shīrāz during the Zand period (cf. M. T. Bāhūr, in *Arusnā*, xiii [1931-2], 71ff.). Apart from a *Dirāsā* (cf. Bāhūr, op. cit., Calcutta 1922, 213-22; Storey, l, 870; A. Mūznāwī, *Fīrist-i mākhkāhī yāḥyā-yi fārsī* ii, 1973-4), four vaḥīds are known: ʿYūsūf-ʿu Lāfīyāyī, fragments of which are contained in the Alṭahkāda (besides separate manuscripts, see Mūznāwī, iv, 3323); 2. a short poem, known as mābānī-i ʿAdhr, which he wrote in imitation of a mābānī entitled Alṭahkāda, or ʿṣār-u ʿudīs, by ʿAlī Mūḥammad Ṣādīk Tafrīshī, which seems to have inspired him also in the choice of a title for his anthology (cf. A. ʿAbūl-ḥānī maʿānī, in *Maḡjūla-ī dāhīgkāhā-ī adabīyātī*, 8, 1931-2, 3; *Abūl-ḥānī maʿānī, in *Maḡjūla-ī dāhīgkāhā-ī adabīyātī*, 8, 1931-2, 3; *Abūl-ḥānī maʿānī, in *Maḡjūla-ī dāhīgkāhā-ī adabīyātī*, 8, 1931-2, 3; *Abūl-ḥānī maʿānī, in *Maḡjūla-ī dāhīgkāhā-ī adabīyātī*). However, his activity as a critic and writer is certain to have been a great deal more important. This author also published other works: a prose-work, Ṣanājīn al-mābānī, composed in the manner of ʿAlī Shīrāzī in Ṣafāhī (mentioned in the *Taḥkīra y-i Ṣafāhī-i Kūrān*, 1329/1950*), and at Bombay 1302/1885*), and a ṣaḥīkh on contemporary poets entitled Dajjar-ī dāhīg kātān, which seems to have inspired him also in the choice of a title for his anthology (cf. A. ʿAbūl-ḥānī maʿānī, in *Maḡjūla-ī dāhīgkāhā-ī adabīyātī*, 8, 1931-2, 3; *Abūl-ḥānī maʿānī, in *Maḡjūla-ī dāhīgkāhā-ī adabīyātī*). As a poet, Lutf All Beg wrote some poems in Turkish as well (cf. M. F. Köprüli, *EL*, s. v. ʿasper, 1390).
Careful to cultivate the trust of the rural and urban classes in addition to that of his tribal army, whereas his successors, including Lutf 'Ali, were too intent on feeding among themselves and funding off the Kadjar to promote or even protect the benefits which the bureaucracy, merchants, artisans and peasantry had obtained from Karim Khan. Having lost the support of the towns, Lutf 'Ali's nomadic force disintegrated in the face of a Kadjar army which was, if not militarily, certainly politically and logistically stronger.

LUTF 'ALI BEG — LUTFI

Lutfi, 19th and 20th century poet in Cezhatai Turkish, and the greatest master of the ghazal before All 'Abd al-Husayn Nawa'i (845-906/1441-1501). The little that is known about his life comes mainly from 15th and 16th century works, especially those of Nawa'i. Lutfi was born in Hamid, and died and was buried at his home in the nearby suburb of Dih-i Kanar at the age of 99 (Muslim) years. Modern scholarly conjecture suggests ca. 768-867/1367-1463 (J. Eichmann); or d. 870/1465-6 or even later (H. F. Holman). He lived quietly, but some contact with the Timurid court is indicated by his dedications of a few poems to princes from Shihab al-Din Khaylabi, who knew him personally, reports that after studying the secular sciences, Lutfi was initiated into Sufi mysticism by Shihab al-Din Khaylabi, that the poet was a saintly person and was a close friend of Djamet, the great Persian poet and mystic of Harat.

Lutfi's poetry has been highly esteemed since his own lifetime. There has been general agreement with the judgement of Nawa'i who said he was "the Master and King of Speech of his people" (Hafiz-i Pahlavani, "the King of Speech of his time"), peerless in Persian and Turkish, but better known for his Turkish poetry (Ma'dali al-nafali), and the single Turkish poet comparable to the greatest Persian poets (Muhammad al-lughahyan). Nawa'i even incorporated five complete ghazals of Lutfi into his own poems (mashahhamus and mawsaddas).

While Lutfi wrote some kashidas and two major meghzes, his poetic gifts and originality were best displayed in the ghazal and bayagh. In combining the classical Persian lyric tradition with elements of Turkish popular poetry, he produced ghazals of graceful simplicity which concealed a subtle sophistication, while yet retaining some flavour of Turkish folksong. This results in part from his preferences for those 'arad metres which corresponded approximately with Turkish syllabic metres, but also from his use of specifically Turkish features, such as proven proverbs and folk sayings reflecting ancient Turkish customs and beliefs, and of imagery which was more realistic than that of classical Persian poetry. His verse seems to contain proportionately more words of Turkish origin and less Arabic and Persian loan words than any of his contemporaries or successors in classical Cezhatai. The musicality he achieved is due not only to his exquisite word choice...
and sequence, but also to his technical skill in developing such features as the extended ḍafīf [q.v.]. The wit and humour displayed in new uses of old images, the enjoyable puns and wordplays in both ghaseṣ and ṭuvğā, were also not negligible factors in ensuring his continuous popularity for five centuries. His influence is visible in the works of such contemporaries as Sukhāna, Yahyā, Godū, and of later poets, directly and, even more, indirectly, by way of his influence on Nāwī's poetry, which was universally admired. Echoes of Lūṭī are heard even in poets from other linguistic areas, such as the Azeri and Ottoman ones, particularly Fudūl (d. 1556) and the Turkmen ones, especially Makhduṁ-Kull (18th century). Verses by Lūṭī are frequently cited in Caghatay-Turkish, except no. 4 (18th century). Verses by Lūṭī are frequently cited in Caghatay-Ottoman and Caghatay-Persian dictionaries from the 18th century onwards, and are plentiful in anthologies of the same period.

Literary Works. All Lūṭī's known works are in Caghatay Turkish, except no. (1) Divān. At least 20 ms. are extant, belonging to five major recensions, but each group contains some material lacking in the others. The total number of poems is not less than 548, of which 378 are ghaseṣ and 122 are ṭuvğā. (Further research may yield more poems.) Of the recensions, the most reliable is group (a), consisting of a single ms.; ms. Bimbaum (Toronto) TČr iii (late 15th-early 16th century) and British Library, Add. 7924 vi (Harç 694/1590). The former contains 362 poems (1 mudīrī, 1 ważīf, 257 ghaseṣ, 62 ṭuvğā) and is the longest Divān of all Lūṭī ms. The latter lacks the last 107 ghaseṣ. The other groups are (b) Paris, Suppl. Turc 981 and (c) Gotha mss. The latter lacks the last 107 ghaseṣ. Group (d) comprises all other known ms. (e) all the ms. in the USSR: Tashkent, Uzbek Academy of Sciences (6 ms.), Navoi Museum (1 ms.), Dushanbe, Tajik Academy of Sciences (4 ms.), Leningrad (2 ms., nos. Atop, C1922—the one numbered Eriṣī is an Ottoman poet Lūṭī); (ii) Istanbul, University Library, Ts452; (iii) Tehran, Sipahsalar 171. Group (e) ms. (which may be further subdivided) were all copied in the 15th-16th centuries and show many Uzbeck and other local influences. The state of their text is markedly varied. Various editor-collators attributed to Lūṭī appear in ms. anthologies in major libraries, especially in the Uzbeck and Tajik academies. Most are quotations from ghaseṣ known from his Divān. Uyghur script copies of 13 ghaseṣ are found in 3 ms. from the 9th/10th century. A number of verses from Lūṭī's Divān appear with minor differences in Sakākī's Divān: (2) Gūl u Nawīrī. An allégorical romantic epic in 2,400 madhwar verses. Composed in 814/1408, it is a free version in simple Caghatay, based on the Persian work of this name by DjallĪ Taṣbih (composed 734/1334). Seven ms. extant (see Hofman, TL). (3) Zafar-nāma (not extant). Described by Nawātī as being a madhwar “translation” of more than 10,000 verses, which never got beyond the draft stage. It was presumably about the exploits of Timūr, whose son Shāh Ṣoḥāl commissioned its writing; it was probably based on Sharaf al-Dīn 'All Yūstī's Persian Zafar-nāma. (4) Divān in Persian, including barāzdis and 472 madhwar and 27 ṭuvğā; poems attributed to Lūṭī appear in ms. anthologies in major libraries, especially in the Uzbeck and Tajik academies. Most are quotations from ghaseṣ known from his Divān. Uyghur script copies of 13 ghaseṣ are found in 3 ms. from the 9th/10th century. A number of verses from Lūṭī's Divān appear with minor differences in Sakākī's Divān.

Editions. (1) Facsimile edition of Bursa ms., Lūṭī Divān [with intro. by] Ismail H. Ertaylan, Istanbul 1950 (incomplete, unbound); (2) the Divān of Lūṭī, including facsimile of Bimbaum ms. TČr iii, ed. E. Birnbaum (in preparation); (3) Lūṭīf, Devam; Gud va Naura (selections, in Cyrillic script, by S. Erdöcs), Tashkent 1965.

LUTFI EFENDI, AHMAD, Ottoman court historiographer (bokh-ı müthārī, r. Life. He was born the son of Mehmed Aga, a master sandal-maker, in 1233/1816-17 in the Alagja Hamam quarter of Istanbul. He attended the local Kur'an school and became a hūfī, and also practised music regularly at the house of Zayn al-'Abīdīn Efendi, Sultan Mahmūd II's chief imām. In 1244/1828-9 he was enrolled in the Mathematical College (Hendesiye-khāne-ye bāri), but left it after a year for the madrasa of Amadija-i-

-sided Hüseyin Paşa, where he studied Arabic, Persian, taṣbih, kāfīzdāf and tīfāf. In 1247/1832-3 he embarked on a scholarly career, and in 1252/1836-7 he became head of the body of religious teachers or mīridārīn in Istanbul. The following year, he was charged with collating documents for the official records office (Takvim-i Kāned), and with lecturing before the sultan on selected days in Ramaḍān. He translated al-Ghazālī's Tuḥf al-muṣallāmīn into Turkish, with some additions of his own, as the Tuḥf al-muṣallāmīn ve muraqqa'et al-muṣallāmīn, and presented it to the sultan, Sultan 'Abd al-Mejnad. He then took up a job in the secretarial office of the Grand Vizier (1258/1842), where he worked as a Persian translator, until Rabī' I 1266/February 1850, when he was appointed to the itinerant clerkship of the Buildings Council (Sıvurdur amir) in the districts of Vīdīn and Nīzh in Rumelia. He returned to Istanbul after a
year and was appointed first to the head clerks of the Police Council (Tahkima-ye meqdlis) and then to the Tahkima-ye meqdlis once more, and was charged with the regular and weekly preparation and publication of the official gazette, the Tahkim-e vaqfsh.

In 1281/1864-5 he was sent temporarily to Philopolis (Filibe) in Bulgaria for a period of nine months, in order to collect arrears (bakhsh) of taxation. Meanwhile, he also held the clerkship of the Investigation Committee (Teffiz hay'at) of Anatolia for two years. When this latter post was abolished, he again returned to the Tahkima-ye meqdlis (1282/1865-2). Eventually, in 1278/1861-2, he became a member of the Medical Council (Tibbiyya meqdlis) and taught (Tibbiyya sana'at [Tibbiyya] sana'at) at the Medical School. Soon afterwards, in addition to becoming a member of the Education Council (Mas'irri meqdlis) and continuing to edit the Tahkim-e vaqfsh, he was entrusted with the supervision of government printing. At the end of 1281, beginning of 1285 it became Wali-e-watani and remained in this job, in which he achieved fame, for many years. However, in 1293/1876 he again returned to the scholarly field, and his midwifery rank was changed to the status of the kudiya of Istanbul. The following year he was appointed a member of the Council of State (Nhur-e-yi devlet) in Muharram 1292/December 1879-January 1880. He was promoted to the kudiya-vakifia of Anatolia; and on 11 Muharram 1299/3 December 1882 to that of Rumelia. In 1300/1889, despite his occupying this latter post, one of the highest ranks in the learned institution, he returned to his previous post in the Council of State.

Lutfi Efendi died at his summer residence at Beyagly in western Anatolia on 3 Safar 1321/17 March 1900 and was buried in the Sokular Mosque cemetery in the vicinity of Akçaray. Highly literate in Arabic and Persian and skilled in poetry and composition, he had also been an adherent of the Mevlevi order. Highly literate in Arabic and Persian and skilled in poetry and composition, he had also been an adherent of the Mevlevi dervish order.

2. Works. His most famous work was the continuation of the history of Djedid Pasha [q.v.], known accordingly as the Lutfi Tahkima, written in a straightforward style, and utilizing information from the Tahkim-e vaqfsh [q.v.] and some official documents. It is in 15 volumes covering the events from the beginning of Muharram 1241/16 August 1825 to the middle of 1293/middle of 1876; the first seven volumes were published between 1293/1876 and 1306/1889 at the Government Press and the Mahmut Bey Press during his own lifetime, and volume eight was published posthumously in 1329/1911 in the Sahab Press by the court historiographer: 'Abd al-Rahman Sheref Efendi with some additions. The manuscripts of vols. 1-5, which were presented to the Sultan 'Abd al-Hasan II, were transferred from the Yildiz Library to the Türk Tahkima Arkeoloji Library, and then placed in the Türk Tahkima Kütüphane Library in Ankara; they remain unpublished. The original manuscripts of the first volume of the Tahkima, together with some other rough drafts of the author's, are in the former Imperial Museum (now Archaeological Museum) Library in Istanbul.

His book Davies-yi 'Abd al-'Alam Lutfi contains some of his poetry and some official documents in poetic form; it was printed at Istanbul in 1302/1884-5 and comprises 100 pages. The original manuscript of his Lughat-i hikma, a dictionary of 53,000 words, arranged by him alphabetically from a Turkish translation of the Arabic Al-Kamus al-milad made by the court historiographer 'Asim [see 'Asim, Ahmad, and 'Amin, 3, Turkish lexicography], is in the Archaeological Museum Library; only the first two parts of it, covering the letters alf and bi, have been published (1282/1865-6 and 1286/1869-70 respectively).

the return of Khayr al-Din, Andrea Doria's attack on two galleys in the command of the hekim ad-din of Gallipoli (Gelibolu [g.a.,] and a second attack on a galley which Lutfi Pasha had sent with messages to Corfu (Kúrfuiz [g.a.]), furnished a pretext to attack this island. On 28 Rabi' al-Awwal 944/25 August 1536, Ottoman forces under Lutfi's command landed but failed to overtake the island, but were unable to take the fortress. On the command of the Sultan, and despite Lutfi and Khayr al-Din Pasha's objections, Ottoman troops began to withdraw on 2 Rabi' al-Awwal 944/7 September 1537. Lutfi Pasha returned to Istanbul with a section of the fleet (see Kâthib Celebi, Tiflisk al-kibur fi asfâr al-bifidr, Istanbul 1830/1831, 48-50).

On the death of Mustafah Pasha in 1 O Mathurra 944/8 May 1536, Lutfi Pasha replaced him as Second Vizier. In this capacity, he accompanied the army on the campaign to Moldavia (Kara Boghdan [see Nihat Külün]). The army left Istanbul on 1 Safar 945/6 July 1536, and crossed the River Prut on a bridge which Sînân had constructed on Lutfi Pasha's orders (SN, loc. cit.).

When Ayâs Pasha [g.e.] died on 2 Safar 945/6 July 1539, Lutfi Pasha succeeded to the Grand Vizierate. In this position he led the negotiations which ended the war with Venice. By the terms of the peace concluded on 20 Rajab 947/20 November 1540, Venice surrendered the island of Corfu, in addition to all places lost in the war, and paid an indemnity of 600,000 ducats (600,000 according to Lutfi Pasha, Tiflisk al-kibur al-Othmana, 384). Lutfi Pasha himself received a payment of 20,000 ducats from the Venetians (E. Charrière, Négociations de la France dans le Levant, 1, Paris 1848, 471). He also headed negotiations with the Habsburgs over Ferdinand's claim to territory in Hungary which Janos Zapolay had ruled as an Ottoman vassal. The issue eventually led to war, and Lutfi Pasha retired for the left for Hungary in Mathurra 948/May 1542. At this moment, however, the Sultan dismissed his Grand Vizier. Although Lutfi Pasha himself represents his removal from office as voluntary retirement to be "secure from the wiles of women!" (R. Tschudi, op. cit., Turkish text, 5), it appears to have followed a violent quarrel with his wife, Dewlet Shihâ Sultan, the Sultan's sister, whom he had married in 945/1539. According to All (Khânâ al-akbar, quoted by Féralpi, op. cit., 123), Dewlet Shihâ was the object of his 'grumpy punishment of a prostitute. After his dismissal, Lutfi Pasha retired to Edirne, where he died probably in 970/1563-4 in Dimetoka (All, Khânâ al-âkbar, quoted by M. Faud Köprülü, op. cit.).

In Edirne he endowed a fountain; in the village of Muslim near Edirne, he endowed a mosque and a muallim-e bane with 100,000 akçe and the income from twenty shops in Edirne (N. T. Gökbilgin, Edirne ve ikinci levent, Istanbul 1951, 506-7).

Having graduated in 1894, he entered the legal department of the government service, where he worked until 1905. In 1907, he became editor-in-chief of a new newspaper, al-Djarida, which voiced the views of a number of enlightened and liberal a'yin and the party which they founded later in 1907, the Hirb al-Umma ("National Party"). Lutfi's writings in these days comprised his most important and influential body of work. From 1915-18 he was director of the National

LUWîA [see Lâwâta].
LUXOR [see LUWATA]
LUZÔM MÀ LÀ YALZAM, “observing rules
that are not prescribed”, term commonly used for the
adoption of a second, or even a third or fourth, invariable consonant preceding the rhyme
consonant (sajj) which, at least in classical poetry,
was often found in 4th/10th century verse (see Sâfîya, iv, 422a, middle). The term is also used in dealing with
rhythmic prose (sajj) [q.v.]. In later Arabic and Persian
literary theory the term covers not only the classical
husn, but also a variety of other devices which have
nothing to do with the end rhyme. Common syno¬
yms of husn are Nash and Hisam, and several
authors insist that one finds the terms tadbn, tashvd, and tasbî in the sense of
husn.
Scholars occupied with rhyme theory point out that
the term husn is associated with the independent
rhyme consonant is rare among the dominant synonyms which are:
and as such had to be in¬
variable in addition to these suffixes themselves (cf.
the explicit statement by the poet Kutâyîr quoted by Alqâfshâh, (Kutâyîr, 16-19)); it also meant that a line
ending in the demonstrative da'iba should prefer¬
ably be followed by lines ending in *-laa, e.g., *anamesalika, and not, for instance, in *beka. They mention that adoption of a second invariable consonant was sometimes achieved by reduplication of the rhyme consonant, and that sometimes the second invariable consonant (for the reduplication) was maintained in part of the poem only. They do not offer an explanation for this last phenomenon and seem to be unaware of the fact that *-laa, *-am, and *-an (less often *-maa) appear at times to be interchangeable, e.g., *djamalikibari (Tarafa, Divan, ed. D. al-Khatib and L. al-Sakhral [Damascus 1395/1975], 86-8), *kalittlefiahann (Khuyyrra, Divan, ed. I. Abbas [Beirut 1391/1971], 95-6, and the lines on p. 207; see also A. Bloch, in *AO, xxi [1933], 290 and n. 21). Poems or fragments of poems ending on *-laa, *-maa, and *-nah are quoted with special frequency. The question of the origin of the figure thus appears complex. The literary theorists beginning with Ibn al-Mutafa (d. 296/890), Badawi, 74-5, who lists the *naa (laa) as one of the ornaments of style (mahalah, see Badawi and Ibn al-Mutafa and cf. Israel Oriental Studies, II [1972], 78-90), made no serious attempt to clarify the history of the figure or to explain what extent the *laa as practised by the poets of their own time was related to the technique of the ancient poets as recorded by the rhyme theorists. This seems to be obvious to Ibn al-Maah and Nasif ibn Musaid even though in the introduction to his Lusumiyati (a work intended to demonstrate the possibilities of the figure and a curious exposition of the author's views on religion and ethics, see al-Maah) he offers a thorough review of rhyme theory: Abu ibn *-laa seems to suggest that the *laa of later poets was largely independent of these earlier examples (37, 1. 3-5) and implicitly denies that the suffix *-am can be taken as *waal (31, 1. 2-7). Ibn *-laa (d. 654/1256), Tabhir, 319, goes so far as to claim that the *laa in the works of the ancients was unintentional.

At a later stage, the literary theorists discovered examples of *laa in the *Kur'aan, but these do not involve doubling of consonants or the repetition of suffixes, except in one case (7, 86, see Ibn Abi *-laa, Tabhir, 518; idem, Badawi *-laa *Kur'aan, 229) which is not valid, since it does not appear at the end of the verse and cannot be considered a rhyme. However, the examples from the *laa and the sayings of *Ali quoted by Yahya b. Hanza (Maktab, 1347/1925, 416-7) in a chapter on *laa and *-laa (badawi) may introduce, of this sort of the second energetic consonant *-al- which found its way into several handbooks (see, for instance, Ibn Abi *-laa, Tabhir, 166-7).

The *Khamish of Ibn *Djamil (d. 392/1389) has a chapter on the tajwanwi *bint laa *val at which stands apart from the treatment of the *laa in other grammatical and rhetorical studies: It offers a wide variety of examples, mostly from older poets and mostly in the *ra'da metre. Ibn *Djamil disregards (or does not recognise) some of the rules adopted by others. He accepts the *maa of the second energetic form of the verb as *waal (see al-Maah, iv, 473 third half; and ignores the tendency of ancient poets to consider the *haaf of *-al as part of the waal (ii, 49); he points to unique instances of the *laa in a poem by Abi b. Abraaj where all first rhemas but one end with the article and in a *ra'da poem by a certain *Huyayy b. *Hunayn the *-laa of his *Abdallah, which is not valid, since it does not appear at the end of the waal (31, 1. 2-7).

If one considers the *laa in two distinct contexts: in a stream of poetry (the term generally refers to early *Abbadis poets, but is also used specifically for 4th/10th century poets) a continuation of tendencies which existed in ancient poetry. It is perhaps the first to accept as a form of the *laa the use of diminutives in the rhyme. Ibn *Djamil's views may not have been widely known; his observations on Ibn al-Rumi and on the use of the diminutives are found in later authors, but are worded differently.

In several works inspired by al-K'awm (d. 739/ 1339) Taf'abb al-mish (see al-Kawm *Khamish [al- Magi]) and in didactic poems on the *baad (badawi) composed between the 8th/14th and 12th/ 18th centuries, the term is applied in a wider sense than before: one speaks of *laa even if only two lines of a poem show an additional invariable consonant (some of the examples quoted by earlier rhyme theorists are from poems that do not show the *laa throughout). The same is true, of course, of the *-al-a, where often there are no more than two rhyming clauses. There is also question of the *laa in internal rhyme, e.g., *waall *-laa *-laa *laa of *Abd al-Malik al-Bakillani (ed. G. van Vloten [Leiden 1935, iv. 410-10]) defines *laa as the poet's following self-imposed rules and does not offer any examples. The term seems to have been forgotten for some time, as appears from the unpublished Maxned al-bayin of *All b. Khlaaf (5th/11th century) (see AIOUN, xxviii [1972], 301 and note, and also I. Kratchkovsky in AIEO, xx [1963], 14, 109-9: The definition which *All b. Khlaaf offers is correct, but as a result of a graphic error *laa had by this time been substituted for *laa; this resulted later in the introduction of a new figure, *laa *-al- *mufadd which found its way into several handbooks (see, for instance, Ibn Abi *-laa, Tabhir, 166-7).

The *Khamish of Ibn *Djamil (d. 392/1389) has a chapter on the tajwanwi *bint laa *val at which stands apart from the treatment of the *laa in other grammatical and rhetorical studies: It offers a wide variety of examples, mostly from older poets and mostly in the *ra'da metre. Ibn *Djamil disregards (or does not recognise) some of the rules adopted by others. He accepts the *maa of the second energetic form of the verb as *waal (see al-Maah, iv, 473 third half; and ignores the tendency of ancient poets to consider the *haaf of *-al as part of the waal (ii, 49); he points to unique instances of the *laa in a poem by Abi b. Abraaj where all first rhemas but one end with the article and in a *ra'da poem by a certain *Huyayy b. *Hunayn the *-laa of his *Abdallah, which is not valid, since it does not appear at the end of the waal (31, 1. 2-7).

If one considers the *laa in two distinct contexts: in a stream of poetry (the term generally refers to early *Abbadis poets, but is also used specifically for 4th/10th century poets) a continuation of tendencies which existed in ancient poetry. It is perhaps the first to accept as a form of the *laa the use of diminutives in the rhyme. Ibn *Djamil's views may not have been widely known; his observations on Ibn al-Rumi and on the use of the diminutives are found in later authors, but are worded differently.
invented the term *lujut* for such devices. The first example he mentions, however, is a device which involves the rhyme: The rhyme consonant may be, for instance, the *kā*, but the poet imposes himself to avoid using the *pronominal suffixes* of the third person singular (presumably even in cases where this would be permissible, see KAF. IV, 479a middle). Others do not seem to be aware of Suyuti's distinction and use *lujut* as a simple synonym of the other terms listed at the beginning of this article.

In Persian rhetoric and prosody, the terms *snāt* and *lujum* ma là yalzum are used, as in Arabic, for the adoption of a second invariable consonant in prose and in poetry, and the reduplication of the rhyme consonant. In addition, however, the two terms are used for the repetition of two or more words in each hemistich or line of poetry, and for the use of internal rhyme. Rūdūyān (middle of the 10th/11th century) denotes the latter use specifically as *lujum* (264-7). Some later poets however disregard without considering this convention as well as the feminine ending of Arabic words in their use of internal rhyme, as for instance *i'tīdāl al-karīna*.

For internal rhyme: The rhyme consonant may be, for instance, the *kā*, but the poet imposes upon himself to avoid using the pronominal suffixes of the material world.

The rhyme consonant may be, for instance, the *kā*, but the poet imposes upon himself to avoid using the pronominal suffixes of the material world. 

The two meanings are not mutually exclusive, but the first tends to put the accent on the role of experience and of knowledge of physical things in the search for metaphysical realities, whilst the second invites one to enter immediately into the domain of supersensible principles in order to deduce from them the nature and laws governing beings of the material world.

One should note at the outset the two synonyms of this expression which denote metaphysics in
Most noble primordial substances are those which are apprehensible experiences. This is al-Farabi's approach, who tries by this means to reduce the divergencies separating Plato and Aristotle. He accordingly remarks in his Kitab al-Dinam beyn ra'ayiy al-hakimayn (ed. A. Nader, Beirut 1968, 86) that for Plato, the most noble primordial substances are those which are near to the intellect and the soul, whilst for Aristotle, the most worthy substances of this name, by anteriority and by their value (bi 'l-faṣā'id wa 'l-ta'kūm) are the first substances, i.e. the individual substances (al-ghaḏahir al-wawal allati biya al-naghāḥā). But the difference arises from what Aristotle then says from the point of view of the logical and physical sciences, whilst Plato speaks from the point of view of metaphysics (al-falsafah) and theological doctrines (al-ḥikmāthiyyah). Consequently, one can set oneself within a certain science or within another, or start from one or start from another, as a matter of indifference, according to one's intention. In his Falsafat Aristifā'ilis (ed. Muḥsin Ṭabā, Beirut 1961), al-Fārābī sets forth the Stagirite's thought, following the progressive order of his enquiry as he sees it. After the questions of logic, and with the intention of discovering what makes for perfection in man, Aristotle studies the various questions which concern nature (fabiyya), the soul (nafs) and the intellect (fāliḥ), "He must also examine profoundly the substances of the heavenly bodies; are they nature, soul or intellect, or are they indeed some other, more perfect (akmal) thing; also, are these substances those which are outside physical speculation? The point is that physical speculation only includes what the categories include. Now it is clear that there are other beings outside the categories: the Intellect acting as Agent and the Thing (māya), which give to the heavenly bodies a perpetual circular movement. This being so, one has to make speculations about the beings which have a more universal (al-'ammi) field than those about physics" (ibid., 132). This is why Aristotle explains in the book called Ma ba'd al-'tabī'yyid that he is making speculations and conducting a deep enquiry into beings in a way which differs from physical speculation" (ibid., 132). One notes that al-Fārābī admits that one can begin by physics, which does not however prevent him from starting (in fact, wrongly) that Aristotle recognises the existence of a domain of the being which is external and superior to the categories which, according to him, only concern the physical domain. Elsewhere he speaks clearly (131) of a penetrating enquiry into the beings which are above the natural things in the hierarchy of being (fi 'l-maṣaṣṣidat allati faws al-fabiyyiyyin fi riha al-maṣaṣṣid). Ibn Sīnā and Ibn Rushd take up the Aristotelian definition of metaphysics as being the science of the being as such (al-maṣaṣṣid bi-yihiw haqiqat al-maṣaṣṣid). But what is meant to be understood by this?

1. Ibn Sīnā's viewpoint. The basic principle is that "the object (maṣaṣṣid) of all science is something whose existence is admitted (or conceded: ami musaallam al-maṣaṣṣid) in that science" (Šīfiyya, al-Ḥikkiyya, Cairo 1960, 1, 35). It is drawn from the Posterior analyses of Aristotle (72 a 20): "If I say that a thing exists or does not exist, it is a hypothesis". Hence if one says that the object of metaphysics is God or the Prime cause (Maṣṣid al-ṭabī'ī), this is only an hypothesis which must be verified by means of another science. Now there is no other science, necessarily more particular than metaphysics, which is able to guarantee the existence of such-and-such an object. The maṣṣid of a science is the object concerning which this science conducts an enquiry (al-maṣṣid fi al-maṣṣid). But since God or the Prime cause are not data, they are on the contrary the goal of a metaphysical enquiry (maṣṣid), Ibn Sīnā concludes that the object of metaphysics is the being as such which is implied by every science, by every
question, by every thought and by every speech utterance (ibid., 30): it is the quid (ma'ad), the "that which" (al-ann) and the thing (al-hayl). It does not have to be vouched for, since it is the thing itself which vouches for everything, or it is by means of that one vouches for what one vouches for. This being as such can be divided, without one needing recourse to any categories, in several ways: these divisions of it are like intrinsic accidents (ka l-'umurid al-fisya), whilst divisions according to categories are like kinds (ka l-annin). It can thus be divided in one and in multiples (al-muhd- al-khatir), in force and in action (biowen-fu), in universal and particular (kautil- -silaf), in what is eternal and what arises from a temporal origin (raddim- umuddhil), in what is completed and what is incomplete (faww k-nadil), in cause and effect (wahsan- sali'al) and in possible and necessary (immunhi- waddhil).

This list has been made up from the metaphysics of the Shi'ite (1, 2) and from the Kitaab al-Nadq al-Tabi'i (ed. Sabir al-Karadhi, 1918, 199). The last pair of oppositions in this division will mark out the Avicennan ontology through the distinction of the Being necessary by itself (wahdh al-muhdi bii- khiim), which is to be identified with God, and the being possible by itself (munhit al-muhdd bii- khiim), necessary by something outside of itself, i.e. the being of the universe. Consequently, starting from this general ontological dichotomy, one has the origin of various beings, first of all the heavenly ones (intellences, spheres, souls of the spheres) by a process of emanation (fayd), as far as the Intellect acting as Agent, the intellect of the sphere of the moon; and then of the sublunary world, which is made out of material elements by a progression from minerals to man, thanks to the shapes received from the Intellect acting as Agent which is Wahd al-ussurer (Dator jumarih). Thanks to reason, man is capable of returning to God, to such a point that God is, as the Kur'an says (LVII, 3), the First and the Last. From the domain of metaphysics, one passes on to that of connection with the heavens, then with physics, by a descending movement; then, beginning with connection with minerals, one passes on to that with plants, and from animals to that with the soul, as far as the rational soul, by means of an upward movement which ends up by a mysticism of the mind (fayd). This conforms to the Imam's saying (al-hy 4, 4): "Each science has its one and its multiples, but it is necessary to have a single science of all the diverse beings, on condition that one understands the names themselves analogically. This is what has been called the analogy of proportionality; being in regard to substance is what being is in regard to substance is what being is in regard to quantity, etc. "Just as the things which are connected (fardrib) with the causative arts fall, on examinations, into one and the same science, i.e. medicine, likewise all the things which are connected with being are the object of speculation in a single science (ibid., 1, 303).

But metaphysics can also be justified by relying on the analogy of attribution, substance being the first analogue of being; "Thus the name of being (huwavya), a synonym of munawj fid, although it is used of different species of being, is only used for each of them through the fact of the connection with which it enjoys with the prime being (al-huwavya al- lahi) which is substance." To be first accordingly means here to be the first analogue. "The categories are connected with the substance, not in that they are considered to be their agentive cause any more than their ultimate one, but in the sense that they subsume the entirety of the object and that the substance is for them a subject (munawdil)" (ibid., 303). Now substance is a basic concept and in the measure that one accordingly brings together the study of being with the study of substance, "since it has been posited that for every unique concept there is a unique science ... there results necessarily that there is a unique science of being" (ibid., 306). Metaphysics, being the study of being as such (Ibn Rusdh), who prefers huwavya to munawj fid, often remarks that an object is metahya ala huwavya whereas it is metahya ala huwavya which are two defective entities (mudu'is). The aim of metaphysics is to examine "the real being which exists outside the soul" and it is "the substance which is the basic principle of this being." (al-fimahe kun ma'dda al-mardj ul-huwavya). This conforms to the importance which the substance assumes basically in metaphysical speculation (cf. ibid., III, 1492). Beginning by the study of substances which are analyzable, from the sense and are mobile and corruptible, and then of substances which have these same characteristics except that they are incorruptible (the heavens), Ibn Rusdh hopes to arrive, with Aristotle, at a substance which is not apprehendable by the senses, is incorruptible and is immobile, the Prime Mover, the cause of all the movements of the universe.

Ibn Rusdh thus carries beyond the apprehendable world an idea of substance which he has drawn from physics and which, according to him, is the basis of all existence, and that exists as substance an exact correspondence here below. Ibn Sinâ, on the contrary, thinks that substance, like all other categories, must receive the quality of existence in order to exist, and that it can only receive existence by acquiring quantity, quality and all the other categories, for a substance which had neither quantity, quality and so forth, would be nothing. So it cannot in itself be taken as the first analogue or the representative of being conceived as existence. For Ibn Sinâ, the Necessary being is not a substance since it exists by itself, the Kudtb of the Qur'ân...
on the contrary, although metaphysics studies of "making an enquiry into the first cause from which immobile Prime Mover, Ibn Sina's, corruptible or incorruptible, and finds it in the labo-

try, if there were not, our knowledge of things which studies the absolute being (al-lawahr al-awml) and that the scholar of divine sciences, it is given the demonstrable proof of its existence" (Tafsir, iii, 1405). Ibn Rushd then replies: "Yes, the specialist in the first philo-

sophy seeks for the principles of substance as substance and sets forth clearly that the separateness of

substances is the principle of the physical substance. But in making clear this search, he constantly calls for (yasuddina) what physics clearly sets forth, whether in regard to the substance which can be generated and is corruptible, in the first book of the Physics (189 b 30-191 b 34), where it is demonstrated that it is made up of matter and form, or whether in regard to the eternal substance, in Book viii (260 a 20 f.), where it is set forth that the driving force of that substance is stripped of all matter. Then he clearly lays down that the principles of the substance which are neither the Universal ideas (al-kaliliyd d) nor the Numbers (al-awml al-adumma) of its "limit", but He is exterior to it. On the other side, w. have seen that what is concomitant with being for Ibn Rushd is the division of being for Ibn Sina. It seems that this fundamental divergence holds good for all the other oppositions.

Ibn Sina's metaphysics is consequently open to a region beyond the world, the earth and the heavens; it makes a mystical system possible. For Ibn Rushd, on the contrary, although metaphysics studies the principles of beings which are objects of other sciences, it is not the foundation of those sciences, but their completion. He writes in his Tafsir, iii, 701, "Since ... each science only concerns itself with studying a certain being which is its special object, it must be put next to a science which studies the absolute being (al-lawahr al-awml). If there were not, our knowledge of things would not be completely exhaustive (lam tutasnef ma-

fr al-sanwiyah)" (Tafsir, iii, 701). Furthermore, whilst Ibn Rushd seeks for the first cause of the movements of substances apprehensible by the senses, corruptible or incorruptible, and finds it in the immobile Prime Mover, Ibn Sina sets himself the task of "making an enquiry into the first cause from which every being is brought about by causality (bulla mau-

gijd matih) as much as it has been the result of causality, and not simply in as much as it is a mobile being (mauqijd madatharrh) or a quantifiable being (mauqijd madathamman) (Yasuf, 1, 118; ibid., i, 14). But there is a problem there; it is not possible for metaphysics to speculate on causes in as much as they are causes simpleicter (al-askd bi-ma hta ya hsa asbd mutjalal), in the first place because this science treats of notions which do not raise the question of proofs equivalent to those causes as such, such as the notions of universal and particular, of act and capability, of possibility and necessity" (ibid., 7) and then because the science of causes taken simpleicter presupposes that the existence of substances has been established for the things which have a cause (bashit al-askd li l-tawm dhamit il-askd). Ibn Sina adopts here a very clear view of the problem of causality: it is not sufficient for the existence of a cause to be demonstrated in the eyes of the specialist. Ibn Rushd, on the other hand, he clearly lays down that the principles of the substance which are neither the Universal ideas (al-kaliliyd d) nor the Numbers (al-awml al-adumma) of its "limit", but He is exterior to it. On the other side, w. have seen that what is concomitant with being for Ibn Rushd is the division of being for Ibn Sina. It seems that this fundamental divergence holds good for all the other oppositions.

Ibn Sina's metaphysics is consequently open to a region beyond the world, the earth and the heavens; it makes a mystical system possible. For Ibn Rushd, on the contrary, although metaphysics studies the principles of beings which are objects of other sciences, it is not the foundation of those sciences, but their completion. He writes in his Tafsir, iii, 701, "Since ... each science only concerns itself with studying a certain being which is its special object, it must be put next to a science which studies the absolute being (al-lawahr al-awml). If there were not, our knowledge of things would not be completely exhaustive (lam tutasnef ma-

fr al-sanwiyah)" (Tafsir, iii, 701). Furthermore, whilst Ibn Rushd seeks for the first cause of the movements of substances apprehensible by the senses, corruptible or incorruptible, and finds it in the immobile Prime Mover, Ibn Sina sets himself the task of "making an enquiry into the first cause from which
He was born at Linhsia (formerly Huchow) in south-eastern Kansu, c.n. 1910 (there is a contradiction in the Biographical dictionary of Republican China, which holds that Ma was born in 1912, but that he became a junior officer in 1926 "at the age of seventeen, when he was in occupation of his own forces") in the province of Ma's immediate family, but it is clear that he shared the same paternal grandfather as the Kansu-Chinghai warlords Ma Pu-ch'ing (Matthews, nos. 4110, 5393, 1758) and Ma Pu-fang (Matthews, nos. 4110, 5393, 1815), and that he was thus a scion of the powerful Ma family of Peh-tsang, a small village some 30 km. west of Linhsia (Mei, op. cit. in Bibl., 665). Ma Chung-ying was also distantly related to the Kansu-Ningsia warlord Ma Linhsia, and to his nephew, who was in occupation of his own forces; "Little Commander" learned this lesson well; he withdrew to the Siniug area of Chinghai and began to build up his own forces.

His uncles, Ma Ku-chung (Boorman and Howard, nos. 1859, 2238, 586), and Ma Hung-mu (Matthews, nos. 4110, 2386, 586), the most powerful representatives of the Ma family of Han-chia-chi, a large village some 25 km. south-west of Linhsia. Together these five Hui warlords were to become famous—or infamous—as the "Wu Ma" Northwestern Muslim clique.

Ma Chung-ying first entered military service during 1924 when, at about the age of fourteen, he joined the local Muslim militia. One year later, in August 1925, troops of the "Christian General" Feng Yü-hsiang, invaded Kansu. The invading forces, under the command of Feng's subordinate Liu Yü-fen, formed a part of the Northwest Army, more commonly known as the First Kuominch'ın ("National People's Army"), a vast rabble which is estimated to have numbered in excess of 100,000 men during the late summer of 1925. Feng intended, through his subordinate Liu, to colonise large tracts of Kansu with Kuominch'ın soldiers; he also intended to finance his struggle against the Northeastern warlords. Liu Yü-fen, with taxes raised and opium cultivated in the Northwest. Not unnaturally, these aims found little favour with the people of Kansu, Ningsia and Chinghai; nor were the local warlords much inclined to support Feng Yü-hsiang.

In 1926, one year after the Kuominch'ın invasion of Kansu, Ma Chung-ying received his first commission as an officer in the forces commanded by one of his uncles, Ma Ku-chung (Boorman and Howard, op. cit. in Bibl., 485). During the same year, Liu Yü-fen, a lieutenant of the "Christian General" and a great-uncle of Ma Chung-ying, was killed in action. Upon Ma Ku-chung's death, a warlord under the command of Liu Yü-fen, who was in occupation of a town in Chinghai, was attacked by a combination of local warlords from eastern Kansu (Sheridan, op. cit. in Bibl., 195-6). Fighting was prolonged and severe, but the Muslim warlords of western Kansu seem to have remained aloof from the struggle, and Liu eventually succeeded in re-imposing Kuominch'ın rule on the province. During his conflict, Ma Chung-ying, still only sixteen or seventeen years of age, is said to have "laid siege to and captured Linhsia on his own initiative" (Boorman and Howard, ibid.). Liu Yü-fen ordered troops under the command of Ma Lin (a great-uncle of Ma Chung-ying) to recapture Linhsia, but the young soldier easily defeated them, winning for himself a reputation as a military genius. Not unnaturally, Ma Chung-ying's triumph was short-lived, however, for his uncle and commanding officer Ma Ku-chung had not ordered the occupation of Linhsia, and he dismissed his nephew for insubordination. The "Little Commander" learned this lesson well; he withdrew to the Siniug area of Chinghai and began to build up his own forces.

The "pacification" of Kansu left large areas of the province devastated, but failed to break the rebellious spirit of its people. In 1927 north-western Kansu was racked by a violent earthquake; this, combined with the increased use of good arable land for the cultivation of the opium poppy and arbitrary tax increases imposed by Liu Yü-fen, caused widespread famine. Early in the spring of 1928, the patience of the Northwestern Muslims ran out, and the standard of revolt was raised against the Kuominch'ın by the Muslim leader Ma T'ing-hsiang (Matthews, nos. 4110, 4540, 3706; see Sheridan, 250). Ma Chung-ying (who according to one source had fled to Sining, together with a group of his followers, because of an illicit affair with a young Muslim girl from a strictly orthodox family; see Ekvall, op. cit. in Bibl., 946) rapidly became involved in this revolt against the Kuominch'ın. The Chinese (i.e. the Kuominch'ın) were panic-stricken at the desperate courage of the Moslems, but eventually, by machine-gun fire and light artillery, proved superior (Evkall, 946-7). The Kuominch'ın was unable, however, to crush the Muslim revolt entirely; no sooner had the rebellion been suppressed in one area, than it broke out afresh in another. By September 1928 over 100,000 people had died (Sheridan, loc. cit.). Anti-Kuominch'ın feeling amongst the Muslims gradually gave way to excessive hostility against all the Chinese. On 14 February 1929, about 20,000 Muslims forced their way into Tangar, a city of some 5,000 families in western Kansu. An American eyewitness described the scene as follows: "[The Muslims] forced an entrance by ladder over the north wall. Immediately by they began to murder the Chinese in the most brutal way, cutting over the head with swords ... The Muslims were in the city only about two hours, but during that time the official figures show more than 2,000 killed, 700 wounded, and $ 2,000,000 damage" (Sheridan, op. cit.). The massacres against the Muslims were equally bloody. According to American diplomatic reports (see Sheridan, ibid.), the ravages of war and famine reduced people to cannibalism; between 1926 and 1929 as many as 2,000,000 people may have died. One casualty was Ma Chung-ying's father, who was executed on the orders of Liu Yü-fen in the winter of 1929 (Boorman and Howard, ibid.).

In 1929 Ma Chung-ying, his position strengthened by several victories over the forces of the Kuominch'ın, approached the Nationalist leader Chiang Kai-shek with a request that his private army should be recognised as a Kuomintang frontier unit. At about this time, Feng Yu-hsiang declared himself independent of the National Government at Nanking; as a result of this, Ma Chung-ying's distant relative Ma Hung-k'uei, the strongest of the "Wu Ma" clique, declared in favour of the nationalist cause. Ma Chung-ying went to Nanking, where he enrolled briefly at the military academy. In 1930 he returned to Kansu where he was appointed garrison commander at Kanchow (Changyeh) in the far north-west, near the frontier of Sinkiang (I 28); from here he controlled a small fief, including the towns of Suchow and An-hsi, which "freed him from any financial
Ma was wounded during the autumn, and withdrew or "Ma House-
commonly called the
Suppl." When Cnin Shu-jen seized power in Sinkiang
lay the ancient oasis city of Komul (Komul fa.y. in
Bibl., 87-8). When Cnin Shu-jen seized power in Sinkiang
during 1928, Komul (Chinese name Hami) was still a
semi-independent state, ruled by the aged monarch
Malisd Shah, the last autonomous Khinate in Central Asia. When Malisd died of old age in 1930, Cnin Shu-jen, who held the heraiprarent heritage in Urumchi, the provincial capital, announced the absolute rule of his forces throughout China. Chinese officials took over the administration of Komul, and Cnin began to settle Han Chinese refugees from his native Kansu to Sinkiang in the late 1920s, Cnin welcomed them with open arms. Less than 200 km from the northwestern frontier of Ma Chung-ying's fief in Kansu lay the ancient oasis city of Komul (Komul q.v. in Suppl.). When Cnin Shu-jen seized power in Sinkiang
during 1928, Komul (Chinese name Hami) was still a
semi-independent state, ruled by the aged monarch
Malisd Shah, the last autonomous Khinate in Central Asia. When Malisd died of old age in 1930, Cnin Shu-jen, who held the heraiprarent heritage in Urumchi, the provincial capital, announced the absolute rule of his forces throughout China. Chinese officials took over the administration of Komul, and Cnin began to settle Han Chinese refugees from his native Kansu on arable land expropriated from the indigenous Uyghur q.v. farmers. Local unrest grew rapidly, and in 1931, following the abduction of a local Muslim girl by a Han Chinese tax collector, open rebellion broke out.

One of the leaders of the Komul revolt, a Uyghur called Yulbars Khan (q.v.) traveled to Suchow in northwestern Kansu where he met Ma Chung-ying (now officially Commander of the 36th Division of the Kuomintang, though Yulbars comments that there were so many Mns in this force that it was commonly called the Ma-chia-chin, or "Ma House-
hold Army"; see Yulbars, op. cit. in Bibl., 87-8). Ma agreed to enter the fray, ostensibly to help his Uyghur co-religionists and in 1932 he led his troops into Sinkiang in an open challenge to Chn Shu-jen. Ma was wounded during the autumn, and withdrew temporarily to Kansu to recuperate. In August 1932 Ma's troops again entered Sinkiang. Initially, they cooperated with the Uyghurs in their struggle against Chn Shu-jen. Ma's crack cavalry units, generally considered to have been amongst the best troops in China, fought their way to the outskirts of Urumchi before being repulsed by White Russian merceneray forces under command of Chn Shu-jen (see Wu, op. cit. in Bibl., 73-100); meanwhile, Uyghur forces under Yulbars Khan and Khöjrä Niyaaz Hâdîidî took control of the greater part of southern Sinkiang, and an "East Turkestan Republic" was proclaimed at Kâshghar (q.v.).

In April 1933 the incompetent Chn Shu-jen was ousted by Sheng Shih-ts'ai, his Chief-of-Staff. The new regime, with the Hom rule, was promptly in the far Northeast, enjoyed the support of a group of some 3,000 battle-hardened Manchurian troops who had been driven into Siberia by the invading Japanese and repatriated to Sinkiang by the Soviet authorities. During the remider of 1933, Ma Chung-
ying's forces made two further attempts to take Urumchi, and despite judicious use of his White Russian and Manchurian troops, Sheng was forced to appeal to the Soviet Union for aid. In January 1934, Soviet military units entered Sinkiang and attacked Ma Chung-ying's cavalry with aeroplanes and, apparently, poison gas. The Muslim warlord was forced to fall back on Turfan, but instead of withdrawing to his old base in north-eastern Kansu he took the decision to try and hold southern Sinkiang.

This decision brought the Kansu Muslims into direct conflict with the Uyghur Muslims of Sinkiang, their erstwhile allies. There had been indications of such a split for some time; as soon as fighting on the northern front had become bogged down before Urumchi, units of Ma's forces had advanced into the Tarim Basin where his troops "ousted by Sheng Shih-ts'ai, his Chief-of-Staff. The retreating Ma Chung-ying fell back on Kâshghar, where he destroyed the nascent Islamic "East Turkestan Republic"; he then transferred command of his forces to his brother-in-law, Ma Hu-shan (Matthes, nos. 4310, 2163, 2162). It is not clear why Ma Chung-ying should have deliberately chosen to enter the Soviet Union when his military position was far from hopeless—after all, he had been driven back from Urumchi by Soviet forces. Ma's eventual fate is uncertain; an article published anonymously in the Journal of the Royal Central Asian Society during 1935 states that he "died on arrival at Moscow", however, it is more likely that he was held by Stalin as a weapon in reserve against Sheng Shih-ts'ai, the Soviet puppet in Sinkiang. Ma may have been executed by Stalin at Sheng's request when the latter visited Moscow in 1938; certainly, he was never seen again, though for many years stories of his imminent return circulated amongst both the Uyghurs of Sinkiang and the Hui of Kansu.

Ma Hua-lung played an important part in this bastion he was able to exercise an influence on the Chinese umma far in excess of that wielded by Ma Ming-hsin during his prime, for during the three-quarters of a century following the death of the latter, the "New Teaching" had spread from the Kansu-Chinghai border area across much of China. Seemingly, Ma Hua-lung played an important part in this process of proselytisation, for in a memorandum addressed to the Imperial authorities at Peking requesting the prohibition of the "New Teaching", Tsu Tsung-tang, the Ch'ing commander who eventually crushed the 1862-78 Muslim rebellion in Northwest China, complained that Ma, who styled himself the Tsung-ta A-hung ("General Grand Multa", Matthews, nos. 4310, 2211, 4258), also known Ma chi'ao-ching (Matthews, nos. 4310, 225, 1271), a Chinese Muslim leader and exponent of the "New Teaching" who played an important part in the great mid-19th century Muslim risings against the Ch'ing dynasty.

Ma Hua-lung was born at an unknown date during the first half of the 19th/19th century, probably at Chiu-chi-p'u's (Hartmann, op. cit. in Bibl., 14), a walled city in the same year; L. E. Nyman, Great Britain and Chinese, Russian, and Japanese interests in Sinkiang, 1878-97, Lund 1977; J. Chen, The Sinkiang story, New York 1966 (trans. H. A. Alcorn)

of the Muslims in that area. He had no illusions Ch'Ing officials still remained unconvinced of Ma's conquest of Ninghsia city by rebel forces in 1863, but some Muslim leaders could command followers from Heilungkiang to Sinkiang, and he was Ma Hua-lung" (Tso, Memorials, cited in Chu, 1935, 143).

The initial Northwestern Muslim challenge to the Ch'ing Empire came in Shensi, where between 1862 and 1864 Pai Yen-hu and other local Muslim leaders conducted a fast-moving cavalry campaign against the Manchu general To-lung-a. The Ch'ing forces scored some early successes in southern Shensi, but in 1864 To-lung-a was killed, and during the following months the Muslim revolt spread with great rapidity across the whole of Northwest China.

During the early years of the revolt, Ma Hua-lung, whose base at Chin-chi-p'u was situated well behind the main battle front in southern Shensi, succeeded in maintaining a precarious neutrality (at least in the eyes of some local Ch'ing officials, see Chu, 1955, 345), whilst simultaneously increasing the fortifications around Chin-chi-p'u and building up the armed forces at his command. It was widely rumoured that Ma Hua-lung was masterminding the capture of Ninghsia city by rebel forces in 1863, but some Ch'ing officials still remained unconvinced of Ma's complicity. Tso Tsung-t'ang, the military veteran who was appointed Governor-General of Shensi and Kansu in 1868, with specific orders to crush the Muslim revolt, had no such doubts. Tso "regarded the Chin-chi-p'u centre as one of first importance and determined to concentrate upon the reduction of the Muslims in that area. He had no illusions whatever about Ma Hua-lung, but was certain that he was the ring leader among all the Kansu Muslims, and he determined to proceed on that basis" (Chu, 1955, 346).

Tso estimated that he would require five years to reconquer Shensi and Kansu; he launched his attack in November 1868, aiming primarily to capture Chin-chi-p'u, with Hochow as a secondary target. It was a savage campaign, with little quarter given or asked. Tso played upon the traditional rivalries between adherents of the "Old" and "New" teachings by giving amnesty to followers of the "Old Teaching" who surrendered a policy which paid off, for in 1872 Ma Hua-lung was taken from the Oral recollections of a Muslim by Lo Cheng-chi, Tso Wen-hsiang-kung Niea-p'u; published together with a biography of Tso written by Lo Cheng-chiu, Tso Wen-hsiang-kung Niea-p'u; details of these works are to be found in Chu Wendjjang's 1966 study of the Muslim rebellion in Northwest China at p. 211. A collection of anecdotes taken from the oral recollections of a Muslim

Throughout 1869, Tso's armies advanced slowly across Shensi and into eastern Kansu, driving the highly-mobile Muslim cavalry of Shensi before them. In early 1870 the Imperial forces arrived before Chin-chi-p'u; the assault was to be long and hard, for "over the whole plain was a network of canals, all the villages were fortified, and the Moslems had erected numberless stockades covering every approach to Chin-chi-p'u" (Bales, 245; for details of the campaign, see 231-65). Tso's armies razed Moslem villages round Chin-chi-p'u, and set about reducing the Muslims through a combination of bombardment and starvation. Ma Hua-lung's position was made critical by his earlier decision to send a large force of his followers into Shensi in a bid to draw off Tso's armies from Chin-chi-p'u, an action which caused Bales, Tso's biographer, to comment, "Had Ma Hua-lung enjoyed a reasonable talent for generalship along with his many other endowments, he could have driven Tso Tsung-t'ang out of Kansu, perhaps from Shensi as well, and delivered an irreparable blow to the Imperial cause" (247).

By January 1871 the population of Chin-chi-p'u was starving; the defenders had been reduced to eating human flesh. On 6 January Ma Hua-lung left his stronghold behind the city walls and presented himself, accompanied by a single servant, at the headquarters of Liu Ch'ang-yang, the Imperial commander. Ma asked that all blame for the resistance at Chin-chi-p'u be laid on him, and that his followers should be spared. After prolonged interrogation by the victorious Ch'ing commandants, Ma was executed, together with twelve members of his immediate family, by the "slicing process"; some eighty of the lesser Muslim leaders were beheaded. Chin-chi-p'u was depopulated, and the surviving Muslims were sent, en masse, into exile or slavery. Tso Tsung-t'ang went on to reconquer western Kansu, and by 1878, ten years after the commencement of his offensive in Shensi, he succeeded in reconquering K'ashgar, the last Muslim town of Northwest China.

After his execution on 2 March 1871, Ma Hua-lung became a martyr for followers of the "New Teaching". The victorious Ch'ing forces made strenuous attempts to stamp out Ma's adherents (it has been estimated that between 1862 and 1876 the Muslim revolt and the Ch'ing reconquest resulted in over 10 million deaths; see Chu, 1956, p. viii), but to no avail. According to W. A. Saunders, a Christian missionary who was active in Kansu during the Republican period, Ma's body was buried at Cheu-chi-p'u, but his head was taken, presumably in secret, to Hsien-hua-kang, near Chang-chia-ch'uan in south-eastern Kansu. When Saunders visited Hsien-hua-kang in 1934 he found Ma's tomb to be "quite an imposing affair of carved brick with a kind of 'Li Pai Sz' (temple) as an entrance" (op. cit. in Bibl., 70). Saunders records that "worship" was made at the tomb every year on Ma Hua-lung's birthday, a practice strongly denounced by local Muslims belonging to the "Old Teaching". It is not known whether Ma's tomb at Hsien-hua-kang still exists.

Bibliography: The most important contemporaneous Chinese sources for the Muslim rebellion of 1862-78 are the complete works of Tso Tsung-t'ang, Tso Wen-hsiang-kung Ch'Uan-chi, 1888-97, published together with a biography of Tso written by Lo Cheng-chiu, Tso Wen-hsiang-kung Niea-p'u; details of these works are to be found in Chu Wendjjang's 1966 study of the Muslim rebellion in Northwest China at p. 211. A collection of anecdotes taken from the oral recollections of a Muslim

(see Bales, 224, "Sketch map of main Muslim centres"). These were: (1) Ma Hua-lung's base at Chin-chi-p'u, the chief centre of the "New Teaching"; (2) Hochow and the surrounding area, a predominantly "Old Teaching" centre under the leadership of Ma Ch'ang (Matthews', nos. 4310, 125, 59); (3) Haining and the surrounding area, a region of mixed "Old" and "New Teaching" allegiances under the leadership of Ma Wei-yu (Matthews', nos. 4310, 7249, 4196). (Note, however, that elsewhere [257], Bales describes both the Haining and Suchow Muslims as being "mostly inclined to the New Sect"). In marked contrast to these Kansu and Chingsha Muslim leaders, Pai Yen-hu [?], the most important of the Shensi Muslim leaders, was a guerilla fighter with no permanent base. Of this plethora of Muslim leaders, however, it is interesting to note that in that Ma Hua-lung Tsung-t'ang "could command followers from Heilungkiang to Sinkiang, and he was Ma Hua-lung" (Tso, Memorials, cited in Chu, 1955, 143).
ma Hua-lung — ma huan

Ma Huan was born ca. 782/1380 in Kuo-chi, a district of Shao-hsing city, Chakiang Province. His home was about 24 miles south-east of Hang-chou, and a mere 7 miles from the southern shore of Hang-chou bay. One of the principal centres of navigation in 9th/10th century China (Mills, Ma Huaan [see Bibl.], 34), Ma Huan probably came from a poor background, though 'his derogatory description of himself as a 'mountain-woodcutter' need not be taken literally' (Mills, loc. cit.). Seemingly, Ma Huan did not belong to a Muslim family, but chose to adopt Islam when a young man—thus his surname 'Ma', so common amongst Chinese Muslims, must have been purely coincidental. He must have received a good education in Chinese classical literature, he wrote a book, and he was acquainted with the contents of Wang T'ao-yan's Tao-i chih-lüeh ('A synoptical account of the Islands and their Barbarians'), 751/1350, of certain Chinese classics, and of 'Buddhist books' (Mills). (On the other hand Duyvendak, in his Ma Huan re-examined, 9, describes Ying-yai shang-lan as being 'written in an almost colloquial style by an unlearned Mohammedan'.)

During his youth Ma Huan seems to have adopted Islam, and have assumed the tso (courtesy-name) of Tung-ho (Malihana, nos. 8696, 6376); possibly as a result of becoming a Muslim he began a study of Arabic and/or Persian, enabling him to become proficient as a translator and interpreter. As a result of the acquisition of these skills, he was appointed to the staff of the great Chinese Muslim admiral Cheng Ho in 819/1415. It is interesting to note that Ma Huan's appointment came one year before the first of Cheng Ho's voyages (818/1415), the first to sail beyond South Asia to the Persian Gulf.

Ma Huan was born 54 years after the birth of his patron, the great Chinese Muslim admiral Cheng Ho. He probably grew up during the height of Cheng Ho's expeditions, 818-831/1415-18, and 824/1421, and was present during the siege of Chin-chi-p'u. Shensi gentry who served with the imperial forces and were omitted from the published version, most of whose sources for this period.

experience and partially on hearsay, is indicative of the paucity of Muslim sources for this period.

Religion, vi/a (1976), 67-87; R. Israeli, in }

unpublished thesis); Mary C. Wright, The last

notably supplement IV, "Ma Hua-lung and the

Ma Huan did not accompany Cheng Ho on his fifth expedition of 820/1421-18; he does not explain why. In 824/1421, however, he once again voyaged with Cheng Ho on his sixth expedition, returning in 825/1422. In addition to returning to most of those countries visited during the fourth expedition, Cheng Ho's sixth expedition took Ma Huan to Çufar and Aden; a part of the great Chinese fleet (which comprised 41 ships and an unknown number of men) visited Mogadishu and Brava in Somalia, but Ma Huan does not seem to have accompanied

ma Huan's first voyage, 824/1421, was a "maritime expedition" in every sense of the word; the Chinese Muslim admiral had under his command a fleet of 63 ships bearing 28,580 men. The expedition visited various ports of the Malay Archipelago, Sri Lanka, Bengal, South India, the Maldives Islands and Hormuz in Persia. The young Ma Huan must have been greatly interested in the various lands he saw, for together with his colleague and life-long collaborator Kuo Ch'üng-i (Matthews', nos. 5746, 1528, 3886), he made local journeys in the various countries he visited, and recorded details of his impressions.

On his return to China in 818/1421, Ma began work on a book based on the notes made by Kuo Ch'üng-i and himself. In 819/1420 he completed the first version of his book (he was to make numerous additions and corrections over the years), and wrote a foreword and a commemorative poem. In his 819/1420 foreword he notes that:

'I collected [notes about] the appearances of the people in each country, the variations of the local customs, the differences in the natural products and the bounds of each country; I arranged notes in order so as to make a book, which I have entitled The overall survey of the Ocean's shores' (Mills, op. cit., 70).

MA HUAN (Matthews' Chinese-English dictionary, Revised American Edition 1969, characters no. 4370, 2266), Chinese Muslim interpreter and traveller who flourished during the 9th/10th century and who was the author of Ying-yai shang-lan ('The overall survey of the ocean's shores'), the best-known account of the early and mid-9th/10th century Ming Chinese maritime expeditions to South-east Asia, South Asia, the Arabian Peninsula and East Africa.

Encyclopaedia of Islam, V
this branch expedition. Mills notes that Ma Huan probably added sections on Zulfar and Aden to his book after his return to China in 835/1432 (op. cit., 35).

Ma Huan, although still a relatively young man, probably accepted that his journeys to the Indian Ocean were over when the emperor Jen Tsung forbade further expeditions to that remote region in 834/1430; however, when the Hsian-te emperor revoked this edict in 835/1431 and ordered the ageing Cheng Ho to undertake his seventh and final expedition to the "Western regions", Ma Huan was once again employed as an interpreter.

Cheng Ho's seventh expedition is better documented than any of the preceding six. We know that more than 150 large ships took part in the voyage, and that a total of 27,550 men sailed with him. The fleet left Nanking in 835/1432, and returned to China in 835/

In his travels in Turkestan led Hartmann (op. cit., 115). It seems probable that he returned to China and visited the Yemen, where he was initiated into the Nadjbandī order. This may have been further compounded by his adoption of an Arabic sobriquet, a practice common amongst Muslim leaders of the 14th/15th century who were instrumental in the development and spread of the "New Teaching", a neo-orthodox reformist movement in Chinese Islam which swept Northwest China in the latter half of the 14th/15th century, and which played an important part in the great mid-19th century Muslim revolt of Ma Hua-lung (q.v.).

Ma Ming-hsin was born at an unknown date during the first half of the 14th/15th century at An-hsing, a small town some 90 km. south-east of Lanchow, the capital of the Chinese province of Kansu (q.v.). The site of Ma's birthplace makes it probable that he was a Hui (Chinese-speaking) Muslin, though his travels in Turkestan led Hartmann (op. cit., in Bibli., 28, n.) to describe him as a native of that region, whilst his role as a religious reformer amongst the Salar Turks (q.v.) of southwestern Kansu and eastern Qinghai has also led to his identification as a Salar (see Mary C. Wright, op. cit. in Bibli., 289). Confusion over Ma's ethnic origins may have been further compounded by his adoption of an Arabic sobriquet, a practice common amongst the Hui.

MA MING-HSIN (Matthews' Chinese-English Dictionary, Revised American Edition 1969, charac-ter nos. 1-310, s. a.). Ma Ming-hsin was known as Muammad Ans, a Chinese Muslim leader of the mid-19th/18th century who was instrumental in the development and spread of the "New Teaching", a neo-orthodox reformist movement in Chinese Islam which swept Northwest China in the latter half of the 19th/18th century, and which played an important part in the great mid-19th/18th century Muslim revolt of Ma Hua-lung (q.v.).

- *MA MING-HSIN* (Matthews' Chinese-English Dictionary, Revised American Edition 1969, charac-ter nos. 1-310, s. a.). Ma Ming-hsin was known as Muammad Ans, a Chinese Muslim leader of the mid-19th/18th century who was instrumental in the development and spread of the "New Teaching", a neo-orthodox reformist movement in Chinese Islam which swept Northwest China in the latter half of the 19th/18th century, and which played an important part in the great mid-19th/18th century Muslim revolt of Ma Hua-lung (q.v.).

Ma Ming-hsin was born at an unknown date during the first half of the 19th/18th century at An-hsing, a small town some 90 km. south-east of Lanchow, the capital of the Chinese province of Kansu (q.v.). The site of Ma's birthplace makes it probable that he was a Hui (Chinese-speaking) Muslim, though his travels in Turkestan led Hartmann (op. cit., in Bibli., 28, n.) to describe him as a native of that region, whilst his role as a religious reformer amongst the Salar Turks (q.v.) of southwestern Kansu and eastern Qinghai has also led to his identification as a Salar (see Mary C. Wright, op. cit. in Bibli., 289). Confusion over Ma's ethnic origins may have been further compounded by his adoption of an Arabic sobriquet, a practice common amongst the Hui.

Within a short period of time, Ma was expelled from his native An-tung for “causing trouble” (Ford, *ibid*). He went next to preach among the Salars, a Turkic people with a reputation for fierceness and independence who inhabit the hills to the south of the Yellow River in the Chinghut-Kansu borderlands. In the Salar hills, Ma gained the support of two local mullahs Su-ssu-shi-san and Hu-su-liu-hu. His teaching, which rapidly gained widespread popular support, became known as the “New Teaching” (asian cihao, Matthewes, nos. 2737, 719) to differentiate it from the various forms of established Islamic practice in Kansu, which in turn became known as the “Old Teaching” (*tai ciao, Matthewes, nos. 3833, 719, or chu ciao, nos. 1205, 771). In New Kansu, Mandzus and Magyars often converted to Islâ (in *ibid.,* 43). Ma Ming-hsin’s “New Teaching” was distinguished by the following characteristics: (1) loud chanting of the scriptures, as opposed to the soft chanting of the old sect (i.e., followers of the “Old Teaching”); (2) prayers with head-shaking and body movement in dance-like manner, stoof-stamping, hand-waving, and face turning up towards heaven; (3) belief in miracles, visions, apparition of spirits, and prediction of good or bad omens; and (4) the worship of saints or their tombs.

Until recently, the identity of the “New Teaching”, thought of in observance ritual, remained unclear (see Wright, 218, together with relevant footnotes). Recent research undertaken by Saguchi and Fletcher, however, indicates that Ma Ming-hsin introduced to Kansu a sub-group of the Nakshbandi tariqa which practiced *zikr gahtir* (vocal recollection) as opposed to the *zikr karim* more usually associated with the Nakshbandiya. This sub-group, which is generally known as the Nakshbandiya-Djahriyya, can be traced back to Khâdiya Mahmûd Anjîr Fâgmaînî, who introduced the sub-group’s *zikr* in 1215. According to an anonymous government official who witnessed this scene records that “When Ma Ming-hsin was taken to appear on top of the city walls, all the Muslims who saw him from below rolled down from their horses and prostrated themselves on the ground. They called him a saint and wept” (*P'ing-Hui chi-tuch, *ibid*). This display seems to have made an adverse impression on the Chinese commandant, who “had him killed at once, in order to keep down sedition within the walls” (de Groot, 314). Ma’s son was seemingly killed with him (Schram, *ibid*).

Ma’s death did not bring about the end of his rebellion, but served only to increase the bitterness of his followers. The Chinese troops stationed in Kansu proved incapable of suppressing the rebels, a task which fell initially to Salar followers of the “Old Teaching”, later assisted by Mongol troops from Alashan and Chinese troops from Szechwan. Some three months after the murder of Ma Ming-hsin, Ch’ing troops surrounded the foremost of the surviving “New Teaching” leaders, the Salar mullah Su-ssu-shi-san, at his stronghold in the Hua-lin mountains. Su was captured and executed, and with his death the rebellion came to an end. The Chinese authorities banned the “New Teaching” and instituted a series of bloody reprisals against its surviving adherents. An edict issued by Ch’ien-lung after the imperial victory in the Hua-lin mountains exhorts his officials as follows: “Of these rebels not a trace, however slight, must remain. All insurgents yet at liberty shall be hunted out... and their wives, daughters and babies now incarcerated in the prison shall be executed, in the provincial capital, in the county town and other places, shall be thoroughly examined for the better realisation of this object; and finally, the transports to the pestilential places of banishment shall start with all possible speed” (de Groot, 315). The Ch’ing authorities massacred whole families and clans with “New Teaching” affiliations, but to no avail. The “New Teaching” leaders went underground, and within three years a still bloodier hsin-chiao rising, under the leadership of Tien Wu (*v.o.*), broke out in the Kansu-Chinghut region. The “New Teaching” or Ma Ming-hsin was also to prove instrumental in the great mid-13th-century rebellion of Ma Hua-lung (v.g.).

**Bibliography:** Details of contemporaneous
Chinese sources may be found in C. L. Pickens, Chinese annals, pp. 30-35 of his Annotated bibliography of literature on Islam in China, Harkwok 1930; this source is especially useful for details of the 1596-1598 Muslim risings contained in the Ta-ting Kao-tung Shun-huang-ti shih-lu (i.e. the official edicts of the Ch'ien-lung period). See also Wei Yuan, Sheng-wu chi ("History of the Imperial wars"), 1842; chuan 7 (cited in Ford, op. cit. below). For further details, see D. D. Leslie, Lanzhou, a city in Chinese Tahliin: a bibliographical guide, in Abr-Naharah, xvi (1976), 25 (Section H, "Imperial Edicts"). Further primary sources, including the Ping-hu chi-hu ("Brief record of the pacification of the Muslims", Kansa, ca. 1190(1781) may be found in Pai Shou-i, ed. Hui-min chi-i ("The righteous uprisings of the Muslim people"), published in 4 vols., Shanghai, 1932, of which vols. 1 and 2 refer to events in the Chinese north-west during the 18th and 19th centuries.

Secondary sources dating from the late 19th and early 20th centuries include: C. Imbault-Huart, Deux inscriptions des Mahométans du Kasson, in JA, ser. 8, vol. xiv (1889), 494-525; J. J. M. de Groot, Sectarianism and religious persecutions in China, Amsterdam 1903-4; M. Brocaholm, Islam en China: a neglected problem, London 1910, see esp. 150-1; H. M. d'Ollone, Recherches sur les musulmans chinois, Paris 1912; and M. Hartmann, Zur Geschichte des Islam in China, Leipzig 1921. More recent works include Mu Shou-chi, Kansu and Sinkiang from 1862 to 1878, Shensi, the suppression of the Moslem rebellion in The policy of the Xian-chu government in the Xin-sheng fsn, Cairo 1935; Pai Shou-i, Hui-hui lun-Islam (below); in Arabic, Mubammad Tawlcju*, 19, p. 6 etc. (cited in Ford, op. cit.; Ningsia and Chinghai"), Lanchow 1936, chUan 18, ("A brief history of Kansu, the Tung-Chih restoration"), Leipzig 1921. Zur Geschichte des Islam in China, published in 4 vols., Shanghai 1952, of which Hui-min chi'i may be found in Pai Shou-i, ed. P'ing-Hui chi-lueh Edicts"). Further primary sources, including the partial this thesis was later published [see Chu, *Towards a political community", Cambridge 1977, p. 57].

1. THE NAME

The frontiers of Mā warā al-nahr on the north and east were where the power of Islam ceased and depended on political conditions; cf. the statements of the Arab geographers on Mā warā al-nahr in G. Le Strange, The lands of the Eastern Caliphate, Cambridge 1905, 433-4; W. Barthold, Turkistan down to the Mongol invasion, London 1926, 64 f. The phrase Mā warā al-nahr passed from Arabic literature into Persian. As late as the 9th/10th century, Hājari Abirī (1279) devotes a special chapter (the last) to Mā warā al-nahr in his geographical work. Under the influence of literary tradition, the phrase Mā warā al-nahr was used down to quite recent times in Central Asia itself (e.g. by Bābur, in his Bābur-nāma, ed. Beveridge, see index; by Mirzā Haydar Dughlat later in the 16th/17th century in his Tahbīth al-Raschīd, tr. Eliazzo and Ross, A history of the Moghul, London 1895, 77, 93 ff., 150, etc.; and by the Uzbek Muhammad Šāǐb, *Fārūq, hukumat Samarkand-a dhu al-qarnayn, (1498-1521) and passion), although to the people of Central Asia the lands in question were on their side of and not across the river. (W. Barthold)

2. HISTORY

Pre-Islamic Transoxiana comprised, in the widest sense, Sogdiana (Arabic Šawād [q.v.], essentially the basin of the Zarafshān river) and the lands as far as the Sir Darya basin, north-westwards to Khorāsān [q.v.] and eastwards to Farangāna [q.v.] and across the Tien Shan Mountains into Eastern or Chines Turkestan (on the general concept of "Turkestan", Eastern and Western, see TURKESTAN). For these regions in classical times, see W. Tomasevčik, in PW, ii, cols. 2801-13 (Baktria, Baktriānī, Baktria, iii, cols. 2406-8 (Chorasonia). All this was still largely an Iranian region, with such Middle Iranian languages flourishing there as Khorāzmiš and Soghdian, both written in scripts going back to the Aryan alphabet; Baktrian in the upper Oxus provinces of Tughristan, Caspian, Kijitan (Kptalan) and Wakṣh (q.v.), written in a modified Greek alphabet; and Khotanese and Tokharian dialects in the Tarim basin of Eastern Turkestan, written in scripts of Indian origin. In Sogdiana, however, the strong cultural influence of Sāsānian Persia may have given Persian a foothold in the main cities at least. Našeršāhi states that just after the time of the conquest of Buhārā by Kūlyāba b. Muslim (sc. in ca. 94/712-13), the people there used Persian (šūrā) for reciting the Kurān, though no doubt Soghdian remained for some time to come the main language of daily intercourse (Tavārikh-i Buhārā, ed. Muaddārī Ridawī, Tehran 1939, 57, tr. R. N. Frye, The history of Buhārā, Cambridge, Mass. 1954, 48). Just over two-and-a-half centuries later, al-Maqrīzī (1365), calls the speech of Buhārā darī, i.e. Persian; this must nevertheless still refer to urban speech patterns only, for Soghdian lasted much longer in the country-side. (A. D. W. FORBES)
In regard to religion, no single faith was dominant. Buddhism was still in full bloom in Eastern Turkestan and still strong in the upper Oxus provinces, where it was the faith of the northern branch of the Hephthalites [see supra] who put up such a strenuous resistance to the Arabs in the later 1st/7th and early 2nd/8th centuries, and where Balkh [q.v.] was still a major Buddhist centre; but it had, for some time, been waning in Sogdia. When the Chinese Buddhist pilgrim Huen-Tsang arrived in Samarkand in 639, he found the Zoroastrians completely in the ascendant there and the Buddhist monasteries deserted; the restorative measures which he took can only have arrested this decline temporarily. For as in the linguistic field, cultural decline in Soghdia and Bukhara, and in Zoroastranism an acceptance of prestige and power in Transoxania, even though direct Sasanian military authority did not extend beyond Marw (cf. W. Barthold, *Histoire des Tures d'Asie Centrale*, Paris 1945, 33 ff.), Manicheism and other dualistic faiths were tolerated, and their adherents found an especially sympathetic haven in Eastern Turkestan and among the Uyghur Turkes, as numerous surviving religious texts from the Turan basin attest; as late as c. 372/982 the *Haddid al-Islam*, tr. Mirsky, London 1911, 173, 23-144 records the presence in Samarkand of a conventional house of the Manicheans, *khagday-i Manawiyân*, with auditores or *nigâdayâtk*. Mzdakiziks are mentioned also in Samarkand, and if the followers of the late 2nd/8th century heretic al-Mukanna, the *weavers of white* (see below) were Mzdakiziks (or Manicheans?), their adherents still persisted at Kish and Nahshab in the time of the continuator of Nasrâgh Ahmad b. Muhammad b. Nasr (*Tarikh-i Bukhšt*, 83-9, tr. 75). The Christian presence was strong. A bishop is mentioned at Marw in the time of the continuator of Nasrâgh Ahmad b. Muhammad b. Nasr. The latter city a local prince Tu-Rârâsh and his successor Qifttrak, Mosques were now in Bukhara, comprised the more powerful members of the *dhâkin* class and bore Iranian original titles such as *dhâkin*, from Old Persian *bashkâh* ("king, ruler"), e.g. in Soghdia and Farghâna. Such a land-owning class (which may be called, not anachronistically, one of feudal magnates) of *dhâkin* was the backbone of resistance to the Arabs, and continued to play a leading social role—eventually as an Islamised caste—in Transoxania till the end of the Sâmânid period, during which political authority was still to a considerably extent decentralised; its decline only came with the influx of Turkish steppe peoples in the 5th/11th century and after.

The Arabs who had invaded Persia and overthrown the Sâmânid empire penetrated to Tukbârštân in *Uighân*’s caliphate, during the governorship in *Kuytsân* of *Abî Allah b. Âmir* [q.v.], and al-Hârâk b. Bahkak-Ishân. When *Abû Uwaisya*, a plunder raid across the Oxus to Maymûngh near Samarkand in 336/949-54. It would have been obviously unwise to commit major Arab forces across the river until some progress had been made against the resistance of the Hephthalites in Oxosania and until a key point like Balkh had been captured (first raided in 32/951, but not fully secured till the time of Kutasiba, see below) and the Oxus crossing-points of Anâil-i Shâtîl [q.v.] and Zamm taken.

In the spring of 54/674 Mu‘awwîya’s general *Ubayd Allah b. Ziyâd* [q.v.] crossed the Oxus, attacked Paykand and defeated the army of the local Soghdian ruler of Buhkara, the Buhkâr-Ishâdî, *Yazîd*’s governor, *Salb* b. Ziyâd (61-4/681-2) was the first Arab commander actually to winter across the river. Any hopes of Arab progress in Transoxania were dashed by the civil wars which broke out in the heart of the caliphate on Yazîd’s death and the protracted resistance of the Umayyad government in Damascus to the anti-caliph *Abî Allah b. al-Zubayr*, even though the Soghdian cities remained divided and their leaders were probably one in Samarkand by the 6th century.

Socially, there was an influential class of merchants in such Soghdian towns as Bukhara, Paykand and Samarkand, which was involved in long-distance trade operations with the Turkish peoples of the Siberian steppes and with the Chinese. The Arab invasions would not seriously hamper these trade movements, and indeed, the Soghdian merchants continued to play a major role in the Islamic caliphate for the goods which they imported from Inner Asia. The landed aristocracy of *dhâkin* was dominant in the countryside and smaller towns, and the pattern of large estates in *Kuwarâm*, along the Oxus channels and their canals, revealed by Soviet archaeology, was probably repeated in the irrigated lands of the Zaraftûn valley and the upper Oxus ones. The local Iranian princes of Transoxania mentioned in the sources, such as those in rural *Tâkh* [q.v.], Sâhik [q.v.] and *Farghânâ*, and in cities like Samarkand and Bukhara, comprised the more powerful members of the *dhâkin* class and bore Persian original titles such as *shâhâr* [q.v.], from Old Persian *Ashâhrâtiya*.
the prince Kütîgîn which penetrated as far as Tamlîr Kapâk, the "Iron Gate" (so the present Buzgala defile between Kish and Tirmidh), "in order to organise the Soghdian people" (the connection of these seems fairly certain, as proposed by Marquart and Sartokh; cf. R. Strzygowski, Der Turkestan, 104, 1913, 30-31; the Transoxianian population which had been converted and JihurAsfln by the growing menace of the Abbasid period (see further on these, beginning with Mongolia and Eastern Turkestan) or in the Far East. That of the Uyghurs, who were essentially concerned towards that of the Kish and Turkmên for help against the Arabs, with Mongolia and Eastern Turkestan) or in the Far East. That of the Uyghurs, who were essentially concerned with the Chinese activity in Central Asia. In 748 Chinese forces captured the Ĥurghana capital of Suyûb, in the Çu river valley to the north-east of Farghâna, and in 749 executed the local ruler of Soghdian descent for "the non-fulfilment of his duties as a vassal". For several decades, virtually since the first coming of the Arabs, the Soghdian princes and the princes of Türkistan (including among the latter the Yaḥûb, Arabic Dabûdûs) had been sending embassies to China appealing for help against the invaders. Now in 750-1 the Chinese general Kao-hsien-chih was sent by the Chinese governor of Kuta in Eastern Turkestan, firstly against rebels in the Pamirs region of Gilgit (q.v. in Suppl.), and then into Farghâna. Here the Chinese army, assisted by the Türkistan Khâlîk (q.v.), met an Arab force under Ŭiyâd b. Ŧâlîf at Allahk or Allahk near Talas in 751-2, and was soundly beaten, with heavy losses of killed and captured (see D. M. Dunlop, A new source of information in the Battle of Talas or Allahk, in Ural-Asiatische Studien, xi. (1947), pp. 91 f.). But the prisoners-of-war were Chinese artisans who are supposed to have taught the people of Samarkand the art of paper-making (al-Thālibî, Luṭufi al-mârîfî, tr. Bosworth, The book of curious and entertaining information, Edinburgh 1968, 140, and Kâgîd). This marked the end of Chinese attempts to assert their hegemony west of the Tien-Shan; to the subsequent entreaties of the Islamic princes of Transoxiana and Khîrâzam for help against the Arabs, the Turkistan Khâlîk, pre-occupied by succession wrangles 755-66, were compelled to return uncom¬mittal answers. Arab authority was thus made reasonable firm in Transoxiana for the first time, since the local potentates no longer had any strong allies either in the Türkistan steppes (the Eastern Turkish confederation had collapsed with the death of the Khašân Mo-ki-lien in 744, to be replaced by that of the Uyghûrs, who were essentially concerned with Mongolia and Eastern Turkestan) or in the Far East. That the masses of population in Transoxiana were as yet far from wholly reconciled to Arab political and social domination was to be demonstrated by various outbreaks of religio-political protest in the early 8th century (see further on these, below), but Arab authority was by that time never seriously jeopardised.

For the detailed history of this first century or so of Arab domination in Transoxiana, see F. H. Rhine and E. D. Ross, The heart of Asia, a history of Russian Turkestan and the Central Asian Khurasans from the earliest times, London 1899, 34-48; Gibb, The Arab conquests in Central Asia, London 1925; Barthold, Histoire des Turcs d'Asie Centrale, 47 f.;
Under the first 'Abbasids, Transoxiana gradually became integrated politically as a province of the caliphate as a whole. The first governors appointed there by the victorious Abū Muslim speedily began intriguing against their patron at the instigation of the caliph Abu l-'Abbās al-Saffār, who became deeply suspicious of his over-mighty subject. Abū Muslim accordingly executed Sībā al-Nu'mān al-Azdī in 155/772-3 at Amul, whilst the fugitive Ziyād b. Sāliḥ was executed, to Abū Muslim's satisfaction, by the Roman sīkhān of Bārkah, on the route from the caliph's army to Uqbar. The movement of the "wearers of white garments" (mu'ta) was suppressed during the governorship of al-Musayyab b. Zuhayr al-Dabīb (164-6/780-1), but the "wearers of white garments" persisted in the rural areas of Transoxiana and Khorāsān for at least two centuries after this. The years 194-186/804-9 were characterised by the revolt centred on Transoxiana, but with partisans joining his standard from the upper Oxus provinces of Cagānīyān and Khūṭāl and from Khārāzam, of Rāfī b. Layyīb, the grandson of Naṣr b. Sāyyār. The motive behind this seems to have been purely personal, without any religious or ideological impulse, and doubtless the prestige of Rāfī's descent from the popular Naṣr b. Sāyyār brought him support. The Arab governor of Samarqand was killed, and Rāfī secured help from the Iranian prince of Shāhīz, from the Karākūn and the Toghour-Oghuz Turks of the steppe and from Tibet before he submitted voluntarily to al-Ma'mūn and secured pardon (see Barthold, Turkistan, 200-1).

Thus intervention by the Turks in Transoxanian affairs continued during the early 'Abbasid period but not on the same scale as during the Umayyad one. The disintegration of Tughrī power in the Western Turkestan steppes was followed by the ascendency of the Toghour-Oghuz, precursors of the Oghuz or Ghuz [?], who were mentioned in the 4th/10th and 5th/11th century Islamic sources as harrying the borders of Šamānī Transoxiana and then emerging to form the tribal backing of the Šahīds [?], when they overthrew Chaznawī power in Khurāsān and entered northern Fūrsī and the central lands of the Šihrāzī Basīrān. In the early 'Abbasid period, the Toghour-Oghuz had their pasture grounds on the confines of Khārāzam and also among the lower Šīr Dāryā. The Karākūn, possibly the ancestors of the later Ikek Khāns [?], or Karākūnīs, took over the eastern Šīr Dāryā basin and Semirečie [Turkish Yeti Su, "the land of the seven rivers"], acquiring in 766 Šīrīyā, the former capital of the Tughrīs. Islamic Transoxiana suffered sporadically from their incursions, and these Turks continued also to give help on occasion to insurgent local Iranian princes and to rebels like Rāfī b. Layyīb. The outbreak of the Khārāzam war Yūsuf al-Barmī al-Thaqāfit at Bukhārā and in the countryside of Badghis, and later, in the time of al-Ma'mūn, Yūsuf's grandson Mānsūr b. 'Abd Allāh also rebelled; such Khārāzam activity was an aspect of the general vitality of Khārāzam doctrines in Khurāsān and Sīsātān at this period. More serious at the time and with a protracted aftermath was the movement of Jumayyā b. Kabtaba, the "wearers of white garments" (al-mu'ta), claiming to be a "deputy prophet" al-Mu'ākāna [?], whose real name was Hāji'm b. Hākim or 'Alī, a former partisan of Abū Muslim's. The revolt, erupting during Humayd's governorship, is treated at length by Nārshākhdī [27-89, tr. 65-76; Barthold, Turkistan, 198-200; Sadighī, op. cit., 163-86; B. S. Amoretti, Sects and heresies, in Camb. hist. of Iran. iv. From the Arab invasion to the Saljuqs, ed. R. N. Frye, Cambridge 1975, 405-501]. It attracted widespread support in Sogdiana, at Kish and at Nağshābūr or Basāf, whilst in Bābhūr, the son of the Bābhūr-Mīrādī Čamārshāhidī, Pīm, a renowned official Israēl and joined the movement. It is not easy to discern from the sources the exact nature of al-Mu'ākāna's religious doctrines. He himself may have been originally a Zoroastrian, but his ideas may have come to include neo-Mazdakite elements and perhaps even Manichaean ones; and certainly, Abū Muslim, whose avatar al-Mu'ākāna claimed to be, was accorded an exalted, almost divine position. The outbreak was suppressed during the governorship of al-Musayyab b. Zuhayr al-Dabīb (164-6/780-1), but the "wearers of white garments" persisted in the rural areas of Transoxiana and Khorāsān for at least two centuries after this.
of al-Mu'ta'sim, the Ash'âb of Ushârîs, Haydar, was to play a leading role in suppressing the revolt of Bâbak al-Khurrâmî (q.v.) in northwestern Persia until his own spectacular fall in 225/841 [see ash'âb].

Of special concern to us here is the contemporary rise to power, under the overlordship of the Tâhirîs, of the Samâ'îlids, who laid the foundations for what became a powerful amirate, at first in Transoxania and then also, in the 13th/19th century, in Khurasân. The early periods (225-95/841-907, p. 157) of the dynasty are still obscure. The origin of the Samâ'îlids, the person anciently known as the Sâmân- Khûdây (q.v.), proved impossible to decide, but the family was clearly a typical Iranian dîkhân one hailing from Tujhâshân. A Samâ'îl-Khûdây of the late Umayyad period is said to have accepted Islam at the hands of Abû 'l-Khayr al-Karîm ibn Hurayrâh, the governor of Merv, in 72-7, and in the caliphate of al-Ma'mûn, his four grandsons, Nûh, Abûn, Yâhâyâ and 'Ilâyâ received, as rewards for their fidelity to al-Ma'mûn's interests, the governorships of Samarqand, Farghânâ, Shâsh and Harât respectively. The Harât branch was unable to maintain power south of the Oxus, and the Samâ'îlids developed essentially as the dominant power in Transoxania, being designated governors, in effect independent rulers there, by the caliph in 261/875 after the downfall of the Tâhirîs at the hands of the Saffârîs Yâhûd (q.v.) and 'Abd b. Layyih (q.v.). For a detailed consideration of the Samanid dynasty and its history, see samâ'îlids, and for the present, a useful general survey by Frye, The Samanids, in Camb. hist. of Iran, iv, 136-61.

Here it may merely be noted that it was a cardinal feature of Samâ'îlî policy, from the time of the real founder of the dynasty's fortunes, Ismâ'îl b. Abûn (279-95/892-907, q.v.), onwards, to maintain those frontiers of Transoxania which faced the south, as against the pagan Turks and Karluk, Oghuz and Birtûbs describe the fringes of Transoxania as dotted with the dîkhân Khûdây, the Khuda Sâlûf in Sistan, the Farîqânis in Gâzghân, the Abd Dawûdids in Balkh, the Muhrâjids in Câhâgînâyân, etc., and whilst the dîkhân remained vigorous and intrusive, this was no source of weakness. Contemporary geographers describe the fringes of Transoxania as dotted with rûbâ'îs [q.v.] against the pagan Karluk, Oghuz and Khûdây, [q.v.], where rûbâ'îs or enthusiasts for the faith, from the Transoxanian towns, could work off their energies in the defence of Islam. In Isfâhân [q.v. in Suppl.], on the northernmost frontier of Islam, as many as 1,700 rûbâ'îs are mentioned, partly manned by volunteers from Nishâbûr, Bukhârâ and Samarqand. Even when some of these Turks had been nominally converted to Islam, rûbâ'îs as centres for offensive and defensive operations were still necessary; al-Mukaddasî, 174, tells how two places on the middle Sir Dâryâ, in the district of Isfâhân, were frontier points (bâkûtân) against the Turkmen (al-Turkmenîyân) who had only become Muslims "out of fear". It was also from these frontier posts that the Turks and other seafarers set off into the litoral of the steppe as evangelists, such as the missionary from Nîshâbûr, one Abu 'l-Hasan Mu'tâmîd al-Kalîmâtî, who worked amongst the Karluk in the middle years of the 4th/10th century and who played some part in the conversion of the founder of the Karâghânid line, Sâhûb Bûgâh Khân, the Islamic 'Abd al-Karîm (Barthold, Turkestan, 173-6, 254-9).

Transoxania flourished under the Samâ'îlids, and there was a dying-down of sectarian religious and socio-political protest movements during their time, compared with the previous period, although these did not entirely disappear. The geographers and travellers praise the ease of life there, the plentifulness of provisions, the comparatively light hand of government and incidence of taxation and tolls. There was quite a complex central administration in the capital Bukhârâ, known to us from the accounts of Nâshâbî and of the encyclopaedist of the sciences 'Abî 'Abd al-Khârîm ibn al-Khânâyîn (q.v.), with a cluster of adjacent or government departments adjacent to the palace built in Bukhârâ by Nasr b. Abûn (302-31/913-43); the model for these was doubtless the A'bbâsid bureaucracy in Bagdad (see Nâshâbî, 31-2, tr. 257; Bosworth, A'bbâsid al-Khawârîmân on the technical terms of the secretary's art., in JESHO, xii [1969], 113-84). Because of the province's frontier position, the people of Transoxania are described as tough, bellicose and self-reliant; also, perhaps because of the continued social influence of the dîkhân class, the ancient Iranian virtues of hospitality and liberality were kept up (see Bosworth, The Ghaznavids, their empire in Afghanistan and eastern Iran 999-1090 Edinburgh 1963, 27-34). Culturally, both the Samanid themselves and the local, petty courts of the empire encouraged the persistence of Iranian oral and literary traditions, seen in the birth and florescence of New Persian lyrical and heroic poetry [by Shâhîd Bahâsh, Rûdakî, Dâkî, etc.] which characterised the 4th/10th century and prepared the way in the early part of the following century for such figures as Firdawsi and the Ghaznavid lyric poets (see G. Legend, The rise of the New Persian language, in Camb. hist. of Iran, iv, 595-632). At the same time, Transoxania shared to the full in the Arab-Islamic heritage of the caliphate as a whole. Several of the compilers of the canonical collections of hadîth, the sunnâs, were from Transoxania and Khûrâsân, and their scholars played a large role in the consolidation and elaboration of orthodox Sunnî theology (kalâm) and law (fîrsâ). Similarly, the fourth section of al-Thâ'âbî's literary anthology, the Yatâyin al-adhr, shows how brilliantly Arabic poetry and artistic prose were cultivated in Khûrâsân, Transoxania and Kâhâramân (see V. Danner, Arabic literature in Iran, in Camb. hist. of Iran, iv, 565-94; Bosworth, The interaction of Arabic and Persian culture in the 10th and early 11th centuries, in al-Akhbâr, xxvii [1978-9], 60, 68 ff.).

As in other fields, during the period 750-1000 Transoxania acquired strong economic and commercial links with the interior of central Asia, including with the supreme centre of consumption, 'Urâsh and its capital Bagdad. Instead of the old military systems of the Arab mukâtîs and then of the early A'bbâsid Khûrâsân guards, the caliphs began in the 3rd/9th century to surround themselves with Turkish slave troops [see playars, and chûlâm]. Hence the trade in Turkish slaves, who passed from the Inner Asian steppes through Transoxania to the slave markets there, became highly important, and Turkish slaves were an integral part of the annual
of the provinces of the Transoxanian emirate of Soghdiana, which had been a tributary of the Sasanian Empire, the rulers of Transoxania, the Karakhanids, began to take advantage of the amlrate’s weakness. In the late 10th century, the Karakhanids, who had succeeded the Ghurids in Transoxania, began to expand their influence in the region.

The Karakhanids, under the leadership of their ruler, the Saljukid dynasty, began to assert their power more aggressively. In the late 11th century, the Karakhanid leader, Al-Muqtadir, annexed Transoxania and established a client state, the Karakhanid emirate of Transoxania, which was ruled by the Karakhanid dynasty.

The Karakhanids, under the leadership of their ruler, the Saljukid dynasty, began to assert their power more aggressively. In the late 11th century, the Karakhanid leader, Al-Muqtadir, annexed Transoxania and established a client state, the Karakhanid emirate of Transoxania, which was ruled by the Karakhanid dynasty.
mediaeval provinces of Caghataiyan, Khurul and Wakhsh did an Iranian-speaking population persist now speaking the form of New Persian known as Tadjik-Tadzhik [see IRAN, III, Languages, in Suppl.], and living in what is now the Tadzhik SSR, their numbers amounting to under 1 3/4 millions (1970 census). It is also during these centuries of the Turkiscation of Transoxania that the region becomes known, at least in popular parlance, as Turkiston [q.v.].

Transoxania and Eastern Turkistan or Kâshgaria were of course the first Islamic lands which Cîngiz Khân encountered when he came westwards with the Mongol hordes. Bâlashân [q.v.], the main urban centre of Semirechye, was occupied after it had already suffered a severe plundering by the Karâ Khîty. Bûkhârâ was ravaged in 656/1259, and soon afterwards, Citrâ or Utur [q.v.], the former Fârâb [q.v.], in the Sr Darya basin, and Samarqand were attacked before Cîngiz pushed on into Kîrânshâb. The Mongol empire at its zenith, Chingiz Khan [see 1206-20; Hambly, The career of 1227-41] appointed governors in Transoxania for Nakhshâb, Bûkhârâ and Samarqand, and the sedentary indigenous population was at the beginning of his reign ruled by his representative Mahmîd Yalawâkî Kâ-zârami [q.v.], appointed to collect the taxation there. Duwaydî praises Mahmîd Yalawâkî's just rule and that also of his son Mustâfi Beg [q.v., stating that Bughârâ reached its former level of prosperity (the latter governor was, for instance, the founder of the Ma'sündîya madrasa in Bûkhârâ), though in fact there was a popular, anti-Mongol rebellion there led by one Mamûd Târâbî, only ended by the appearance of a large Mongol army (63/1238-9) (see Barthold, Turkistan, 521-519; Grousset, L'empire des steppes, 393 ff., 374-8; Hambly, The career of Cîngiz Khan and The Mongol empire at its zenith, in Central Asia, 80-113).

Transoxania, together with those steppe lands to the north henceforth to be known as Moghulistan [q.v.] or Moghulistan, came within the usûs or patrimony of Cîngiz's second son Caghâyat, together with Eastern Turkistan (Kâ-zârâmî came within the usûs of Dîqâî, the eldest son, together with western Siberia and South Russia); but the Caghâyatî khanate was not properly constituted till some time after Caghâyat's own death in ca. 1241. Caghâyat and his descendants took little interest in the sedentary and urban life of Transoxania, Pref-Moghol Turkish landowners and chiefs, the successors of the Iranian abolâhs, remained influential in the countryside; the descendants of the Karâkhânids remained in power in Farâhârân; it seems (Barthold, Histoire des Turcs d'Asie Centrale, 178-191; in Moghulistan, to the north of the Ir river, there was a distinct decline of urban life in favour of pastoralisation (see ibid., 149-55). Urban traditions in Transoxania were much stronger, and especially notable in the towns there is the prominent role, from Karâkhânî times onwards, of local Hâfiz religious leaders functioning as go-between (awlâd, sing. awlî), usually with the title of sharîr or sharîr-i ejhân. Leaders with this title are found in Bûkhârâ, Samarqand, Khojand, Urgand, Shâh and Amlâh; the best-known of these were the Aîl-i Bûhân in Bûkhârâ (till the revolt of Mahmûd Târâbî in 656/1259) and their successors, the Aîl-i Mahbûbî (till the mid-8th/14th century) (see O. Pritsak, Aîl-i Bûhân, in Isâ, xxx (1952), 81-96, and Sâbâ). Because of this lack of interest in the settled lands on the part of the Caghâyatî khans, the nomadic traditions of the Mongols lasted longer amongst them, as also amongst the Golden Horde in South Russia and the Kipchak steppes (see KIPCHAK STEPPES, till the Persia of the Il-Khâns or the northern China of the Great Khâns. The Caghâyatî khans' favoured encampments were in Semirechye, in the Ir basin, with the town of Amlâh [q.v.], between the Tien-Shan and Lake Balkhash, as their administrative centre; the town was flourishing and frequented by foreign traders, ascribed by western travellers to the Great Khân's court until it was destroyed in the civil strife amongst the Mongols in the 8th/14th century. Rebeî (ca. 1218-28), though still, like the previous khans, resistant to Islam, moved his capital to Transoxania proper and built a palace near Nakhshâb in the Kâshka Darya valley, although this did not entail renunciation of the nomadic life; from the Mongol term for "palace", khâbîdî, the nearby town of Nakhshâb came to be called Kâshgar (see SHÂHR-I Kâshgar). Rebeî's move must nevertheless have had the eventual conversion of the Caghâyatî khans to Islam, from the time of Tarnavshân onwards (1236-34). Caghâyatî rule lasted in Transoxania till the rise of Timûr (see below), and in other parts of Central Asia till after then, but Timûr's successes were facilitated by increased disunity amongst the Caghâyatî family, with Caghâyatî puppet rulers placed on the throne by Turkish princes. For an account of the khanate, see CAGHÂYAT KHAN AND CAGHÂYAT KHANATES; Barthold, Histoire des Turcs d'Asie Centrale, 133 ff., 193-7; Grousset, L'empire des steppes, 397-420; Hambly, The Caghâyatî khanate, in Central Asia, 127 ff. Timûr, a Barlas Turk from Kîh in Transoxania, succeeded by forces of arms to the Caghâyatî khanate heritage there. In 771/1370 he became de facto ruler of Transoxania, ruling in the name of fâtimid descendants of Ogedey, sc. Soyurghâlitâf (771-5963, and then his son Mahmûd (756-816/1358-913). He linked himself by marriage to the Caghâyatî royal house, including to a daughter of Khîrî Khodja (d. 801/1399) of Mogholistan, who was reputedly a son of the last significant Caghâyatî khan Tûshlûk Timûr (760-71/1359-70). Under the rule of Timûr's descendants, above all, that of Shâhrûdî (807-50/1405-57). Transoxania enjoyed much material prosperity, with Samarqand and Bughârâ becoming lively centres of artistic and literary life, of painting and book-production, and of poetry in both Persian and Eastern Turkish or Caghâyat. Samarqand was the city which Timûr preferred to all others as his main capital. European travellers like the Spanish envoy Clavijo (1403) describe the splendour of his court, and fine buildings in Samarqand, of which the Gûr Amûr mausoleum and the Bibî Khânum mosque survive, attest the high aesthetic level of early Timûrid architecture. The reign of Timûr's grandson Uluḫ Beg [q.v.](ruled in Transoxania from 814/1411, at first as Shâhrûdî's deputy, to 853/1449) is associated with his foundation of a short-lived observatory in Samarqand and the compilation of astronomical tables (see Barthold, Uluḫ- Beg, tr. V. and T. Minorsky, in Four studies on the history of Central Asia, ii, Leiden 1958, 129-34).

As his second capital, Timûr developed Shâhr-i Sâbâ in the Kâshka Darya valley, in the heart of the area of the Barlas Turks and near his own birthplace, starting there the construction of impressive buildings, including his own tomb (see Barthold, Shâhr-i
Sabs from Timur to Ulugh Beg, tr. J. M. Rogers, in Iran, JBIFS, xvi [1978], 163-26, xviii [1980], 124-43.

Popular Islam, in the form of a cultivation of Sufi mysticism and the growth of a network of dervish orders, especially flourished in Transoxania during Caghatayid and Timurid times, and the Shaybans and their orders enjoyed the patronage of the Timurids. Thus the Nasabhanids of the eight lord of the Turkmens, the Uzbeks, this last Turkish people moved southwards into Transoxania, forming the Shaybansids. See Hambly, "The Shaybansids," in Central Asia, 105-62; see also MIRKHANID

Meanwhile, the Caghatayids managed to survive during these years in the lands beyond Transoxania, and under Esm Buka II (63.67/1429-62) flourished in Moghstellar and Eastern Turkestan, being hostile however to the later Mamluks. For the detailed history of this period, see Barthold, Histoire des Turcs d'Asie Centrale, 165-64; Grosset, op. cit., 386-96, 568-80; Mahir Fajlanpur, The Timurid empire, in Central Asia, 150-62; and TURKISH HISTORY.

In 906/1500, Muhammad Shaybanl, the son of a line of Mongol khans, the descendant of Djoici's youngest son: Shiban (one part of whom had remained in Siberia as Ulusans and another part of whom had moved to the Turkmens of Transoxania from the steppelands of South Russia and western Siberia), was, indeed, to become the permanent home of the Shaybansids and the Uzbeks, this last Turkish people giving their name to the modern Uzbek SSR, in which they probably form some 70% of the present population. The Shaybansids brought into Transoxania a Turkish following amongst whom the nomadic steppe traditions remained strong and who were virtually untouched by Iranian cultural and religious influences, as had been the case with their predecessors there. It was the strength of popular religion, that of the dervishes and Shi'ahs, already notable in Timurid times (see above), rather than that of the orthodox Isla, which characterized Islam there in the time of the Uzbeks. Like Timur, they exalted the cult of the Shi'ah saint Ahmad Yasawi, whose tomb in the lower Svr Dary-valley at Yaul had long been a popular pilgrimage place for Turks from all over Inner Asia. The Shaybansids in fact made Yaul their capital for a while, and under them it received its new name of Turkistan, indicative of its importance to the Central Asian Turks in general.

Politically and diplomatically, Sumr Transoxania under the Uzbek was in the 10th/16th and 11th/17th centuries frequently involved in warfare with the powerful and aggressive Shi'ah monarchy of Samarkand Persia. As so many earlier Turco-Mongol dynasties had done, the Shaybansids coveted the rich province of Khurasan, and invaded it on several occasions. But Muhammad Shaybanl (905-16/1500-62) and successors of his like Abu 'l-Ghabr Usayd Allah (940/1634-6) failed to overcome the experienced troops of Shih Ismail and Shih Tahmasp, who had a greater appreciation of the value of the modern weapon of firearms and who had seasoned troops in their Keshlshak Turkmens and then in their Georgians, Armenians, etc., slave guards. The long-term result of this warfare was the virtual sealing-off of Transoxania from the rest of the Islamic world through the erection by the Samarkand of this bulwark on their northeastern frontier. Although Turks from Central Asia and Afljanz streamed into Muslim India as mercenaries, adventurers, etc., the traffic was largely one-way. Hence Transoxania became culturally introverted and impoverished, although the steppe lands of South Russia and western Siberia were by the 17th century beginning to come under Russian, Christian control, and the popular Islam of the regions was the Zayawaiyya, the Cightyly and the Nasabhanidiyya, though intense in religious fervour and emotion, was weak in intellectual content. Only in the sphere of Eastern Turkish or Caghatay literature may it be said that Transoxania made a significant contribution to the cultural stock of Eastern Islam at this time. It was a flexible and expressive enough language for Bbubur [q.v.] to write his memoirs in it; to produce a lively folk-poetry, seen e.g. in the verses of the 18th century Golden Turkmen bard Maksut Kall; and to give rise to a genre of historiography amongst the Shaybansids, the Djinids or Askarhans and the Mangits of Bukhara and the 'Arabshahids of Khiva in the former Khazar, although such outstanding figures as the 10th/16th century Shaybansid historian Khidr Tanjik [q.v. in Suppl.] continued to write for a preference in Persian. For the detailed history of the Shaybansids, see Hambly, "The Shaybansids," in Central Asia, 165-74; Barthold, Histoire des Turcs d'Asie Centrale, 185 ff.; and GRABAR.

In the course of the 10th/16th century, Bokhara and Khiva formed themselves into separate, often mutually-hostile khanates, and then in the early 18th century, a third Uzbek khanate arose in the Farghiana valley, that of Khokand. The three principalities were to have separate existences, punctuated by much squabbling and internecine warfare, till the Russian occupation of Central Asia in the second half of the 19th century, Bukhara and Khiva remaining, however, as virtual protectorates of Russia until the aftermath of the Bolshevik Revolution.

The history of these khanates can be followed under BUKHARA, KHIVA, KHOKAND; see further BANIDS, BURGZAT, MANGITS, and also INAK in Suppl.

(C. E. Bosworth)

The lack of perennial water courses in Arabia and the infrequency of springs prevented the development of such divinatory techniques as these amongst the Arabs. We have nothing to confirm that the reflection of the surface of the water was ever used for such purposes. Water, like perfume, was used in the rituals over the making of pacts and alliances [see LS'AKAT AL-DAM], but these procedures had no divinatory character at all.

## 2. Water in Classical Islamic Law

In Islamic law there are seven kinds of water which it is lawful to use for drinking or ablution: water from rain, snow, hail, springs, wells, rivers and the sea. These sources may, however, be rendered impure by the presence of them of unclean objects. Questions of ownership and the right to take water depend on the nature of its source, whether natural or artificial watercourses, wells or springs (freshwater lakes are not generally discussed in the sources owing to their scarcity in the Islamic lands). Ownership of a source of water implies ownership of its khirman (reserved area), consisting of that portion of land adjacent to the water source sufficient to enable the source to be used. One *haded* defines the extent of the *khirman* of a well as 40 cubits on every side, but other measurements are also given.

The *Sharia* distinguishes three types of water sources which may be the subject of use or ownership:

1. Water from rivers, which may be (a) great rivers, such as the Tigris and Euphrates, which are of such a size that they can be used by all for drinking and irrigation, or (b) lesser rivers, in which case two possibilities may be distinguished: (i) where there is generally enough water for all users but where it is possible to cause shortage to other users by eg. digging a canal to take water from higher up the river than other users (whether this is allowed or not must be decided after inquiry into the consequences); or (ii) where damming or the allocation of fixed times is necessary to provide enough water for irrigation. In such cases, the river is normally regarded as the joint property of the riparian cultivators, and the question of how much water may be retained by the highest riparian cultivator depends on differing circumstances, such as the season of the year, the type of crop irrigated, etc. (c) canals. These are the property of the landowner or landowners in whose property they are situated; where they are the common property of several landowners, none of them may make unilateral changes in arrangements for sharing the water, or by building a mill or bridge over it, etc.

2. Wells: (a) Wells dug for the public benefit; here the water is freely available to all, the digger merely having the right of first comer. (b) Wells dug by persons for their own use, eg. wells dug in the desert by tribesmen. Such persons have first right to the water while they are living in the vicinity, but are obliged to give water to persons suffering from thirst after they have moved away. The water becomes freely available to all. (c) Wells dug by persons intending them to be their own property. Ownership, however, cannot be claimed until water has actually been found, and if the well needs lining, until it has been lined. The owner of the well has a duty to give water to anyone suffering from thirst. This is illustrated by a tradition which records that ‘Umar made some owners of water pay the *dina* for a man who died of thirst after they had refused his request for water.

3. Springs: (a) Natural springs: these are treated analogously to permanently flowing rivers. If the water-supply is limited, the first person to undertake irrigation in the area has priority; otherwise the water has to be shared equally. (b) Springs opened up by digging: the person who does this becomes the owner, together with the surrounding *harim*. (c) Springs opened up by persons on their own property. In such cases, the only claim against the owner is that of persons suffering from thirst. If the owner has a surplus of water, he may be obliged to give it gratis to other men’s cattle, but not for irrigating crops.

A person who possesses water in a vessel is its sole owner, and he is not obliged to give it to others gratis; he is, however, obliged to relieve someone suffering from thirst in return for a recompense.

## 3. Hydraulic Machines

There is ample evidence from written and archaeological sources for the widespread use in pre-Islamic times of all the main hydraulic machines, described below, in all the areas that were to form part of the Muslim world. The *shajjat* (shadaf) was known in ancient times. The *suhjja*, although this did not become fully effective before the introduction of the pawl in the 4th or 5th century A.D., was known in Roman times. Both machines are still in use today. The *noria* (*shana*) and the vertical undershot mill-wheel are both described by Vitruvius but none of these names seem to have preserved originality. (On *architecture*, Lech Classics, ed. F. Grainger, 1929, ii, 503-7). Vertical mill-wheels were sometimes mounted on boats moored to the banks of rivers (N. Smith, *Man and water*, London 1975, 140). The origins of the horizontal, vanné mill-wheel are still obscure: it may have been referred to by a Greek writer of the 1st century B.C. and it was in use in Ireland in the 7th century A.D. (Smith, *op. cit.*, 143). It is described in a Byzantine treatise, probably of the 7th century A.D., extant only in Arabic version (*Wiedemann*, *Aegyptischen Historien*, 50-6, see
The water mill is a simple machine consisting of a wooden beam pivoted on a raised fulcrum. At one end of the beam is a bucket, at the other end a counterweight. The bucket is dipped into the water, then the beam is rotated by means of the counterweight and the contents of the bucket are emptied into a cistern or supply channel. The flume-beam swipes are a development of the sidiuf, a solid beam, a channel is connected rigidly to the bucket; when this is raised the water runs through it into the outlet.

The sidiuf is more complex, and indeed has over two hundred component parts. It consists essentially of a large vertical wheel erected over the water supply on a horizontal axle. This wheel carries a chain-of-pots or a bucket chain. On the other end of its axle is a gear-wheel that engages a horizontal gear-wheel to which the driving bar is attached. The animal is harnessed to the free end of this bar, and as it walks in a circular path, the gears and the wheel carrying the chain-of-pots rotate. The pots dip in succession into the water and when they reach the top of their travel they empty into a channel. The norias (sometimes confused with the sidiuf) is a large wheel driven by water. It is mounted on a horizontal axle over a flowing stream so that the water strikes the paddles that are set around its perimeter. The water is raised in pots attached to its rim or in bucket-like compartments set into the rim. The large norias at Hamir in Syria can still be seen today; the first known mention of norias at Hamir is by Almay b. al-Tavyib in 371/981.

The Vitruvian mill-wheel turns a vertical gear-wheel that meshes with a horizontal gear-wheel to which the driving shaft is attached. The horizontal vaned mill-wheel is fixed directly to the driving shaft; there are no gears. It cannot be mounted directly in the stream since the water must be directed on to its vanes from a pipe or channel.

There can be no doubt that all these machines were in continuous use in Islam from the early conquests until the introduction of modern technology. (As mentioned above, the gddaf and the sidiuf are still in use; they are cheaper and more easily maintained than motor-driven pumps.) The evidence comes from treatises on machines, references in the works of historians and geographers, and archaeological investigations. For a selection of the available evidence, the reader is referred to the Bibli, under Wiedemann, Schiliz, and Schub. The remaining discussion will be confined to developments of particular importance in the history of technology.

Mills were used in Islam for other purposes beside the grinding of corn and other seeds, e.g. for crushing sugar cane and for sawing timber (A. Y. Hassan, Taki al-Din and Arabic mechanical engineering [in Arabic], Aleppo 1976, 51, quoting al-Nuwayri and Ibn Asaki). This suggests that rotary motion was converted to reciprocating, probably by means of trip-hammers. More examples of similar applications may be discovered when a systematic study of the historical and geographical works is undertaken.

Another area of interest is the use of the overshot mill-wheel, in which the water is conducted through a channel to the top of the wheel, which has bucket-like compartments around its rim. The overshot wheel works mainly by the weight of the water, whereas the Vitruvian one is operated by its force. In many conditions, the former is the more efficient of the two. Its use is recommended by a certain al-Muradi in a treatise composed in Andalusia in the 5th/11th century (D. R. Hill, A treatise on machines, in Journal for the History of Arabic Science, 7 [Almeppo 1977], 33-46. In this paper the treatise was wrongly attributed to the well-known astronomer Ibn Merry, above, p. 242, and 247, describes a similar wheel in operation near Tabriz and M. A. Hassan, above, p. 247). The overshot wheel did not come into general use in the West until about the 9th/15th century. Al-Dizareai (in Suppl.) often uses small overshot wheels in his devices, but these are usually scoop-wheels, a kind of primitive Pelton wheel, the scoops being fixed to the ends of spokes that radiate from a solid disc.

It is reasonable to infer that the scoop-wheels used by al-Dizareai were miniature versions of wheels in full-size machines, an inference that is strengthened by the fact that he used such a wheel in one of his water-raising machines (Category V, Ch. 3). The visible part of this is a sidiuf, which is provided with a model cow to give the impression that this is the source of motive power. The actual power, however, is provided in a lower, concealed chamber and consists of a scoop-wheel and two gear-wheels. This system drives the vertical axle that passes up into the main chamber, where two further gear-wheels transmit the power to the chain-of-pots wheel. Such devices (without the model cow) were in everyday use. A similar machine was in continuous use on the River Vezio above Dammasso from the 7th/13th century until about 1560 for water supply and irrigation. It was restored to working order by the staff and students of Aleppo University (Hassan, op. cit., 58-9).

Al-Dizareai describes four other water-raising machines in Category V, Chs. 12 and 4 dealing with flume-beam swaps operated by animal power through gear trains. The first two of these incorporate segmental gears. The earliest known occurrence of these gears in Europe is in the astronomical clock completed by Giovanni De* Dondi in 1365. The fifth machine is a slot-bod pump, driven through gears from a paddle wheel. It is remarkable for having two horizontally opposed cylinders and true suction pipes. Tabi al-Din (10th/16th century) describes a similar pump, but equally remarkable is his six-cylinder "Nonoblic" pump (Hassan, op. cit., 47-50).

The vertical cylinders are fitted into a single wooden block which rests in the water. Delivery pipes lead out from the sides of the cylinders, near their tops, and are brought together into a single outlet. Each cylinder has a valve at the bottom. The pistons are provided with weights at the top and lever arms at the sides. The lever-arms are supported at fulcums and their free ends extend inside the perimeter of a scoop-wheel. As the water strikes the scoop-wheel it rotates, the scoops bear down in succession on the lever arms and the pistons rise and fall in continuous succession. It should be apparent from the foregoing brief discussion that Islamic engineers were active in the construction and development of hydraulic machines for water-raising and power supply throughout the mediaeval period and beyond. Similar activity took
place in Europe, India and East Asia. Each region used the machines that were best suited to its needs, to the local hydraulic conditions, and to the available constructional materials.

Bibliography: (in addition to works mentioned in the text): two treatises are available in annotated English translations by D. E. Hill, The Book of Knowledge of Ingenious Mechanical Devices by al-Jazari, Dordrecht 1974, see esp. chs. 12, 15-6, 170-98, 275; and The Book of Ingenious Devices of the Band Masr (fl. Baghdad mid-th century), Dordrecht 1979, see chs. 222, 226, for horizontal waterwheels; there is an Arabic-English glossary, now available, ed. A. Y. Hassan, Aleppo 1978, Abu 'Abd Allah al Kharaszmi, Mathâb al-Sulân, ed. van Vloten, 1969-93 (this section contains definitions and brief descriptions of parts used in hydraulic and other machines); E. Wiedemann, Aufsätze zur arabischen wissenschaftsgeschichte, Hildesheim-New York 1970, see index under taqâb, náªra; Wiedemann and F. Hauser, Vor Rerichtungen zum heben von Wasser in der islamischen Welt, in Jahrbuch des Vereins Deutscher Ingenieure, viii (1918), 121-54. T. Schlaier, Roman and Islamic water-lifting wheels, Odense 1973 (deals mainly with the sûbâa); useful discussions on hydraulic machines in various regions, including Islam, occur in M. Neidham, Science and civilization in China, ii, Cambridge 1966 (see index under "mills", "water-raising devices", "water-wheel", etc.: Lynn White Jr., Medieval technology and social change, Oxford 1962, ch. 3; R. J. Forbes, Studies in ancient technology, Leiden 1955-64, ii, 79-9; N. Smith. op. cit., ch. 11. (D. R. Hill).

4. PRE-20TH CENTURY IRRIGATION IN EGYPT

Until the 20th century, irrigation in Egypt remained much as it had been in Pharaonic times. The continuity of practice stemmed from the dependence on the annual Nile floods, which provided Egypt not only with water for irrigation but also with the alluvial soil deposits to renew the fertility of the cultivated lands. The great river, however, does not only bestow its gifts, but may also be the cause of misfortune to the country. Up to modern times and before major dams and irrigation projects were undertaken, a high Nile promised the richest results. The irrigation dams (the djusûr) were of paramount importance for the irrigation of the fields, were classified into two types in medieval Egypt: the small irrigation dams (al-djusur al-balâdîyya) and the great irrigation dams (al-djusur al-sûlânîyya). The first were important for conveying water from one field to another in the village. Each musâkâ (holder of an idâra) with his clerks was responsible for the upkeep of these irrigation dams within the confines of his idâra. As for the great irrigation dams, which were constructed for the benefit of the provinces, the sultan was responsible for them, at least in theory. In practice, especially under the Mamlûk sultans, the musâkâs assisted the sultan in the construction of this type of dam by supplying peasants, oxen, harrows and tools, cf. Ibn Mamânî, Kawkân al-dâmmânîn, ed. A. S. Atiya, Cairo 1943, 252-3, 344; al-Kâshâshâb, SUVâb, iii, 449; al-Mâkri, Kûdâd, i, 102.

Because of the importance of the great irrigation dams, both the Ayyûbîd and the Mamlûk sultans used to select distinguished and able amirs and officials to supervise the work of their maintenance. Al-Nâburî (d. 660/1261) states in the kitâb Lûânâ al-jasânîn al-mudâwînîyya (ed. G. H. Becker and C. Cahen in Bulletin d’études orientales, xvi [1958-60], 39-50) that every year the Ayyûbîd sultan al-Malik al-Kâmil used to send him with 3 or 4 amirs to the Dîla provience during the flood period in order to keep the dams of that province in good condition. It seems that the Ayyûbîd sultan sent officials like al-Nâburî to other Egyptian provinces for the same purpose. Under the Mamlûks there was an office called kâshî al-djusûr...
(office of inspection of irrigation dams) for each province in Egypt. The holder of this office, called khattāf al-dāDIR, was an amīr who was added by assistants in the construction and maintenance of the irrigation dams in the province under his charge, cf. al-Kalkagandi, 53, 54, 55, 56, 57.

Each year before the advent of the Nile flood, not only had the canals to be dug and the irrigation dams to be constructed and repaired, but also the land to be cultivated had to be prepared. The methods of that preparatory work as well as the tools used were more or less the same traditional ones known to have been used by the Egyptian peasants for thousands of years. As for irrigation, al-Nuwayrī and al-Makrizī state that when the Nile rose during the flood period, the peasants took water from channels and wadis, which were not yet taken by the first waters of the Nile, and only reached the villages, which were established on hills and mounds, by boat or on the great irrigation dams. When the soil had had sufficient water, the khawālīs (stewards) and the ġaybāh (village headmen) supervised the cutting off of the irrigation dams from specified places at certain times in order to draw off water from the fields, thus letting it flow benefit other places, cf. al-Nuwayrī, 1, 264-5; al-Makrizī, Kāfīrī, i, 96; see also al-Masudi, Maudū al-dhakāb, Beirut 1965, i, 375; Nāṣir-i Khusraw, Safarnāme, ed. and tr. by C. C. Wellesz, 39, tr. 118, al-Kawāzin (d. 692/1293), Alībūr al-bilāda wa-ṣafr al-dāDIR, ed. Wüstenfeld, Göttingen 1848, 175, mentions that when the water of the Nile reached gradually after being on soil for forty days, the peasants began sowing.

The crops which were cultivated after the Nile flood season in mediaeval Egypt did not need any more irrigation than their inundation during the flood period, cf. Ibn Hawqlī, 97; al-Ṭāhirī, 49. This was the most common method of irrigation, called bi ʿayb by al-Nabulusī, Taʾrīkh al-Fayyūm, ed. B. Moritz, Cairo 1911, 63, and mān al-mārād by al-Makrizī, Kāfīrī, i, 107. The last term is still used by the contemporary fallāḥ to denote irrigation without artificial implements. Crops watered in this manner were called "winter crops" in order to distinguish them from the summer ones which the peasants began sowing during the Copanic month Baramīlāt (February-March) and which relied on irrigation by artificial means such as water-wheel, shadoof, etc., cf. Ibn Manmālī, 49.

Al-Makrizī in the Minḥālī and al-Makrizī in the Khāshiṣhūf distinguish between the winter and summer crops which discussing the kinds and farming of the al-Makrizī states that the winter crops were wheat (ṣalām), barley (ḏafar), beans (fīfī), bitter-vetch (dāhrūna), lentils (lādā), and flax (kaṭaṣ) al-Makrizī adds to al-Mahānī's list of winter crops chick peas (kumrus), clover (ṣayr), onions (bāṣal), garlic (ḏīms), and leekious (fartūm). For summer crops al-Makrizī mentions ureipe melons (fujābī), water-melons (bīghīf), kidney beans (ḡābīya), sesame (ṣimṣim or sawsim), cotton (būn or ʿabī), sugar-cane (bāṣāb al-saḥhār) and locascia antorum (kūbīḍ). Although al-Makrizī lists the same for summer crops, he adds arguevines (bahrīgā), indigo (niṣa), radishes (fūd), turnips (fīfī), lettuce (ḥamz) and cabbages (barūm), and puts both the unique melon and water-melon under the same name bīghīf; cf. al-Makhtāmī, Kūbīd al-Minḥālī ʿilm ġamālī Dīn, ms. B.M. London Add. 23483, ll. 308-310: al-Makrizī, Kāfīrī, i, 101-2.

There were many methods known in pre-20th century Egypt to irrigate the soil under the summer crops. They were inherited from older times and continue until today, with the exception of one which was very primitive and arduous. This was the transportation of water to the fields in buckets, jars, etc., hung from the necks of the oxen. This method was mentioned by al-Nabulusī as the means of irrigation for the two villages Dimashqīn al-Baṣāl and Damūh, known as Kūm Darī, in the Fayyūm province, cf. Taʾrīkh al-Fayyūm, 99, 101. This method, which was a continuation of a Pharaonic technique, seems to have been known in other Egyptian villages.

The other methods of irrigation used by the mediaeval Egyptian peasant employed any one of four artificial irrigation contrivances, namely, the nalūṭ, the dhīlā, the sāḥīya and the ʿabīth. These four contrivances were used in Egypt before the advent of the Arabs and are still in current use. There is no mention of what was known as the nalūṭ in the available classical sources, but the existence of such a device in Ancient Egypt, as well as its depiction in the Description de l'Égypte, État moderne, Planches, Tome deuxième, Paris 1817, Arts et métiers, Pl. vi (4), proves its existence in pre-20th century Egypt. It is still in use in Egypt, as well as in many African countries. Two men stand face to face, each holding two cords of palm-fibre ropes to which is attached a wide, shallow waterproof basket. This basket, made from twisted palm leaves or leather, is known in Egypt by the same name. The two men holding the ropes bend slightly toward the water, dip the basket and fill it. Then they straighten while turning to the field, thus raising the basket which is emptied into the mouth of the irrigation canal, cf. Lane, An account of the manners and customs of the modern Egyptians, London 1871, ii, 27.

The dhīlā or shadoof is a kind of draw-well which was used in Pharaonic Egypt and in mediaeval ʿIrāq, and is still used in Egypt and other eastern countries for raising water for irrigation. It usually consists of two posts, beams of the acacia tree or shafts of cane, about five feet in height. These posts are coated with mud and clay and then placed less than three feet apart. The two beams are joined at the top by a horizontal piece of wood, in the centre of which a lever is balanced. The shorter arm of the lever is weighted with a heavy rock or dried mud, while at the end of the longer arm hangs a rope carrying a leather pail. The peasant stands or a platform on the river bank and pulls down the balanced pole until the pail dips into the water and is filled. A slight upward push, which is helped by the counterweight of the rope, raises the pail above the irrigation canal, into which it is emptied.

As for water-wheels, al-Makrdādī al-Tawīlī (14th century) states that there were many dawālaʿ (pl. of dālaʿ, a Persian word which denotes a water-wheel) on the banks of the Nile for irrigating orchards during the low waters. He also says that the kūdbī was the bucket of the dīlah, cf. Aḥsan al-ṭakhāmīn, 208. In the next century, Nāṣir-i Khusraw mentions in his Safar-nāma, 39, French tr. 118, that 'up the Nile there are different cities and villages, and they have established so many dīlahs that they are difficult to count.'

In mediaeval Egypt, there were two words used to denote wooden water-wheels, i.e. the sāmašī (sing. sāmaša), and the nāṭī (sing. nāṭī), al-Nabulusī, Taʾrīkh al-Fayyūm, xi, 27, 31, 48, 52, 54, 63, 94, 125, mentions that some villages in the Fayyūm province had sāmašī to raise irrigation water. In Fājdīa, for example, he states that there were sāmašī which were running day and night. In the Kūbīd Līmān al-kandūnī, 48-9, al-Nabulusī warns the Ayyūbīd Sūtan al-Malik al-Ṣāhid Ayyūb of the negligence and dis-
The irrigation of sugar-cane when the Nile water is low, one or two

and to avoid wasting water on the way to the field,
circular journey. The work of the peasant or his sou
up water which they spill out into the irrigation chan-
the Nile, he is said to have designed this screw to
invented by the Greek mathematician and inventor
Archimedes (ca. 287-212 B.C.) while studying in
the same industry, the technical representation is lacking.

The Arabic word mahdi (sing. mahdal) denotes the huge pulley which is used for raising water from wells, cf. Ibn Manzur, Ld, Beirut 1936, xi, 620-1. However, al-Maqrizi in the Khita, i, 1, 702, uses it to refer to the water-wheel. When discussing the irrigation of sugar-cane when the Nile water is low, al-Maqrizi says that each of these mahdal can raise the water to irrigate eight faddans of sugar-cane, providing that the water-wheel is installed close to the Nile and that eight excellent beasts are available to work it. When the wells are established at a distance from the Nile, each of the mahdal cannot irrigate more than 4 to 6 faddans. Al-Maqriz also refers to the hadbla, which is discussed earlier explained as the bucket of the water-wheel.

It is apparent that the ordinary, contemporary Egyptian water-wheel is more or less the same as the medieval one, since it does not differ appreciably from the one depicted in the Description de l’Egypte, Etat moderne, ii, 1, 501-2; Planches, Tome deuxième, Arts et métiers, Pl. v. The flat horizontal wheel of the sahiba is turned counter-clockwise by a single beast, or pair of oxen. The flat wheel’s rough cogs engage the vertical wheel which carries a long chain of earthen pots (daddal). These clay pots are suspended from ropes and are lowered, mouth downward, into the water. Following the path of the wheel, the pots scoop up water which they spill out into the irrigation channel as they arrive at the top of the wheel on their circular journey. The work of the peasant or his son is toGoods the beast, to watch the turning wheel, and to avoid wasting water on the way to the field.

As for the tibil (water-screw), it was apparently invented by the Greek mathematician and inventor Archimedes (ca. 287-212 B.C.) while studying in Egypt. Observing the difficulty in raising water from the Nile, he is said to have designed this screw to facilitate the irrigation of the fields.

The water-screw has been continuously in use in Egypt when the level of water is not very low, from the times of the Ptolemys until the present. It consists of a wooden cylinder (about 6-9 feet in length) hooped with iron. While the spiral pipe is fixed between the inside wall of the tibal and an iron axis, its upper extremity is bent into a spiral, and its lower end is inserted under the water. One or two peasants crouch at the water's edge, endlessly turning the crank handle. The water rises from bend to bend in the spiral pipe until it flows out at the mouth of the canal.

However, using the primitive implements of the nasifdj, the dailja, the sibija and the tibil, the pre-20th century peasant in Egypt irrigated the land and managed to produce the necessary crops to maintain the economy of the country. Many of the techniques and implements that he devised or used have proved to be efficacious to such a degree that they are still extant.

5. Irrigation in ‘Irak

Since it is impossible here to look at the use of water in all its aspects and in regard to all the problems which it raises, the present section merely deals with irrigation in the same manner as is done for other regions of the Islamic world.

Taken as a whole, ‘Irak is a flat plain irrigated by two great rivers, whose risings and fallings lack however the comparative regularity of the Nile. Since the Euphrates (al-Furût [f.3]) flows at a higher level than that of the Tigris (Dijja [f.3]), the canals which, from ancient times, have connected them run at an oblique angle in relationship to them. Aerial photography, together with other sources of information, has allowed Adams to supplement and complete, for the left bank of the Tigris,
the information of the mediaeval authors and, especially, of Ibn Sarafyln (Serapion). In regard to the zone between the two great rivers, periods of neglect before and after the coming of Islam have transformed part of central Iran into a marshland, the Bahla [q.v.], the drainage of which has not been possible. The rivers and the great canals, constructed and maintained by the state, were important routes for communication, which were not impeded by the bridges of boats across them or by the mills. The upkeep of the smaller canals was the responsibility of local people. An ancient system of customary law regulated the amount and the periods of water used amongst the holders of land along the banks, and specially-appointed officials had the task, through the manipulation of sluices and water-gates, of securing this regulation. The interest shown about irrigation questions by mediaeval authors arises from the fact that, both for the land-tax and for local dues, irrigated land was distinguished from non-irrigated land.

The anonymous author of the Kitb al-Husfl (5th/11th century) has provided us, in the shape of mathematical problems, with some interesting details about the administration of the canals and about hydraulic machinery in mediaeval Iran. He describes various kinds of waterwheels, dindak, the balance, and it is to be understood that an azala = 100 cubic cubits of water, and then spreading it for irrigation purposes, according to the season, and the numbers of men and animals required to work them. Then he moves on to the "balancing out of ground" intended to fix the levels of canals which have to be dug out (see E. Wiedemann, El, art. MEZAN). Finally, he raises the question of the construction and upkeep of the raised canal banks, which he calls bandan, a pre-Islamic term not listed in the classical dictionaries, hence often wrongly read. It is necessary to know the volume of earth, reeds and brushwood which has to be transported, which is counted according to a special unit, the azala = 100 cubic cubits of balance", and it is to be understood that an azala is procured by 33 "spade loads", handled by two men, one digging and the other transporting the earth, etc. in sacks. The provision of materials and the labour, which seem never to have been done by slaves, are paid according to an official tariff.

(C. CAHEN)

6. Irrigation in Persia

The distribution and density of population and the development of agriculture in Persia throughout history have been closely dependent upon the availability of water, and the nature of the irrigation systems has influenced both the siting of settlements and the pattern of society. Precipitation is scanty and seasonal, it is concentrated on the periphery of the country, as also are the major perennial rivers.

As a general rule, rainfall, which occurs between October and May, decreases from the north to the south of the country and from west to east, but in a number of areas the high relief of the Alburz and the Zagros mountains has modified this pattern. Along the Caspian Sea coast and the northern flanks of the Alburz, precipitation exceeds 1,800 mm. near the mouth of the Safid Rud; annual totals fall to less than 500 mm. on the east side of the Caspian near Gumbad-i Khi Discuss. Along the western flanks and summits of the Zagros Mountains, precipitation amounts to between 300 and 500 mm. in some of the higher peaks and to more than 1,000 mm. on the west of Shabzir receive more than 400 mm. In the north-western highlands, between the two belts of high precipitation, there is a zone of moderate precipitation of 350-900 mm. In the centre of the country occupied by the Dasht-i Kavir and the Dasht-i Lut, great sterile deserts, precipitation totals almost everywhere less than 100 mm., though a higher precipitation is found on the eastern borders of the Kavir in the highlands around Birjand and Zâhâddin. Everywhere, with the exception of the Caspian littoral, low and episodic rainfall is a major constraint on agriculture, hence the importance of artificial irrigation.

Dependable supplies of surface water exist only in isolated districts around the margins of the country, but there is nowhere an annual surplus of water, and seasonal surpluses, except in the north and west, are insignificant. Run-off is episodic, and occurs only because precipitation momentarily exceeds the infiltration capacity of the surface. The flow of water in streams and rivers throughout the country is seasonal and highly variable from year to year. Peak flows are too late for winter crops and the minimum discharge occurs when summer crops are in greatest need of moisture. The control of water by artificial irrigation is therefore immensely important for agricultural production and prosperity. Without artificial irrigation the cultivation of plants native to regions where summer rainfall is normal, such as cotton, millet, rice and sugar would not be possible.

There are few great rivers in Persia—the great hydraulic civilisations have no place there. The largest are the Kârûn and the Karâkha [q.v.] which flow into the Persian Gulf, draining almost all the area between ‘Abâdân and Kirmânshâh. Further south are the basins of the Mand [f.v.] and the Shûr, which also drain into the Persian Gulf and the Gulf of Oman respectively. The Safid Rud flows into the Caspian, as also do the Aras [see AL-RASS] and the Atrek [q.v.]. The water of the two last-named, which flow along the modern Russo-Persian border in the north-west and the north-east respectively, is shared with Russia. The central zone of Persia, covering the largest part of the country, is an area of internal drainage. Small rivers flow into the closed basins of Lake Urmiyya (Rûd-‘Izârayyâ) in Ardârây- jânu, into the Hûmûn in Stûran and into dry lakes and saline marshes in structural basins in the East Zagros, the depression between the Zagros and the volcanic axis extending from Kûm to Kirmân, the Džiz Mûrûnîn basin, the southern Lût, Balû- čistân, the eastern highlands north of Birjand and in the frontier zone with modern Afghanistan. South-west of the central desert is the basin of the Zayanda Rûd, which supports ‘Ishâhân and to the south of this, the basin of the Kûr. The discharge
of most streams in the central zone is small. Many of the larger streams, gathering in high mountains, have steep and irregular profiles. Leaving the mountains, they diminish quickly as a result of evaporation, seepage and diversion for irrigation, leaving dry channels, the underflow of which now and then supports an exotic agricultural efflorescence. From ancient times, the water of these rivers and streams has been used for irrigation and has formed the basis on which flourishing civilisations have been established in pre-Islamic and Islamic times. The history of the water use of the Kur in the Marvdasht plain illustrates the importance of the role played by irrigation in the establishment of the early Persian empires in that region and the changes in the prosperity of the region and the density of settlement which took place over the centuries as a result of fluctuations in the upkeep of dams and irrigation channels (see further, G. Korium, Die Marvdasht-Ebeno-Fars, Kiel 1976). For the most part, the rivers flowing into the southern end of the Caspian Sea, apart from the Oxus [see AMO DARYA] appear to have been less used for irrigation in early and mediaeval times than the rivers in central, southern and eastern Persia. Hamid Allah Mustawil states that little of the water of the Zhran River was used for irrigation and most of it ran to waste (Nuzhat al狩alb, ed. 0. Le Strange, 214). Similarly, hardly any of the Tadzhik and Karkharan rivers was used for irrigation, except for that little which watered the lands lying immediately along its bed; most of it was wasted (ibid., 217); and the same, he alleges, was true of its tributary, the Shahrud (ibid., 218), though this was not so in the case of the rivers of the two Ţarums, which also flowed into the Safid Rūd: in summer most of their waters were used for irrigation and little flowed into the Safid Rūd (ibid., 221). The smaller basins of the arid centre of Persia and the south-east, together with the fringes of the basins, receive incoming water mainly by seepage: seepage of many small ephemeral streams. The traditional method of tapping this water is by kānāt (g.v.), which, with its associated network of canals, is characteristic of irrigation on the Persian plateau; hence too the frequent siting of settlements on gentle slopes some distances from the foot of the hills that feed the kānāts. From earliest times, the material basis of the population on the Persian plateau has been provided by kānāt water (H. Goblot, Essai d'une histoire des techniques de l'eau sur le plateau iranien, in Persica, vii [1939], 120). The various systems of irrigation—by river, kānāt, spring or storage dam—are not mutually exclusive; many districts use more than one.

The configuration of settlements has been decided in many cases by the nature of the water supply. Where water is scarce, villages tend to be concentrated; elsewhere they may be more scattered. They frequently flank water-courses and cluster about the outlet of kānāts or round springs. The area immediately round a town or village is usually intensively cultivated with irrigation—even in the dry farming regions there is often a small irrigated area in or near a town or village. Beyond the cultivated land there is sometimes a periphery of marginal land which may be cultivated in years when the water supply is extraordinarily plentiful. Similarly, mountain villages in regions where the rainfall is sufficient for cultivation usually have an irrigated area, however small. In mountain valleys, the villages tend to be situated on rocky slopes rising above the intensively cultivated valley floors or to straggle along the mountain streams. Mountain slopes are often skillfully terraced, and much time and labour is expended on the construction and repair of dry stone retaining walls for the cultivated plots (cf. X. de Planhol, Geographie de l'agriculture, in The Cambridge history of Iran, i, ed. W. B. Fisher, Cambridge 1964, 149-50). The need for regular attention to the upkeep of irrigation works has, further, been an important factor in making the village, rather than the isolated farmstead, the typical form of settlement throughout most of Persia.

Artificial irrigation may already have existed in late Neolithic times. By the Achaemenid period, there was an extensive network of kānāts, and with the extension of irrigation there was an expansion of agriculture. It is probable that drainage schemes were also undertaken in different parts of the empire. Later, the Sasanids brought more land under cultivation by clearance and drainage and applied new techniques to irrigation (R. Ghirshman, Iran from the earliest times to the Islamic conquest, Harmondsworth 1954, 239). In Islamic times, control of water for irrigation remained crucial to prosperity and settlement.

Such control is a highly complex matter, and requires for its successful implementation not only technical skill but also political stability. The heavy load of state administration that irrigation systems impose takes a large share of the public revenues; the covering and control both difficult and costly. Flash floods often destroy irrigation works, especially those connected with kānāts, while spring floods may also cause much damage in lowland districts. On the plateau, the lowering of the stream-beds through normal erosion results in the lowering of the water-table itself and leaves irrigation canal intakes above the new water level. In modern times, the lowering of the water-table by the extraction of water by pump operation connected with the sinking of semi-deep wells has led to many kānāts falling into disuse, especially those connected with kānāts, while spring floods may also cause much damage in lowland districts. On the plateau, the lowering of the stream-beds through normal erosion results in the lowering of the water-table itself and leaves irrigation canal intakes above the new water level. In modern times, the lowering of the water-table by the extraction of water by pump operation connected with the sinking of semi-deep wells has led to many kānāts falling into disuse, especially those connected with kānāts, while spring floods may also cause much damage in lowland districts.

Inadequate drainage, on the other hand, often leads to a rising water-table under irrigated lands, water-logging, salinisation and alkalinisation, which result in considerable loss of output. These processes vary widely in different districts and different years. In some regions, notably Kūhāstān and Sistan, deterioration of the soil because of a change in the water-table due to over-lavish irrigation and inadequate drainage, or both, has been a major problem. Another problem is that ground water in some districts may be heavily charged with soluble salts and be too saline for use in irrigation. This is the case in many districts on the borders of the central desert and in the Persian Gulf littoral.

Natural conditions and agricultural practices cannot alone, however, explain the fluctuation in the history of irrigation in Persia. The shifting of centres of political authority which accompanied dynastic changes and demographic changes resulting from invasion and the increase in dead lands because of the slaughter or flight of their inhabitants has also played a part. A breakdown in the control of water, for whatever reason or reasons, was inevitably followed by a decline in prosperity. The decay of Kūhāstān, which culminated under the Abbāsids, is an illustration of this. Under the Sasanids, the waters of the Karkhā, Diz and Kārūn had been utilised by an elaborate system of barrages, tunnels, inverted syphons, lifting devices and canals (see below). Cereals, sugar cane, rice and dates were produced in abundance. In the last fifty years or so
of Sāsānian rule, irrigation was neglected. Under the rule of the Orthodox Caliphs and the Umayyads, adequate attention was not paid to artificial drainage of the irrigated land, and under the Abbasids the province declined—rising water-tables under irrigated land may have been responsible for the attempts of the Abbasids to irrigate new lands of poorer quality. Waterlogging, alkalinisation and salination, and the hazards of flood, all contributed to the decline of the region which occurred in post-Sāsānian times (see further R. McC. Adams, Agriculture and urban life in early southwestern Iran, in Science, cxxvi, 3511 (1962), 109-22). Changes in prosperity in other regions brought about by a failure to control irrigation have been, perhaps, less spectacular but none the less important. The decay of irrigation and drainage not only resulted in an increase of waste and unproductive land, but may also have led to the spread of malaria (see Malariα), thus contributing to a decline in population and output.

Water utilisation: technical features. Irrigation works, plain take-offs, dams (see Band), weirs, lifting devices, artificial reservoirs and Bandānāt, supplemented by principal and secondary canals, are to be found all over the country; and some are ancient structures.

(i) Dams. Several large dams existed in Khuzistān in Sāsānian times, including the bridge dams at Sīshtar and Dīzful, built by Shāpur I and Shāpur II or Ardashīr II respectively, the dam on the Dārāshīr near Khalafābād, and the dam on the Mārūn at Aradānī on the last, see H. Gauß, Die südpersische Provinzialarchitektur, Vienna 1975, 189-90). They continued in use for varying periods after the fall of the Sāsānians. Repairs and reconstructions were numerous, and the Romano-Sāsānian work at Sīshtar and Dīzful was partially replaced by pointed-arch bridges. The dam at Sīshtar, known as the Band-i Mīrān, had a length of 7,200 ft. and raised the water to the level of the city of Sīshtar, which was situated on a rocky outcrop on the east bank of the Kūr. The dam was built partly by Roman prisoners of war taken in Shāpur I's victory over Valerian in A.D. 260. It had a rubble masonry core set in hydraulic mortar; the facing was of large, cut masonry blocks, held in place by both mortar and iron clamps set in lead. It was pierced by numerous sluices for the purpose of releasing water in time of excessive flow. It took three years to build, during which time the Kūr-i Rūd River was diverted through two by-pass channels. One of these, the Ab-i Gargar, winds its way south for some twenty-five miles and then rejoins the Kūr. When the work of the dam was completed, the entrance to the Ab-i Gargar was closed by a second dam, the Kāyārān dam. This was made of large stone blocks mortared and clamped together, and six sluices were provided to control the flow of water into the Ab-i Gargar. Part of the bridge at Sīshtar and the Band were swept away by floods, and may have been responsible for the translations of Muhammad 'Ahd Mīrān, when governor of Kirmānshāh, undertook repairs to it in the early 10th century (J. M. Kinneir, Geographical memoir of the Persian empire, London 1823, 98-9). When Curzon visited Sīshtar in 1889, there was a gap of over seventy yards in width in the middle of the bridge, which had been swept away by a flood in 1885. The efforts of Nīqūn al-Saltāna, the governor of Agrabātīn, to repair it proved abortive (Persia and the Persian question, London 1892, ii, 374-5). A further canal, the Miyan Ab canal, was cut, apparently to divert water through a tunnel made in the face of the castle rock in order to irrigate the high-lying lands to the south of the city, the level of the water of which was regulated by dams. As a result of the rupture in the Band-i Mīrān and the bridge, the river-bed was lowered at the point where it formerly fed the canal and the land which was intended to irrigate became desertic (Curzon, op. cit., ii, 376).

The Dīzful dam, a replica of the Sīshtar dam, was 1,250 ft. long. When Curzon visited Dīzful, the dam was in a dilapidated condition, two of its arches having recently fallen in (op. cit., ii, 303). After it fell into decay, all local irrigation depended upon rough dams of stone and brush-wood, which were reconstructed after every flood (H. Wulf, The traditional crafts of Persia, Chicago 1967, 285; N. Smith, A history of dams, London 1971, 59, 82; A. K. S. Lambton, Landlord and peasant in Persia, repr. Oxford 1969, 236).

South of Sīshtar, where the Ab-i Dīz and the Ab-i Gargar flew into the Ab-i Sīshtar, the main channel of the Kūr, another Sāsānian dam, the Band-i Rīr, of which only the name survives, was located. The name is of interest because it suggests that bitumen (Bir) may have been used to make the dam watertight and solid. Another dam on the Ab-i Gargar, called the Pul-i Bulayt, was added to the Sīshtar system in Islamic times. This was a power dam; mills were installed in tunnels cut through the rock at each side of the channel, the dam providing the necessary head of water to drive the mill wheels (see Curzon, op. cit., i, 372-3). A third bridge dam was built, also in Sāsānian times, over the Karkhā at Fār-yi Pul. It fell out of use when it burst in 1837. Its remains were seen by Sir Aurel Stein in 1933 (Aurel Stein, An archaeological journey to Western Iran, in Geogr. J. [October 1938], 327).

At Ahvāz (Pers.), there was another great dam (but not a bridge dam), probably over 3,000 ft. long, and about 25 ft. thick. Its remains were to be seen until recently. Al-Mukaddasi describes the dam as being wonderfully constructed from blocks of rock behind which the water was held back. He states that the water was divided into three canals, which watered the fields of the estates of the people of the city, and that without the dam Ahvāz would not have been populous and that its canals could not have been used (Ahsan al-takdsim, 412; see also Curzon, op. cit., ii, 347-8). The collapse of the dam in the 9th/10th century brought ruin to the city.

Numerous storage dams and their remains are to be found in many parts of Persia. Although their overall contribution to irrigation was not as great as that of Bandānāt, or of the dams in Khuzistān, they were of considerable local importance and enabled land which could not otherwise have been cultivated to become productive. One of the most interesting systems is that on the Kūr River in Fars, which has provided irrigation for the Kurbāl district to a greater or lesser extent for some 2,000 years. The most famous dam of this complex is the Band-i Amir, built about 349/960 by the Buyid Muhammad 'Ahd al-Dawla ([q.v.], probably on earlier, possibly Achaemenid, foundations. Prior to its reconstruction, the water of the Kūr could not be raised to irrigate Upper Kurbāl. Al-Mukaddasi, who wrote soon after the dam was built, and Ibn al-Balkhī ([q.v.], who wrote rather under 150 years later, describe the dam in similar terms. The latter states that 'Ahd al-Dawla brought engineers and workmen to the place in order to build the dam and spent much money on its construction. The dam was made of
stone set in mortar, reinforced by iron anchors, which were set in lead. Upstream and downstream the river-bed was paved for several miles, and the supply canals extended for over ten miles, serving 300 villages in the Marvdasht plain. Ten water-mills were built close to the dam, the crest of which was wide enough to allow two hundredmen abreast to ride across it [al-Muhammed, 444; Ibn al-Balbi, Fara rauna, ed. G. Le Strange, London 1911, 157-7; see also G. Le Strange, Developments of Irrigation in Persia at the beginning of the 19th century A.D., London 1912].

Upstream from the Band-i Amir there were five other major dams for the irrigation of Lower Kurrâbî. These included the Râmdjîrî dam, built on Achaemenid foundations, which was almost as large as the Band-i Amir, and five downstream, the last of which, the Band-i Kaşâr, was only a few miles from Lake Buhštâgân into which the Kur flows (A. Houtum-Schindler, A note on the Kur River in Fars, its sources and dams and the districts it irrigates, in Proc. Royal Geogr. Soc. 1891, 287-92; see also N. Smith, op. cit., 83-5, and Kortum, op. cit.). By the 6th/12th century, the Band-i Amir, the Band-i Kaşâr and the Râmdjîrî dam had fallen into a state of decay and were repaired by the Sa'djûk governor of Fârs, the Atâbâh Dâjâl al-Dîn Čâvîl Sâlâw (Le Strange, Lands of the Eastern caliphate, 277-8). The Râmdjîrî dam was again rebuilt towards the end of the 6th/beginning of the 13th century, and there were several reconstructions after that date (Smith, op. cit., 53).

In the eastern provinces of Persia there were also a number of dams and irrigation works on the Oxus or Amû Daryâ [49] and on other great rivers and lesser streams. Some of these were repaired, and others constructed by the Muslims. Sîstân was depend-ent almost wholly upon the control of the water of the Hîrmând (Hilmand) River [see Bîrmând]. Zarand, the capital of the province under the Abbâsidâs, was situated near the original capital of Râm Shahrâsîn (Abrasghârîyîr), which according to tradition, had been abandoned when a dam across the Hilmand had burst and the water had been permanently diverted from the Râm Shahrâsîn canal (Le Strange, op. cit., 339-40). From the works of the Muslim geographers, it would appear that Zarandî was irrigated by six dams on the Hilmand near where it enters Lake Zarâb. Some of these may have been of Sàsând origin. The Muslims added various water-wheels to the system. In 286/1285 Zarandî and its irrigation works were destroyed by Timûr, as was also the Bandî Rustâm on the Hilmand River near Bûst, the water of which had served to irrigate all the western lands of Sîstân. Failure to repair and maintain the elaborate system of canals and dams on the Hilmand River resulted in much of the land formerly irrigated and drained being converted into reed beds and swamps. The headwaters of the Hilmand and the main stream are at the present day in Afghanistan. After entering Persian Sîstân, the river divides into two branches, the Pariyaq and the Sîstân rivers. The former flows in a northerly direction, and with its tributaries waters northern Sîstân. The latter flows through southern and south-western Sîstân. Near the Afghan frontier, the Kahâk dam diverts water into the Pariyaq, while another dam lower down, the Bandî-Zâhâk, diverts more water for irrigation. The use of the water of the Hilmand and the construction of new dams has been the subject of bitter controversy between Persia and Afghanistan. The first award of the river waters between them was made in 1872. In 1950 the Hilmand River Delta Commission was set up (though subsequently disbanded).

The water of the Murghâb River in Kûrâsân was diverted by numerous dams and canals for irrigation. Al-Îtâkhirî relates that one march south of Marzû, its bed was artificially dyked with embankments faced by wooden works which kept the river-bed from changing. Under the Sa’djûks, the number of dams and dykes on the Murghâb was increased. These were later abandoned, but after a deep gully, the dam of Marzû converted into a desert swamp, according to Hâfîz Abîrî (Le Strange, op. cit., 397, 402). He states that after Timûr’s conquest of Kûrâsân, various of the andirs and pillars of the state each made a canal leading off from the Murghâb, in order to irrigate the land, and that when he was writing, i.e. at the beginning of the 9th/15th century, twenty of these were in existence. He describes the city as being in a flourishing condition (Yadkhrîyî-yi Hâfîz Abîrî, hîrmat-i rabâ-i Kûrâsân: Hâfîz, ed. Meydî Harâwî, Tehran A.I.I.S. 1349/1970-1, 36).

One of the most important periods in medieval Persian construction of dams appears to have been the Ilhâân period, when, in the late 7th/13th century and early 8th/14th centuries, several dams were constructed. The great achievement of this period was the construction of a number of arch dams. One at Kibar (Kivar), some 15 miles south of Kûmân, is the oldest surviving example of this type of structure so far located. Built in a V-shaped gorge, which narrows about halfway down to a deep gully, the dam is 85 ft. high and 180 ft. long at the crest, the thickness of which is between 15 and 161/4 ft. The air-face, the radius of curvature of which is 125 ft., is vertical except near the face where there is a slight slope in the downstream direction. The dam has a core of rubble masonry set in mortar (sârî) made from lime crushed with the ash of some desert plant, which makes it hydraulic and results in a strong, hard and highly impervious mortar ideal for dams. The dam has a vertical series of arches on the face, the water-face connected by shafts and galleries to provide passage for the water through the dam walls (though their precise function is uncertain). Two other arch dams, probably also belonging to the Ilhâân period are situated near Tabâs, the Shâh ‘Abbâs, east-north-east of Tabâs, so called because it was repaired in the Safawid period, presumably by Shâh ‘Abbâs I or Shâh ‘Abbâs II, and the Kurî dam, to the south of Tabâs. The latter is remarkable for its height of some 120 ft. (H. Goblot, “Sur quelques barrages anciens et la genèse des barrages-voutes,” in Science-Progrès, no. 353 [April 1973], 15-20; idem, Kêbar en Iran sans douze le plus ancien des barrages-voutes, in Revue d’Histoire des Sciences, cahier no. 6, Smith, op. cit., 65-8). Another dam, a large gravity dam at Sâwa was also built in the Ilhâân period. Hâst Allâh Mustawfi states that it was constructed on the orders of Shân al-Dîn Muhammad Shâhî-Dîwân [see Grouvy, Hâst Allâh amir Muhammad] (Khûshp al-Tâhir, 211). It was situated to the west of Sâwa and east of the point where the Kârâkîyî (Ghâmîrah) joins two streams from Sâwa and Awâ respectively. Although the limestone rock at the side of the valley was sound (as far as is known), the base of the dam was built on river alluvium consisting of sands and gravel, which go down 90 ft., before bed-rock is reached. Consequently, as soon as the reservoir began to fill, the pressure above the foundations drove the
water through the alluvium and the water established a permanent outlet for itself. The dam was abandoned, but the structure survived (Smith, op. cit., 64-5). It is not without interest that a number of dams and irrigation works were constructed about the same time in Yamaan by Sa'di Adjlal, who apparently became governor of Yamaan in A.D. 1274 (J. Needham, Science and civilisation in China, 1973, 997).

The dating of the gravity dams at Khorrud and Kamsar near Kārgān and at Faribān and Turuk in Khorusān is uncertain. The Khorrud dam is attributed to Shāh 'Abbās and the Kamsar dam to Dālahā-āl-Dīn b. Muhammad Khārazm Shāh (Abd al-Raḥāmān Dārūš, Ṣāḥibī-yi Irānīn Timur tāshīd, ed. Irakli Afqeflr, Tehran 1962, 40-1, 42, 43). The Kazvānī dam in Khorusān was made by the Timurīd Shāh Sa'dī Mirzā (855-71/1450-27) (Aṣāṣīd wa mulekābīāt-i ʿarāk-yi Irān tā Shāh Ismāʿīl, ed. Abd al-Husayn Nawāy) (1334/1914, 313). The Sālūm Dam in Khorusān was constructed by Chiyyūd al-Dīn Kurī (760-91/1360-24) (N. M. Clewenger, Dams in Khorusān, some preliminary observations, in East and West, N.S., xix [1959], 393). These dams were still in use in the 1960s, but most of them furnished very little water because their reservoirs were heavily silted up.

Under the Safawīs, there was renewed activity in dam-building and other constructions for irrigation. Shāh Tāhosānp (930-84/1524-76) attempted to divert the water of the Kūrūn into the Zāyandāh Rūd by a cutting tunnel through the mountain ridge which separates them. The work was abandoned owing, it was said, to the foul atmosphere of the workings. Shāh 'Abbās I (958-1028/1548-79) revived the project, but abandoned it after a tunnel in favour of an open cutting. It is reported that at times he employed 100,000 men on this undertaking, but the scheme came to naught. Shāh 'Abbās II (1023-78/1614-67) made another attempt, in which he was assisted by a French engineer named Genest. A dam, 300 ft. long and about 100 ft. high was built across the Kūrūn to divert the water of the river while the channel was cut. Smith, thinks that Genest may have had in mind more than a mere diversion of the river and that he may have hoped to reduce the amount of excavation through the mountains by raising the level of the river. The scheme, however, was also abandoned after 100 ft. of the tunnel was cut. The Hungari dam between the two rivers had been cut. The idea was revived during the reign of Ridd Shāh Pahlavi. Work was begun on the cutting of a tunnel connecting the two rivers. Known as the Kūhrang tunnel, it was finished in 1953 (Smith, op. cit., 72-3). The increase in the flow of water in the Zāyandāh Rūd which resulted has enabled more land to be cultivated in the districts through which the river flows. Shāh 'Abbās II also built, on the foundations of an earlier weir, the Khāqānī Bridge over the Zāyandāh Rūd in Isfāhān. It is a combination of a weir with sluice gates and flood arches above these, with a permanent roadway on the top (Wulff, op. cit., 248; Smith, op. cit., 73-4).

(ii) Wells and lifting devices. A variety of lifting devices operated by men and animals to raise water from rivers, streams and wells have been widely used in the past, especially in Khūzistān, the Persian Gulf littoral, Fārs, in the neighbourhood of Isfāhān, in some districts in eastern Persia and on the shores of Lake Urmīyā (Riddīrīyā). They are still used, but have been largely superseded by power-operated wells. Man-operated wells consist of a windlass set over the well with a large leather bag attached to it. These operated by draught animals are worked by one or more draught animals such as oxen, mules and, less frequently, buffaloes, each draught animal having one or more men working with it. The constructing of these devices varies slightly in different regions, but the general principle is the same. Their operation is both laborious and inefficient. A wooden wheel is set in two brick or stone built pillars, or two heavy upright posts, above the well, connected by a wooden scaffold. Two pulleys are run on axes attached to the scaffold, over which a main and an auxiliary rope run into the well; the wheel end of the main rope is attached to a hook and a ring carrying a wooden cross from which a large leather bag is suspended. An auxiliary rope to which the auxiliary rope is attached. The draught animal is harnessed to the ropes and sets the wheel in motion by walking up and down a runway beginning at the well-head and descending at an angle of about 20 degrees. By this action, the bag is let into the well. When it is full, it is lifted to the surface and emptied itself in front of the well into a trough which carries the water into the irrigation channel. In some wells, a big wooden horizontal cog-wheel, geared to a vertical wheel which turns a basket carrying the bag on the same axis, is used in motion by an ox or mule walking round and round a circular runway made about the well (see further Wulff, op. cit., 253-8, and Lambton, Landlord and peasant, 227-8; and also C. Cahen, Le service de l’irrigation en Iraq au début du XIXe siècle, in BEO, xii [1949-50], 176-89). Curzon describes how water was lifted for irrigation from the Kūrūn above Ahwāz, where the river was confined within banks from 20 to 30 ft. high. Pools were hollowed in the river bank and water was drawn up by means of leather skins and a pulley worked by oxen pacing up and down an inclined plane on the top of the bank (op. cit., ii, 356-7). (iii) Cisterns, water tanks and ponds. These are found in regions in which water supplies are scarce and are especially common in districts on the edge of the central desert, though they are also to be found elsewhere, notably in Fāmixāt. They are supplied by water from kardās, underground springs or rain-water. Some are made with stones or bricks and cement and are of a considerable size. Abd al-Raḥīm Dārūš states that almost all the villages and hamlets in Khūzistān have at least one of these tanks (masārī), and that of Nīyārūs was too 'dharī' by 50 'dharī' and 35 'dharī' deep. He describes the purpose of an istebrāh as follows: "In some hamlets (masārī) the water is less than [the amount required for] a plot of land (kardā) for the first rotation when water is due to be let into sown land or orchards. As a result, it takes a long time for the plot to be inundated, because when the quantity of water is small, it is less than [the amount required for] a plot of land (kardā) for the first rotation when water is due to be let into sown land or orchards. As a result, it takes a long time for the plot to be inundated, because when the quantity of water is small, it is less than [the amount required for] a plot of land (kardā) for the first rotation when water is due to be let into sown land or orchards. As a result, it takes a long time for the plot to be inundated, because when the quantity of water is small, it is less than [the amount required for] a plot of land (kardā) for the first rotation when water is due to be let into sown land or orchards. As a result, it takes a long time for the plot to be inundated, because when the quantity of water is small, it is less than [the amount required for] a plot of land (kardā) for the first rotation when water is due to be let into sown land or orchards. As a result, it takes a long time for the plot to be inundated, because when the quantity of water is small, it is less than [the amount required for] a plot of land (kardā) for the first rotation when water is due to be let into sown land or orchards. As a result, it takes a long time for the plot to be inundated, because when the quantity of water is small, it is less than [the amount required for] a plot of land (kardā) for the first rotation when water is due to be let into sown land or orchards. As a result, it takes a long time for the plot to be inundated, because when the quantity of water is small, it is less than [the amount required for] a plot of land (kardā) for the first rotation when water is due to be let into sown land or orchards. As a result, it takes a long time for the plot to be inundated, because when the quantity of water is small, it is less than [the amount required for] a plot of land (kardā) for the first rotation when water is due to be let into sown land or orchards. As a result, it takes a long time for the plot to be inundated, because when the quantity of water is small, it is less than [the amount required for] a plot of land (kardā) for the first rotation when water is due to be let into sown land or orchards. As a result, it takes a long time for the plot to be inundated, because when the quantity of water is small, it is less than [the amount required for] a plot of land (kardā) for the first rotation when water is due to be let into sown land or orchards. As a result, it takes a long time for the plot to be inundated, because when the quantity of water is small, it is less than [the amount required for] a plot of land (kardā) for the first rotation when water is due to
has [sufficient water] in the first rotation period for three or four pieces of land, and it wishes to divide the water into three or four irrigation channels, some giving more water and some less. A cistern is therefore necessary, so that the requisite amount can be let into each irrigation channel, or so that water from two or three sources can be let into different channels and then divided (zaridga-paymānī namāyand) (Tāzīkā-i Kāshān, 56-7).

Hand Allah Mustawfi describes how small catchpools were made on the edge of the cultivated area round Tān to catch rain water which was used for grain cultivation (Nuṣḥāt al-Bālūd, 143-4).

Irrigation practices and water distribution and measurements. Irrigation practices range from heavy perennial irrigation, land watered less heavily throughout the year or parts of the year, to land watered once or twice a season through the capture of flash floods or water stored in a cistern. The usual method of irrigation is by inundation; for some crops, trench irrigation is used. In the case of rivers, the water is diverted into canals and sub-canals and cross-canals, whence it is led into the fields to be irrigated. The division is made according to established rights of priority, usually (but not always) starting upstream and ending downstream. The water of other sources, if it is prolific, is also divided into various channels and led to different users simultaneously. The division of the water between several users is assured by a variety of mechanical devices, distributors, or runnels with inlets of a fixed size or by the allocation of fixed periods of time. Where water is divided by a weir between a number of villages or users, the size of the orifices at the rim of the weir varies according to the share of the water permanently allocated to the different users. Water is led into individual fields, plots or gardens by breaching the banks of the canals (usually with a spade) for the appropriate length of time.

The rotation period of the water (dawar-i dib) normally begins in early October with the start of the agricultural year and is fixed at so-and-so many days. Within that period, so many shares, defined in days, hours, or minutes, are allocated to the different districts, villages, fields, or plots of land watered by the source in question. A common way of measuring the unit of time is by a kind of hour-glass, the time-unit being the time it takes for a small copper coin to run, i.e. until it is placed in a vessel or water-tight well or basin (Aghnīdēs, Mohammādiān thowres of finace, Lahore 1961, 515). See also Zayn al-Dīn B. 'Ali al-Amin al-Shahād al-Tīni, Kawāfs al-bakhiyya fi gār lamān al-Dimmāgīhīyya, lih. 1291/1875-6, 267). Water in rivers, kāndīs, wells and basins which are not water-tight is, therefore, considered to be mubāh, even if the rivers, kāndīs, wells and basins should be private property. Everyone is entitled to use such water for drinking purposes for himself and for his animals, provided that the animals do not exhaust the whole supply. The sale of the water of privately-owned rivers, kāndīs, wells and basins (for drinking purposes) is permitted by some jurists, though all appear to consider it better to give such water than to sell it (Aghnīdēs, op. cit., 516, and see also Muhammad b. al-Ḥasan al-Tūsī, al-Nibāyā fi l-fishāṭ wa-l-fatwā, ed. Sayyid Muhammad Bāhir Sārba-zāwīl, Tehran 1333-41/1955-6, 2 vols., ii, 282). The right of all men to use water is confined to the imād (crop-sharing) (usurpation), gāfāb (agreements) and musādāt (agreements for the sharing of fruit and other trees). The general principles concerning water laws are accepted by both Sunnīs and Shi’ahs, but there are differences in matters of detail between them and between the different law schools which, in view of the fact that water laws are based on custom, is not surprising.

(i) The right of thirst (gāfāb). By virtue of the hadith which states that Muslims are partners in water, fire, and grass, the use of water is considered as common (musādāt) to all men, but it may be appropriated by "occupation" (lābīd), e.g. by collecting rain water in a vessel placed outdoors to that end. It cannot, however, be "occurred" until it has ceased to run, i.e. until it is placed in a vessel or water-tight well or basin. (Aghnīdēs, Mohammādiān thowres of finace, Lahore 1961, 515). See also Zayn al-Dīn B. 'Ali al-Amin al-Shahād al-Tīni, Kawāfs al-bakhiyya fi gār lamān al-Dimmāgīhīyya, lih. 1291/1875-6, 267). Water in rivers, kāndīs, wells and basins which are not water-tight is, therefore, considered to be mubāh, even if the rivers, kāndīs, wells and basins should be private property. Everyone is entitled to use such water for drinking purposes for himself and for his animals, provided that the animals do not exhaust the whole supply. The sale of the water of privately-owned rivers, kāndīs, wells and basins (for drinking purposes) is permitted by some jurists, though all appear to consider it better to give such water than to sell it (Aghnīdēs, op. cit., 516, and see also Muhammad b. al-Ḥasan al-Tūsī, al-Nibāyā fi l-fishāṭ wa-l-fatwā, ed. Sayyid Muhammad Bāhir Sārba-zāwīl, Tehran 1333-41/1955-6, 2 vols., ii, 282). The right of all men to use water is confined to drinking purposes and does not extend to its use for irrigation.

(ii) The right to use irrigation water. According to the Sunnīs (fikrāh), the water of the great rivers belongs to the Muslims in common (Abō Ṭūsī, La livre de l'impôt foncier, tr. E. Fagnan, Paris 1921, 148) and according to the Shi‘ahs (fikrāh), to the imām. Their water may be used by anyone for irrigation and power provided its use in this way does not harm the community, and anyone may divert water from the great rivers by means of a canal, unless such diversion is prejudicial to interests already acquired. In the case of the lesser rivers, the water of which is sufficient to irrigate the land along its banks without
the construction of dams, anyone may lead off water in a canal to irrigate other land, provided such action is not prejudicial to existing interests. If the water of a river cannot be used for irrigation without the construction of dams, lands higher up have, according to most authorities, Sunni and Shih, a prior right to those situated lower down (cf. al-Mawardi, 386 f. and Muhammad b. al-Hasan al-Tusi, al-Nihayat, ii, 283). The Hanafis, on the contrary, hold that lands situated lower down the river have a prior right over those situated higher up, while the Malikis lay down that land situated higher up has the prior right of irrigation until the water reaches as high as the ankles, but if the land lower down has been developed earlier and there is a danger of its crops being destroyed, it has a prior right over land higher upstream. These various views are reflected in existing practice. As to the amount of water that may be drawn off, the Prophet is said to have allowed a level as high as the ankle, and this tradition is widely followed. Al-Mawardi, whose exposition is concerned with the practice of water management rather than the theory, holds that the amount varies with the nature of the land, the kind of crop, the time of sowing, the season and whether the flow of the river is permanent or intermittent (op. cit., 388; see further Aghnides, 517, Lambton, Landlord and Peasant, 210-11).

The right to use water flowing in artificial holes, such as the water of a canal dug by the people of a village, belongs exclusively to the owners of the bed of the canal, and others may not use the water for irrigation. The manner of use is established by the agreement of the co-owners. The construction of mills and bridges, etc., requires the consent of the co-owners. The construction of new canals and irrigation channels under a mudarras or musajjat (govt.) is only allowed in the lands which border the river. The ownership of landed property involves the revivification of dead lands (khayd al-mattat) normally involves the irrigation of the land. Thus al-Mawardi states that land to be revivified for cultivation must be irrigated if it is dry, and drained if it is marshy (op. cit., 380, 382; Aghnides, 500-1; see further Zayn al-Din b. 'All al-Amili, al-Sihdya, iii, 265-7). Revivification concerns ownership, and canals dug to bring water to dead lands belong to those who dug them (al-Mawardi, 389), and wells or handais made in dead lands in order to revivify them belong to those who made them. If irrigated with river water, revivified land pays ushr, and if reclaimed with khayrd water, kharij (al-Mawardi, 382 f.). Al-Muhakkik, discussing the conditions for the revivification of dead lands, states that there is no shar'i text governing these and that reference is to be had to custom. If the intention is the cultivation of the land, ownership is established either by talab, or by bringing water to the land by a water-wheel or some similar method (khayrd, al-islam, ed. Abd al-Husayn Muhammad 'Ali, Nadji 1328/1910, 4 vols., iii, 275-6). New canals and handais to bring irrigation water to dead lands are subject to the law governing harim. Hilar. The ownership of landed property involves also a right over the land which borders it, where it is necessary for the full enjoyment of the property. So far as irrigation is concerned, this is of vital importance in respect of springs, streams, handais and water channels. Accordingly, "borders" are laid down for such forms of property, within which a third party may not undertake new irrigation works, though some jurists lay down that "borders" can only exist in land to which no one has a prior right. The extent of the "borders" varies according to the nature of the water source and according to the nature of the soil (al-Mawardi, 390, 392, 395, 'Abd Yusuf, 153-3, al-Muhakkik, Sharif, iii, 372-3). Al-Muhakkik permits 1,000 cubits (arg) for a handai if the soil is soft and 500 cubits if it is firm (al-Muqaddas al-nafis, 306).

Mudarras and musajjat (govt.). The first is a crop-sharing agreement and the second an agreement for the exploitation of fruit trees and other trees, under which the two parties each have a share in the proceeds. Agreements of this type were known in pre-Islamic Persia. Under the former, water is traditionally regarded as one of the five elements (the other four being land, draught animals, seed and labour) affecting the proportion in which the crop is divided between the two parties to the agreement, the landlord and the peasant. In theory, one share went to each of the five elements, but in practice there was much variation in the shares going to either party, though the ownership or provision of water always played an important part in the division of the crop in the case of irrigated land.

Musajjat was an agreement made between the owner of a garden and another party, who would undertake to irrigate the trees and who would receive in return a specified share of their fruit. It could also be concluded for trees or plants which did not bear fruit, but the produce of which was capable of exploitation, such as the henna or tea plant. It could also be concluded for newly-planted trees which would not bear fruit for some years. The responsibility for cleaning handais and irrigation channels under a mudarras or
mukatūd, sūr al-Mubakrād, Mukhtasar al-ndfī*.

Water or rain paid full (Abū ʿIsâr, while lands watered by river, device paid half—carried on the back of a beast or raised by a lifting water also ceased to be of practical effect.

Soon the distinction between hūrā and land and distinction between ʿishr and land be¬came blurred, the distinction between water and land and distinction between hūrā or according to whether it is found in water or hūrā land. There is, however, some difference of opinion among the jurists over the status of the water of the great rivers and the implications of its status for tax purposes (see further al-Mawardī, 282-3; Aghna
des, 359, 366-7). Land reclaimed with ʿishr water paid ʿishr and with hūrādī water, hūrādī (see above, s.v. Dead lands). When in the course of time the distinction between ʿishr land and hūrādī land be¬came blurred, the distinction between ʿishr water and hūrādī water also ceased to be of practical effect.

What was crucial in assessing the tax-bearing capac¬ity for the upkeep of the great rivers was vested Kharān and ʿisrāwūn, which is dedicated to Sulfūn Uways b. Muhammad b. Hindu shah, it can be taken as a typical example of contemporary practice (as it should be rather than as it was). In some cases, royal farmanīs were issued for the settlement of water disputes—and not necessarily always those of a major nature. A short farman, dated Dhu 'l-Qa'a 953/Apr., 1546 issued by Shāh Tahnānā, regulates a dispute over water rights between Kharānīs and Sulfūs, two villages in Aḏharbāyjan. It orders the peasants and crop-sharers of Kharānīs to act towards the peasants of Sulfūs in accordance with the shaartūnā (imposition of water supply only. In its simplest form, a certain rate was imposed per unit of water (šāb, ʿabādī, ṣūfīna, sāhī). The rate varied from village to village; reassessments were seldom made, but the incidence of taxation might be increased by the imposition of additional quotas. Wells in some districts in southern Persia in the 19th century paid a wheel tax (ṣuq esh-bī) (Stack, ob. ed., ii, 259).

In the case of the declaration of dead lands, tax concessions related to the nature of the water supply were from time to time recorded. The Ilīhānī Ghāzān Khān (694/1295-1304), who attempted to bring about a cultural and agricultural prosperity, classified dead lands into three groups according to the labour required on irrigation works, and gave them tax concessions for three years (see Landlord and peasant, 51).

Water rights and the religious officials: the settlement of disputes. Water, perhaps because it is closely associated with ʿishr and hūrādī, which are among the īmān aḥlis, generally speaking came within the purview of the religious officials. The regulation of the water of the Hari Rūd in the 8th/14th century is said to have been carried out by the Shaykhw al-Islām Nisām al-Dīn Aḥdī al-Raḥīm Khādī, and that of the Zāyanda Rūd in the 12th/17th century is attributed to Shaykh Bakr al-Bakr al-Dīn Muhammad al-Anīlī (see below). So far, however, as the religious officials gave due attention to issues for disputes over water (which were of frequent occurrence), they relied for the execution of these, as they did in decisions over other matters, on the officials of the government. Thus when Aḥdī al-Raḥīm b. Tahir (273-308/882-944) found that there was no body of laws on the subject, he assembled the jufbāh of Khu¬rāsān and ʿinkh (not the ʿummalīs) of ferrous metals for the purpose of deciding on the disputes over water (which were of frequent occurrence), they relied for the execution of these, as they did in decisions over other matters, on the officials of the government. their services for the purpose. The cleaning and repair of canals from the great rivers leading water to individual villages was the responsibility of the owners of the canals. If they refused to carry out the necessary work, they could be compelled to undertake it, since neglect of their duty might result in injury to the community and might diminish the supply of water to those who had a right to it (Abu Ya'uf, 144, 148; see also N. B. E. Bailey, *The land law of India, according to the Mochummadan law*, translated from the Fatawa Alumgeers, London 1873, 49-50). In the provinces, responsibility for the control of the waters of the great rivers was in practice delegated to the provincial governor. With the fragmentation of the caliphate and the rise of local dynasties, this responsibility passed to those who held power locally. There was, therefore, no uniformity of system and information concerning water control and irrigation is patchy. It was presumably the theory that the *imda* had the right to compel the Muslims to give their services for the repair and cleaning of the great rivers which gave sanction to the practice of levying corvées for irrigation works, either of a seasonal nature, as in Sistan (though it would appear that in the early centuries an allocation was made on the *kharaj* for irrigation works, see *Tadhkired-i Mulk*, ed. Malik al-Sharifgarz, Bahar, Tehran A.H.S. 1341/1962, 15). He gives the regulation from Salawid times onwards. Under the *tirid* and *buluk*, the water was led off in canals to the villages which varied at different periods of the year, having a seasonal nature. Thus when Fazl al-Din Mukaddam made plans to restore prosperity in Harat in 653/1257-8 after the depredations of the Mongols, he held a meeting in the Friday mosque and assembled the men of Harat to work in corvées (*baghar*) on the irrigation channels which had silted up (Istizâr, *Rawdat al-djamâât*, ed. Muhammad Kârim Imâm, Tehran A.H.S. 1333/1950-1, ii, 110-12; cf. also Saiyf b. Muhammad b. Ya'qub al-Harawi, *Tihrîk-nîmā*; Calcutta 1944, 111). Some centuries later, Fâqîl Allah b. Ruzbihân Khûndî (d. 927/1512), while still taking the view that expenditure on irrigation works came under the heading of *masâili* al-nawâsib and was therefore a legitimate charge on *khârid* revenue, nevertheless sought to legitimize the raising of special taxes (nawâsib) for such expenditure. He writes, "What is taken in *khârid* from the generality of men for the repair of dams on the Oxus or for the building of walls round the kingdom or other such matters of public interest is a debt which must be paid and a claim which is rightly due, and refused to pay is not permissible; such taxes are not unjust" (*Sûlûk al-malûk*, d.l. ms. Or. 253 [microfilm copy], 119).

There are from time to time references to special departments in charge of irrigation, but, on the whole, it would seem that their existence was the exception rather than the rule. In western Persia, there appears to have been a *dâwin-i db* in the 4th/10th century at the time of the rise of the *bûyids*. The *Târîkh-i Khâm* states that when the Ghûlids and Daylamids conquered Khûmân they abolished the *dâwin-i db* (Hasan b. Muhammad b. Hasan al-Kârim, tr. into Persian by Hasan b. Sa'id b. Hasan b. 'Abd al-Mâlik, ed. Djalâl al-Dîn Tîhrànî, Tehran A.H.S. 1313/1934, 53). The only Bûyids who appears to have been concerned to foster agricultural prosperity and hence to have paid attention to the upkeep of irrigation works was *'Abû al-Qâdir* al-Dawla (d. 532/1527), the builder of the *bûlûk* of *Amû* (Hasan b. Muhammad b. Khân al-Kârim, *Tadhkired-i Mulk*, ed. L. Castani, Leiden 1909-17, vi, 505 ff.). About the same time, there was in the eastern provinces an extensive water administration for the Margâhî River, which was under the jurisdiction of the rulers of Ghardîstan. A specially appointed *amir* was in charge of the upkeep of dykes on the river and the regulation of the water supply. He had 10,000 workmen and horse guards under him. 'Abd al-'Îsahb al-Shâhî states that he enjoyed greater respect than the *wâli* (*Masâli* al-masâlih, 261-2; Le Strange, *Lands*, L, 597-8). Under Ya'qûb b. Layyîn in Sîstân, there appears to have been a *mirâb*, who was a government official. Cases against him, in the event of his abusing his power, were heard in the *dâwin-i masâlih* (*Târîkh* Sîstân, 266). Under later dynasties, such as the *Sâlûks*, *Khârazm-Shâhls*, *Ilkhâns* and *Timûrids*, control was, no doubt, exercised over the great rivers by the government, though the sources contain very little information on this subject (see *Majmû'iyâ-yi mansûhâ*; 53 'Abd al-Salîm al-Sâlihîyan, *masâli-i sâlih-i Mughal*, ms, photo-copy in the National Library, Tehran, 80-b-61 for a diploma from 11 Rûmah for the *mirâb* of Bûkhârâ, and see H. Forst, *Die Staatsverwaltung des Grossfeganen und *florâns-šîks*, Wiesbaden 1964, 137). So far, however, as agriculture was fostered by individual rulers, this implied some degree of water control.

Information on the division of the Hac Rûd in the 10th/16th century is contained in an essay written by Kâsinî in *Yâsîn b. Muhammad b. Ya'qub al-Harawi* (*Kismat-i db*, ed. Malik al-Sâfu'ara, Tehran A.H.S. 1339/1960-1, ii, 196). He writes, "What is taken in Khârid from the generality of men for the repair of dams on the Oxus or for the building of walls round the kingdom or other such matters of public interest is a debt which must be paid and a claim which is rightly due, and refusal to pay is not permissible; such taxes are not unjust" (*Sûlûk al-malûk*, d.l. ms. Or. 253 [microfilm copy], 119).
and lands in the bukhār, each portion of the village lands having the right to the water for a fixed period of time (Lambton, The regulation of the waters of the Zayandeh, Rūd, in BSOI, ix [1939], 665-73) within the rotation period. The mirāb in charge of the water was an important official, ranking among the higher officials of the bureaucracy and the court. That he enjoyed such pre-eminence was due in part to the fact that Isfahān was the capital of the empire and the land watered by the Zayandeh Rūd, or most of it, came under the khāṣa administration, which was in charge of the nūbah, those districts around Isfahān which were directly administered by the central government and in which to be found also land and water resources which had been constituted into anbāf or which were the private property (khāṣa) of the shah. The duty of this mirāb was to order the peasants, on the eve of the Naw Rūd, to clean the nūbah (as the major canals in Isfahān were called), lesser canals (anbāf) and channels (dajālāt) which belonged to them, according to established custom. He was to see that the water of the Zayandeh Rūd reached all the districts round Isfahān which had a water right (khāṣa dhā) in turn and according to the share customarily allocated to them from ancient times. The appointment and dismissal of those in charge of the nūbah (muḥāṣf) was his responsibility. He was also charged with the task of deciding disputes and claiming damages concerning the water of the river, though certain disputes of a general nature affecting all the landowners and peasants were referred, according to the royal order, to the wazir of the supreme dinār; in such cases, the khāṣa, muṣaffa and mirāb of Isfahān would go with the mirāb and the wazir of the supreme dinār to the districts, examine the nūbah, canals, channels and runnels and decide the khāṣa dhā of each district on the basis of the dinār registers and settle all claims according to common sense, custom and the practice of former years. In accordance with this practice, many ordeals and decrees (jurām wa ḥabām) had apparently been issued and had become customary practice. Apart from the customary dues (rusūm) which the mirāb received in each district on account of the first water given to wheat (khāṣa dhā) and the water given to wheat when it was nearly ripe (dān dhā), a small amount (kādir) was allocated to him by the khāṣa administration (jarār-i muḥāṣf-i āsrāf) in cash and kind, which he received annually (Muhammad Taqī Dāšqāpārd, Dastār al-mulūk-i Mirzā Rāfīq wa Tadhkīr al-mulūk-i Mirzā Serafīd, in Tehran University, Rev. Fac. des lettres et sciences humaines, xvi/6 [A.H.S. 1340/1962], 403-3; see also Tadhkīr al-mulūk, facs. text, tr. and explained by V. Minorsky, London, Leiden 1943, 83-8). The accounts of European travellers who visited the Šafawī court also show the mirāb to have been an important official. Tavernier states that his office was one of the best offices of the court and much sought after, and he who obtained it was obliged to give large presents (Voyages en Perse, Paris 1907, 67, 23). Besides he writes that his emoluments amounted to 4,000 dirhams per annum (Voyages, iv, 100). Mirzā Husayn Khān b. Muhammad Ibrāhīm Tāshqalādār, writing in 1877, states that the mirāb and that of baillif (muḥāṣf) of the royal kamāt (banāwāt-i ḥażūsa) existed, but that "at the present time there is no one holding these offices. Authority lies with the officials of the bulākh (i.e. the districts watered by the river) and it is not necessary for them to be someone holding these offices as a special charge" (Dīwān-i tāsīyat-i Iṣfahān, ed. Manoochehr Sotoodeh, Tehran, A.H.S. 1342/1963-4, 128).

The mirāb in other large cities was also often a person of considerable local importance and influence. In Šīrāz in the 13th/18th and 13th/19th centuries, there was a hereditary tendency in the office (as there was in many other local offices), the office of mirāb of Šīrāz having been held for many generations in the same family (Fāsān, Fārs-nāme-yi Nūrīf, 1st., 1315/1855-6, 2 vols in one, ii, 74-5).

Apart from the great rivers, water management was carried out by small-scale local efforts. In the case of the lesser rivers, banās and springs, the administration and control of the water was normally in the hands of the users. They might or might not appoint a mirāb, who might also have assistants whose duty was to supervise the allocation of the water to the users served by the individual canals. In some districts, a mirāb was appointed only when water was abnormally scarce. He and his assistants were paid by dues collected locally or sometimes by a share of the crop (see further Lambton, Landlord and peasant, 222 ff.). In Šafawī districts (districts in which large landowners predominated) the mirāb was commonly the servant of the Šafawī.

Modern developments. Land and water were sensitive issues, and under Šīrāz Pahlavi fundamental changes were not, on the whole, introduced. The administration of rivers and the protection of water resources, the basis and rate of which varied on the different rivers, was under the Department of Irrigation of the Ministry of Agriculture. The civil code, various parts of which were promulgated between 1925 and 1935, is largely based, so far as land and water are concerned, upon Šīrī law. A number of other laws concerning the use of water, some based on āsrāf practice and custom, others of a more innovative nature, were passed. Provision for the registration of water rights was made in 1929 and, in 1937, the banān-i ʿunār of 25 māns (the land for water development) was passed. This defined ʿunār as the greatest possible agricultural development by means of, inter alia, the making and repair of banās, the reclaiming of waste lands, the maintenance of irrigation channels and the drainage of marshes. Although on the statute book, this law was never put into operation because of the opposition some of its provisions were likely to create among those who held land (Lambton, op. cit., 1927-3). The law of 29 Urūl-Billī 1323 (1945) authorized the establishment of an irrigation institute under the supervision of the Ministry of Agriculture and contained provisions for a widespread control of irrigation by the state. These were put into operation somewhat erratically. A number of dams and barrages were planned, and some constructed by the government and by private enterprise, notably at Simnān, Ravānāsir, Šahānḵār, Ābā Daghī and Hamdiyya. Little real progress was made and no hydrographic survey, which was a prerequisite to the efficient management of water by the state, was undertaken (see Lambton, op. cit., 1927-3, 1945, 196 ff., 192-3). There was also some forcible diversion of water to Tehran from neighbouring villages by Rādī Šīrāzī (Afīn Allah Musawīlī, Šāhīs-i ʿiṣrāsī-yi man, Tehran A.H.S. 1344/1965-6, 3 vols, iii, 128 ff.). After the Second World War, there was heavy investment by the government in irrigation under the various development plans, especially dams, mainly for energy but also for irrigation, among them the Dīz dam (the Rūd Shāh Kabīr dam), the Sefīd Rūd dam (the Muḥammad Rūd Šīrāzī dam) and the Karajā dam (see further H. Bobek, Unternehmungen Landes unter Kultur, Frankfurt am Main-
The land reform of 1962 laid down special provisions for the transfer of water rights and the upkeep of irrigation works. These provisions were also put into operation somewhat erratically, and there were conflicts of interest between the land reform administration and various ministries, especially the Ministry of Water and Power, which was set up in 1964. A water nationalisation law was passed in September 1968, which attempted to alter the system of water control radically (see further Lambton, The Persian land reform 1968-69, Oxford 1969, 273 ff; C. Salamanzadeh, Agricultural change and rural society in southern Iran, Menas Press Ltd. 1980; D. A. Caponera, Water lines in Moslem countries, FAO, Rome 1973, 74 ff.).

Irrigation and society. Although it is difficult to generalise on the subject of irrigation in Persia, some few observations can be made on the influence which irrigation has had on society. It was possible through irrigation to introduce new crops and to intensify and diversify agriculture. This agricultural specialisation became the basis of the flourishing civilisations which developed at different periods in the history of Persia. But this process was not uniform over the whole country. Generally speaking, the exploitation of water resources on the plateau would seem to have been more intensive than in the periphery or in regions with a concentration of nomadic or semi-nomadic tribes. The early centuries of Islam were marked by the growth of cities and towns, round which there was, in many cases, an expanding area of irrigated land, the agricultural surplus of which provisioned the cities and towns. The list of the crops grown in the 3rd/9th and 4th/10th centuries given in the work of the Muslim geographers bears witness to a highly-developed agriculture, which depended on irrigation. In the later centuries also, agriculture flourished from time to time, though seldom over the whole of the country at the same time. Periods of expansion alternated with periods of recession, which were the result of natural calamities or political vicissitudes. With the neglect or destruction of irrigation works, land went out of cultivation and the area under grain crops expanded relative to that under cash crops, as appears to have happened in the early period of Mongol domination. Be that as it may, agriculture up to modern times was the major source of the revenue of the state. It was also the basis of the wealth of the ruling classes and of the livelihood of the majority of the population. The well-being of the state and the people was thus dependent upon a well-maintained irrigation system, and prudence, if nothing else, demanded that attention should be given to the upkeep of irrigation. Sharif law recognises this, and permits the expenditure of haward on the upkeep of irrigation works (even if, in practice, funds were often not available, or not made available, and the work was done by corves). Treatises on the theory of government recognise, in general, that the economic foundation of the state was a flourishing agriculture and that the upkeep of irrigation works was therefore incumbent upon the ruler. The sources do, in fact, frequently mention, in general terms, the efforts of individual rulers and their ministers to spend and divert irrigation water, to make hawards and to repair irrigation channels; and they also mention the decay and destruction of irrigation works in time of war and insecurity. This dependence of the state and society upon agriculture and of agricultural prosperity upon an irrigation system which was inherently fragile had certain consequences. In the first place, it produced a certain caution towards experiment and change (whether in the political or the economic field) among those whose income and livelihood depended upon agriculture. The maintenance of irrigation works demanded regular care. This could only be given in conditions of political security. Canals, if not cleaned, silted up and dykes, if not repaired, were breached by flood-water. If the destruction brought by flash floods and storms was not immediately made good, irrigation water decreased. Similarly, without some degree of political security there was no investment in hawards, the digging of which was a highly-skilled operation and the upkeep of which demanded regular care and attention. Secondly, there was a general tendency to seek security in stable and orderly government backed by coercive force. Secondly, the rotation system of the water, fixed in advance and determined by rules observed by the users, imposed the acceptance of a common discipline. Usurpation and the illicit diversion of water brought strife into the life of the local community and disaster to those who were deprived of their due share of the water. This, too, led to an appreciation of order, and since the responsibility for the distribution of water, except in the case of the great rivers (which were controlled by the state), rested upon the local community, who appointed their own water officials, it fostered the cohesion of local groups and communities and encouraged local particularism.

Drinking water. The right to use water for drinking purposes according to the Sharī'ah has been set out above under the right of thirst. The drinking water of villages and towns comes mainly from springs, hawards and wells. In the villages, springs are the main source, and from them water is fetched by the users in skins and earthenware water-pots. In the towns, as for example Isfahan, many houses had their own wells from which drinking water was drawn. Large houses in many towns had a storage tank (al-'anbār), built of fired bricks and lined with waterproofed mortar (sārdīd), in the basement and an open tank (haward) in the courtyard. These were filled whenever the householders' turn to water from the haward or other sources came. Their water was used for household purposes but not primarily for drinking. In districts where water was short or brackish, drinking water might be brought from a distance on the backs of animals (cf. Curzon's description of the water supply of Bushire, op. cit., ii, 234). Covered cisterns (al-'anbār) are common in towns and villages where water is short, especially on the borders of the central desert. They are also to be found along the roads, sometimes associated with caravanserais. Some have their own springs, but more usually hawards or rain water is stored in them. Dome-shaped structures, some 50-70 ft. in diameter, reaching 15-20 ft. or more below the surface of the ground, they are a characteristic feature of local architecture (see Wolff, op. cit., 258-59).

Many, perhaps most, towns on the plateau, especially as they grew in size, were supplied by hawards. Hamd Allah Mustawfi records that the water of Kazvin was originally from wells. The first haward was made, he states, by 'Amir b. Iyasa, who became governor of the town under Mahmud b. Sebuktigin. The water of this haward reached most of the quarters of the town. Subsequently, a number of other hawards were made to serve various quarters of the town. Hamd Allah lists eight (all of which
were wafṣ) and states that according to the conditions laid down by their founders (wafṣiyān), their water was to be used for drinking purposes and for ḥamāmān and was not to be let into gardens or cultivated land (Tārikh-i guzda, ed. 'Abd al-Ḥusayn Nawḵī, Tehran, A.H. 1339/1960, 782). In some places, notably Vardān, wafṣ flows through the houses and the householders have the right to use the water for drinking purposes. Naṣīr-i Khosrow mentions that some of the houses in Arradjan also had a ṣanād running through them (Sefer Nameh, Relation du voyage de Nasiir Khosrow, ed. and tr. C. Schefer, Paris 1881, Persian text 81; Gaube, op. cit., 44). This was also the case in Ṣaḥḥār (‘Abd Allāh b. ‘Nūr al-Dīn al-Ṣaḥḥārī, ed. Khān Bāḥūr Khān Mawliwalabkhī, Taḏkira-yi Ṣaḥḥārī, Tehran repr. n.d., 10-11).

The provision of drinking water was considered a meritorious action. Many individuals made ḫawāṣṣ and constituted them into wafṣ for the drinking water of a town or one of its quarters. For example, a ṣabku-khānā of a town or one of its quarters. For example, a muḥtasib.

behind dams on rivers flowing from the mountains almost entirely by kandts, Shah's first minister, wished to investigate the 105). In modern times, with the in¬

supply on rain-water for two months in winter and spring (ibid., 100). In Dihdasht, snow was brought from in the middle of the 17th century, the people relying lor example, appears to have been short of water and the water supply of Tehran, which was then supplied in the bazaars and streets of the towns similarly constituted into wafṣ (cf. ‘Abd al-Ḥusayn Sipind, Taḏkira-yi awfṣ-yi Ṣafafī, A.H. 1346/1927, 360).

A shortage of drinking water in many villages and towns, especially in southern Persia, was a common occurrence (cf. Gaube, op. cit., 54, 80). Bibihān, for example, appears to have been short of water in the middle of the 17th century, the people relying on rain-water for two months in winter and spring (ibid., 100). In Dihdasht, snow was brought from near mountains to supplement the drinking water supply (ibid., 105). In modern times, with the increase in urbanisation, water shortages have been a serious problem in many towns. In the middle of the 17th century, Ḥabīḍī Mīr Ṣādi Ḵān, Muḥammad Shīr’s first minister, wished to investigate the possibility of sinking wells with a view to assuring the water supply of Tehran, which was then supplied almost entirely by ḥamāls, but nothing came of this (Great Britain, Public Record Office, F.O. 50:115, Shell to Aberdeen, no. 106, Tehran, 20 September 1831). In recent years, the water supply of Tehran has been supplemented by water stored in reservoirs behind dams on rivers flowing from the mountains to the north of the city (see further, Planoï, op. cit., 437 fl.).

Drinking water in the towns came under the general supervision of the muḥāfiṣīn. If water conduits were in a state of disrepair, it was his duty to repair them, or, if there was no money in the public treasury, to order the townspeople to do so. Similarly, if the source of drinking water was fouled, he could order them to rectify the matter (al-Māwari, op. cit., 524; R. Levy, The social structure of Isfahan, Cambridge 1957, 337). In modern times, the regulation of the water supply of the towns has been under the munici-

palities, and in recent years there has been cannalisa¬

7. Irrigation in North Africa and Muslim Spain

Since the purely geographical aspect of the topic of water (amount of rainfall, hydrology, etc.) has been or will be treated in the articles on Muslim Spain or al-Andalus [e.g., Algeria, Morocco and Tunisia], the present article is limited to a consideration of the supplying of drinking water to the towns and villages, as it appears from the medieval texts, in addition to a consideration of the customary rules concerning the ownership, use and repartition of water needed for irrigating gardens. The topic of modern irrigation, one especially involving the construction of large dams began during the colonial period of North Africa, will not be examined, but a few words will be said about prayers for obtaining rain, since the procedures followed in the Maghrib were neglected in the article itself.

The works of the mediaeval historians and geographers have hardly any information on the system adopted in the rural areas, but for al-Andalus, there exists a rich geoponic literature (see [1952], 5-275), which has recently been utilised by Messrs. L. Bolens, J.-C. Pellat, I. S. Allouche, A. Bechraoui, A. Solignac, and A. Le Toumeau, among others. It is surprising that al-Mukaddas I (cd. and tr. Ch. Pellat, Description de l’Occident musulman au IVe-Xe siécle, Algiers 1959, xoff.; A. Bechraoui, La vie rurale dans les oasis de Gabis (Tunisie), Tunis 1950) rarely neglects to mention the source of the local inhabitants’ drinking water. The installation of a modern water distribution system has reduced the activities of these [231], who have now become largely a tourist attraction.

In Spain, Muslim travellers were able to note the Roman aqueducts which brought water from quite considerable distances, but the Arabs in turn did not fail to construct water channels, in particular to bring water from the sierra to the mosque of Cordova. (On underground channels, known in Spain, and especially at Madrid, as well as in certain regions of North Africa, see [231].)

However, the most original installations, it seems, are in the region of al-Kayrawan, in Byzasene (Tunisia), and are attributable not to the Phoenicians or Romans, as has been thought, but to the Arabs, who developed an earlier existing system by practicing, during the four centuries before the Hellenic invasions, the practice of transporting underground water to thirsty passers-by without asking the slightest return, in order to make a living, they had a regular clientele to whose homes they delivered drinking water. The installation of a modern water distribution system has reduced the activities of these [231], who have now become largely a tourist attraction.

In Spain, Muslim travellers were able to note the Roman aqueducts which brought water from quite considerable distances, but the Arabs in turn did not fail to construct water channels, in particular to bring water from the sierra to the mosque of Cordova. (On underground channels, known in Spain, and especially at Madrid, as well as in certain regions of North Africa, see [231].)

However, the most original installations, it seems, are in the region of al-Kayrawan, in Byzasene (Tunisia), and are attributable not to the Phoenicians or Romans, as has been thought, but to the Arabs, who developed an earlier existing system by practicing, during the four centuries before the Hellenic invasions, the practice of transporting underground water to thirsty passers-by without asking the slightest return, in order to make a living, they had a regular clientele to whose homes they delivered drinking water. The installation of a modern water distribution system has reduced the activities of these [231], who have now become largely a tourist attraction.

In general, water is so important in the eyes of the peasant that ownership of it is sometimes independent of that of the soil. Two main ways of acquisition are in effect possible: (a) personal ownership acquired by purchase or inheritance of the piece of land where there is a spring, well, etc., of which the owner can dispose at his own will, subject to his respecting certain rights of use; and (b) collective ownership, in which water is appropriated to each patch of land which can be irrigated by water belonging to the community. The sale or lease of the estate implicitly includes the disposal of a corresponding part of the water, but the land's owner can also sell or lease out the land whilst reserving to himself a right of usage which he can then dispose of however he likes, compelling the buyer or lessee to obtain by some other means the water which he needs.

The customary law which governs the utilisation of the water has very precise provisions which often go back to the period before the arrival of Islam; indeed, the provisions regarding, in particular, the rights of usage affecting the land owners and the water supply, are clearly similar to those of classical Islamic law, which in fact only confirmed those of the customary regulations (see e.g. A. Hamoteau and A. Letourneux, La Kabylie et les coutumes kabyles, Paris 1893, ii, 219-53, 276-9).

The division of the individual shares is also subject to strict rules, which nevertheless do not always ensure absolute equality between the participants and which do not sufficiently guard against wastage which might well be avoided. The measuring-out is done in various ways. E.g. a copper vessel with a hole pierced in it may be placed in a tank, etc., filled with water; when the vessel itself is full and sinks to the bottom of the tank, a stipulated fraction of the time-share in the water is finished. When the water comes from a basin with vertical sides, one may use a rule whose length is equal to the basin's depth and which is graduated, i.e. it bears notches whose spacing corresponds to a given volume of water. Other methods are still in use. When the share of water supply, whose duration and periodicity vary according to the differing regions and, of course, according to the amount of water available, comes to an end, the arrival channel is blocked up with a mere clod of earth, or a rudimentary sluice-valve, which he needs.

8. Irrigation in the Ottoman Empire

The Ottomans followed the detailed provisions of the Islamic law according to the Hanafi school, as exemplified mainly in the Kitāb iţāha al-maṣāliṣ and the ḫabd al-ghuṣūb (see Mawāfikātī lāmāhu, ii, Istanbul 1318, 271-22, and Mīqdād, 1262-9, 1270-91; and 1224-53 also). The basic notion is that water, like wild vegetation and fire, is muḥād, that is, open to the use of the public at large. Seas, large-size lakes, great rivers, and subterranean waters are considered to belong absolutely to this category. Everyone is free to make use of these waters so long as no harm is caused to any other. In this case, the individuals had to bear all the necessary labour and expense. But usually the state was responsible for large-scale waterworks on the great rivers. For that purpose it was permitted to make use of public revenues except for sadāh (q.v.). If the state treasury was unable to finance such works, which were considered essential to the public good, the state could appoint a superintendent (nāṣir), who was authorised to employ the local population, if necessary by force, to construct them (Mawāfikātī, ii, 220).

Property rights were recognised over certain types of waters which were regulated and protected. Mānīlāb or privately owned waters were distinguished as either nawr ḍāmīn, in which the waters remaining after use by the owners were free for public use, and nawr ḍādīs, where the water was exclusively for the use of the owners. Shābū (q.v.), pre-emptive right, is in effect in the second case. The reclamation of waste land was legally recognised for individuals, Muslims or dhimmis, who might dig out water-channels (kār or cinnād) or wells, or who might find a spring or drained flooded land. In the Rumm region, individual usufruct was established only with the permission of the imām or sultan, with the condition that the reclamation process be completed within three years. In the Ottoman Empire, possession rights were recognised to those who reclaimed waste land without permission. Reclamation projects were given prior approval by the sultan by special diplomas called tumūlub-nāmes which recognised proprietary rights on waste land as well as on running water and springs within the area delineated by the document. A prescribed amount of land, called kārīn, and surrounding newly-cleared water conduits, springs, or wells, was recognised as the legal property of the owner of the water.

Water in the ēnhāres and ḍandīta (q.v.) was subject to private ownership, and no one could make use of it without previous permission of the owner. In the case of those waters under joint ownership of a number of partners, none of the partners could open new water channels, construct mills, or change the
sequence or direction of water-use without the consent of the other partners. When given, such permission could be revoked at any time. Water was divided between the partners according to the size of their respective landholdings. Partners on the upper reaches of the river were not allowed to dam up the water and thereby cause shortage on the lower reaches. If a dam had to be constructed, water rights were distributed among the owners of the land upstream from there. The owner of a body of running water had certain rights when it flowed through somebody else's land. The owner of the land was forbidden to obstruct the flow of the water and had to permit the owner of the water to carry out necessary repair work on his land. 

The village of Avshani on the Struma river was distributed starting at the lower reaches of the river. The owner of the land was given the right to make use of water at a given interval, which could be the subject of inheritance or devise, but could not be either sold, bequeathed, rented, or given away as charity. However, in Ottoman practice we find examples of owners of water, of individuals or of a waqf foundation, where the water might be sold for use in irrigation. What the state was concerned about was to prevent speculation in the price of water and to prevent the depleting of those who had waqf-i shar, the right to make use of water at a given interval, in favour of those paying higher prices (Ertemen, hâkim-nâmis, dated 1340, in Barkan, Kanunlar, 70).

In addition to the prescription on water use in Islamic law, the Ottomans continued practices and regulations which they found in the conquered lands and enacted new legislation. Concerned about the water supply for cities, water distribution, especially in areas with water shortages, and rice growing, which became a major state enterprise involving water use on a large scale, General Ottoman policy regarding water use and water works was determined to a great extent by the Ottoman land tenure system, which left the direct exploitation of agricultural land primarily to the redeva farming small units. The state did not participate directly in large-scale water or land reclamation projects or in agricultural production, except for the water supply in the cities and for rice growing. Such projects were usually initiated and carried out in the form of waqf endowments by members of the Ottoman house or of the upper echelons of the ruling class. There was no government agency responsible for water projects or regulations for water use. The construction of aqueducts and maintenance of water works was under the supervision of the ser-bundar âlehis, head architect in charge of public works. Under his authority, and directly under a nâzir or superintendent, were the sufiqda, technicians in charge of the maintenance of water pipe system in Istanbul.

**Rice cultivation as a major irrigation activity.** Here one can see how the Ottomans realised large-scale irrigation projects. In rice growing, abundant water supply and maintenance of water courses for constant watering of the rice paddies was crucial, so that the real object of irrigation was achieved. Rice growing was important as a source of revenue for the state, and it helped alleviate hunger in areas of food shortage. The Ottoman state was concerned about was to prevent speculation in the price of rice, the Ottomans encouraged from the beginning the extension of rice growing, either by establishing direct government control over watercourses, or by granting possession or proprietorship of waste (mânsul) lands, particularly in the flooded areas. Official sources conclusively show that rice was widely cultivated in the Maritsa, Mesta (Karaas) and Vardar valleys in the 9th/15th century. The growth of government revenues from rice growing in various regions in the Balkans is shown in Table 1 based on the suâyâr registers from this period (see M. Tavyp Gökdülm, Edirne ve Phaça idaresi, Istanbul 1952, 125-53).

The principal rice growing areas in Anatolia and their respective revenues in 1045/1636 are shown in Table 2 (see R. Murphey, The functioning of the Ottoman army under Murad IV, unpubl. dissertation, Univ. of Chicago 1979). An Italian source of 880/1475 (F. Babinger, Die Aufgründung der Gewasen Ivatco de Promontorio-de Cambis . . ., Munich 1957, 65) estimated at 15,000 gold ducats the revenues from rice production. Idris-i Bâlikli (Hasçk bâlink, the conquest of Filibe, Murad I's reign) states that the sultan's share of the rice production in the Maritsa valley amounted to 80,000 gold ducats in the time of Bayezid II. Besides those mentioned above, there were other important rice-growing areas in the Sakarya river valley and its tributaries in the provinces of Khudawendigar, Sultân-öni, Bolu, Ankara and Kütahya. **Note:** The data provided in Table 1 are estimated revenues for the three-year period in Ottoman \( \text{adhis} \). The conversion factor used is 50 \( \text{adhis} \) = 1 Venetian ducat. The revenues are based on the suâyâr registers from the 16th century. The table shows the growth of government revenues from rice growing in various regions in the Balkans, with a focus on the Maritsa, Mesta (Karaas), and Vardar valleys. The data include a range of years, and the revenues are presented in gold ducats. The table highlights the importance of rice cultivation as a major irrigation activity, particularly in the Ottoman state's efforts to control water use and prevent speculation in the price of rice. The Ottoman state encouraged rice growing by establishing direct government control over watercourses and granting possession or proprietorship of waste (mânsul) lands. The table provides a snapshot of the economic and agricultural activities in the Balkans during the 16th century, showcasing the importance of rice production and the role it played in the Ottoman economy.

due to the *timār* holders. Cotton and other crops were also expected to be cultivated on the reclaimed land. Apart from the tithe to be paid to the *timār* holders, and the profit accruing to the *reyyān*, the promoters promised to undertake the expenses of repairing the caravan highway passing through this flooded area and to construct a caravanserai and five fountains. The sultan gave his approval to this project, subject to the willingness of the *reyyān* of the area to work on the reclaimed land.

We find numerous examples of such irrigation and land reclamation projects in the Ottoman empire, always made subject to the approval of the sultan, and made conditional on the consent of the local population and *timār* holders to co-operate. Such projects, with large potential yields, were almost always proposed and realised as *wakf* endowments. This method was the predominant form of land reclamation and irrigation in the Ottoman Empire. Except for rice cultivation, the state seldom took a direct part in organising such irrigation projects. Such irrigation projects were undertaken more extensively in the period of the rise of the *reyyān* and the local dynasties in the 18th century. Under the impact of European commercial expansion during the period, they made efforts to put into cultivation previously unused swampy lands. It was during the *Tanjumād* (1550) period that, under the influence of current ideas from Europe, the state became systematically interested in land improvement and in the extension of agriculture. A Council for Agricultural and Industrial Affairs, the Zirā'at wa ṣānā', Medjlisi, had already been created in 1254/1838. In a questionnaire distributed in 1259/1843, the state attempted to find out the amount of land left out of cultivation due to flooding, and European experts were sent to the Dobrudja, Cyprus, and other parts of the empire, and reports were submitted with suggestions for the improvement of agriculture. The desire for European demand for cotton from the Levant during the American Civil War spurred the Ottoman government to introduce broad measures to increase cotton production in the watery plains in Cilicia, the Aegean coasts, and in Macedonia. This development caused shrinkage in rice cultivation in these areas. Apart from the extensive irrigation works in the Konya plain which were open for use in 1231/1815, no substantial drainage or irrigation project was accomplished by the state until the Republican period. As late as 1945, the area of irrigated land in Turkey was limited to 20,000 hectares.

Regulations on water distribution. In Anatolia and Rumelia, where water supply was generally adequate for agriculture for 9-10 months, fixed regulations for water distribution as in Iran and in the Fertile Crescent were not common. In the dry regions of the central and eastern Anatolian plateau, and during the summer months starting from July, certain regulations were worked out for the distribution of available water sources among individuals. Such arrangements, stemming from pre-Ottoman times, were particularly common in the neighbourhood of large towns where numerous orchards and gardens were to be found. According to the observations of modern geographers, in certain parts of Anatolia where traditional methods survived, the organisation of water distribution was dictated by shortages of water both regionally and seasonally, by the extension of irrigated agriculture, or by aggregation of population (X. de Planhol, *De la plaine pamphylienne aux lacustrines*, Paris 1838, 146, 323-8). As to sharing of spring water between several villages, there was usually no formal regulation, unless recurrent disputes forced the government to intervene as an arbiter and to work out regulations. Such disputes usually appeared as arguments over the use of pastures lands, and it was the *hāshī* court which was responsible for settling them in accordance with the *shāhī* rules, as was the case with all matters involving water distribution. This explains the lack of universally-applied regulations enacted by the government.

As a general policy, the Ottomans avoided imposing regulations on water use, and abolished pre-existing taxes and dues on water (see the *bānān-nāme* of Malatya, Barkan, 113). In some districts, the Ottomans retained older regulations for distribution of water, for irrigating gardens and fields, and for water supply to the city. In the province of Karaman, where the Ottomans found the most developed system of water distribution for urban areas, a *mir-āb* or superintendent of water was chosen to supervise the application of these regulations. To distribute water according to the provisions of the *ghara* regarding the *jāhir* water, right in the use of water, and *jāhiria*, or pre-emptive right, was the *mir-āb*’s responsibility. To ensure complete equity, the *mir-āb* appointed, with the approval of the community, several *muqaddas* who oversaw the distribution of the shares. He was also assisted by individuals who performed the work during the actual irrigation process. The regulations tried to prevent various abuses, such as taking water out of turn by bribing the *mir-āb* and others, which reflect the acute competition between the users of water during the summer months. Each user of distributed water paid a fixed fee to the *mir-āb* (for the rates see the *bānān-nāme* published in *JESHO*, xi/1, 116), who acted as tax-farmer for the government. The revenue deriving from *mir-āb*iyah, together with certain connected dues for Konya, amounted to 90,000 akçes in 1273/1856 (see R. Murphy, *op. cit.*). The function of *mir-āb*, apparently originally a Persian institution (see I. T. Khāli, Persian tr. ed. I. Afšar, Tehran 1347, 206-7; *Tadhkiral al-mluluk*, ed. V. Minoerko, London 1925, 84), was performed in other parts of Anatolia sometimes under the name of *sağaf* (see Ewliyâ Cebeli, ii, 397, iii, 29). Ewliyâ Cebeli made the remark that, if it were not for the *sağaf*, the populace would have murdered one another. (For the organisation of water use within the village, see X. de Planhol, *op. cit.*, 325-6.)

As to the techniques used in harnessing water, the Anatolian peasant usually used the simple method of channeling water from the rivers through *kaρār* or arba, but the methods of drawing up water by means of animal-powered wheels or *dılba* and small dams were used. (For an interesting example of building dams for irrigation in the Karaman province, see *JESHO*, xii/1, 123.)

City water systems. The supply of water to the towns was the second main area of concern for the Ottomans. The Ottoman water system in the towns before 857/1453 has not been studied. However, it is known that after the conquest of Istanbul the Ottomans developed quite a sophisticated water system for the city, and applied this system too in other cities in the empire, notably in Jerusalem and Mecca. In Istanbul, the most complex and best-studied example, we see that the system consisted of collecting in reservoirs or *benda* (Pers. *band*) the waters from the two hilly areas in the outskirts
of the city, namely the Khalkall valley and the Belgrad forest, and then bringing this water underground in large pipes and over aqueducts to high points in the city. Water towers or su tevars were constructed to keep the water at a high level and water depots, masalsaks and masBallus, distributed the water in different directions. In order to construct and maintain the system, an extensive organisation grew up under the chief architect or hajgija mihrd-bahzi and the superintendent of the water conduit workers or the su yedidvarl nayr. The construction and maintenance of the water works was financed and organised by suahf, either of individuals or of sultans. The main water conduits and aqueducts came into being to bring water to the complexes surrounding the great mosques which, as we know, served as the nuclei for the development of the city (see Istanbul). The mainstay of this water system was created through efforts under two sultans, Mehemmed II and Sulayman I. In the winter of 860/1456 Mehemmed II gave orders "to bring into the city from the countryside an abundance of water through aqueducts" (Kritovoulos, History of Mehmed the Conqueror, tr. Rigg, Princeton 1934, 109). The Byzantine water works, pipes and aqueducts which had been left to fall into disrepair during the last centuries of the empire, were re-discovered and used by the Conqueror to create the first Ottoman water system (see Tursun Bag, The History of Mehmed the Conqueror, ed. Inalcik and Murphey, Chicago 1978, 55-6). Dalman and Wittel (Der Valens-Aquadukt, 31) maintain that these works were concentrated on those areas of the Khalkall valley closest to the city. The Khik-Ceshme or forty fountains constructed by the Conqueror at the Valens aqueduct or Bezogian-Komeri received its water from this conduit. The rapid increase in the city's population, first under Bayezid II and then under Sulayman I (see Istanbul), together with the construction of major mosques under these sultans, led to a search for water sources at a greater distance. It was under Sulayman I that the second major water project was carried out, this time concentrating mainly the waters of the Khalkall valley which also had been used for the water supply of Byzantium up until 1204 (Dalman and Wittel, 3-9). Dalman and Wittel (14-15) show that the main aqueducts or su-kemen on this line were the work of the architect Sinan, who built them first in 561/1164 and then again in the 15th century as the previous systems had destroyed them. In constructing their water works, the Ottomans made use of the remains of the Byzantine water conduits and aqueducts as well as employing native Greek experts (a certain master called Kiriz Nicola is mentioned by Selâlî, Ta'rifhâh, 5) among the su yedidvarl. It may be suggested at this point that the Ottomans borrowed from the Roman-Byzantine system some hydrological techniques and, combining them with their own traditions, evolved quite a complex organisation to supply water for their huge capital city. Sulayman Sulayman's extensive water pipeline brought to the city and to his newly-constructed mosque abundant water, which was distributed to a number of new fountains. A report by Sinan himself of Safar 976/1568 (Atif Efendi Library, ms. 1734, fol. 263b-263b) gives the following details about the situation at that date. The water newly supplied by both the Khalkall valley and Kirik-Ceshme water pipelines amounted to 81 tülle (one tülle is traditionally defined as the amount of water passing through a pipe of given dimensions in 24 hours, or approximately 60 m³; see Dalman and Wittel, 21-1). At the time of low water level, out of 95 private and public fountains existing at this date, 54 had been recently constructed. The 95 fountains served up 36 tülle of the total water supply (in 1345, I. Topnik found in Istanbul alone 220 public fountains of Ottoman times). In addition, Istanbul had 15 masalsaks using 5 tülle and 1 hamisl (one-fourth of a tülle), 18 wells using 5 tülle and 1 masara (one-eighth of a tülle). The remainder of the water went to the Palaearctic and gardens of the Sultan and grandees in the city, as well as to the public bath houses. The basic system was expanded upon by succeeding sultans, particularly in connection with newly-constructed mosques (see for example, Ta'rifhâh-i Dîvân-î garih Nâr-i Oğlum, in Cevâdski, Istanbul 1235-9/1917-19, 26-31). They constructed water reservoirs and water lines, extending those already in existence in the two main areas of Khalkalline and Khalkal.

Water sources found and brought to the city through government initiative belonged to the miri wafl or state-controlled endowments and were placed under the control of the relevant wafl's administration, which was also responsible for meeting repair expenses. Fearing lest the water supply specified for the use of imperial mosques, palaces and public fountains be cut short, miri wafl water were not allowed to be used for any other purpose. Constant inspection to ensure their proper use was carried out by the su yedidvarl, who even had the authority to enter houses for investigation. When a new charitable institution, a mosque, bath or fountain was to be built, its founder was first required to find a water source outside the city. This water was brought to the city by means of a device called haima, that is, the adding of newly-discovered water to the main water conduits of the miri wafl. This haima water could be taken from the main conduits only at certain specified points. Upon application, the sultan gave his formal permission for the use of haima and recognised ownership rights over this water in a special firman. The gari principles required that such a procedure be followed. Many wells were dug in order to exploit underground water as a further addition to the city's water supply. Such waters became the property of the individuals who discovered them. Despite the close watch kept over the miri wafl waters, there were many instances of diverting of water by individuals for private use. The government therefore closed a strip of land adjacent to the water line to new construction and assigned the population of twelve villages as guardians and repairers of the water lines outside the city. To meet the water needs of the city population, water from the public fountains was distributed in waterbags by zaks or sahbas. The sahbas were organised in two corporations, the arba sahbarl or human water-carriers, and the a sahbarl or horse water-carriers, who were in competition with one another.

In requiring and enlarging the water system of Mecca dating from Abyssinian times, the Ottomans made use of the organisation which they evolved in Istanbul. They sent a team of experts to carry out the construction, and using black slaves and others organised a maintenance crew along the lines of the su yedidvarl organisation of Istanbul.

Bibliography: X. de Planhol, De la plaine pamphyligne aux lais pédésiens, Paris 1936, 137-8, 258-9; idem, Les fondements géographiques de l'histoire de l'Islam, Paris 1958. On irrigation and rice-growing in the Ottoman Empire, docu-
of India (800/1398). The construction of fountains
by Sultan Firuz-Shah (751-90/1353-88) thereon,
tends to suggest that the dam was built with lofty
embankments for the storage of rain water in the
nearby area. The construction of these royal lakes
considerably raised the water level in the area,
and thus reduced the depth of the irrigation wells
in the area around.

The Tughlukid period is marked by much improve-
ment in irrigation facilities in the empire. The
number of lakes and tanks increased, not only in
Dihli but in the provincial towns also. The con-
temporary Persian epigraphs mention the construc-
tion of lakes in Bihar Sharif (Bihar State), Garh
Mukhtasar (Dist. Shahdab, U.P.) and Mandore
(Dist. Sambalpur, U.P.). An inscription at Nawagar
informs us that the malkas (governor), Malik Firuz b.
Muhammad, constructed a large lake in Nawaiwar and
named it Firuz Sagar (Hindi sagar "sea").

The lakes constructed in Dihli are important as
reflecting the progress being made in civil engineer-
ing on the one hand, and the concern of the succeeding
sultans in causing to be constructed more beauti-
ful lakes and tanks than those built earlier on the
other hand. For instance, Sultan Ghiasuddin al-Din
Tughluk constructed aqueducts over the lake in
Tughlukabad, whose traces can still be seen. Referen-
ces are also found to the lakes built during the reigns
of Sultan Muhammad b. Tughluk and Sultan Firuz-
Shah. The anonymous author of the official history,
Sirat-i Firuz-Shahi, and hagiographies, mention the
famous lakes of Dihli, such as the Hamad-i Tughluk-
Shah, Haedef-i Sultani Khan, Hamad-i Shakhada Fath
Khan and Hamad-i Shanada Mushtar Khan. In the
province, the lakes constructed in Dawlatabad and
Hijjar Firuz are worth mentioning. Sultan Muhammad
b. Tughluk's Haedef, built on a considerable height
in the fort of Dawlatabad, can be seen today. In
Hijjar Firuz, Sultan Firuz-Shah also had a cistern
built in 754/1353 on a raised platform. It was origi-
nally constructed for supplying water to the ditch
evacuated around the fort, but after water from the
newly-constructed canals became available, its
water was used in the gardens and flower beds inside
the fort.

In the 9th/15th century, cisterns appear to have
been constructed by the rulers of the regional king-
doms that arose in the wake of Timur's invasion
of India (800/1368). The construction of fountains
in Dwarka, Gujarath, and other cities in the plains
led to the construction of cisterns, as their water,
flowing through narrow channels from a height, could
make the fountains work. Bhaus's description of lakes
in the Panjab also testifies to the fact that old
lakes were kept under repair, while new ones
were evacuated in the new towns. As the izahāts
assigned by the king to nobles in lieu of cash salary
and allowances were hereditary, at least in practice
during the pre-Mughal times, the assignees con-
structed tanks in their lands for the extension of
cultivation and horticulture. For instance, Yusuf b.
Mullah Dihalan, the muqtaf or judge of the jargana
of Cavadd, in 925/1525 constructed a beautifully-
patterned tank in his administrative charge during
the reign of Shih Shih Sül.

Later on, the Mughal emperors, and the Dakhani
sultans of Biddar, Golconda, Bijapour and Ahmed-
nagar, established reservoirs. Allusions to these
reservoirs in contemporary inscriptions provide in-
sights into the skill employed in their construction.
The Muhammad-Nad, a reservoir built at Bijapour in
1265/1751-2 by Afdal Khan, is a great feat of en-
engineering. The huge tank-like well with
coconuts was built with the money of Tād Sultān,
the wife of Sultan Adil Shāh in Bijapur. The Panj-
Mahall (water-palace) at Nādir and the tank of Mā-
Sīhāb at Haidarābād are notable examples.

In the 12th/18th century, the amirs of Sind and
the two rulers Hayyār All and Tipū Sultan [paw] of
Mysore maintained the traditions of the early
rules. Tipū Sultan took special interest in irriga-
tion questions, building new tanks and repairing old
ones. The huge tank built by him in Doradji possesses
a huge embankment about 15 miles long, and at
places is 45 feet high. He also rewarded other people
who constructed tanks. The āmils (revenue collec-
tors) were entrusted with the responsibility of main-
taining the tanks in the kingdom. All these tanks and
reservoirs maintained the traditions of the early
expansion of the towns and cities many of them
have been filled in and the land used for residential
purposes. In South India, however, they still survive
and are used as picnic spots.

As for the construction of wells, they are mentioned
in our sources either as sīh or la'āt or bāhā. The bāhās
and la'āts [qbp] are step-wells, meant for the use
of men and animals. Evidence available about the
sīh is interesting in so far as it reflects on the use of
the Persian wheel to lift water from the deep wells in
areas around Dihli during the early Sultanate pe-
tiode, indicating, from its comparative costliness,
considerable local prosperity. Only fairly opulent
farmers could afford the installation of this
water-lifting machine.

Sources from the 8th/14th century refer to the
sāhāra and the dārēgā set up on the walls that
were owned both by the state and by the cultivators.
In Devarā in his Māzārī l-kalīna was informed by an
Indian traveller in Arabia, Shaykh Mubarak of
Cambay (Gujarat), at some time in the beginning
of Sultan Muhammad b. Tughluk's reign (725-27/1325-
27), that people in and around Diblit set up Persian
wheels on the wells to water their fields and gardens.
The writer refers to the Persian wheels as sawdāk,
whereas the contemporary Indo-Persian writers use
rather the term dārēgā. An interesting anecdote relat-
ing to the Dīwānī l-kalīna about Shaykh Niẓām al-
Dīn Awlīya suggests the presence of the Persian
wheel in Dihli in the preceding century. It tells us that
Shaykh Niẓām al-Dīn once came across a dārēgā set
up on a well. The cultivator who was driving the
bullocks for lifting water, exhorted the animals, say-
ing dge barh, dge barh ("speed up, speed up") in a
melodious tone. The sound produced by the motion of
the wheels and the voice of the peasant had such
an effect on the Shaykh that he immediately passed
into a state of ecstasy.

The anonymous author of the Sirat-i Firuz-Shahi
states that dārēgās were set on wells around
the newly-constructed Hamad-i Shakhada-yi Mubarak-
Shāh outside the capital Firuzabad. The haedef
was filled with the water lifted from the wells in
the summer when the rain water was exhausted. He
further informs us that the income from the lake was
endowed by Sultan Firuz-Shah for the benefit of
the poor. The work also contains references to the
bucket (īlāt) made of metal (iron) instead of kāta

1884 Mā
The Persian term **dulab** also occurs in the same passage, signifying the surface wheel which was used to lift water from the **bund**. The **dulab** was used to lift water from the open surface of tanks or rivers, the pitchers or buckets being fixed on the rim of the wheel, which was revolved by the hand.

Later sources reveal that the use of the Persian wheel was quite widespread in North India. Kabir, who flourished during the 9th/15th and the first decades of the 10th/16th century, refers to it in his verses when he likens the rosary used by the externalists to the garland of vessels attached to a **rahal** (Hindi equivalent of the Persian wheel). As Kabir lived most of his life in Tenares, we may assume that he found the Persian wheel being used in the region of modern eastern Uttar Pradesh.

Like Indo-Persian writers, Shaykh Zayn, the **sadr** or minister of Babur, mentions the **karai**. In 935/1529 when he wrote that irrigation for agriculture there. The **sadr**-t翊 (Sargodha District in Pakistan) he found Persian wheels as a common means of irrigation there. The orchards and the sugar-cane and paddy-fields were irrigated with the water of wells lifted thus. Later on, when he occupied the territories of Lahawr, Dipalparr and Sirhind (935/1529-9), he found everywhere the peasants irrigating their fields by means of the Persian wheel, and he describes its structure thus: "They make two circles of ropes long enough to suit the depth of the well, six strips of wood between them, and on these fasten pitchers. The ropes with the wood and attached pitchers are put over the well-wheel. At one end of the wheel axle, a second wheel is fixed, and close to it another on an upright axle. This last wheel the bullock turns; its teeth catch in the teeth of the second, so that the wheel with the pitchers is turned. A trough is set up where the water empties from the pitchers, and from this the water is conveyed everywhere. Shaykh Zayn says however that in India, other wheels for irrigation are **dhinkar**, including the leather bucket (karas) lifted out of water by yoked oxen, whilst **dehtis**, based on the lever system, which is still in use, was most common.

Gradually, use of the Persian wheel seems to have spread everywhere during the Mughal period, but they were especially numerous in the Pandharn, the most prosperous region. Even an average cultivator there could afford to set up a Persian wheel on his well, which had been built of bricks and plastered with lime, despite the expenditure. Mughal historians like Abu 'l-xxxx, Hamid al-xxxx, Yaszuf Mirak and Sudjan Rani Bhanderi, mention it as one of the commonest means of irrigation in North India, but since the turn of the 19th century, it have been generally replaced by tube-wells.

As for the harnessing of rivers for irrigation purposes, the construction of large artificial canals began in the reign of Sultan 'Ala al-Din Khbala (695/1295-701/1297) towards the close of the 8th/14th century. Abu Hamid al-xxxx refers to a deep and wide canal built by Ghiyath Malik in the territory of Multan when he describes the revolt of the army and people of Multan against the governor Mughalat. Besides this, Ghiyath Malik seems to have constructed canals in Multan and Dipalpur units. Barani adds that in every territory where Ghiyath Malik served as governor, he constructed canals for the progress of agriculture there. The **Inqilab-i Mahrut** contains a **miftah** (official document) issued by the governor of Multan, Mahir, in the reign of Firuz-Shah, to an official, Kamal Tadj, asking the latter to carry on the repair work of the old canals. Three canals, **Djanuma** (modern Hissar), **Khalud** and **Dianah** are mentioned, and must have been constructed by Ghazi Malik before his accession to the throne in 726/1320.

The credit for constructing a number of canals in the region between the river Sutlej and Dihll goes to Firuz-Shah. First, the vast and tract of Haryanka, where only one crop was raised during the rainy season in a year, attracted the royal attention. In 755/1354, he laid down the foundations of the city of Hissar Firuz Shahi (modern Hissar) and then constructed a double system of canals, the headwaters of which were drawn both from the Sutlej and the Djamuna rivers. The **Sutlej** canal, named **Ghiza-Khan**, flowing through Surpur and Sirhind town, met the **Djamuna** canal called **Rajputaw** near the new city of Hissar Firuz Shah. Both of them passed via Karnal. At Hissar Firuz Shah, they discharged their water into a single channel into the ditch around the city. Yasya Sirhindi supplements Shamsi Sirag: 'Affi when he informs us that the construction of canals started in 756/1355. Besides the **Djamuna** and Sutlej canals, he mentions another canal from the Sutlej, the waters of which were conducted up to Dihhjhar (a town in Rohtak Dist.), irrigating a vast and tract of 95 sq. miles. In 757/1356, another canal was excavated from the Chagar river. This flowed past the fort of Sirsuli (town) and reached the town of Hissar. Like Indo-Persian writers, Shavkh Zayn informs us that KhDan Shahan Malkab built planted gardens and constructed canals, serais and bazaars in his 1357.

All these canals were kept under repair by the later Sultans of Dihll. Though Babur complains that there were no artificial canals in India, although they could easily be constructed at a number of places even in the plains, Shaykh Zayn refers to the canal of Firuz-Shah flowing via Dihhjhar, as well as the canal in the 1357 held by Dilawar Khan Lodi's maternal uncle in the foothills of the Panjabb (Diyawan gurad). Babur's description was the most important canal was the **Djanuma** canal (later called western Djamuna canal) that was also cut from the Djamuna and conducted to the capital city of Firuzabad. Besides, the **Sultai** canal (later Khankhur he madhi) was dug in the Siwalik hills and the waters of Sirsuli and Salimani were diverted into it. It flowed past Shakhaband town (to the south of Ambalai). Like their master, some of Firuz Shah's nobles also appear to have excavated irrigation channels in their 1357, e.g. the **Sirj-Khan** informs us that KhDan Shahan Malkab built planted gardens and constructed canals, serais and bazaars in his 1357.

Likewise, the Mughal historians furnish information about the repair of the old and the construction of new canals. According to Abu 'l-xxxx, first Shaha al-Din Ahmad Khan repaired the Firuz-Shah's Diamuna canal, as it had silted during the early years of Akbar's reign. Later, another officer of Akbar, Nair al-Din Muhammad Tarkhun, had the same canal repaired a second time. The reign of Shaha Dihahan witnessed the digging of new canals in different territories. Shaha Dihahan also increased the length of Firuz-Shah's Diamuna canal by reopening it in the hills at Khairabad, and brought its water up to Shaha Dihahanabad (Dihh). This came to be known both as **Nahi-i-bhijaha** and the **Nahi-i-fayd**.
owing to the introduction of tube-well technology, of canals in Baglana cut from the river, and they have almost disappeared.

The Persian wheel also became obsolete, in the 19th century, when the modern canal system was introduced. For instance, there were thousands of canals in Baglana cut from the river, and they supplied water to every village and town during the 18th/19th century. Tippu Sultan, however, built a large canal in the tradition of the Muslim rulers of North India. In 1797 he constructed a dam across the Kavari, a few miles west of Sringapatam, with an embankment of 70 feet high.

This irrigation system survived till the close of the 19th century, when the modern canal system began. The Persian wheel also became obsolete, owing to the introduction of tube-well technology, so that in the Pandjab and western Uttar Pradesh they have almost disappeared.

Irrigation in Transoxiana. [see Supplement].

10. Irrigation in Transoxiana, [see Supplement].

The use of water for irrigation in agricultural production is widely practised in the cultivated areas of the Muslim world where constraints of low and episodic natural precipitation limit yields on existing crops or inhibit the introduction of a wider range of crops. Such areas include the desert lands of North Africa, the Arabian Peninsula, Iran, Central Asia and the Indian sub-continent, the semi-arid zones generally lying adjacent to the deserts, the Mediterranean zone and, in South Asia and Asia proper, the dry tropical climatic regions. The greater part of the Muslim world has explored the possibilities of growing crops in these areas, where it has been possible to begin the cultivation of wider ranges of crops. It should be added that there is scientific evidence that this process of desertification is affecting the semi-desert margins over wide areas. In consequence, it is possible that the surface area where irrigation is essential to agriculture is gradually extending, not least in the Sahel of Africa. In all except the dry tropical zones, the use of irrigation permits stabilisation of output of staple winter grain crops by offsetting fluctuations in annual rainfall and allows cultivation of summer vegetable and other cash crops, which would otherwise be difficult or impossible. In the dry tropics, where hot and wet summers alternate with hot but dry winters, irrigation mainly functions as an aid to cultivation in the winter months.

Irrigation has taken on a special significance in recent decades as population growth has tended to accelerate and as the need has increased for states to provide reliable and augmenting food supplies from domestic sources. While some success has been achieved in encouraging greater use of dryland areas under mechanised systems and with new improved seed varieties, most governments have attempted to reduce the growing and adverse imbalance between domestic supply and consumption of foodstuffs through expansion of the area under irrigated cultivation and better use of existing water supplies in traditional areas. Governments have played the major role in a drive common throughout the Muslim territories to increase the volume of irrigation water at the disposal of their agricultural sectors. Irrigation budgets have often been the major sources of financial allocations to agricultural development, especially in countries such as Iran, Egypt. In the latter country, the continued engineering of the River Nile, culminating with the completion of the Aswan High Dam in 1970, was the main economic preoccupation of the state for much of the modern period. For Tārīqī, the hydraulic works on the Tigris and Euphrates for flood control, waterstorage and generation of hydro-electric power made a large and important claim on national resources, beginning with the first financial allocations of the Iraq Development Board in the 1952-5 fiscal year. The second Iran Development plan (1954/1955-6 to 1957/1958)
was above all concerned with the construction of storage dams on the main river systems of the country, including the Diz, Safid Roud and Karaj structures. Rapid and expensive adoption of irrigation projects has not always been accomplished with regional co-operation or with a critical appreciation of the appropriateness of irrigation technology borrowed from the industrialised states of the world. Exploitation of the irrigation potential of the Euphrates in the period since the Second World War has brought conflicts between riparian states on the division of waters, as storage facilities in Turkey, Syria and Iraq have been constructed without co-ordination. In 1954 and 1975 the flow of the Euphrates at Hitt in Iraq fell to unprecedented levels (9.02 milliard cubic metres in 1954 and 9.42 milliard cubic metres in 1975) as a result of new water storage reservoirs built in the states upstream. In contrast, close liaison was maintained between Egypt and Sudan during the course of the creation of Lake Nasser behind the Aswan High Dam, both to ensure agreement on the division of waters and to provide for the settlement of communities displaced from the lands submerged beneath water level.

A slow response by traditional agricultural areas to the demands of a larger and often higher consuming population led to increasing state intervention in irrigation affairs with perceptible effect from 1954, though particularly from 1958 in Arab countries and 1962 in Iran. With few exceptions, governments favoured centrally financed and controlled irrigation projects, which demanded imported technology and sophisticated management of land, water and farmers by the national bureaucracy. Irrigation developments in the Muslim world have witnessed damaging failures in selecting techniques of an appropriate type by scale and technology. In Iran, the Dez irrigation scheme founded in part, since large farming units created to work the area proved unmanageable. The Libyan government controlled Kufra irrigation scheme in the south of the country, a show-piece designed to demonstrate Libya’s ability to utilise oil revenues to set up permanent non-oil assets, is one of the many high-technology irrigation projects established in the oil-exporting states of the Middle East and north Africa which have outstripped indigenous economic and technical resources and have added little to the sum of domestic food production.

Sources of irrigation water have changed only insignificantly in recent years. Surface and ground water are the mainstays for irrigation water provision, though a number of richer states, notably Saudi Arabia and Kuwait, have made use of desalinated sea water on a very small scale at extremely high cost. Pumping of irrigation water from deep aquifiers, of which the Kufra scheme is an example, has increased in importance, though in many cases water extraction is faster than replacement rates, or comes from fossil water reservoirs, with clear implications for the longevity of these sources. Considerable scope remains in the area for more efficient use of existing water resources, rather than the expensive creation of new ones.

The total area of irrigated land in the Muslim world has grown very slowly, despite large allocations of resources for the construction of reservoirs and irrigation schemes. In the Middle Eastern heartland of the Muslim world, the proportion of agricultural land under irrigation has remained more or less unchanged at a quarter of the total. Individual states have improved their positions somewhat, above all Egypt, where the Aswan dam has increased both the total area under irrigation and the area under perennial cropping. Estimates of relative reliance on irrigation for the main Muslim states are shown in Table 1, including both traditional and modern systems. The strength of traditional systems has been much eroded in recent years. Underground water channels, handi, faidiq or kähr, have been generally neglected and many have fallen into disuse. The diesel pump has widely replaced other manual and animal-powered water lifting systems. Meanwhile, the addition of new irrigated areas served by modern systems of water storage has been offset by losses of irrigated land rendered infertile through growing alkalinity and salinity as a result of bad water management, inadequate provision of drainage facilities and inappropriate cropping patterns. Most countries of the arid and semi-arid zone are affected by this problem, though none worse than Iraq, where it is estimated that more land is lost annually through the effects of soil salinity than is reclaimed by developments projects.

Despite the expenditure of considerable funds on, and the economic dedication of governments to, the expansion of the irrigated area in the recent past, results expressed in real gains in land under cultivation and crop production have been disappointing in most areas of the Muslim world.

In a land so dependent generally on the summer monsoon, where there are few permanent sources of water away from the great rivers and their surrounding terrain where the water-table is high, human settlement depends on artificial means of conserving water from one rainy season to the next. These means, which apply to the domestic water supply as well as to agriculture, have been described in detail; for canals see also Nasir. Many of these utilitarian works, however, are frequently ornamented and decorated beyond the call of functionalism, and are consequently described here.

Many water monuments were constructed before the coming of the Muslims, who continued not only their function and form (except for the elimination of figural ornament and the introduction of the arch) but also their maintenance through civil or waqf funds. The simplest examples are large open reservoirs in and around towns (commonly called "tanks" in India; see Vats and Burnell, intro., s.v.), for example also wadi, wādi, and in the case of Muslim constructions also bāna, of all shapes but commonly rectangular, sometimes with masory surrounds and steps leading well below the average water-level; as the water was used or dried up more steps would be exposed, the shelves being convenient for personal ablutions or for washing clothes; pavilions (kākā, ātari) may be added mainly for ornament (see further on these, above, 9). Similar masory surrounds (kākā) may be provided on river banks or on artificial lakes caused by damming a valley (e.g. the Anasagar at Ajmer, the Picholi at Udaipur [s.v.]). Since open expanses of water cause a perceptible change in the microclimate, buildings might be sited to take advantage of the cooling effects of evaporation (e.g. Firoz Shah's madrasa and other structures on two sides of the Hazīr Khān at Dihl [s.v.], Mahmud Shah's palace, the tombs and the mosque at Sarkā [see gurgār and śīkh, vii. Indo-Muslim architecture]; and many pleasures might be sited in the middle of an artificial lake (e.g. Dāhāgh's Hurin Minār complex at Shāhshupura, for etymologies; also sād, sādah, and in the case of Bahārīs, the name of a locality even where no traces of gardens remain), as in e.g. the garden surrounding Humāyūn's tomb at Dihlī (see plan, Vol. ii, 265, above), where the divisions are marked by water-channels of bricks, named with cisterns at or seats over the intersections; the pattern was followed and augmented in later tomb complexes: notably Akbar's tomb at Sikandra, the tomb of Timār al-Dawla and the Tādī Bahārīs (s.v.), the Zafar Mahal in the Hayāt Bahāk garden in the Dihlī fort [see plan, Vol. ii, 266 above]; the tombs would have been used as pleasant retreats during the owners' lifetime.

Tanks and artificial lakes fed from constant sources naturally need provision to be made for the escape of surplus water; overflow tunnels and sluices may occasionally be sumptuously decorated, as at Sarkā in Gurgurāt, but the simpler structures in the local quartiare at Dihlī have a monumental beauty of their own, e.g. that on a water-channel off the Nātalābā canal at Wafrahābā, with an included silt (and fah?) trap; those on the band connecting Tughlukābād with Ādilābād (see plan, Vol. ii, 257 above), where the low-lying fields to the south of Tughlukābād could be flooded to a depth of some 2 m. to create an artificial lake for the defence of the citadel and leaving Gīhyāsh al-Din's tomb as an isolated outcrop; and, more complex, a two-storied sluiced dam, called Sāt pula, built into the south wall of Muhammad b. Tughlak's Dāhānānābād to regulate the storage of water within the city; analyses, photographs and measured drawing of all these in Yamamot e alī, Delhi, iii.

The simple well does not much lend itself to ornamentation, but may form part of a complex, such as the Dāhāgh's, designed to be constructed at regular intervals along the road to Kashmir, of sand? + mosque + well, water from the latter being taken up by fārus (see Fīlahā, vi) to irrigate a small flower-garden. The step-well (bdānī [s.v.]), however, is most frequently decorative as well as functional, providing chambers at various levels close to the water's edge to provide cool retreats in summer; e.g. in Dihlī the Gaudkāt bātī, ca. 630/1233; the circular bdānī in Firūz Shah's Khānī, ca. 753/1353; and the superb Bāhārī bātī at Bāmīr, intro. 9.756; both analysed in Yamamot e alī, Delhi, iii, with photographs and measured drawings. Analogous structures in Gurgurāt, called sā, have the entire well covered at surface level; comprehensive study, including other water monuments, in Yasmin Amrāsī Shārīf, Water monuments of Gujarat..., University of London M.A. Archaeology thesis 1981 (unpublished).

Water was a necessary adjunct to palaces and gardens, and might be provided, when either of these two was beside or close to a river or lake, by a Persian wheel (raḥīla; a further Persian wheel, or series of wheels, housed in a tower, might be used to raise the water to a greater height when it was necessary to provide a sufficient head of water to operate fountains. The water was led through palace courtyards and gardens by stone channels, often with intermediate cisterns which could be highly ornamental, as that in the Lāl bāg at Bidar (plan in Yāzdi, Bidar, 53); in Bābāpur, where all the centre of the city was supplied by underground channels from the Īshān and Tādī bāwrsis, a special water-pavilion, ḍaḥān-saḥar, in the elaborate later Ādīl Shahī style, discharged water from jets into a large stone surrounding tank to make a visual focal point in the city scheme. Under the Mughals, however, the garden was developed more than ever before as a new art form (see nātālāb, ii). The ideal garden shape was a fourfold plan, bahār-bāgh (the name dār-bāgh persists in many Indian towns as the name of a locality even where no traces of gardens remain), as in e.g. the garden surrounding Humāyūn's tomb in Dihlī (see plan, Vol. i, 265, above), where the divisions are marked by water-channels of bricks, named with cisterns at or seats over the intersections; the pattern was followed and augmented in later tomb complexes: notably Akbar's tomb at Sikandra, the tomb of Timār al-Dawla and the Tādī Mahāl (s.v.) at Agra, the tomb of Avangāghar's queen ("Bībī kā matbāra") at Awrangābād, and that of Saḍar Dīnān āt Dihlī, where the principal channels are often expanded into stone—often marble—basins 3 or 4 m. wide with a central rank of fountains, terminating on the cross axes in bānārādīs. Similar gardens exist apart from tombs and palaces, e.g. Rām bāgh, Zahrā bāgh, Wazir Khān kā bāgh, Aftār Khan kā bāgh, Āmānāk bāgh, all at Agra (ASI, iv [1871-2], 104 ff.); in his suggestive (but sometimes naı̈ve) Early garden-palaces of the great Mughals, in Oriental Art, NS, iv/3 [1958], 3-40, R. A. Jairazbhoy proposes the latter as the site of Bābūr's original dār-bāgh in India.

Mughal gardens reached their peak of perfection in Kashmir, where at Shringar, Āftār's Nasīm Bāgh, Āsaf Khan's Naṣīmī Bāgh and Dāhāgh's Shāhmir took advantage of the copious natural water supply; 'All Mazām Khan's canal from the
Rāwī made possible Shāhjāhān's Shāhjāmār at Lāhāwar. These make use of ḍabāhīr, water-chutes, an oblique bed of flat or scalloped marble, and āhārīn, cascade, with water flowing in a sheet over a straight edge to fall over a vertical bank of small niches, each intended to hold a small lamp with a shade of coloured glass. Other Mughal gardens are mentioned above s.v. ṽostān. A curious late Mughal water monument is the Fān ḍaktī, water-mill, in the shade of Bāb-ʾAllāh Mughal Masjīd; see below. A spiritual preceptor of Awrangzīb, outside the city walls of Ḍāhurgābd; water brought from a distance falls through some 7 m. to operate a small mill, and the water then flows through two large tanks. Mughal water monuments and gardens were much imitated by Hindu rulers in Rādjaḍāsthān. The Sakhījīyān Kābāgh in Udaypur offers a number of fountains of different designs fed by water under high pressure from one of the city lakes, in a more extravagant taste than any Mughal conception. The small palace at Gāhī, near Muḥāfīzī, is more refined in its elegant tanks and channels, and water is led in copper pipes over the openings of the buildings in order to flow over screens of ḥikā grass, to cool and perfume the air passing through.

The devices of water decoration embodied in the gardens are found also in Mughal forts and palaces (see especially Mughal, v, a). These sometimes involved bringing water from considerable distances (e.g. All Mardān Ḍuḥnānān's canal which supplied the Red Fort at Ṣahājījānābād, Ḏīlī, tapped the Djamūnā at 4 km. away; see W. E. Bayley, Memorandām on the western Jumna canal . . . London 1849). Some of the aqueducts involved are themselves works of art. In the Red Fort of Ṣahājījānābād, the water is further raised in the Ṣahā būrī, from an open pavilion in front of which, with ḍāhrānī and ḍarānī, water flows through a marble channel, the Nāḥi-i bīlghī, which not only supplies the Ḥāyīt Bahāshī and other gardens but also flows through all the palaces on the east wall (buildings marked c, d, e, f, g, h in the plan in Vol. 11, 266 above) at a depth of some 25 cm., whose surface is composed of two layers of different kinds, a shallow basin 3 m. square in the Rāng mābis, carved into the shape of an open lotus flower; this is a shallow basin 3 in. square in the Rāng mahābis, barely covered with water to produce a ripple effect. When still young he left home. When he was about 1780, and his Fadiliyya order was pan-Sūfī in its aspirations. His ideal envisaged the unification of all other Sūfī orders by a recognition of equal worth and by acceptance of his independent counsel. His wūdh and ḍēkīr encouraged a high-pitched, shrieked and ecstatic repetition of the shāhāda, and his religious acts were accompanied by charms, spells, magic mumbers and thamaturgy. The family claimed Ḡirdjīh dawzā from Abd al-Tālib through Yahyā b. Idrīs al-Saghlī. It also claimed Ḡirdjīh dawzā from her as the loss of her sight.

1. Life. Muḥammad al-Mustāfa was the twelfth son of Muḥammad Fadīl b. Māmīn al-Kalāmī, the founder of the Fadiliyya dawzā. This was an offshoot of the Kuntī Bakhshīyya branch of the Kirdarīyya order (see Kuntī) Muḥammad al-Mustāfa was born about 1780, and his order became known as the Fadiliyya. He was born about 1780, and his Fadiliyya order was pan-Sūfī in its aspirations. His ideal envisaged the unification of all other Sūfī orders by a recognition of equal worth and by acceptance of his independent counsel. His wūdh and ḍēkīr encouraged a high-pitched, shrieked and ecstatic repetition of the shāhāda, and his religious acts were accompanied by charms, spells, magic mumbers and thamaturgy. The family claimed Ḡirdjīh dawzā from Abd al-Tālib through Yahyā b. Idrīs al-Saghlī. It also claimed Ḡirdjīh dawzā from her as the loss of her sight. When still young he left home. When he was
16 years old he visited Marrakesh in order to study, and for some time he lived with the Agháil on the border of the Hawd. In 1858 he performed his first pilgrimage to Mecca. On his way he paid his respects and requested support from the Moroccan sultan, Mawlay Abdul-Rahmán, and from the heir to the throne, Sidi Muhammad. He returned to Morocco in 1859, and in 1860 he was appointed as an advisor to the Hawd. He stayed at the casbah town of Tindif. It was then a centre for slave traffic, and was dominated by the Idráí Bhl and the Tádžájákt. MÁ al-Áynayn acquired a reputation for miracles, and he enjoyed the favour of a noted scholar, Sidi Muhammad al-Mukhtar b. Amásh al-Dikáján. He had access to his library and taught and wrote, but he declined an offer to remain as a teacher in Tindif. In 1861 he returned to the Hawd. In 1865 or 1867 he left the Hawd definitively on a journey to the Adrar town of Shinid and to Tíris.

In 1869 his father, Shaykh Muhammad Fadil, died in the Hawd. His legacy was divided between his four principal sons. MÁ al-Áynayn was held in the highest esteem and wielded most political power. After 1873 he chose the barren regions of the Rio de Oro and the Sákiya al-Hamrá as a permanent headquarters for his growing company of novices (hàláníyyá) whose life style owed much to the example of the Kunta Shaykhs [q.v.], and their successors.

These northern districts of the Western Sahara facilitated closer contact with the Moroccan sultans, who were regularly visited by MÁ al-Áynayn and who supplied them with slaves. Meanwhile, he counteracted European encroachment on the Atlantic coast of the Sahara. He married into the principal tribal groups of the region and enjoyed wide support from: the Awlád Dulay, the 'Arúsíyín, Tádžájákt, Awlád Bhl Shí and Ahl Bálnalá. He dominated the Western Sahara caravan routes, and his power grew so great that, according to his son, Sháyk Muhammad al-Mustafta Murábih Rabbuh, Mawlay al-Ásáa (1857-94) entrusted MÁ al-Áynayn with the guarding of the frontier between al-Daghila (Villa Cisneros) and al-Tárfáya (Cape Juhy), as almost the entire coast of the former Spanish Sahara. During this period, MÁ al-Áynayn had neither village nor town. He lived in his tents in the Tíris, al-Karhi, Aswán, al-Dikhábá and Tawrik, but, as the pull towards the north increased, he commenced the construction of a záiyá at Dár Hamrá in the Sákiya al-Hamrá, a fortress, and a small settlement at Máltga in the same region.

After 1866, ties with the Sultanate were particular close. The growing influence of France to the north and the south strengthened the unity and coordination of political and religious policies. In 1897 MÁ al-Áynayn was received in triumph by the sultan, Mawlay 'Abd al-Áziz, who had ascended the throne in 1894. The sultan received the word of the Áynayná and religious instruction from MÁ al-Áynayn. Záiyáy were founded in Marrakesh, Fás and Salá, and lands and estates were bestowed on the Sháyk and his family. He became an éminence grise at court, and he was feared at court on account of his magic power and his fanatical followers. The 'ulámá of Fás gave him the title of ́alá (see kuttá. 2. in my article). In 1895 a major project was undertaken in a magnificent site in Marrakesh, MÁ al-Áynayn commenced his most ambitious project in 1895. This was the building of a zábába, záiyá, mosque, library, political and commercial headquarters at the red beds of Shárá on the banks of the Wayn Silwán in the Sákiya al-Ámrá. The site was close to a road which linked the Wál Nún to the Adrán and Tíris. It was not far from the port of al-Tárfáya, and the terrain was suitable for pasturage, some agriculture and the planting of date palms.

Shárá was, and still is, a complex of low buildings designed in a style which blends the brown dry-stone walling of the Adrán and Tíltí with the decaying urban Hispanic-Moresque of Morocco. Building stone was locally quarried or brought by steamer from Mogador and the Canoey Islands. Moroccan stone masons and architects were employed in the task of constructing a compound to which buildings were annexed. Some were private dwellings for the four wives and many concubines of MÁ al-Áynayn. Others belonged to his sons or accommodated guests, artisans and talismán. Work commenced on a large mosque and a qábare. Space was allowed to house MÁ al-Áynayn's library of 300 books and his collection of at least 500 manuscripts. Other buildings were store-houses, granaries and arsenals.

The design was a compromise between the desert and the sea. Certain parts of MÁ al-Áynayn's edifice were more than walled enclosures inside which tents were pitched and animals were penned.

The work was never completed. In 1903 the French declared the Trárra district of south-west Mauritania a French protectorate. In 1905 the Commissaire général français, Xavier Coppolani, was assassinated at Tádiht by anti-European Saharans who had the backing of MÁ al-Áynayn. In 1906, France occupied the Tagant. As Shárá was indefensible, MÁ al-Áynayn withdrew to his zábába at Tízkat in the Sú. In 1902, the sultan made it the base for his áïyadí (q.v.), and he appealed to the sultan for maximum assistance. Events worked against his interests, however.

The ineffective Mawlay 'Abd al-Áziz relinquished the throne to his brother, Mawlay al-Háit, to whom MÁ al-Áynayn swore allegiance (háya) in 1907. The latter sultan was anxious to achieve an accommodation with the French, so that MÁ al-Áynayn quickly lost faith in him. In 1910 he arrived in Marrakesh with an army of tribesmen of the Anti-Atlas and the Sufi Aq więks who by this show of strength, it was alleged that he announced his claim to the throne of Morocco as Mabdil [q.v.] of the hour, but some authorities doubt the historicity of this reported claim. The religious influence of MÁ al-Áynayn in Morocco was formidable, but it should be remembered that he was 79 years old and was approaching senility. His son, Shaykh Muhammad al-Ámrán, and a brother of MÁ al-Áynayn, Shaykh Sá'd Abtí (Saad Bhl)—who cooperated with the French—both discount such reports as unfounded.

Evidence suggests that MÁ al-Áynayn's eldest son, his successor (áyyála), Ahmad al-Háib or Hayba [q.v. in Suppl.], directed the policy of his father. A major reverse took place at Khábat Tadla on the 23rd June 1910. In September MÁ al-Áynayn retired to Tízkat, and he died there on 29 Shawwát 1328/19 October 1910. His tomb in Tízkat has remained a family shrine. Shárá had been abandoned and was occupied by a French force under Colonel Mouré in 1913. The dome of its zábába, the symbol of MÁ al-Áynayn's authority, was severely damaged, and the library of several hundred books on mysticism, astronomy and theology was burnt.

According to Muhammad al-Mukhtar al-Sú, MÁ al-Áynayn married 16 wives. He fathered at least 21 sons and 30 daughters, and some sources give the total number of his offspring as 68. His most noted descendants, among them his áyyála, were seven sons by his wife, Maymúná bint Ahmad ibn 'Alíyyín, who was born into a lettered household...
among the Barabuh of the Hawd. She was the mother of Ahmad ibn al-Hibah (d. 1915), Muhammad ibn Mustafa Murabbih Rabbah (d. 1924), Tlibih Khayyur, Muhammad ibn Imann and Muhammad ibn Aghyaf (d. 1927-2). These noted sons, together with brothers from other marriages, continued the family tradition of scholarship and sanctity in the Mahgrib and the Sahara. Several of them were preeminent in the fields of theology, legal subjects and on the ideas of their father. Some of them cooperated with theSpaniards in the then Spanish Sahara; others became exiles in Morocco and Mauritania or lived a pastoral life in the Hawd. They strove to maintain the influence and status of the family and to combat European domination of the Western Sahara. In the main, they showed solidarity with the Moroccan royal house and followed the example set by Mâa al-Ayynn himself. The extended family represented, and conserves a representative force in the radically-changing Western Sahara.

According to the Kurrai al-'ayynayn (fol. 72), Mâa al-Ayynn mastered all the disciplines, language, grammar, syntax, elocution, logic, mathematics, the dating of seasons and feasts, the system of Arabic cryptology, jurisprudence, prose and medicine (Arabic and Saharan Hassiniyya). Alongside these studies he gained experience in several branches of the occult. Supernatural power was accepted as part of his personality. Its manifestation could not be separated from his involvement in mundane matters which concerned the day-to-day life of his talâ
dfa or Saharawis. They sometimes found contradictions between their life and the Shafa. Similar problems had been faced by earlier Kunta shayhs and by Shaykh Muhammad al-Mamli (d. 1895) of the Tiris Ahi Birkiitahla. They, too, had devoted followers of Mâa al-Ayynn. They were familiar with attempts by Saharan teachers to resolve these question. Shaykh Muhammad al-Mamli's book on tribal law and custom, Kitab al-Shayks, can be matched, though not surpassed, by opuscules of Mâa al-Ayynn, and likewise his mathematical and astronomical theories. Pamphlets by the latter on tawmmun, prayer, fasting, hospitality, divorce and sexology were widely quoted, and several of these were appended to other works and lithographed. A major work, Fisih al-rub' al-sami al-fahim, thoroughly and logically argues the case for humane treatment of women, slaves, bidders and orphans, and for respect and deference towards kings and sultans. Supernatural revelation accompanied the study of Arabic grammar, phonetics, and prosody. The Kurrai al-'ayynnayn (fol. 74) records that “when he composed a book about prosody one day he left with his mind occupied by certain obscurities. He sat facing a tree, and he began to beat the rhythm of the metres on the ground using a stick which he held in his hands. While thus engaged a burnt brick appeared before him. He raised it with his stick and discovered a treasure beneath it. He shinned it. He returned the brick to its former position and said, 'I do not want it.' Then he arose and sat opposite another tree, and God enlightened him in the matter he sought.”

At least 30 of Mâa al-Ayynn's major works are about Shifism. Nafa' al-munafat wa-tawteef al-nihdyat, lithographed in Fas and twice published in Cairo, is still widely read in the Sahara and is possibly his
masterpiece. In its pages, Ma' al-'Aynayn argued that all Sufi brotherhoods display only trivial divergences. All brotherhoods were of equal merit and ought to combine. His arguments were carried a stage further in his book Madhdah al-makhzawf 'ala 'addab al-taggawnuf, which is outspokenly pro-Ottoman in its sentiments. To the author, the Ottoman state exhibited pan-Islamic eclecticism and was the last hope to counteract the appeasement of the Mahdi who would unite Jews, Christians, and Muslims after cataclysmic events.

Mention has been made of the license allowed by the Tadillya and the 'Ayniya for the use of spells and secret scripts for religious purposes. Ma' al-'Aynayn, an avowed thaumaturge, displayed an interest in the occult and paranormal. Those unsympathetic to Ma' al-'Aynayn have dismissed him as a sorcerer posing as a scholar and have argued that his mysticism was an example of Sufism in decadence. It is clear from the works which he wrote, for example Madhdah al-makhzawf 'ala 'addab al-taggawnuf, where prayers are computed by letters of the alphabet, magic squares and numbers worn as amulets, that the system he used was highly complex and derived from medieval systems invented in the Maghrib. The Hawd is adjacent to Black Africa and has its own tradition of secret scripts. Eleven secret alphabets have been recorded in the Hawd. Some characters in these scripts represent the numerical value of a corresponding Arabic letter, or are based on the skeletal forms of complete Arabic words. Other characters are non-Arabic, possibly Libico-Berber, and are lunette in shape. One Hawd script which is particularly rich in Non-Arabic characters is the al-YasInl alphabet, which relates either to YasIn, its inventor (Abd Allah b. Yasin the Almoravid), or to the letters YasIn which open Sura XXXVI in the Koran. Characters from these Hawd scripts appear in several lithographical works of Ma' al-Abd Allah b. Yasin the Almoravid (r. 1142-1166), or to the School of Sufism in Tenth Century Africa, Cambridge 1976, 125-51. Other sources which discuss aspects of his life and thought are: J. Caro Baroja, Estudios Saharianos, Madrid 1955, 285-335; Un sordo Sahariano y su familia; G. Desiré-Vuillemin, Contribution á l'histoire de la Mauritania, Dakar 1952, 146-157; H. T. Norris, SfjayM al-Mubdir al-Sukhuf, the author of the Forbidden City, London 1933. M'sfajkh Muhammad al-Mam, Ma' al-'Aynayn found it natural to employ such scripts and alphabets for religious purposes.

Over one hundred miracles are attributed to Ma' al-'Aynayn in the Kurrat al-'Aynayn. They range from the rescue of his books and books from the flooding of the Sakiyn al-Hamr28 in 1890 to the exorcism of one of his wives; punishment of robbers by fire; and the illumination of a room by his clothing. Certain of these happenings are patterned on miracles attributed to the Prophet. Nonetheless, they are far too varied to be unconnected with the psychic powers of Ma' al-'Aynayn, which were acknowledged even by his most bitter opponents. His powers of psychological persuasion were employed to dominate the minds of the Saharawis and to instil a fanatical zeal in the 'Ayniya and its allies.

3. Al-ShihultU's portrayal. One of the most objective portraits of Ma' al-'Aynayn towards the end of his life is in Ma' al-'Aynayn al-Qalqami in the folk literature of the Spanish Sahara, in BSOAS, xxxi (1968), 153-56; J. Mercer, Spanish Sahara, London 1976, 103-22, 153-6, 249-50; Al-Moutabbasir, Ma' al-'Aynayn fi 'Ushshamul, in RMM, xxxi (1957), 125-51. Other sources which discuss aspects of his life and career are dealt with in the following works: A. Abd al-Quddus, Haddad, in RMM, 1316. — 2. European sources. A most useful source for the life of Ma' al-'Aynayn is to be found in B. G. Martin, Muslim brotherhoods in Tenth Century Africa, Cambridge 1976, 125-51. Other sources which discuss aspects of his life and thought are: J. Caro Baroja, Estudios Saharianos, Madrid 1955, 285-335; Un sordo Sahariano y su familia; G. Desiré-Vuillemin, Contribution á l'histoire de la Mauritania, Dakar 1952, 146-157; H. T. Norris, SfjayM al-'Aynayn al-Qalqami in the folk literature of the Spanish Sahara, in BSOAS, xxxi (1968), 153-56, 247-76; C. C. Stewart, Islam and social order in Mauritania, a case study from the nineteenth century, Oxford 1973; M. Veuve, Smara, the Forbidden City, London 1933.

(H. T. Norris)

MA'AD (a.), place of return, a technical term in religious and philosophical vocabulary.

The verb 'a'da', 'sawm' signifies "to return to a place". Al-Djawhari treats it as a synonym of rajd/j.'a.

The action of 'sawm is the movement whereby one returns to the point of departure: rajd/j.'a 'abd al-'a'da', or rajd/j.'a 'abd al-'a'dim, either through a continuous progress, in describing a circle for example, or stopping at a certain point and retracing one's steps (cf. Sibwayh, cited by L.J), whence the idea of a return to the origin, to the source. The verb rajd/j.'a is used in many Kur'anic verses to indicate return to God: Then He will make you die and then He will bring you back, that you will testify (al-rajd/j.'a rajd/j.'a, 11: 28). This return takes places after the Resurrection. In the 4th verbal form, 'a'da denotes "to recommence, reiterate". This is the sense which it has in the verses where this root is associated with that of rajd/j.'a, for example (XX, 11): "God begins (yalld'a creation; then He repeats it (yu'adada); then you will be brought back to Him". Subsequently, God is qualified by the titles al-Mubdir and al-Hakim. These terms are not reserved for God. The Prophet said: "God loves
the mukadd mounted on a mukadd". He was asked the meaning of mukadd. He replied "It is a strong and skilled man who is muddād and mu'dād, mounted on a strong and reliable horse which is mukadd and mu'adda". Abū Ubaydah explains that the reference is to a man who volunteers for successive military expeditions and returns ceaselessly to the attack. The well-trained and obedient horse names the same distinctions. It is the notion of this 4th form which is dominant in the Kūrān: resurrection is a recreation. Theologians in fact mainly speak of ṣāda in the sense of a second creation. The idea of return is only implied, to the extent that there must be a return to the point of departure before there can be a recreation. Thus al-Dhawāniy (Irshādā, Arabic text, 317, ed. J. D. Luciani, Paris 1938) quotes Kūrān, XXXVI, 78-81, from which he concludes: "That which has been brought back into existence (al-muṣāda), is the same as that which has been created for the first time." We leave aside the question as to whether substances only, or both substances and accidents are the objects of ṣāda. In the Kitāb Uṣūl al-dīn, ed. Istanbul 1928, 232-3, Abī al-Kāhir al-Baghdādī shows that the return to existence of something which has been annihilated is possible, and he expresses himself in the same terms as those used by al-Dhawāniy. Consequently, if ṣāda is a second creation following death and annihilation, the place reached by resurrected persons is the place reached by resurrected persons.

But the word muṣāda is used only once in the Kūrān (XXVIII, 85): "Yes, He who endows you with the gift of Prophecy, it is He who brings you back to a place of return". The term is variously interpreted: some treat it as a synonym of muṣār (place at which one arrives), as in III, 28: "And towards God is the place of arrival"; for others, it is the equivalent of ṣāda (place to which one returns), as in V, 18: "Towards God is your place of return for all"; or it is identified purely and simply as the Next Life (al-akhirā). It should however be noted that the term has been understood in a much more concrete sense: it could denote, according to some, Mecca, whither the Prophet was to return, having conquered the town according to God's promise; in a more general sense, it could be the country where he was born (al-Farrā') or his homeland (al-sā'ib). Finally, the word muṣāda has been interpreted in terms of the verse I, 25: "And when We made the House (i.e. the Kūrān) a place where one returns (muṣāheb); consequently, muṣāheb = muṣād = place of Pilgrimage = ṣāda. In fact, al-Kurtubī explains, a large number of pilgrims and visitors make their way each year to the holy places, and moreover, each one, having left them, desires to return there. Ibn Sīdāh retains the two meanings of Pilgrimage and the Last Life. It may be noted that they conform perfectly, since ṣāda is a departure from the house, involving the leaving of country, goods, family, in order to go to the House of God, which, as al-Ghazālī explains, is the place reached by departure from this earth in order to go to Paradise to see God Himself: seeing the House of God inspires the wish to see the Master of the House. Thus, muṣāda, etymologically linked to ṣāda, taken in the symbolic connection ṣāda-ṣāda, came to refer primarily to the place of return of resurrected persons in the presence of God. It is in this sense that al-Tahānawi associates it with ṣāda and ṣāda, the Assembly for the Last Judgment and the Resurrection. He distinguishes between a physical muṣād (gismāni), which is the return to life of bodies leaving their tombs, and a spiritual muṣād (riḥānā), which consists of the return of spirits restored to their bodies (vudud al-arwāh 'ulā haddāmūn). There can be as many as five doctrines on this subject. The first affirms only the reality of the physical muṣād; this, says al-Tahānawi is the approach of the theologians who deny the existence of a rational soul. He is no doubt referring to certain Hanbalīs, of whom Ibn Baṭṭa is an example, for whom the words nafs and rūḥ retained their ancient Semitic sense of vital principle, breath, even blood. Ibn Baṭṭa writes "We must believe in the call which Isrāfīl will utter to make the dead rise from their tombs". H. Lucost mentions in a note a passage of Ibn Taymiyya: "Men will rise from their tombs and appear before their Master, without shoes, all naked and uncircumcised. The sun will approach them and they will bathe in their sweat". (La profession de foi d'Ibn Baṭṭa, 94). In regard to the angel of death, Lucost quotes a passage of the 5thādī, attributed to Ibn Hanbal, where it is said "He catches the souls (arassāli), which are then restored to the bodies in their tombs". This point of view may be related to that of al-Naẓāmī, as revealed by Abī al-Kāhir al-Baghdādī in the Fārī bāy'a al-Fīrāk, 145: "The twentieth of these disgraceful doctrines is that which concerns maṣṣad, whereby scorpions, snakes, beetles, flies, ravens, dung-beetles, dogs, pigs, wild beasts, insects will be gathered (fasādānu) on the way to Paradise". In fact, these animals do not have a rational soul, but this does not prevent al-Naẓāmī believing in their maṣṣad.

The second doctrine listed by al-Tahānawi is that which asserts exclusively the spiritual muṣād; it is that of the philosophers. It is known that al-Ghazālī was opposed to the idea of survival of the rational soul only. Nevertheless, Ibn Sīnā did attempt to understand in what sense the presence of a sensible human reality in the other life could be philosophically admitted. On this subject, we refer to the thesis of Jean Michot, presented at Louvain-la-Neuve in 1961 (still in manuscript) on maṣṣad in Avicennan thought, where there are to be found minute analyses of the metaphysics and psychology of Ibn Sīnā, based on numerous texts. But it was not only the philosophers who maintained that man is a spirit of which the body is only a "mould" (kalābā). The Muṭṭazīlī al-Mu'āmmār, although he is counted al-Tahānawi among the adherents of the third doctrine, thought, according to al-Baghdādī, Fārī bāy'a al-Fīrāk, 154, that "man is something other than this sensible body, something living, something knowing, something powerful, which is neither at rest, nor in motion, which is not localised anywhere..." When asked if he meant that man is in this body, or in Paradise, or in Hell, he replied "I say that he is in the body insomuch as he controls it; in Paradise insomuch as he enjoys heavenly gifts; in Hell, insomuch as he is punished". Al-Naẓāmī also reckoned that man is a spirit (rūḥ), but by spirit he meant "a rational body which penetrates (maṣṣādādū) this compact body, the life (al-dīn) of a rational soul. He is therefore closer to the preceding doctrine. The third doctrine is that which affirms both the resurrection of the body and of the soul when man is restored to life. It is that which is taught by the Ash'ārīs as well as al-Ghazālī, numerous Ṣafīs and certain Ikhwānīs for whom man is "two things", "the body which is inseparable (maṣṣad) and the spirit which is active, endowed with sensibility and with perception; this is the thesis of al-Baghdādī al-Tahānawī (Maṣṣādī al-Tahānawīyyin, 1, 125; Fārī bāy'a al-Fīrāk, 65). Al-Tahānawi places among the adherents of this doctrine
those who consider that man is "in reality" (bi 'l-haštā) the rational soul, for it is the latter which bears the responsibility of prescribed acts, which obeye or disobeye, which is rewarded or punished.

But this soul is linked to a body; also, "when God wills the gathering together of His creatures, He creates for each of the spirits a body (badām) to which it is linked and in which it acts freely, as was the case here below. But this is not a question of metempsychosis (lansahēq), since it is a case of return (vawd) to the fundamental parts of the body (idh 'aqrār) ašliyya li 'l-badām), although this is not in itself the first body, as is made clear in the Word of God (IV, 58): "As often as their skins are burned, We shall give them other skins in exchange".

The last two doctrines are that which denies mašid and that which characterises this type of thought. Those who deny it are the "physical philosophers" (al-falasifa al-fab).

Al-Fārabi quotes the Kašf al-huṣna: "For the Sūfis, the mašid, they say, are the first and the last body (badām), and in the beginning the mašid, the universal names relating to beings in development (asmā'i kulli-yi karāni).

The arrival in this world of ḥusn viator (zilkh) is accomplished by the route of these second names; his return (rujūs) by the route of the first. This definition relates to the concepts of Ibn 'Arabī, with the journey into God (safar al-tanzih), for whom the names have two faces, one turned towards the Creator and the other towards God (ism al-tanzih), for whom the names have two faces, one turned to¬

It may be recalled finally that the root rādā is only used, in religious language, to express a return to a place from which one does not come again. This is how it differs from the root rađa. In a mystical context, the name rādā is the name of the path (ṭālik) which brings to¬

The notion of mašid is very important in the view of Ibn Sīnā, not only in terms of the destiny of man after death, but also in terms of his life on earth. In fact, God teaches that He "has prepared for those who obey Him a place of return which gives them good fortune (al-mašid al-muṣrīd, Shīfā, Bāb al-muṣrīd, Cairo 1960, ii, 441), which poses the problem of eternal beatitude (iḥād, 445). But in this world men are in need of regulation: "It is therefore in¬

Bibliography: given in the article.
genealogies of ancestors of Ma'add are given in Ibn Khatibya, Ma'drī' (1834; 30 t, 63 t), Ibn Hishām, Sira (579), and al-Ma'sāfir (Ma'drī'), iv, 115-18). Muhammad is said to have forbidden the tracking of genealogies beyond Ma'add (ibid., n. 112, 118 t). In a hadith Muhammad commanded al-Ma'sāfirī, which is said to be the rough clothing (or the way of life) of Ma'add (Ibn Hanbal, Musnad, i, 43; Lane, Lexicon, s.v. 'd, al-llsaa al-Ma'addiyā).

**Bibliography:** given in the article, but see also Tabari, i, 671 ff.; Ibn al-Kalbi, Dakhmarāt al-nasab, ed. Caskel; Ma'sūdī, Tabāris垣, index (evidence of genealogical disputes).

(W. Montgomery Watt)

MA'SAFIR (OF AL-MA'SAFIR), the name of a South Arabian tribe, the genealogy of which is given as Ya'far b. Malik b. al-Żarī'ī b. Udād b. Huma'ay b. 'Amr b. Wasālībī b. 'Arbi b. Zayd b. Kahān b. Saba'; they are included among the Himyār.

The name was also given to the territory which the tribe inhabited and this corresponded roughly with the Turkish Mikhāf, especially significant. The overall picture it presents of the tribe and the area in mediaeval Yemeni historiography. Certainly, the area was controlled by the Ayābidīs, the dynasty founding the Umayyad Ziyād centre on Zubīl, in the 9th/10th century. The Zūray'īds too in the 6th/11th century reckoned al-Ma'sāfir as part of their territory, but it was wrested from them by the Ma'dīds. It must have fallen to the Ayābidī conqueror of the Yemen, Tūrān-Shāh, the brother of Sa'idī, who won over Tīhāmā and the south of the country in the years 568-71/1173-6. The Ayābidīs' successors, the Rasūlīdīs, built military establishments in al-Ma'sāfir in the 7th/12th and 9th/13th centuries, and we hear of a rebellion led by the Ma'sāfirī tribal leader against the Turkish occupation forces of the Yemen in 1028/1618.

(A. Grohmann - [G. R. Smith])

AL-MASAFIR, Abu 'l-Ḥasan 'Ali b. Muḥammad 'Ali b. Da'Mān b. Sa'd al-Dīn, an Andalusian Mālikī scholar who settled in Jerusalem and died there in 603/1208. Born and educated in Málaga, al-Ma'sāfirī left his native town early in his life and, like many of his companions at the time, travelled east for the dual purpose of performing the pilgrimage and acquiring knowledge. Though the sources mention that al-Ma'sāfirī did some writing, they do not name any of his works. We know of only one extant work, a unique untitled manuscript in his own handwriting, found at present in the Chester Beatty Library, Dublin, and listed in the catalogue (ms. 3010) under the title Biographies of famous women. The manuscript has eleven chapters, of which the first two and the last two deal with biblical figures; the rest of the chapters (now published in Libya-Tunis 1978, ed. 'Abd al-Tili, under the title al-Jaddīf al-żamālī al-shābī al-musāfīrī), which form the main body of the manuscript, deal with post-Islamic women, mainly from the Unayzah period.

Bearing in mind the general paucity of biographical material about women in mediaeval Arabic literature and, in particular, the limited number of works devoted exclusively to them, this manuscript, with its diverse information, colourful anecdotes and copious verse quotations is, without doubt, especially significant. The overall picture it presents for peace. Sawwā must at this time have been on the side of Ma'add and its prince 'Isāmādāl Dāyādān on the side of the Ḥabashīt, the enemies of Saba'. In 98/610 the Ma'addīs with Dāi Dāyā and Ḥamādn adopted Islam and received a letter from the Prophet Muhammad with detailed instructions regarding their obligations. At quite an early date in their Islamic history, many of the Ma'āfīr migrated to Egypt, where with other South Arabs they played an important part in the building-up of the country. A Ma'sāfir was, for example, put in charge of the planning of al-Fustāt by 'Amr b. al-Ās. This migration probably explains the infrequent mention of both the tribe and the area in mediaeval Yemeni historiography. Certainly, the area was controlled by the Ayābidīs, the dynasty founding the Umayyad Ziyād centre on Zubīl, in the 9th/10th century. The Zūray'īds too in the 6th/11th century reckoned al-Ma'sāfir as part of their territory, but it was wrested from them by the Ma'dīds. It must have fallen to the Ayābidī conqueror of the Yemen, Tūrān-Shāh, the brother of Sa'idī, who won over Tīhāmā and the south of the country in the years 568-71/1173-6. The Ayābidīs' successors, the Rasūlīdīs, built military establishments in al-Ma'sāfir in the 7th/12th and 9th/13th centuries, and we hear of a rebellion led by the Ma'sāfirī tribal leader against the Turkish occupation forces of the Yemen in 1028/1618.

(A. Grohmann - [G. R. Smith])
of the character and status of women in early Islam is unexpectedly refreshing: it is an image of a proud, courageous woman with a keen sense of moral values and a high evaluation of her own worth, a woman who had not as yet succumbed to the disastrous consequences of being segregated from the world of men.

In his manuscript, al-Ma'afiri mentions that the year 581/1185-6 in Damascus collecting material for this work, his main source being Abū Muḥammad al-Kāsim (d. 600/1203), son of the illustrious Damascene historian Ibn ʿAsākir. In 382/1193, when Jerusalem was regained from the Crusaders, al-Ma'afiri must have been among the numerous Muslims who then fled to the city, for we are told that he was appointed resident preacher of the Aṣkā Mosque by Sultan Sulayh al-Dīn Muqīr al-Dīn ʿUṯayy an (al-Uṯayw an bi-naʿīlāt an-ṭanād wa ṣ-Rūd, Nadīf 1168, ii, 235) puts him second on the list of those who preached in the Aṣkā Mosque after the fate. Al-Ma'afiri spent the rest of his life in Jerusalem, where he became known as al-Hādījī al-Kāsimī. There he achieved fame as a scholar and lecturer, and attained a position of wealth and power, but remained none the less devout and given to charitable works. He continued to strengthen the inhabitants of his adopted city, for when he died large numbers followed his cortège. Ibn ʿAbd al-Malik al-Marrākiš (al-Dhawī waʾl-tamāhī, Beirut 1965, v/5, 926) relates that "no worthy person was absent from his funeral and even the Christians who were in the church there joined the procession: they threw some of their garments on his coffin and then began to pass to each other and to hold them to their faces in the hope of being blessed."

MA'ALTHAYA, MA'ALTHAYA (Syrian "gate, entrance", Payne Smith, Thesaurus syriacus, col. 3881), modern Maalthay, the name given to two villages in the former bād of Dehok (Duḥak) in the wilayah of Mawsil in Ottoman times, now in the Autonomous Region of Dehok in Republican Iraq. The two villages were formerly distinguished as Ma'althay al-Naṣrān, "M. of the Christians", but has recently become largely Kurdish and Muslim, like its fellow-village. Ma'althay lies on a small affluent of the Tigris, the Nahr Dehāk, 43 km. to the north-east of Mawil and to the east of the mountains of Kurdistan and the lands south of Lake Van, the modern Turkish vilayet of Hakkari. It owes its name given to two villages was formerly distinguished as Ma'althay al-Naṣrān (E. Tisserant, art. Mawil, in Dictionnaire de théologie catholique, xi, cols. 26-30). It was the seat of an episcopal diocese known as either Ma'althaya or as Bābā-Bābā-Nubahā. The line of Nestorian bishops begins in 410 with Isaac and continues till 1255 with Makšīghīs, apparently the last, whilst the Jacobite line begins with Zakai at the end of the 6th century and continues until Yūţyan Yob in 1258 (J. B. Chabot, ed. and tr., Synodicon orientale, in Notices et extraits, xxvii, Paris 1902, index s.v.; J. M. Fiey, Assyrise chrétienne, Beirut 1965-6, ii, 342-53). The Assyrian Christian community and its church in Ma'althaya of Mawil must have suffered during the massacres by the Kurds of Christians and Yazidis [q.v.] towards the end of the 19th century, and the village seems to have been abandoned by its Christian community eu. 1900-7, and the service books and manuscripts of the church transferred to Dehok (Fiey, op. cit., ii, 973-91).

It had nevertheless been a flourishing place in early Islamic and pre-Mongol times. Al-Baladhuri, 331, records that al-Ma'at (Ma'alla) was one of the places, together with Bābā Naḥṣāra, etc., overrun by ʿUrān's general ʿUrūb b. ʿAbūṣad al-Ṣulami in 204/617. The Arabic geographers expatiate on the fertility and agricultural richness of the district of Ma'althaya and Fayshābūr (= originally, Fīṣḥābūr of Bābā-Nubahā, see Fiey, op. cit., ii, 693 ff.). According to al-Maḳkaddashi, it was small but rich in gardens, and it had a Frūṣī mosque (hence already a Muslim community) on a tell; its specialties included dairy products, wool, grapes and fruit, hemp seed and flax, and dried, salted meat (al-Maḳkaddashi, 139, 145). Ibn Ḥawākī, 217-18, tr. Kramers and Wiet, 211-24; cf. Le Strange, Lands, 93, 124). For Yāḵūt, iv, 278, Ma'althaya was a "little town" (balšaya), but it is possible that this information was already anachronistic by the 7th/13th century.

Ma'althaya's position on the route into Kurdistan gave it a certain rôle in medieval Islamic history, and is mentioned in several times by e.g. Ibn al-Abbar. It was a centre for local chiefs and for the Khurāsīd ruler Karbūn in 566-7/1170-1 in their squabbles with the Turkish caliphal governors of Mawsil (ed. Beirut 1385-6/1965-6, v/7, 353, 359). In 590/992 the Būyūk ʿAḏūd al-Dawla (q.v.) launched an expedition via this route against the Hakkārī Kurds, and crucified their chiefs along the road from Mawsil to Ma'althaya (viii, 709). In 441/1050-5, during the warfare between the ʿUkaylī ruler of Mawsil Muḥammad al-Dawla Kīrwaḥ b. al-Muḳadl and his brother Zā'im al-Dawla Abī Kāmil Bāraka, the former's Kurdish allies marched on Ma'althaya and sacked it (ix, 553).
Thereafter, Ma'ānιhaya sinks into obscurity on the wider stage of history, until it was visited in the 19th century by G. P. Badger (1842-4), the French Consul in Mawṣil G. Rouet (1843) and A. H. Layard (1846); Badger found there only the wider stage of history, until it was visited in the 19th century by G. P. Badger (1842-4), the French Consul in Mawṣil G. Rouet (1843) and A. H. Layard (1846); Badger found there only the wider stage of history, until it was visited in the 19th century by G. P. Badger (1842-4), the French Consul in Mawṣil G. Rouet (1843) and A. H. Layard (1846); Badger found there only the wider stage of history, until it was visited in the 19th century by G. P. Badger (1842-4), the French Consul in Mawṣil G. Rouet (1843) and A. H. It should be noted, however, that the practice of separating some of these figures from the corpus of the badi poses dates back at least till the 5th/6th century (see S. A. Bensebaker, A Fausum manual for secretaries, in AJUON, xxxvii [1977], 310-12) and may have been initiated by al-RummanI (d. 384/994), though the latter work can be seen as an expression of meta-

aphor and a comparable part of the bistiqal of the badi poses does not state explicitly that these are not to be considered badi figures (see al-RummanI, al-Nahj fi 'l-dalal fi Ikhtila, in Thalath rasd, ed. M. Khulaf Allah and M. Z. Salam, Cairo n.d., 72, I, 3-4, and the quotation in Ibn Rashik, al-'amal, ed. M. M. 'Abd al-Hamid, Cairo 1352/1934, i, 214). It should also be noted that it is not correct to think of the history of rhetorical studies since the time of al-KazwinI as being completely dominated by the system he had introduced; works continuing the older tradition which brought all figures of speech under the heading of badi and devoted a separate chapter to each figure (see badi) continued to be written (they were especially popular in North Africa and Spain, see Ibn KhalqI, Makaddima, iii, 292-3 = Ibn Khaldun, Rosenthal, 2nd ed. 1967, iii, 336-8), even though their authors were aware of, and probably influenced by, the new trend represented by the Talqis (Ibn Khaldun suggests that the Talqis was the basic text). In many respects, the later history of Arabic rhetoric presents essential, but still unanswered, questions.

Finding adequate translations of the terms ma'ani and bayan is made complicated by the fact that the relation between grammar, logic, and rhetoric, and between literary theory and literary criticism, is not apparent at first sight. Moreover, the borderline separating the disciplines dealing with these two categories, the 'ilm al-ma'ani and the 'ilm al-bayan, is not always clear. In the Talqis, the definitions overlap, and al-Sakkaki himself seems to regard the 'ilm al-bayan as a branch of the 'ilm al-ma'ani (see Talqis, 77, 156-7, and cf. 77, lines 4-3 from bottom; see also BadiI al-Din al-Sakkaki in Sakkaki, iii, 264-5 and Matlah, al-Sakkaki, 131-5). It is not surprising that al-KazwinI felt the need to criticise and rework these definitions and rearrange some of the material. Considering the etymology of the term bayan and the definition which al-KazwinI gives of the 'ilm al-bayan as "the science through which one knows how to express one and the same concept in ways which differ as to the degree of clarity achieved in indicating this concept, which involves, among other things, avoiding obscenity (istibd) in sentence structure (naaz) and in the relation between statement and theme (istibd, Talqis, 5, 7 = SyrhI, i, 103 ff., 110; see Mehren, 15-16), the translation "Science of exposition" (Mehren, 20: "Darstellungslehre") seems justified; but if one keeps in mind that the 'ilm al-bayan deals only with the similar (istibd) (as an introduction to the discussion of the metaphor), the metaphor (istibd I) (q.v.), the analogy (istibd II), the metonymy (istibd III) and the allusion, statement by implication (istibd IV), the translation "Science of figurative expression" seems more appropriate.

Even more confusing is the term ma'ani, since what is meant is not the study of subjects and themes in poetry (as found in such works as the Kudab-
Ma'dnī al-kabīr of Ibn Khatibya (p.v.) or the Da'irat al-Ma'dnī of Abū Hilāl al-Askarī (d. ca. 400/1009), nor a study of lexicography, but essentially a study of those rules of syntax which have a bearing on the theory of functional, appropriate style, as al-Kazwīnī puts it, "finding the proper expression to meet what is required in a given situation" (the full definition of the 'ilm al-ma'dnī is "the science through which one knows the various existing patterns of Arabic speech by means of which it meets the requirements of each situation"). [auraa'] 'ilm ma'dnī yur'afu bihh ahuwa li-l'afaq li-l-arabiyyya l-falā bidd biḥ yushfa'ī muqaffa 'l-hala'; the translation "Semantics of syntax" suggests itself (cf. al-Sawārī, i, 1146: "the different kinds of sentence and their use").

The awkwardness of the terms ma'dnī and bayān and the difficulty of finding proper definitions for the two disciplines, 'ilm al-ma'dnī and 'ilm al-bayān, particularly in their relationship to lexicography and grammar, has not escaped the mediaeval critics (see the interesting observations in Yāhūy b. Hamza's Tawāz, i, 8-18), and one wonders what determined the choice of these terms. The ma'dnī and bayān sections in the Miṣāḥīh were based respectively on the Dalīl al-Djurdīnī and the Aṣṣār al-balagha by Abū al-Sāhir al-Djurdīnī (see al-Djurdīnī in S. al-Mu'tazzīnī) and it is in these two works that one would first try to find an answer to this question. On p. 64 of the Dalīl, al-Djurdīnī makes clear that composition (nayn) depends on obeying the rules of syntax (which he briefly enumerates), and on p. 65 he declares that determining a correct or faulty nayn always involves a principle of syntax (ma'dnī min ma'dnī l-nayn). On p. 222, II, 4-5 of the Aṣṣār (Ritter's tr., 261 bottom) he qualifies the similarity as ma'dnī min al-ma'dnī, apparently meaning a way of formulating a common syntactic construction. It is possible that al-Sakkālī derived the term from al-Djurdīnī's definition of the nayn as essentially a matter of correct syntax, the more so since the chapter on the ma'dnī in the Miṣāḥīh immediately follows the section on syntax, so that the 'ilm al-ma'dnī could be seen as an extension of syntax into the realm of rhetoric. It is also possible that he based himself on an earlier model: The term ma'dnī al-nayn appears in the famous discussion between Abū Sa'd al-Shāfi'ī and Abū Bīrāb Mattā b. Yūnus al-Kūriyyātī which took place in 310/922 (see Abū Hāniyāy al-Tawhidī, al-Muḥabbat, ed. H. al-San̄dībī, Cairo 1349/1930, 80; also, al-İmām wa l-ma'dnī al-nayn, ed. A. Amin and A. al-Zayn, Cairo 1373/1953, i, 121; Yākūn, Ḳiṣṭāḥ, iii, 117; D. S. Margoliouth in J.R.A.S. [1905], 122), but seems to be used there for grammar in its widest sense. Ibn Fāris (d. 395/1004) in his al-Ṣābīlī (ed. M. al-İcchūmī, Beirut 1383/1964, 170) uses the term ma'dnī al-kadīrī for the following categories: Ḳīnār, ỉstātsbār, amr, makh, ỉstād, Ḳadīr, Ḳaṣīb, Ḳawāmī, and Ṭalāʾūdūn, nearly all of which appear also in the ma'dnī chapters of al-Sakkālī and al-Kazwīnī. The term ma'dnī has been abandoned because it was too general and had to be associated, as al-Djurdīnī states clearly on pp. 306-7 of the Dalīl, with the use of the ỉstāfā, the ỉndbnāa, and the ṭamālī as well as other tropes (fīrāb al-ṣan̄āfī). It should be noted, however, that al-Kazwīnī (Jāḥ, i, 57-8) and al-Tatțāțīnī (al-Šāhīr al-muṣawwar, 27) quote a definition which gives the term a narrow sense and which was based on al-Djurdīnī (cf. Dalīl, 67-9). However that may be, one cannot deny that there is a certain logic in the new introduction by al-Sakkālī and al-Kazwīnī as long as one sees the 'ilm al-ma'dnī as a set of rather strict rules governing the art of correct sentence structure, the purpose of which was to demonstrate the change in meaning; al-Bayān as an analysis of figurative expressions which, one might argue, the writer is free to use but which, since they are the product of his creativity and often lend clarity and distinction to his style, are by necessity part of any theory of style; and the Al-Baṣrī as a list of "embellishments" which are not essential criteria of a good style, but which are nevertheless applied quite frequently. It is conceivable that al-Sakkālī and al-Kazwīnī tried to programme the study of rhetoric in such a way that the reader would become familiar first with the elementary skills of composition, then with the characteristics of literature as a form of art, and finally with some stylistic devices used by accomplished poets and writers. It is true that much of what comes under the heading of 'ilm al-ma'dnī is syntax or formal logic; but very often one finds that these statements of rules and principles explain how the speaker ought to convey a certain mood which requires him to emphasize, exaggerate, play on the hearer's imagination, or conform to a given situation by making tacit assumptions about what is known or acceptable to his audience, etc. This unquestionably draws the 'ilm al-ma'dnī into the sphere of rhetoric and oratory. The use of the term bayān may reflect the view that metaphors should be used since they are sometimes more effective than terms used in their proper sense. Or the term may have been chosen simply because it was often associated with this aspect of the Miṣāḥīh (see Bayān, i, 1114; also see al-Rummānī, al-Nuḥayt, 79, l. 12 and cf. A Fatīmī manual, 313-19: al-Rummānī speaks of the metaphor as leading to a baldūtī bayān not possible if the proper term were used). One could suggest that al-Sakkālī had in mind the formulation of a concept in an unconventional, artful manner (and as such different from the common methods described in the ma'dnī chapters) (cf. Bayān, i, 1116 bottom, cf. also al-Nuḥayt, 98, l. 2-15, and A Fatīmī manual, 317, l. 12—318, l. 11), but no other examples of bayān being used specifically as a term for figurative expressions are known to exist; The terms ma'dnī and bayān appear in al-Zamākhshāri's (d. 538/1444 [p. v.) al-Kashgālī and in Fāhrī al-Dīn al-Rāzī's (d. 606/1210 [p. v.) Nihāyat al-fīlū Ḳīrātay al-fīlūtī. Al-Zamākhshāri made frequent use of al-Djurdīnī, al-Rāzī's Nihāya is actually a digest of al-Djurdīnī. But both authors use the terms in too vague a way to justify any conclusions, and, consequently, al-Sakkālī, who knew both the Kashgālī and the Nihāya, cannot have derived his definitions from these two books. He speaks however of "scholars" or "leaders" in the 'ilm al-ma'dnī without specifying who they are (Miṣāḥīh, 95, 119, 127; also see Matṭū, al-Sakkālī, 119-20), and this could of course be taken as an indication that he was not the first to introduce ma'dnī as a term for a more or less clearly defined category of rhetorical studies.

How difficult it is to keep the 'ilm al-ma'dnī and the 'ilm al-bayān completely separated appears from the treatment of the ma'dnī as part of the chapter on attribution (zandād) in the ma'dnī section of the Talkhīsh (10-13 = Šahrīb, i, 224-72; cf. al-Djurdīnī, Aṣṣār, 342-5 = 399-402 of the translation); al-Kazwīnī discusses sentences such as "The springtime made the herbage come forth" for "God made the herbage come forth" where there is a "trope of the intellect"
(madğar ah), i.e. the hearer's realisation that it is the creator who makes the herbage come forth, while the terms 'springtime' and "made [the herbage] come forth" are used in their original sense; and "The springtime made the earth come to life" where there is not only a trope of the intellect in the relation between subject and predicate, but also a trope of "unification" (laylat) (the word for "covered the earth with herbage"), Al-Kazwî points out that the hearer cannot do without a "frame of reference" (karima) supplied by an element in the context or the result of logical reflection which enables him to understand that the sentences are not to be taken in their literal meaning (see Matlîb, al-Kazwîni, 353-71, for views on this point by al-Kazwîni's predecessors and followers; see also Mehren, 30-1, 75-9). However, Al-Kazwîni gives no further attention in this section to the association that makes it possible to use "come to life" in the sense of "come forth", since this is a question that belongs to the "ilm al-bayan. It would be wrong, however, to see the "ilm al-bayan as a science that is exclusively concerned with individual words used metaphorically in a certain context (involving, of course, once more a discussion of the karima) and of the associations which make such metaphors acceptable (cf. Mîyâk, 157, ll. 2-3) in phrases such as "I see you advancing one foot while at the same time moving backwards with the other", which are intended as analogies (tangâl), the words are used in their original proper meaning, though the sentence as a whole is used metaphorically to describe somebody who is reluctant to commit himself (Talkhi, 86 = Shu'âb, iv, 143 ff.; see Mehren, 58-9); and in the ananonymy "He has many ashes [around his hearth]" there is no need to attribute a tropical sense to any term in the sentence in order to conclude that what the speaker wants to say is that the man often prepares meals and therefore must be a generous person who entertains many guests (Talkhi, 92 = Shu'âb, iv, 236 ff.; see Mehren, 412). Moreover, Al-Kazwîni considers the tiri dal as essentially a form of simile (tâbâhi) (67 = Shu'âb, iii, 287 ff.; see Mehren, 534); this theory may go back to al-Rûmînî, al-Nahhat, 79, ll. 5-10, see Heinrichs, The hand, 41, 42, and Benebalder, A Fatsadî manual, 313-14, and was adopted by al-Sakkâlî's contemporary, al-Muţarîf (d. 610/1213), see Yahyâ b. Hamza, Tîriâ, i, 280-1 and Matlîb, al-Sakkâlî, 275, as well as by al-Sakkâlî himself, Mîyâk, 157, ll. 22 ff., and therefore introduces a detailed chapter on the tâbâhi in the bayân section before dealing with the tixdâ. The ma'ani chapter, however, also deals briefly with the simile when it analyses the inversion (tâbâhi) which, if we may believe Ibn Khaldûn (see the passage quoted above), included the elements of the rhetorical section of the Mîyâk by al-Sakkâlî himself, as a "reduced size copy" of the Mîyâk which should not be confused with his Mîyâk fi 'l-ma'âni wa 'l-bayan (Sellheim, 315, 333, correcting Brockelmann). The latter work has been recognised by Ahlwardt (no. 7249, pp. 3940-3950) and Sellheim (316) as an independent system of rhetoric, though it may have been influenced by the "standardisation" established by al-Sakkâlî. Matlîb (al-Sakkâlî, 385) goes farther and finds that the Mîyâk is no more than a "reduced size copy" of the Mîyâk, though in his book on al-Kazwîni (pp. 1-7, cf. also 160, 209) he points out some important differences between the two texts. In addition, Badr al-Din Ibn Mîlîk wrote a Mîyâk fi 'l-bayan wa 'l-ma'âni (Sellheim, 315, 333), correcting Brockelmann).
Sharh talghsh al-miftah (see Sharuh, i, 30, 159, 376 and elsewhere) and is preserved in a manuscript in Leiden (see Matbkh, al-Kazwln, 92, 684). According to Matbz, it was written before the (second) Miftahh and was like its companion volume essentially a digest of the Miftah, the first work to reach Egypt. The substantial agreement between the Miftah and the Miftahh appears clearly from a comparison of the definitions of the ma'san and the baydn and, to a lesser extent, from a comparison of the tables of contents. Where the two books show an important difference is in the use of the term badi* (see above) and in the detailed treatment which the badi* receives in the Miftahh (which falls outside the scope of this article).

Much more interesting as an independent study of the sim al-ma'san and the sim al-baydn than Badr al-Din Ibn Malik's Miftahh is another little-known work, the Tirds al-mu'annadin min asr ar al-baydn wa asr-ar sharh talghsh al-adid'il of al-Mu'ayyad bilharr Yahyâ b. Hamza al-Àalawi (d. 747/1346; see Brockelmann II, 186, S II, 242). A curious aspect of this book is that the author apparently knew neither of the two books by al-Qa'idhân nor al-Sakkikl's Miftahh and it cannot be precisely determined where he found the quotations from the Miftahh which so much influenced his thinking (see Matbkh, al-Sakkik, 359-63). In the preface (I, 34), he acknowledges that he used the Miftahh of al-Sakkikl by al-Djurqanj and that Yahya b. Hamza al-Àalawi (d. 652/1254), of whose works, however, he may not have known that the work by al-Sakkikl was a compendium of the Miftahh, and that Yahya the author apparently knew neither the two books by al-Qa'idhân nor al-Sakkikl's Miftahh and that Yahya by the coins the Miftahh to Yahya b. Hamza derived his knowledge of al-Sakkikl. He apparently also feels certain that the work by 'Abd al-Karim b. al-Karim, the Tirds al-adid'il of al-Qa'idhân, or the Tirds al-adid'il of 'Abd al-Rahmân (or 'Abd al-Rahmân) al-Abbasî (d. 965/1550), both of which works have not been published, contain elements of the same tradition.

The popularity which the system of al-Sakkikl and al-Kazwln has enjoyed to this day is shown by such works as the edition by M. 'A. Khâlidî al-Azîznî's Idth Cairo 1360-1370/1940-1950, which contains extensive notes on the interpretation of the text and the history of the genre, and by modern works on the ma'san and the baydn such as the Bshaght as-nasr hâl-lasîr of 'Abd al-Rahmân (or 'Abd al-

As noted earlier, there are numerous commentaries on the Talghsh, as well as supra-commentaries and glosses. An authoritative and informative list of many of these, with valuable information on manuscripts, appears in Sehleim, 310-15. A collection of commentaries which comprises not only al-Kazwln's Talghsh and al-Taftanzânl's Sharh muq'hsharr, but also the Mawdâl al-falshât of Ibn Ya'qûb al-Maghribi (wrote 1100/1696; see Brockelmann, S I, 518), the 'Arâs a'la-fadil al-Bin al-Din al-Sukî (see above), and the Hâshyâ of the Sharh muq'hsharr by Muhammad b. Muhammad 'Arâs al-Atlasî (d. 1230/1815; see Brockelmann, II, 54, S II, 98 and Matbkh, al-Kazwln, 592-7) was published in Cairo in 1917 (and earlier in Bâsil in 1381/1901-2, according to Brockelmann, S I, 516, 36) in four volumes. Mention should also be made of the Sharh 'a'idl al-qismân fi sim al-

The popularularity which the system of al-Sakkikl and al-Kazwln has enjoyed to this day is shown by such works as the edition by M. 'A. Khâlidî al-Azîznî's Idth Cairo 1360-1370/1940-1950, which contains extensive notes on the interpretation of the text and the history of the genre, and by modern works on the ma'san and the baydn such as the Bshaght as-nasr hâl-lasîr of 'Abd al-Rahmân (or 'Abd al-

An excellent summary of the 'ilm al-baydn and the 'ilm al-badî* is found in Mehren's Rhetorik. Mehren based himself on the Talghsh, the two commentaries by al-Taftanzânl, and the 'Ullânî by al-Suyûtî. Other texts were known to the author and occasionally used by him (see pp. 110-113). Mehren also dealt briefly with the 'ilm al-ma'san (18-19), but apparently gave up his plans to deal with this discipline in a separate publication (p. v). However, the technical terms in the ma'san chapters, as far as they pertain to rhetoric, are sometimes the same as those of the baydn which are adequately treated in the Talghsh and they are common badî* terms which can be identified in handbooks composed by authors who followed the "older" school, such as the Tahâr al-tahâr of Ibn Abî l-Ishâr, ed. H. M. Sharaf, Cairo 1383/1963.
Another useful introduction is the article by M. Weisweiler, "Abdalqahal al-Sakkakl's Werk über die Umnahmeleihigkeit des Korans und seine syntaktisch-stilistischen Lehren, in Orient, xi/2 (1958), 77-121, which, though intended as a summary of the Dalal'i, can be used as a study of the 'ilm al-ma'arif and thus makes up in a large measure for the omission of this section from Mehten's book.

W. Aḥwārāt, Die Handbücherverzeichnisse der Königlichen Bibliothek zu Berlin, XVIII Bd.: Verzeichnis der arabischen Handschriften, VI. Bd., Berlin 1894, 365-442 (tables of contents of texts mentioned in this article and of other texts belonging to the same tradition); I. Brogelmann, I, 294-9, II, 22, S I, 515-19, 965, S II, 15-26; A. Maṭlī, al-Dalālah wa我认为 al-Sakkakl, Baghdād 1368/1949; idem al-Kawant wa-ṣawāqir al-Dalālah, Baghdād 1387/1967; idem, Muṣallaha al-baladaha, Baghdad 1366/1946; A. G. Ablwardt, Die Handschriftverzeichnisse der Königlichen Bibliothek zu Berlin, XVIII Bd.: Verzeichnis der arabischen Handschriften, VI. Bd., Berlin 1894, 365-442. (Tables of contents of texts mentioned in this article and of other texts belonging to the same tradition); B. Reinert, MA'ARIF (ac.), education, public instruction. The word is the pl. of ma'arif "knowledge". The term was already used in medieval times to denote the secular subjects of knowledge or culture in general (e.g. in the title of Ibn Ḫutayba's Kitāb al-Ma'arīf), in opposition to the religious sciences ("'ulūm, pl. of 'ulum").

1. IN THE OTTOMAN EMPIRE AND THE CENTRAL AND EASTERN ARAB LANDS

It seems that the official use of the term appears for the first time in the Ottoman Empire in 1838, when a school for educating government officials was established in Istanbul and was named Mekteb-i Ma'arif-i Veli'diiyye. After that, the term was frequently used in Turkish to indicate education. Thus the first governmental body charged with the administration and supervision of the system which was created in 1845 was called Muvakahhat Ma'arif Maṣlaptive, Provisional Council of Education. This was the forerunner of the Ministry of Public Instruction, Ma'arif-i ʿUmmiyeyi Neṣīrāt, established in 1857. It is noteworthy that the first directorate of the new state schools, which had been created in 1839, was called Mehteb-i Küniiyyeyi Neṣīrāt and did not include the new term ma'arif, perhaps because it was a department within the Ministry of Pious Foundations under the Muṣallah al-Talim. The Ministry of Education was renamed in 1920 by the Kemalists Ma'arif-i Veli'diiyye. In 1923, with the language reform in Turkey, the former Arabic-Ottoman Turkish-sounding term was replaced by a purely Turkish one, and the Ministry was renamed Mili Eğitim Bakanlığı, Ministry of National Education, which has retained the official term, although ma'arif is still a common word in Turkish for education, along with the neologism ʿelmin.

The use of the word ma'arif for public education became current in Egypt and Iran in the 19th century, almost certainly under the influence of the Ottoman term. Both in Egypt and in Iran the official use of the term to designate the system of education was avoided for about half a century. When the first Ministry of Education was formed in Egypt in 1837, it was simply called Diwan al-Ma'arif (Ma'arif Diwanī) in Turkish, the Department of Schools. Only since the Khedive Ismail's rule (1863-79) was the Ministry of Public Instruction

...
called meşrûf (later, in 1933, meşrûf) al-ma'tûrin. The term ma'tûrin was universally used for "education" in the Ministries of Education of the Arab successor-states of the Ottoman Empire, and until the mid-1930s, also in Iran. Only after the Egyptian Revolution at the beginning of the school year 1954-55, was the Ministry of Public Instruction renamed Wiştâni al-ma'tûriyya wa l-lilâfin, literally "Ministry of Education and Instruction". The Minister of Education explained that the change aimed to emphasize the shift from the static and passive "knowledge" to the dynamic process of education and the teaching of various skills. It may be suggested that additional reasons were behind the decision to do away with the term ma'tûrin. Although the word is of an Arabic origin, Arabic was less comfortable with it in the sense of education than Ottoman, and even modern Turkish. The expression dî współpr al-ma'tûrin, for example, has the double meaning of "Department of Education" and "encyclopedia". The dropping of the old and, from the Arabic point of view, the somewhat clumsy term ma'tûrin should be also viewed against the background of the Arabisation after the Egyptian revolution of 1952 of the official nomenclature, which had retained many Turkish terms in the civil administration and in the Army. Following the Egyptian example, the other Arab countries replaced in the fifties the term ma'tûrin with larbiya or larbiya wa-l-lilâfin for their Ministries of Education. It further seems that the word ma'tûrin in the sense of education is dying out in Arabic in the non-official usage also.

I. The Ottoman Empire and Turkey

The beginning of modern education in the Ottoman Empire. — Islamic society had traditionally the highest regard for the pursuit of knowledge, ilm, but education was considered as a religious or communal matter of no concern to the state. Muslim children were taught the Kur'an and the basics of religion in the Kur'an schools, the mekteb (Arabic maktûb or kuttab [q.t.]). Higher religious studies were given in the medresâ [q.v.] (Turkish pronunciation, medrese). The traditional educational institutions were financed by private donations, but mainly by the wa'arif, pious foundations. The religious educational system was entirely within the jurisdiction of the 'ulama'. The traditional religious education was restricted to the religious aristocracy and was quite uniform, some local variations notwithstanding. The modernised, state-directed, and at least partially secularised education which was called meşrûf emerged only in the 19th century, although there were some hesitant beginnings in the 18th century. These had been prompted by the Ottoman defeats at the hands of the European powers. The Ottoman government realised that it had to improve the training of its officers and that this could be accomplished only by borrowing European training methods and techniques.

As early as 1824, a school of engineering, huuczûk-i hancî, was established in Uskûdar. This first institution was to be shortlived, but in the last quarter of the 19th century more successful efforts to found military schools were made. After the Ottoman army was burned by the Russians, the Ottomans established in 1776 a new Imperial Naval Engineering School, Mihêndîsî-î êğne-yi Bâgir-yi Hümâyûnî. In order to train army artillery officers, an Imperial Land Engineering School, Mihêndîsî-î êğne-yi Derrî-yi Hümâyûnî was founded in 1794 (or in 1795). These military schools were staffed largely by French officers, and European textbooks, especially translated for the cadets, were used there.

Mahmûd II. — Yet the first real educational beginning in the Ottoman Empire belongs to the reign of Mahmoud II (1808-39), who was following the example of Muhammad 'Ali, Egypt's modernising Pasha. Mahmoud's first significant step in the field of education was issuing an edict which stated that "the majority of people lately avoid sending their children to school and prefer to give them to a trade as novices to artisans when they reach the age of five or six because of their ambition to earn money immediately. This condition is the cause not only of widespread illiteracy but also of ignorance of religion... No man henceforth shall prevent his children from attending school until they have reached the age of adulthood...". This edict cannot be considered as a compulsory education law, and it contained nothing to change the traditional aims and structure of elementary education, but it did mark a departure from the past by declaring the direct involvement of the state as such in the education of children. Mahmoud realised that in order to reform the army, the reactionary forces should be eliminated. Therefore he destroyed the Janissaries in 1826, as Muhammad 'Ali had massacred the menzûlas in 1811. This was in order that the greater part of Mahmûd's educational activity took place after that date. It was to be typical of educational development in the Middle East that reform in the school system started from the top, by establishing modern specialised schools to train officers, doctors, engineers and administrators for the army and the civil bureaucracy. The higher, specialised schools were unrelated to the traditional educational system; the elementary schools especially saw very little change until the 1958 revolution. Because of this, students of engineering and medicine in the first higher schools had to study such elementary subjects as arithmetic, Turkish grammar and French. Eventually, the higher institutions of learning had to form their own preparatory sections, until the state gradually developed the higher-elementary and secondary stages of the educational system. An impressive number of higher schools were founded during the reign of Mahmûd II. In 1827 Mahmûd opened a medical school in Istanbul to train doctors for the army, less than a month after the opening of Mahmûd's first secondary school. Among the educational achievements of Mahmûd's reign should be mentioned the first students' mission to European capitals, which started in 1834 (according to one source, in 1827), also by following Muhammad 'Ali of Egypt, who was the first Middle Eastern ruler to adopt his method of training specialists for his army and administration. Another method to raise the educational standards of his army was to establish training units within the military corps (1832).

Toward the end of the reign of Mahmûd II, two schools of a new kind were created, the Mekteb-i Ma'tûrin-i 3elîyê, the so-called 3elî (after a title of Mahmûd II) School of Science, a school designed specifically to train employees for government offices (1838), and the Mekteb-i Ulûm-i 3elîyê,
School of Literary Sciences, to train translators and interpreters (1839). These schools taught, among other things, modern subjects such as French, geography and mathematics. Mahmud's educational system created a new type of school, the rüşdiyye, higher elementary school (from rüşûd, meaning "adolescence"), which was to serve throughout the empire the two principal stages of education as a link between the elementary schools and the higher stages which were somewhat modernised and secularised, although lip-service to religion was always paid. As has already been mentioned, Mahmud's reign also initiated the first government offices which were charged with administering and supervising the new schools, the forerunners of the Ministry of Education. One of them was the Medres-i Umûm-i Nûfûs, the Board of Useful Affairs, established in 1838, which among other things constructed schools. Another body was the Department of the rüşdiyye, Mekâbî-i Rûşdiyye Nesâreti (1839). Despite the impressive record of Mahmud's period, one must remember that the number of students exposed to the new education was severely hampered by lack of teachers and by difficulties of language and terminology.

The Tanzimat. — The period of the Ottoman Reforms, the Tanzimat (q.v.) (1839-76), brought about a real breakthrough in all the spheres of education: organisation, legislation and development. For the first time the Mekteb-i Mevliî and Ministry of Public Instruction, known as the Mekteb-i Mevliî, a Government Board of Education was formed, in the next year it became Mekabî-i Umânîyye Nesâreti, Ministry of Public Schools, and was replaced in 1857 by the Ministry of Public Instruction. In 1851 the Society of the Learned, Ednûzîni-i Dânîsh, was formed with the purpose of sponsoring Ottoman culture and contributing to education. It was active only for a few years and did not accomplish much. In 1868 a Council of State was set up. The Council had five sessions, after the French model, one of which was in charge of agriculture and public instruction. A Higher Council for general education was formed in 1869 within the Ministry of Education, on which representatives of the non-Muslim communities (milıezes [q.v.]) also served. Subordinate to this central council, provincial councils were established in each province as part of the local government. During the Tanzimat era, important innovations were introduced. For the first time programmes and regulations were issued to all the elementary schools of the empire (1847). In 1870 a similar set of regulations concerning the rüşdiyye schools was circulated. In 1846 'Ali Pasha and Fâlîd, two of the chief reformers, prepared an ambitious but unrealistic scheme to reorganise the entire educational ladder from the şibâyin elementary schools up to the university. With the foundation of the Ministry of Education in 1837, another scheme for the organisation of the school system was prepared, which provided for an elementary school (mekteb-i şibâyin) of 4 grades (ages 7-10), secondary school (rüşdiyye) of 6 grades (ages 11-16), from which the graduates could continue in various higher institutions of learning, including the Mekteb-i Mevliî, a school which was actually founded only in 1859 to prepare civil servants.

In 1851-1856 a comprehensive law or reorganisation of the state school system was issued. This time the scheme was more thorough than previous attempts aiming at the rationalisation of the school system and integrating all that which had been achieved till that date. The Ottoman Education Law was inspired by the European legislation of the day, and perhaps also took the Egyptian Education Law of 1867. The Ottoman law classified schools in the empire into public (tanzîmiyye) and private (hâkkîsiyye). The former were graded as elementary (şibâyîsiyye) higher elementary (rüşdiyye), lower secondary (Mekâbî-I) and higher secondary rûşdiyye. At the top there were higher institutions of learning, technical, agronomic and medical schools, and the state university (Dâr al-Fïlî). Already in 1868 a compulsory education law had been issued, according to which all boys aged 7-11 and all girls aged 6-10 had to go to school. The 1869 law provided for a şibâyin school in every village or town quarter, a rûşdiyye in towns with 50 or more families, and an rûşdiyye in communities with 1,000 families or more. A şubûnîyye secondary school was to be established in every provincial capital. The actual development of the Ottoman education, however, lagged behind this scheme, for lack of funds, teachers and facilities. By 1876 there were only 362 rûşdiyye, and only one şubûnîyye school was opened for a long time to come. As for the University, the first public lectures were held in 1863, but it was soon closed down. In 1870 another attempt to open the Dâr al-Fîlî was short-lived. Only in 1900 was the university finally organised.

The Tanzimat period began with the promulgation of the famous Rûşdi-i Sherîf ("Noble Rescript") of 1839 which proclaimed at least implicitly the principles of the equally of all Ottoman subjects, regardless of creed, and which opened the new state schools to non-Muslim children. The Khâtât-i Hümâyûn of 1836 made these promises explicit. Generally, the Tanzimat period witnessed some genuine attempts to integrate the non-Muslim elements in Ottoman society, and it was realised that this could best be achieved through education. Midhat Paşa (q.v.), the famous reformer and administrator, established in 1869 an English-language school, to which all boys aged 7-11 and all girls aged 6-10 were considered as qualified teachers. The rûşdiyye, the forerunner of the Ministry of Public Instruction, was founded in 1870, and by 1908 there were 33 teachers' training institutes throughout the empire. The Tanzimat period was also marked by the establishment of the Lycée of Ghala-ta-saray, which was to be a conscious copy of the French lycée. The school offered a European-style curriculum in a five-year course and religious education for students of the main Ottoman millets; the Muslim children consulted about one-half of the student body. In its first years, the administration and the staff were mainly French. But in the seventies the French influence decreased and the school became increasingly Turkish in character. Robert College, the Protestant counterpart of Ghala-ta-saray, had already been in existence since 1868. The Tanzimat period is also to be credited with the first institutes of teachers' training. The idea of state supervision of the teachers belongs to the time of Mahmûd II, but nothing had been done before the Tanzimat to train teachers formally; masters graduates were considered as qualified teachers. The first college of teacher training (Dâr al-muhalisînî) for the rûşdiyye was opened in 1848 in Istanbul. The first normal school for girls (dâr al-muhalisînî) was founded in 1870, and by 1908 there were 33 teachers' training institutes throughout the empire. The Tanzimat period saw a determined effort to spread education to the provinces. The váliâyêt Law of 1874 made provisions for provincial educational administration. In 1872 a decree for reform in the elementary schools in the provinces was issued.

Perhaps most important, the organised under-
taking of female education was original to the Tanzimat. Coeducation was practised in the elementary schools, and the first female teachers for girls' trade schools were appointed in 1872.

To sum up, the educational efforts of the Tanzimat meant that new forms emerged; a network of military and civic schools developed; pioneer work in the fields of education of girls and teacher training was started; contacts with Europe continued, including consultations with European education experts; student missions were sent; and the Ottoman School in Paris (1857-74) became a centre for the Ottoman students in that city. The Tanzimat, the gap between the secular and the religious in Ottoman society widened considerably.

The Constitutional, Hamidian and Young Turk periods. — The Constitution of 1876 reiterated the principles of compulsory and free primary education and the concept of a centralised and somewhat secularised school system. The state did not interfere with religious education in the elementary schools and in the medreses, which remained the province of the Jumshud.

Although the long reign of sultan 'Abd 'al-Hamid II (1876-1909) was a time of despotism and political reaction, the sultan carried on his predecessors' educational activities. He imposed strict censorship on curricula and textbooks and his spies belittled the lives of teachers, students and intellectuals. Yet during his rule the literacy rate tripled, many schools were opened, new types of higher institutions of learning were established and the first modern university in the Muslim world was finally established in 1909. During the period 1879-99 the number of the rüşdiyyes rose from 253 to 389. The network of military schools was developed; there were 29 military rüşdiyyes in 1897. In accordance with his overall Islamic and Arab policy, 'Abd 'al-Hamid II paid more attention to education in the Arab and other Muslim non-Turkish provinces than had been done previously. A typical example of this policy was the Fürediye Mektebi, School of the Tribes, which was opened in Beshbaskid in 1894 and lasted until 1907. This school trained teachers, officers and administrators from the Arab, Kurdish and Albanian provinces. In 1883 the sultan decreed that every provincial capital should have its own teacher training college. In the same year he imposed an "assistance tax", a share of which was set apart for education. A medical school was opened in Damascus in 1893; it was then transferred to Beirut in 1916, and finally closed down in 1918. The network of military schools was extended, and in 1904 military schools were opened in Damascus, Bagdad, Erzincan, Erzurum, and Musul. Legal schools were established in 1907 in Konya, Saldırga and Taşköprü.

'Abd 'al-Hamid sponsored the opening of schools for finance (1878), fine arts (1878), commerce (1882), engineering (1884), a school for the blind and deaf (1889), veterinary services (1886), police (1891) and customs (1892). Generally, vocational and technical education was emphasised, and courses to train telegraphic operators and steamboat mechanics were given. The institutions of higher learning developed vigorously under 'Abd 'al-Hamid's rule, although the sultan realised that these could endanger his régime. Indeed, the first revolutionary group was organised in the military medical school in 1889. Similar circles were eventually successful in bringing about the 1908 revolution, which ushered in the period of the Young Turks, or the "Second Constitution", which lasted until the collapse of the Ottoman Empire.

The turbulent last ten years of the empire witnessed some basic changes in the approach to education. It can be stated that in this short period the educational system was transformed through modernisation and secularisation, preparing the road for the future Kemalist reforms. Besides the institutional and legal reforms in Turkish education, which will be presently discussed, new concepts about education came to the fore. As N. Berkes aptly put it: "If the word ma'arif symbolises the era opened by Mahmut II, the term terakki well represents the Mevleviyyet era, and signifies an important improvement over the first." Thus, to the concept of knowledge, the idea of education was now added. This era saw the emergence of the first professional Ottoman pedagogues, such as Saidi al-Husri (who would be later better known as an Arab educator and nationalist), Ridâ Tewfik, Selim Sîri and Ismail Hâkkî, who promoted the publication of psychological and pedagogical literature. While the educational model during the Tanzimat was the French system, the educators of the Mevlevîyyet turned to the Anglo-Saxon education system for inspiration.

There were significant beginnings of secularisation. The first teachers' organisations appeared. The struggle between the fâl'ifa (clerical teacher) and the mu'allim (secular teacher) became more pronounced in the Young Turk period. The idea of the ruling Union and Progress Committee (İttihat ve Terakki Dernegi) that education (ma'arif) was the province of the state, should control and supervise public instruction. As a result of a resolution adopted at its 1916 convention, the Union and Progress Committee transferred the elementary schools, which had been previously under the Ministry of Edebî, to the Ministry of Education. The medreses were merely transferred from the Ministry of Edebî to another religious authority, the Edebî Mevents, the Department of the Şeyhülislâm.

In the legislative field, the 1909-1913 Provisional Law of Elementary Education, the most important law since the Ottoman Education Law of 1286/1869, was promulgated. The law created educational committees at the level of districts and sub-districts, thus delegating administrative, financial and pedagogical responsibility to local authorities. The law placed all the financial burden of maintaining the schools, namely establishing a school, acquiring the land, constructing the building, paying the teachers' salaries and all current expenses, on the people of the countries and districts. This meant in practice that universal elementary education could not be achieved in a long time to come.

In the "Second Constitutional" period, progress was achieved in the sphere of women's education. Educational opportunities for women were extended to the secondary school. In 1911 the first rüşdiyye and in 1913 the first lycée for girls were opened in Istanbul. Trade schools for girls were established, not only for cooking and sewing, but to train nurses and secretaries. In 1915, women were admitted to the University, although in separate classes, to be trained as secondary school teachers. After 1918, women were allowed to work as elementary school teachers.
After the 1908 Revolution, the University was reorganised and the curriculum now included history, philosophy and sociology, which had been banned under 'Abd ul-Hamid.

*Education in the Turkish Republic.* — The educational developments in the Turkish Republic in the twenties and thirties are closely linked with the reforms of Mustafa Kemal, the future Kemal Ataturk [qv.], the first president of the Republic. The Kemalists, committed as they were to drastic cultural change, rightly understood the utmost importance of education for their objects. The revolutionary government in Ankara established its own Ministry of Education in May 1920, while still fighting against the Allied-supported Ottoman government in Istanbul. The Law of Unification of Instruction (Tasfiye-Te'darîk) of 1924 ended the century-long dichotomy between secular and religious education in Turkey and created a fully secular and integrated school system. All educational institutions were placed under the control of the Ministry of Education. The medresses, 479 in all, with a total enrollment of 8,000 (only a third of whom were genuine students) were closed down. To provide alternative higher Islamic education, the Faculty of Theology was opened at the University of Istanbul and 26 secondary schools for training imams and dâbîhs were established. The anti-clerical atmosphere of the period did not encourage the development of these institutions. The Theological Faculty was closed in 1934 and the last imam-hatip mektepleri were closed down in 1933-5, after their enrolment had been continuously dwindling. As for the religious education in regular schools, this too was adversely affected by the secularising ethos of the Ataturk era. In 1928 Islam ceased to be the state religion, and the principle of laicism was accepted. In the same year, the Latin script was adopted for the Turkish language. Artuk himself went out to the people to teach the new script. In the next year, Arabic and Persian were eliminated from the curriculum. In 1932 religious instruction in the secondary schools was finally stopped. There is no agreement as to when religious instruction in the elementary schools was discontinued; some sources date it as early as 1924, others mention 1928, a date which seems more accurate. It seems that religious instruction was simply phased out, although it continued in many village schools. Toward the end of the forties, the public mood became definitely favourable to the reintroduction of religious instruction in schools. The issue came up in the National Assembly at the end of 1947. In January 1949 the Ministry of Education issued a circular, according to which two hours of religious instruction would be given in the fourth and fifth grades of elementary schools to pupils whose parents might ask for it. The coming to power of the Nationalist Party in 1950 was a turning-point in the attitude of the government toward religion generally and religious instruction in particular. After 1950, religious education became compulsory for all; parents were required to opt out instead of in as before. At the beginning of the school year 1956-7, religious instruction was introduced to the middle schools, or junior high schools (ora okulları), as well. In 1951 new imam-hatip okulları were established. In contradiction from the early version, these institutions have been successful. Higher religious instruction have been offered in institutes in Istanbul and Konya, but the most important faculty which teaches Islam at the university level is the Faculty of Theology (İlahiyat Enstitüsü) at Ankara University which was founded in 1949-50.

It is not surprising that, due to the administrative traditions of the Ottoman Empire, which had been influenced by the French model, the Ministry of Education of the Turkish Republic was centralistic from the start. This Kemalism was justified in part by the determination of the government to create a unified, modernised and secularised education in a country which was fragmented into numerous regions and tribes and which was far from enjoying linguistic and cultural homogeneity. Centralistic educational administration was also needed to overcome the difference or even hostility of the conservative elements, particularly in the countryside, towards the Kemalist Revolution and its educational goals. In 1928 the Ministry of Education was reorganised. The country was divided into twelve regional directorates of education, each being headed by a superintendent of education (ma'sarif emini), directly responsible to the Ministry in Ankara. Since 1949, the organisation of the educational system has been somewhat more flexible, each governor being responsible for the education in his district. He is assisted by an educational council and a director of education, who is more responsive to local needs. In spite of these reforms, the educational system of Turkey, like most countries in the Middle East, is quite centralised, and the state is not only responsible pedagogically, administratively and financially. The Ministry of Education is helped by a National Educational Council (Milli Eğitim Şurası) which consists of educators and administrators and has wide powers in drawing up educational policies concerning curricula, textbooks and school regulations. The Council meets once every few years. The Tenth Educational Council convened in 1961. The Ministry of Education has a virtual monopoly of textbooks. The government controls higher education as well, and inspectors private and minority schools closely. Private institutions have been declining in comparison with state schools.

Scores of higher institutes which train students in such fields as economy, commerce, engineering and architecture were nationalised at the beginning of the school year 1971-2 after the important education law no. 1472 had been promulgated. Education in all state schools at all levels is free of charge. The most difficult task which the education authorities had to face was to raise educational standards and to combat illiteracy in the nation generally and in the countryside in particular. The formal school system was complemented by the Turkish Hearths (Türk Odalıklar), a network of kind of clubs founded in 1923 to promote Turkish culture and economic welfare through lectures, publishing books and opening schools. The Turkish Hearths were closed down in 1931 and replaced by a network of People's Houses and People's Rooms (Halkevi and Halkaladı [see Link], community centres established to diffuse Turkish culture and closely associated with the ruling Republican People's Party. Teachers were encouraged by their Ministry to participate in the activities of these centres.

The Ministry of Education devised several programmes to train teachers for the village schools. One of them was to send soldiers of rural origin and having some education on short pedagogical courses. Since 1936, young villagers who had finished primary school were sent on courses of six months to prepare them to teach in their villages. According to the Village Educators’ Law of 1937, special centres to
train teachers were initiated. In 1940 the law of 1937 was supplemented by the Village Institute Law. Subsequently, the two programmes were united. In addition to his regular teaching assignments, the village educator was expected to teach adults and to help in the social and economic development of the village. The Village Institutes were merged with the regular teacher training colleges in 1954.

All these efforts have produced positive results, and the gap between school attendance rates in villages and in the cities is not nearly as wide as is the case in most Middle Eastern countries. This applies even to education of girls. In the school year 1973-4, for instance, the proportion of girls in state elementary schools in the cities was 46%, while in the villages the percentage was only 37% lower. National schooling rates for children between the ages of seven and twelve, who are obliged to go to school according to the compulsory education law, were 90% already in 1972-3, again a much higher rate than in most countries of the region. The school attendance rates have been on the rise in all educational levels. Consequently, literacy rates rose from 19.2% in 1933 (9.3% for men and 9.8% for women) up to 54.9% in 1970 (69% for men and 46% for women). The progress in the education of women is especially impressive. Coeducation has been a principle in Turkish education since 1927; only when there are special circumstances or professional needs are separate schools for girls established.

The basic structure of the Turkish educational ladder is 5-3-3, i.e., primary school (ilkokul) of five grades (ages 7-11) followed by a junior high school or "middle school" (cemeviokul) of three grades (ages 12-14) and leading to the secondary or high school, lice (lise) of three grades (ages 15-17) or a vocational or a trade school. The ilkokul and the ortaokul comprise the two stages of the "basic education" (temel cetvem). At the orsa level, the student may already start at a teacher training school, which continues four more years at the secondary level. Other courses which last four years after the ortaokul, that is up to the twelfth grade, are the imamhaci okullari and technicians' schools. In addition to regular schools, there are evening schools for working youth. Special mention should be made of the schools which teach in foreign languages. These institutions teach the "national" subjects in Turkish, but the language of instruction of all other subjects is English, French or German, according to the particular school.

Despite the impressive achievements, education in Turkey has yet to overcome many serious difficulties. Teachers' status and salaries are quite low. There is considerable shortage of teachers, since the teacher training schools at the secondary and university level do not keep up with the rapid growth of the student population. In 1972-3 the teacher: student ratio was 1:33 in the state primary schools, in the state ortaokul 1:43 and in the lise 1:39.7. Another structural weakness of the educational system is the small proportion of students in vocational and trade schools at the secondary level, which is well beneath 20%, of the secondary school student population. One result of this is that each year, increasing numbers of the lise graduates cannot be admitted to the universities and other higher institutes of learning for lack of space, although the higher educational system is also expanding very quickly.

---

**ii. Egypt**

*Educational development under Muhammad Ali.* — The foundations of modern education in Egypt were laid by Muhammad Ali Pasha, the virtually independent viceroy of Egypt from 1805 until 1848. His ambitions were personal and dynastic, yet he was aware that if he was to establish a powerful state, he had to build a modern, European-style army and an efficient administration and economy. This he could accomplish only with Western methods and advice, since education and learning in Egypt, even more than in the centre of the Ottoman Empire, were wholly traditional and were confined to religious instruction at the kutubs and the madrasas, the most important one being al-Azhar [q.e.d.]. So it happened that although Muhammad Ali had little interest in raising the educational standards of the Egyptian people, his dynamic reign made Egypt the forerunner of modern education in the Arab-speaking world, and a model for the Ottoman Empire, of which Egypt was nominally only an outlying province.

Having destroyed the Mamluks [q.e.d.] in 1811, Muhammad Ali set out to establish the Nizam el-dawla, his new army. For this purpose he started to send student missions to Europe to study various technical subjects, and on the other hand began to found new state schools, bypassing the traditional system of education. France and Frenchmen enjoyed a predominant influence in the modernisation of Egyptian education, at least until the British occupation in 1882. Therefore it is of interest to note that the first student missions, in 1809 and 1810, were sent to Italy (to Leghorn, Milan, Florence and Rome) in order to study military science, shipbuilding, printing and engineering. The foreign language which was taught in the first state school established by Muhammad Ali was Italian. Since about 1820, however, Italian influence was replaced by the French, and a group of French experts and educators gained central positions in Muhammad Ali's bureaucracy. The best-known of these was Colonel Seve, who as a convert to Islam became known as Sulayman Pascha. Seve organised the new army and a group of French experts and educators gained central positions in Muhammad Ali's bureaucracy. to his military duties. In 1830 the **Conseil supérieur de l'Instruction publique**, which in Arabic was inaccurately known as *mddin al-mdhdib* or *mddin al-mdhr*, was established. It was a pedagogical body which was expected to coordinate the schools and the *dinv al-mdjdhibiyah*. A committee was formed, and it prepared a comprehensive scheme for education in Egypt, providing for primary schools, two preparatory schools (known in Arabic as *kuttab 'al-targja* and the one in Alexandria) and special schools. Finally, in February 1837, a separate department, independent of the *dinv al-mdjdhibiyah*, and in charge of the schools, was founded. It was called the *dinv al-mdhr*, the Council of Schools, a term which was more correct than the bombastic French term by which the department became known, *Ministère de l'Instruction publique*. It is true, however, that the *dinv al-mdhr* was the core of the future Ministry of Education. At first, the *dinv al-mdhr* suffered from mismanagement, inefficiency and ineptitude. In addition to its pedagogical functions, it was charged with construction (for a time it was called the Council of Schools and Construction) and with the publication of the Official Gazette (*al-Wahab* al-Migriyya). Initially, the *dinv al-mdhr* was divided into three sections: Arabic, Turkish and engineering. The Delta Barrage and the engineering services were also attached to the *dinv al-mdhr* on account of their dependence on the *Muhandis-hdnc*. The special schools: to Muhammad 'Ali's imperialistic ambitions by the Treaty of London in 1840 drastically curtailed the extent of the Egyptian army and caused the breakdown of the school system in the 1840s. In 1841, only 5 state primary schools remained. The special schools were affected too. The student missions abroad continued, however, and in 1844 a large mission which included several princes (and was called thereafter *khqyat al-anjali*) was sent to France. In 1847, toward the end of Muhammad 'Ali's reign, a programme to establish popular elementary schools, called *mttkhbd al-mlln* (in contradiction from the government primary schools, the *mubtadiydn*), was brought forward. It is probable that Ibrahim Pasha, Muhammad 'Ali's son and successor, took an interest in the project, but his reign was too short to accomplish much and the reforms in the elementary education had to wait until the accession of Isma'il.

**Education under 'Abbas I (1849-54) and Sa'id (1854-63)**: Educational development suffered a serious slowdown during the reigns of 'Abbas I and Sa'id. Although 'Abbas was no more interested than Muhammad 'Ali in educating the Egyptian people, the training of army officers and bureaucrats continued on a modest scale. 'Abbas sent some 40 students abroad, this time mainly to central Europe. 'Abbas declared his intention to organise an Egyptian school there. On the other hand, he favoured and promoted 'Ali 'Umar ibn 'Abbas (the future Mubarak), an able administrator, reformer, and writer, who was to become a key figure in the development of education in the next three decades. 'Abbas weakened the Council of Schools and the educational system in general, but he was interested in the army and founded in 1849 the elite military school, *al-Mudraa al-tumriyya al-nafsiyya*. Of the special schools, only the medical school and the school of engineering remained.

It is generally agreed that Sa'id's educational policy was erratic, and that he aimed at reversing his predecessor's decisions. Upon his ascension to the vice-regal throne, he abolished the *dinv al-*
higher institutions of learning which had been closed. Shaykh al-Talita was recalled from the Sudan, whereas 'Ali Mubarak was sent by the ruler to the Crimean War. Egyptian students were sent to France again. Sa'id's short reign was favourable to the development of foreign and missionary schools; by the end of his reign their number reached approximately 60.

The period of Egypt's occupation (1869-79) — During Isma'il's reign, educational activity was vigorously renewed under the able direction of the European-educated administrators Rashidh Adham and 'Ali Pasha Mubarak. For the first time, education in Egypt was becoming "public" in the true sense of the word, not limited to the task of training experts and technicians for the army and the state machinery. Unlike Muhammad 'Ali, Isma'il made the kuttbis the basis of the elementary education, and the wa'f funds were used to finance them. Immediately after assuming power in 1863, Isma'il reactivated the Council of Schools (daw'at ul-madaris) which became in 1875 the Ministry of Public Instruction (Naqarat al-ma'srif al-ismiyya), with 'Ali Mubarak as Minister. Isma'il gave full support throughout his reign to the initiative of Mubarak and other progressive educators. In November 1869 'Ali Mubarak presented a document which he had prepared with a committee of administrators and notables. This was the Radjub Regulation of 1869, which aimed at promoting elementary education by establishing provincial primary schools, which would be under government inspection and would be financed by wa'f and private contributions. The new regulations provided for the first time for a sort of pedagogical supervision of teachers. The curriculum of the elementary schools was to be somewhat modernised. Of course, many reforms remained on paper only for a long time to come, but scores of elementary schools were nevertheless opened and the principle of state control over all elementary schools was established. Mubarak also put an end to the confusion between civil and military schools and confined the authority of the daw'at al-madaris to civilian schools, freeing them from their military character. The provisions of the daw'at Radjub were complemented by the regulations set down in 1880 by a committee, known as the horayiyun, which provided for three types of schools depending on the size of the community: villages, provincial towns and cities. Provincial authorities were empowered to collect contributions and fees from well-to-do parents and to use wa'f/s to finance schools.

Isma'il's reign should be credited with introducing education of girls and teacher training. The only kind of female education before Isma'il was the School of Midwifery which was founded in 1832. The first school for girls, al-Madtasa al-Suyufiyya, was opened in 1863 but closed down in 1850 was reopened in 1868 under the name the School of Administration and the Islamic Philanthropic Society (al-djam'iyun al-hayriyya al-ismiyya) which was founded in 1875 by the journalist-orator 'Abd Allah al-Nadim for opening community schools, in order to counterbalance the influence of the missionary schools. Al-Nadim accomplished little, however, because of his involvement in the 'Urabi revolt.

Education under the British occupation — After the military occupation of Egypt in 1882, the British controlled the entire state machinery, including the Ministry of Education. Educational policy was perhaps the most criticised aspect of the British rule, since it was highly restrictive and conservative, due to financial and political considerations. Lord Cromer, who ruled Egypt from 1883 to 1907, considered the financial recovery of the country as his most urgent goal and spent less than 1% of the budget on education. Previously, almost all the schools were free; now students had to pay tuition fees. This made even the primary education, and certainly the secondary and higher education, elitist in nature. The British made some efforts to improve the cutubis, turning them in 1916 into elementary (awwaliyya) schools, where nothing but religion and the three Rs were taught. The British intentionally hampered the development of secondary and higher education. They regarded the school as an educational system as a means of training a limited number of Egyptian clerks who were to serve in the lower and middle levels of the bureaucracy, and were expected to carry out the instructions of the British policymakers. Cromer conceived higher education as undesirable, since it might lead to political agitation. Therefore the University was opened only in 1908 as a private institution and did not become a state university until 1925, three years after Egypt's formal independence.

Douglas Dunlop, a Scotsman who administered Egyptian education under Cromer, did it in a rigid, contrivistic and unimaginative manner. Strict discipline was imposed both on teachers and pupils. All studies continued to be geared to passing examinations. English was made the language of instruction in history, geography and the natural sciences. Learning by rote continued to be the main method of study. During the British occupation, Egyptian students were sent to study in England only. Whereas before the occupation students travelled to Europe to study mainly technical and industrial subjects, they
now studied humanities and the law. This was in accord with the British policy to keep Egypt an agricultural, not an industrial country.

Many of the higher institutes of learning were closed down, but a few new ones were opened, such as the School of Police and Administration in 1896, a Veterinary School in 1901, a teacher training college for women in 1909, another one for men in 1904 and a College of Commerce in 1911.

As a gesture to ease nationalist resentments, Said Zaghiul, the future nationalist leader and founder of the Wafd party, was appointed Minister of Education in 1906. He enhanced the status of the Arabic language in the school system and exempted many poor children from paying tuition fees.

It is not surprising that the balance-sheet of British educational policy was poor. The illiteracy rate barely changed from 18% in 1917 to 1918 (91.7 per cent) to 1917 (91.3 per cent). In 1924, 230,000 students were enrolled in the madrasa and only 14,000 in the primary schools. High schools of various kinds enrolled some 10,000 students. The number of students in foreign and private schools exceeded by far those enrolled in government schools. There was progress in the education of girls, but the majority of them were in private schools.

**Education under the Monarchy 1922-52** - Although Egypt did not gain full sovereignty in 1922, control of internal affairs, including education, passed into Egyptian hands. During the next three decades, the educational system improved but did not free itself as yet from negative aspects of the pre-British and British inheritance, and further suffered from newly-acquired weaknesses. The Egyptian school system under the monarchy did not reduce illiteracy substantially, and in 1933 it stood at about 80 per cent, and was particularly high in rural areas and among women.

Article 19 of the 1923 constitution guaranteed compulsory and free elementary education; the compulsory education law, passed in 1923, provided for elementary schools of six years, later reduced to five. In 1925 the Ministry of Education planned to universalise elementary education within 23 years. Although quantitative progress was achieved, with student enrolment rising from 809,000 in 1930 to 1,310,000 in 1939, the goal of bringing all children aged six to twelve to school has not yet been reached even by 1981, when only about three-quarters of the children of compulsory education age were in school.

The Egyptian elementary school system was fragmented into several types of schools, a fact which was detrimental to the function of nation-building, and it did not provide equality of opportunity. In the school year 1925-6, elementary schools (madrasa awal al'iyya) were opened to offer free education according to the 1925 law. These schools gave a six-year course (shortened to five years in 1930) and worked usually on a half-day, two-shift basis. The primary schools (madrass tibi al'iyya) charged fees. They had better physical facilities than the elementary schools and their teachers were better trained. Perhaps the most important difference between the two types of schools was that the curriculum of the primary schools alone included a foreign language (usually English), thus making it possible for the pupils to continue their studies to secondary and higher education, while the elementary schools were terminal. In 1943 another kind of school was added—the rural elementary school (madrasa awal al'iyya rif'iyya), and special teacher training colleges were opened for them.

Beside the public schools, al-Azhar provided religious education at the elementary, secondary and higher level. Finally, there were the private and foreign schools, both religious and lay. In 1942-3 more than 25% of the elementary school pupils and more than 50% of primary school pupils were in private and foreign schools. Their role was particularly important in the education of girls. The foreign schools were accused of educating their students in languages and cultures alien to Egypt. Private schools were sometimes accused of being more interested in financial profits than in the education of their students. In 1933 and in 1940 laws were passed which imposed stricter supervision of the state over the foreign schools. These schools were instructed to teach Arabic language and the religion of Islam to their Muslim pupils. After the 1956 Suez crisis, all foreign schools were either closed down or nationalised. The relative importance of the private schools had been declining since tuition fees were abolished in the primary schools in 1945 and in the secondary schools in 1951.

It should be noted that the fragmented and deficient nature of the Egyptian school system was criticised by leading educators and administrators such as Taha Hussein and Ismail al-Kabbani in Egypt and Siwm al-Hijri in Iraq, and some steps were taken to make the system more just and less divisive. English, to make education more accessible to all social classes. The abolition of tuition fees has been mentioned. In 1938 the teaching of English was postponed from the first to the second grade in primary schools to enable more children to transfer from elementary to primary schools. Again in 1944, English lessons began only in the third grade. In 1951 a law was passed which aimed at creating a unified elementary school system of six grades. This was given effect, however, only after the 1956 revolution.

The secondary and higher levels of education developed more quickly than the elementary schools. The number of students in the secondary schools increased from 2,500 in 1913 to 15,000 in 1933 to 122,000 in 1951. This growth created pressures on the university and also created the problem of many unemployed graduates. The familiar weaknesses of the secondary education, such as rote learning and overemphasis on examinations, were not cured. Secondary and higher education were regarded mainly as a means to enter government service. It is not therefore surprising that vocational and technical education were neglected and that their prestige was low.

Higher education also developed and was modernised to some extent. In 1942 the Fath al University (renamed in 1952 the University of Alexandria) was constituted. The Dib al-Uldm, the old institute which trained Arabic language teachers, became in 1945-6 a part of the Fu'ad I University (since 1952 Cairo University). After earlier efforts to reform al-Azhar (1921), further steps were taken in 1936 in the same direction.

Educational administration in Egypt, as indeed in all the Middle Eastern states, was highly centralised, despite some efforts at decentralisation, especially after 1945, when the country was divided into educational zones. The Ministry of the Interior conducted the elementary schools of the provinces. As in Turkey, a Supreme Education Council meets periodically to discuss broad educational policy.

**Development since the 1952 Revolution** - Even the most critical review of the educational policies of the post-1952 regime would admit that the main
school students are channelled to the vocational and African countries. Teachers work temporarily or permanently in Arab is a deficit, mainly in modern languages and technical training. By 1971 the rate reached 52% in 1976. A decision to extend compulsory education to the preparatory school age group has been reached, but has not yet been put into practice. A new unified elementary school of six years, for the ages six to twelve, followed by a preparatory school (madrasa 'ibtida'iyya) of three years, and a secondary school (madrasa 'almawiyya) of three years. According to the new curriculum, the teaching of a foreign language was postponed to the preparatory school. The quantitative development has been fairly rapid. In the school year 1973-4 there were about 4 million pupils in the elementary schools, 2.6 times more than in 1952. The preparatory schools had a million students, three times more than in 1952; the secondary schools had 670,000, an increase of three times; and 334,000 students were enrolled in higher education, an increase of six times for the same period. Owing to the improvement in the implementation of the compulsory education law, illiteracy rate in Egypt has been declining, though not dramatically, from 86% in 1952, to 70.5% in 1960 and 36.5% in 1976. A decision to extend compulsory education to the preparatory school age group has been reached, but has not yet been put into practice. The most important change in Egypt's school system has been the structural transformation of secondary education from an overwhelming general or academic education towards technical and vocational training. While all the Middle Eastern states are aware of the need to slow down the growth of general academic education and to train technically skilled manpower, only Egypt has been able actually to realise that ideal. In 1952 only 15% of the secondary school students were enrolled in technical and vocational training. By 1971 the rate reached 52% and has risen to 55% in the early 1980s. Still, technical and vocational education in Egypt has serious problems of quality and status. In the general secondary education, about two-thirds of the students are in the science stream and only one-third in the literary stream, reversing the situation in the pre-revolutionary period.

Egypt has a well-developed system of teacher training for all levels, and all schools will be supplied with qualified teachers in the foreseeable future. In some subjects (such as the social sciences) there is already a surplus of teachers, while in others there is a deficit, mainly in modern languages and technical training. Nevertheless, tens of thousands of Egyptian teachers work temporarily or permanently in Arab and African countries.

Despite the fact that the majority of the secondary school students are channelled to the vocational streams for boys and girls, the pressures on the universities are growing rapidly. The universities are becoming increasingly overcrowded and understaffed, and suffer from insufficient space, libraries and teachers. In order to administer the admittance of secondary school graduates to higher education, all applications are processed centrally through a "coordination bureau", which distributes students into the various faculties according to their grades and their preferences. The figures of the academic year 1976-80 are typical: 227,500 students sat for the final secondary school examinations and 333,000 passed. From these, some 80,000 were admitted to the universities, and the other 253,000 proceeded to their studies in the various institutes for higher learning.

During the 1960s considerable decentralisation of higher education was made. The universities were granted a measure of independence. Many regional universities were established, some of them new, others as branches of existing universities.

Between 1961 and 1976 Egypt had, in addition to the Ministry of Education, a Ministry of Higher Education in charge of the universities, higher institutions, student missions and the like. In 1976 it was announced that the Ministry of Higher Education would be abolished and its responsibilities would return to the Ministry of Education. It should be pointed out that the Higher Council for the Universities, a body which lays down the national policy concerning the universities, has wide powers, and many have rendered the Ministry of Higher Education redundant.

The quantitative development has been fairly rapid. In the school year 1973-4 there were about 4 million pupils in the elementary schools, 2.6 times more than in 1952. The preparatory schools had a million students, three times more than in 1952; the secondary schools had 670,000, an increase of three times; and 334,000 students were enrolled in higher education, an increase of six times for the same period. Owing to the improvement in the implementation of the compulsory education law, illiteracy rate in Egypt has been declining, though not dramatically, from 86% in 1952, to 70.5% in 1960 and 36.5% in 1976. A decision to extend compulsory education to the preparatory school age group has been reached, but has not yet been put into practice. The most important change in Egypt's school system has been the structural transformation of secondary education from an overwhelming general or academic education towards technical and vocational training. Arab provinces in agreement with the Ottoman government was short and was stopped by the First World War.

In the interwar period, most of the Arab successor states of the Ottoman Empire were subject to European domination in varying degrees.

Libya was occupied by Italy from 1911 until 1943. During that period, the educational system was controlled by the Italians, and Italian became the main language of instruction in state schools after the third grade. From 1943 until 1951, when Libya became independent, the British administered the educational system in the Libyan provinces of Tripolitania and Cyrenaica and the French controlled the province of Fezzan.

In Palestine, which became a British mandate, the Arab school system was controlled by the Department of Education whose director was always British. There were in the system some Arab inspectors and administrators, but they did not make the educational policy. The British influence on Arab education in Palestine was very strong; the standard of English required for the Palestine Matriculation examination was high, but as a result led to the emergence of an elite of Palestinians with a high level of education and culture.

Transjordan was also placed under a British mandate until 1946, when the state became independent. Unlike other Arab states, Transjordan did not experience political struggles, and the transition from British control to purely Arab administration was smooth. Thus the Jordanian educational system had all the benefits from British assistance and advice without the tensions of other Middle Eastern countries. This was possible because of the rudimentary and primitive conditions of the Transjordanian school system at that time.

Iraq also was placed under British mandate until 1932, and the school system was administered by the British after 1925. However, the country enjoyed a large extent of independence and developed her education in a national spirit, although the school system was influenced by British teaching methods. In the days of the mandate, a British adviser was attached to the Ministry of Education but the office was abolished prior to the termination of the mandate. Leading Iraqi educators were influenced by British, American and French methods of education.

Under the French mandate following the First World War, education in Syria and especially in Lebanon underwent an extremely strong French influence, both in organisation and curriculum. The Ministry of Education in Lebanon was established in 1928 and replaced the High Commissioner's Service de l'Instruction publique, but the French advisers could still interfere in the policy of the Ministry of Education. Only after Syria and Lebanon attained their independence, and especially after the withdrawal of the French troops in 1946, were they able to assume full control over their educational systems. In Lebanon, the French character of the educational system was retained; the French educational ladder was not changed with the termination of the mandate, and the Lebanese system is still outstanding in the area in its close resemblance to the French model. Upon the attainment of independence, important decrees on education were issued, the foremost among them being that Arabic became a compulsory language; that the teaching of national subjects, such as the history of Lebanon and the geography of the Middle East, was made compulsory; and that schools could choose English as a first foreign language instead of French.

On the other hand, Syria changed the nature of her education as soon as the French left. Under the mandate, French advisers had been attached to the Ministry of Education, and in Syria too French influence was spread by the teaching of French in schools and through French private schools. Now all traces of French influence were removed from the educational system, and the teaching of a foreign language was postponed to the intermediary school.

Upon the establishment of the Arab states after the First World War, their governments showed that they were aware of the importance of education as a factor in nation-building and as a tool for progress. It was in the interwar period that illiteracy was first faced as a national problem. The first reliable educational statistics in the Arab world date from that period.

Whereas the traditional educational system was considered a religious and communal matter of no concern to the state, now, on the contrary, the new nationalist government education was regarded as another agency of the state rather than as an integral part of community life. This feeling was partly justified by the highly centralised nature of the Ministries of Education in all the Arab countries. The Ministry exercises almost unlimited powers over the school system. It determines curricula, acts as a publisher of textbooks, administers public examinations, constructs or supervises the construction of schools, trains, appoints, transfers, promotes and dismisses teachers, and finances all educational activities. According to Ottoman education laws, village communities were responsible for the construction of the school buildings. Nevertheless, the idea of municipal initiative, control, or financing of education has not yet taken root in the Arab world.

There is a marked uniformity in the structure and organisation of the Ministries of Education in the Arab states. The Minister of Education, who is a cabinet member, is assisted by a Director-General. The Ministry functions through departments for elementary education, secondary education, vocational and technical training, teacher training, curricula and textbooks, personnel, statistics, etc. The country is divided into education districts, which are identical with the administrative division of the state. In each district there is a bureau of education, which is a miniature copy of the central Ministry in the capital. Generally, the regional directors of education have little independence; they are charged with implementing the decrees issued by the Ministry and have to report local problems to the capital. Most of the school systems in the area are administered by the government. After attaining independence, the Arab states started to impose much stricter control over the numerous private and foreign schools which had been established and flourished under the protection of the European powers. Now the Ministries of Education demanded that the national subjects be taught in the private schools in Arab and Palestinian citizens of the host country. The closer inspection of the private schools and progress in the implementation of the free and compulsory education caused the proportion of pupils in private and foreign institutions to decline, especially in the primary stage. Even in Lebanon, the only country in the Middle East where private education is more important than state education, the weight of state education has been growing. Under the French mandate, a state elementary school system emerged.
it served mainly the Muslim population, which was less attracted to the private Christian institutions. A state system of public secondary schools started to develop after 1949. Total arabisation of the school system was emphasised as an expression of national sovereignty. Nevertheless, minorities were allowed to use their language in their schools, as demonstrated by the 'Irākī Local Languages Law of 1937 which provided for the use of Kurdish and Turkish as the medium of instruction, with Arabic as a second language, in the regions where these minorities constitute a majority.

The need to train teachers was one of the most urgent tasks facing the Ministries of Education. The teachers were the same uncertain status as the teaching profession below the university level does not attract the best men and women, and the social status of the teachers is lower than it was in past generations. Until the 1930s there were multiple ways and levels in which teachers were trained in the Arab world, ranging from courses lower than the secondary school up to two years above the secondary school. In recent years, with the tendency to standardise the educational levels and methods in the Arab world, the most common teacher training college begins after graduation from the preparatory or intermediate school and lasts four or five years. In recent years, with the rapid growth of higher education, the training of teachers for secondary schools is entrusted to the university schools and faculties of education. In the interwar period, all the Arab countries suffered from shortage of trained teachers; only Egypt and 'Irāk came near to self-sufficiency.

Recently, this situation has improved considerably, but there is still a shortage of teachers for certain subjects (mostly foreign languages, the sciences and technical training). Generally, the teacher shortage worsens as one goes higher up the educational ladder.

The most formidable problem with which the education authorities have had to cope has been the widespread illiteracy, which reached 80-90% of the population in most countries of the region in the interwar period. Since adult literacy campaigns have not been efficient in the middle East, the main burden was placed on the elementary schools. Generally speaking, the principle of free elementary education was accepted throughout the Arab world at an early stage. Yet the idea of legislating for compulsory education stage to apply also to the intermediate school. Other countries, including Egypt, are contemplating doing the same, but will probably do it officially only after reaching full or nearly full attendance rates at the elementary stage.

Achich, the difficulties in bringing all children to school are similar in the Arab countries, although their severity varies from one country to another. It is difficult to provide education for bedouin tribes or for small and remote villages. The realisation of the importance of education was not universal a few decades ago. Parents have been reluctant to send their daughters to school, especially after puberty, as they regarded this as contrary to traditional morality. Until today, the illiteracy rate among women is higher than among men and the percentage of girls who attend school is lower than that among boys; that among women, especially in the countryside. Many parents refrain from letting their children go to school because they need their help in the field, the workshop or at home. This tendency has been strengthened by a widespread feeling that the curricula taught at school are unsatisfactory and irrelevant to the needs of the community. Besides, there are not enough qualified teachers. Another problem is a severe shortage of classrooms, and many classes are lodged in rented rooms. Schools often operate in two or even three daily shifts because of scarcity of space. Many children do not enter school at all, and many pupils fail to graduate. Children who leave school after a few years relapse into functional illiteracy. Of course, some of the shortcomings were in the past caused by lack of funds. This factor has been fundamentally changed in those countries of the region which have large incomes from oil, although it has made its notable impact on education only recently. Yet, generally, some of the above-mentioned difficulties have been alleviated recently, and education in the Arab world has been making a qualitative as well as a quantitative progress. The beginnings of systematic planning of national education by the Arab states, including five-year-plans, belong to the 1960s, and have helped to clarify the problems and to approach them more efficiently.

Although demand for secondary education has been growing rapidly, the elementary school is still terminal for some 70-75% of the pupils in the Arab world. The promotion from the elementary to the secondary (or intermediate) stage is determined by passing external examinations, except in the few countries which have made the intermediate stage compulsory. In the interwar period, access to secondary education was extremely limited. Usually, there were no secondary schools outside the towns, and although there were dormitories attached to a few schools in the cities, the vast majority of the population which was rural was deprived of post-primary education. Besides, tuition fees were a serious barrier for poor students, although there were some exemptions on the basis of good grades or financial need. By 1950, tuition fees in the state secondary schools had been abolished throughout the Middle East, and in the 1960s the universities, too, became free
of charge. The popularity of secondary education should be partly ascribed to the fact that it is considered a gateway to higher education and then to a government post. Another motivation for study in a secondary school was exemption from military service or the possibility of service under favourable conditions in some countries.

The weaknesses of the secondary education are well-known, and are in fact an inheritance from the pre-modern period: the overemphasis on rote learning, discipline, examinations, the heavy load of subjects to be taught and frontal lessons. Most of the secondary schools in the region are not equipped with sufficient libraries, laboratories and playgrounds. Secondary education has been overwhelmingly academic; vocational and technical education have been neglected or even looked upon with disdain. In the recent two decades, official attitudes toward vocational and technical education have been changing, but among the Arab states of the Middle East, only Egypt has accomplished a structure change in secondary education by channelling over half of the students into technical and vocational schools.

In the first decades of their independence, the educational ladders in the Middle East differed widely from one Arab state to another. The school system was influenced both by the elements inherited from the Ottoman Empire, which on their part had been shaped by the French model, and by the example of the European mandatory powers. Since the end of the Second World War, the Arab educational systems have been drawing closer to each other, and efforts have been made to coordinate the curricula, the organisation, and the terminology of the educational systems. Egypt has been the object of emulation in a secondary school was exemption from military service, or the possibility of service under favourable conditions in some countries. Over the years, various inter-Arab conferences have been called for coordination of the school systems. Many inter-Arab conferen¬
ces. Over the years, various inter-Arab conferences have been called for coordination of the school systems. Many inter-Arab conferences have been called for coordination of the school systems. Thus today the educational ladder of 6*3-3 is the most common pattern in the Arab world, although there have been other variations, such as the Lebanese pattern, Kuwait (4-4-4), and 'Irak (6-3-2). There are other differences in the curricula, mainly in the teaching of foreign languages and religions instruction. There is a tendency to postpone the teaching of the foreign language to the intermediate school. Yet in Lebanon, Jordan, 'Irak and South Yemen, it is taught in the primary school. 'Alawi Arabia and Sudan devote more hours to the teaching of Islam than other Arab states.

Occasionally, conferences are held to discuss and coordinate educational and cultural policies of the Arab countries. Thus in 1947 a convention was held in Lebanon to coordinate methods of teaching Arabic. In 1957 the important Agreement of Arab Cultural Unity was signed by Egypt, Syria and Jordan, and was joined a year later by 'Irak. The agreement called for coordination of the school systems from all the cultural, pedagogical and organisational aspects. Over the years, various inter-Arab conferences and conventions have been held which have dealt with the teaching of civics, textbooks, examination conditions in some countries, educational planning, the teaching of the sciences, illiteracy, etc.

Bibliography: The bibliography on the history of education in the Ottoman Empire and its successor states is vast and of greatly varying quality; it is accordingly impossible to try to give anything resembling an exhaustive list. The best sources for the current educational developments in the area are the official reports and publications of the Ministries of Education and reports and studies prepared by UNESCO and by other regional and international organisations.

2. In North Africa

However, the problem of quality remains outstanding in the framework of Arab-French bilingualism. In the first place, the process of apprenticeship of the French speaker gives him a privileged place at the outset in acquiring competence in communication through language expression (aptitude at varying the message according to psycho-social-cultural conditions, in connection with purilo-linguistic communication (skill in transmitting a message orally or by means of writing in accordance with the rules of the languages). Hence the option of keeping up Arab-French bilingualism, 25 years after independence, forms part of a project concerning with general culture: (1) primacy for Arabic ("the language which expresses the Tunisian cultural identity and authenticity"); and (2) the opening-up of the educational system on the problems of development defined by the Fifth Plan (1977-82), the aim of educational policy being to favour the development of education, alter the orientation of primary teaching, improve its quality and its impact by developing the child's personality, thereby ensuring for him at one and the same time an intellectual and a manual training (this latter orientated towards the industrial and agricultural techniques built into the teaching), reduce losses of pupils and the inequalities of fortune and fate, and thus facilitate the integration of young people into the economic life of their home districts and regions.

Yet this attachment to French language and culture has always provoked debate between the supporters and opponents of bilingualism since independence. The problem of arabisation (باير) has always stirred up controversy, sometimes violently, and has released religious, political and philosophical passions, as it endeavours to make some people realise their "linguistic, and even cultural, mutilated state". A process of acculturation is felt to be at work here: (1) the French language—considered as one which is widely-spread through the world and one which gives access to a culture with a universal, scientific and technological character—presents itself as a strong rival to Arabic, the bearer of deeply-rooted values, and seen as the language of communication and of liberation; and (2) the two cultures, Arabic and French, express a class antagonism between the comfortably-off classes and the rest, and a confrontation between modernism and traditionalism.
the elite, since "primary education is a right for everyone, secondary education is a necessity, and higher education meritorious". Lengths of the stages of education: primary, 6 years; secondary, 7 years (3 years of a common core and then three branches leading to baccalaureates in letters, mathematics and sciences or mathematics and technology); and higher, 7 years (3 years of a common core and then three branches leading to the baccalaureates in sciences, the medical and biological sciences and the human and social sciences, totalling in 1982 53 units, the Faculty, Schools and Institutes).

B. Algeria. On the eve of independence in July 1962, the educational system inherited from the colonial period (ie. the French system as it existed before 1966) was kept in being, like all the other institutions which were not contrary to national sovereignty. Under the stimulus of a Ministry of National Education, this system slowly evolved and then changed radically after 1970. The slow period of evolution consisted mainly of an adaptation of the content of syllabuses (concentration of studies on Algeria), the gradual Algerianisation of the teaching personnel (accompanied however by a massive appeal for co-operation from other Arab countries) and the arabisation of a certain number of sectors: the first two primary education years in 1956 and then the higher classes, with the preservation of the French development for the basic foreign languages. From the third year onwards, immediate arabisation in secondary and higher education and the opening-up of official channels in the Arabic language.

In 1970 a fairly important change took place. The Ministry of National Education was split up into a Ministry of Primary and Secondary Education and one for Higher Education and Scientific Research. At the side of these two there was set up a Ministry of Basic Education which started to put into effect a parallel system of education, but one completely organised. In 1971-2 higher education was completely reorganised. The essential preoccupations of the Algerian government which lay behind this reform were the following: "to form the type of cadres of which the country has need, a cadre engaged in the work of socialist reconstruction and filled with the Algerian national personality and the socio-economic realities of the country. From this follows the new shaping of the subjects of teaching and educational qualifications and their integration within educational frameworks based on a new criterion indicated by the sectors requiring these skills. A student must accordingly be directly operational". The organisation of these subjects of teaching was inspired by what existed in certain western countries and those of the East: the substitution in place of an annual curriculum structure of a system of semesters, units of teaching (modules) and the consequent institution of continuous control of courses. The application of these reforms got under way only with great difficulty. Moreover, it required the recruiting of a considerable number of assistants, often at the expense of quality. The establishment of courses of instruction in Arabic parallel to and not instead of those already being carried on in French developed extensively in this period. This distinct monolingualism has not been without serious consequences for the cultural unity of the country.

In regard to primary and secondary education, the system was extensively remodelled in 1957 (by the application of law no. 7635 of 16 April 1957). Henceforth it was to be made up of three levels: preparatory, basic and secondary. The basic school, a fairly original concept, had as its aim the providing of a basic education for all, compulsory and lasting nine years (up to the third grade class of the old system). In order to get the system into operation as quickly as possible, the ministry in charge of this sector of education was in 1958 divided up into a Ministry of Basic Education and Instruction and a Secretariat of State for Secondary Education.

The lack of personnel at the teaching level has led to the extensive establishment of a grade of elementary (Brevet élémentaire) teachers (instructors) or of a grade of elementary teachers (monitors). This last group made up 42% of teaching personnel in 1965. By 1976 it was only 14.8% and had disappeared totally in 1977. On the other hand, because of the drive towards homogeneity in education, non-state education (secular and confessional) was integrated with public education (Kur'ān schools, madrasas and ariyas in 1963, private education in 1977). In the same year, all the institutions within the
jurisdiction of the original educational system, which was dissolved, were integrated in the Ministry of Primary and Secondary Education.

Other forms of education have also been made possible by other Ministries, who have started "institutes for technology" or institutes for higher studies in order to provide trained personnel for "institutes for technology" or institutes for higher studies in order to provide trained personnel for their own needs. A Ministry for Professional Education has been in being since 1981.

The growth of those undergoing education has been rapid and great since 1962, at all levels, as the following table shows:

Average annual rate of increase: 8.17%
action which guided the Moroccan government's educational policy after independence: making attendance at school available for all children of appropriate age; unifying the different types of schools left behind by the colonial power; the arabisation of curricula and the language of instruction; and the moroccanisation of the body of teachers.

The results obtained after a quarter of a century of massive investment in the educational sector are impressive, as the following table of the school enrolments shows:

These figures demonstrate the size of the financial resources devoted by the state to public education—almost 25% of the annual budget—which have enabled the transformation of the embryonic educational network inherited from the Protectorate into a vast and complex system.

The present educational system, whose structure is to a considerable extent modelled on the French one, comprises three levels. Primary school lasts for five years and accepts children from the age of seven. This first level is completed by a nationally-organised examination (the certificate of primary education) which gives access to the following level.

Secondary education is itself divided into two stages. The first four years, forming the first cycle, are common to all pupils. Then at the end of this, specialist educational advisers divide the children, according to their aptitudes and wishes, into differing channels of the second cycle. The fifth year of secondary education offers two options of general education (scientific and literary) and two technical ones (commercial and industrial studies). In the sixth and seventh years, the choice is even more varied, with a spread of six channels, each one leading to a distinct type of baccalauréat.

Higher education comprises two groups of institutions. In the universities, which are controlled by the Ministry of Education, students can follow the usual groups of studies, such as arts, law, economics, science and medicine. At the side of this channel of classical university education, which 90% of students of higher education follow, there exists a complete network of specialised schools and institutes of higher education functioning under the control of different technical government departments and aiming at training engineers and the middle management grades which will work in the public and semi-public sectors. Among the most important of these are the Mohammed Veterinarian School, the National School of Public Administration, the National Institute for Statistics and Applied Economics, the National Institute of Posts and Telecommunications, the Higher Institute of Commerce and Business Administration, etc. There further exists a certain number of pedagogical institutions (regional schools for primary teachers, regional pedagogical centres and teacher training colleges) intended to prepare Moroccan teachers in order to replace foreign instructors, especially in the scientific disciplines.

Considerable progress had been made towards arabisation. All literary topics are taught in the official language. The arabisation of scientific courses has spread outside the regular academic framework and will be progressively extended to the secondary and higher levels.

From the legal aspect, it should be stressed that school attendance is compulsory till the age of 13 and that education is free at all levels. Moreover, over the last 12 years or so, the government has adopted a policy of granting very generous scholarships for the large majority of students of higher education.

Nevertheless, despite these very positive results, the Moroccan education system has for several years gone through a severe crisis of development whose main components can be set out in the form of three paradoxes with interconnected effects. In the first place, despite a great increase in public expenditure on education and in the number of children enrolled in the schools, making primary education general remains a distant ideal because of the population growth (3% per annum). In the second place, a significant share of the resources devoted to the educational system is wasted because of the high rate of these having to repeat courses or abandoning them altogether. Finally, educational planners find themselves faced by a lack of correspondence between the "products" of the educational system and the employment needs of the labour market, above all in the scientific and technological fields.

The sum total of these difficulties which the Moroccan educational system has come up against, like those of many other young countries of Africa and Asia, has led the authorities in the Ministry of Education to prepare at the present time a long-term reform programme which will allow the Moroccan educational institutions to be better adapted to the needs of a changing society and to enable them to play a more positive rôle in the country's development process.

Bibliography: A detailed description of the Protectorate's educational policy is given by the Directorate of Public Education in Morocco in its Bilan 1945-59, Rabat 1959. A more analytical treatment has been made by L. Paye, Enseignement et société musulmane, introduction et évolution de l'enseignement moderne au Maroc, thèse d'état, Paris, Sorbonne 1957; see also the section on this topic in Ch. A. Julien's Le Maroc face aux impérialismes, Paris 1979.

The main research works on Moroccan public education are those of A. Malatouv, Tendances actuelles de l'enseignement au Maroc et problèmes d'orientation scolaire, Contribution à l'étude des problèmes actuels de l'éducation au Maroc, pays du Tiers-Monde, thèse de 3e cycle, Paris 1970; A. Mezuaz, Enseignement supérieur au Maroc et développement, Mémoire de DES, Casablanca 1977; J. Salmy, Educational crisis and social reproduction: the political economy of schooling in Morocco, Ph.D. thesis, Univ. of Sussex 1982. Various more descriptive articles and studies should also be mentioned, including Montassime, La politique de l'enseignement au Maroc de 1957 à 1977, in Maghreb-Machrek, no. 79 (Jan.-March 1979), 29-54; C. Tibi, Politique éducative et financement de l'éducation au Maroc, Institut International de Planification de l'Éducation, Unesco, Paris 1976; A. Baina, Le système d'enseignement au Maroc, Casablanca 1982; M. Merrouhi and M. Souali, Question de l'enseignement au Maroc, in Bull. Économique et Social du Maroc, quadruple no. 143-4 (1962), which has a very complete bibliography. The most useful of the regular publications are Le mouvement éducatif au Maroc and prepared each year by the Ministry of National Education; Altâdîres, a twice-yearly educational review published by the École Normale Supérieure, Rabat; and the cultural chronicle on Morocco which appears each year in the Annaire de l'Afrique du Nord, Aix-en-Provence.

(J. SALMY)
Before the appearance of secular education in Iran, what primary education there was was essentially that of the maktab or skütâb [q.v., where children from the age of six or so learned the rudiments of reading and writing. Islamic religion and some arithmetic. These maktab, as small-scale, informal, locally-organised institutions, continued to exist in the small towns and villages of Iran till after the Second World War, although after 1925 they had to use Ministry of Education textbooks.

Organised higher education may be said to go back to the pre-Islamic medical school and hospital at Dhourshâphûr in Ahwaz (see GONDAGH), but under Islam, the medresâs [q.v.] took over the function of higher religious education, teaching, however, in the Safavid period to become exclusively centres for the training of the Shi'ite clergy, so that by the end of the 19th century, there was virtually no awareness in Iran of the modern intellectual and scientific progress of the West, and little attention was paid also to the rich heritage of classical Islamic scientific and secular literary production.

The impetus for the acquisition of modern Western science and technology began to be felt by the leaders of Iran under the Russian threat to the northwestern provinces of Iran early in the 19th century. Abâbs Mîrzâ [q.v.] the enlightened Qâdir crown prince directly concerned with Iran's defence against Russia, and his able minister Mirzâ Buzurg Kâfîn-i Mâlam [see Kâm-i Mâlam-i Fârâbî], tried to modernise the Iranian army; he told the British envoy James Morier in 1809 that "no pains have been spared to acquire a knowledge of military tactics and theory of fortification which they had gleaned from French and Russian books translated by 'Abbas Mîrzâ's order" (see A. K. S. Lambton, Persian society under the Qadjârs, in JRCAS, xlviii [1960], 122-39).

Negotiations with the embassy sent by Napoleon under General Gardane in 1807-9 (see R. M. Savory, British and French diplomacy in Persia, 1800-1820, in Iran, JBIJS, x [1973], 31-44) for training the Iranian army included the project of sending 200 Iranian students to study in France, but this project never materialised. In 1811 and 1813, seven students were sent to London for training, and this was the first attempt by the state to acquire an element of modern science and learning through sending students abroad.

Modern Western-type of education dates from the establishment of the Dâr al-Funûn, the term being a rendering of "école polytechnique", in 1851 (see Qâmî'). In 1848, Násir al-Dîn Shâh began his reign and immediately appointed Mirzâ Ta'âl Kâfî, later called Amir Kâbir [q.v. in Suppl.], as his minister. Amir Kâbir ushered in many reforms, and prepared a project for the establishment of a modern-type university, mainly to train experts for the army and the higher echelons of the civil service. He started on the necessary building and engaged a number of professors from Austria for it. The university was inaugurated by the Shâh in 1851, only a few days after its initiator, Amir Kâbir, had fallen from power.

The Dâr al-Funûn was a combination of a military college and a secular university. Branches of study comprised infantry, cavalry and artillery sciences; medicine, physical sciences, mathematics, pharmacology, cartography, history, geography, and the Persian, Arabic, French and Russian languages. In addition to the Austrian professors who were engaged for six years, a number of European experts already in the service of the Iranian government were assigned to teaching posts, as well as a number of native Iranian scholars.

For the first year, 150 students were enrolled. Studies were free, and students were given a free mid-day meal and two uniforms per year. It had a theatre and a model factory attached to it, and was well-equipped with laboratories. Although the Amir Kâbir was executed soon after the opening of the Dâr al-Funûn, it continued its work. Amir Kâbir's reforms, and particularly his founding the Dâr al-Funûn, were not applauded by the powerful Muslim clergy, but as he had linked it with the needs of national defence, it was difficult for them to oppose it (see F. Adamiyyây, Amir Kâbir va Irân, Tehran 1348/1969).

The Austrian professors wrote many textbooks in their respective fields, and these were translated into Persian; thus not only was modern science introduced into Iran, but also, the foundations for modern Persian scientific terminology were laid.

The Dâr al-Funûn was a landmark in the history of Iranian education, both as the first organised attempt to introduce modern science and technology and also as the first attempt by the state to assume responsibility for public education. For over forty years its work was responsible for the education of an élite class of intellectuals who were in no small measure responsible for the establishment of constitutional monarchy in 1906 (see F. Adamiyyây, Febr-i Asr, Tehran 1340/1961).

Násir al-Dîn Shâh became increasingly suspicious of the new learning, and education stagnated in the later part of his long reign. In 1855, the Ministry of Science (Wiwârât-i Uliyâ) was created. In 1858, 42 students were sent to France to study in various scientific fields. In 1871 a modern school with European teachers was established in Tabriz.

In the last decade of the 19th century, two colleges of higher education were established which later became faculties of Tehran University. One was the College of Political Sciences, primarily intended for the education of future diplomats, and the other was the College of Agriculture, with training at secondary school and university level. With the creation of the Society for Promotion of National Education, many philanthropically-inclined citizens were encouraged to endow and start their own private schools on modern lines.

The reformist movement which had started early in the reign of Násir al-Dîn Shâh was fully conscious of the inadequacy of the traditional maktab-madrasa type of education, and worked towards the adoption of a modern Western-type of education. Mirzâ Mâlakam Khan [q.v.] was the first to propose a national system of education, similar to the French one of primary, secondary and university stages (see Admiyyây, op. cit.). Others, more nationalist and anti-clerical, like Mirzâ Fâhî Makâm-i Fardûsî [q.v.], Mirzâ A'âl Khan Kirmâni [q.v.] and Tâlibov, demanded a secular system of education.

The constitutional period, beginning in 1906, inaugurated a period of upheaval for Iran, with the re-imposition of despotic Qâdir rule, pressures from outside powers during the First World War years and finally the downfall of the Qâdir [see MAJâ'IS-e TAVâRBî and KâDIR], yet a great deal was done for education between 1906 and 1925.

In 1920 the Majâlî passed the administrative Law of Education which established the Ministry of Education (Wiwârât-i Ma'ârif va Awkal va Sânû'ât-i Mustarjâf), whose responsibilities included also, as its name implied, pious endowments and the fine arts.
Responsibility for public education was assigned to this Ministry. In 1917 the Fundamental Law of Education made the Ministry responsible for the provision of basic education for all children aged from 7 to 13 years of age. This law also recognised the existing state of education: primary, secondary and higher stages. Private schools were recognised, but they all had to carry out the curriculum ratified by the Ministry of Education. Corporal punishment was banned in all types of school (see further on the provisions of these laws, Issa Sadiq, *Modern Persia and her educational system*, New York 1931).

In 1918 the Central Teachers' College was established for training secondary school teachers. A number of French teachers were engaged to teach modern sciences, and eminent Iranian scholars came to be associated with this college, later called the Higher National Teachers' College. When the University of Tehran was established in 1935, this College was incorporated into the University to form its faculties of Arts and Sciences. In 1921 the School of Law was established and a number of European teachers engaged to teach modern jurisprudence. In 1922 a law was ratified by the Majlis establishing the Supreme Council of Education, which was the legislative and supervisory body with regard to all matters pertaining to education. Thus with the education acts of 1910, 1911 and 1922, the foundations were laid for a national system of education.

With the advent of Rıdā Shāh Pahlavi [r.], Minister of War in 1921, prime minister in 1923 and voted as Shāh by the Constitutional Assembly which deposed the Qādjar dynasty in 1925, a new era began in the history of Iran, one marked by unification of the country under a strong central government, economic progress, the first steps towards emancipation of women, a resurgence of Iranian nationalism and further progress in education.

The need for trained people in higher education prompted the new Shāh to introduce a law into the Majlis authorising the Ministry of Education to send at least ten students abroad every year for higher education; the first group left for France in 1928. Scholars sent abroad under this law provided the future universities with the bulk of their teachers and also manned important posts of state. At the same time, the government engaged a number of foreign professors to teach at centres of higher learning. Whereas there were 283,000 students in primary schools in 1941, the figure rose to 4,476,000 in 1976. Secondary school enrolment rose from 23,000 to 2,337,000, and university enrolment from 3,567 to 11,54,000 in the same period. The increase in educational expenditure was from 154 million rials in 1941 to 260 billion rials in 1976. In addition, in 1976 there were some 69,000 Iranian students studying at foreign universities, mainly in the United States and in Western Europe.

Under Muhammad Rıdā Shāh Pahlavi [r.], there was an enormous growth in all fields of education. Whereas in 1941, the figure rose to 4,476,000 in 1976. Secondary school enrolment rose from 23,000 to 2,337,000, and university enrolment from 3,567 to 11,54,000 in the same period. The increase in educational expenditure was from 154 million rials in 1941 to 260 billion rials in 1976. In addition, in 1976 there were some 69,000 Iranian students studying at foreign universities, mainly in the United States and in Western Europe.

In 1943 a law ratified by the Majlis made the University of Tehran autonomous. Between 1949 and 1950, new universities were established in Tabriz, Ahvaz, Isfahan and Mashhad. In 1962, Pahlavi University was established in Shiraz, in 1957 the National University opened in Tehran, and in 1962 the Arya-Emir Technological University was inaugurated in Tehran. By 1964, eleven new institutions of higher education had been established. In 1963, the law establishing the Literacy Corps or "Army of Knowledge" (Sipāh-i Dāmiš) was ratified. According to this law, young men of military age, with secondary school certificate, could choose to undergo four months of training as primary school teachers and afterwards teach for 20 months in remote rural areas, this being regarded as in lieu of military service. Between 1963 and 1969, some 1.3 million children and adults had been taught by the Literacy Corps in 24,000 villages.

In 1963, the system of primary and secondary schools was reorganised. The primary school was allotted 5 years, the "guidance" school 3 years after the primary school and the last four years of secondary school could be devoted to specialised studies relevant to the university course which the student planned to follow. Alternative vocational and technical schools were provided after the primary school and after the three years of "guidance" school, this system marking a considerable improvement over the previous one.

In 1968 a new Ministry of Science and Higher
Education was created to deal with ever expanding higher education. The new Ministry authorised the establishment of private colleges of higher education, higher education. The new Ministry authorised the establishment of private colleges of higher education, but the experiment was not a successful one, and all the private colleges were nationalised in 1974. Also in 1974, education at all levels was declared free by the Shah.

The demand for the growth of secondary education had created a large number of applicants for university places. Notwithstanding the fast expansion of educational facilities, only a fraction of the applicants could find places. The accumulating number of young people whose levels of aspiration had been thereby raised, but could not be satisfied, was another factor responsible for the discontent that led to the 1979 Revolution in Iran, but the consequent closure in effect of the universities as potential centres of resistance, and the relegation once again of women to an inferior status under the Khumayyid régime have diminished rather than enhanced educational opportunities.

MA'ARRAT MA'RIN or MI'RIN, a small town in North Syria (lat. 36° 50' N., long. 36° 40' E.). It is 40 km. to the north of Ma'arrat al-Nu'mán [q.v.], 30 km. south-west of Aleppo or Halab [q.v.], and 12 km. north-west of Sarmlu. It owes its importance to its position between the districts of the Djazr and the Djubal al-Summak and its vicinity to the town of the Djazr and notably Ma'arrat Mar' in. As the chef-lieu of a nahiya of the mukāfat of Halab, situated in the district of the Djazr, Ma'arrat Mar' in had 3,000 inhabitants in 1930 and 5,000 in 1945, and came under the kādī of Idlib.

The name of the town is often given in the form a'arrat Mar' in, but it is also called Ma'arrat Mar'in, which some authorities, such as al-Mukaddasi and Abu T-Fikād, connect with the name of Kinnārūn [q.v.], the 'āmil of which the town formed part, just as Ma'arrat al-Nu'mān [q.v.] was sometimes designated Ma'arrat Him in by an allusion to the a'āmil to which the town belonged. In the 8th century, this town, situated in the bāb of Antiyya [q.v.], is called Ma'arrat Munīr; the monastery of Bēth Mari Kānūn was there. In the chronicles of the Crusades, one encounters the names Megenat Basrin or Menguaret; Munīr. In Isma'īlī's Guide (7.4), one reads Maarrat Moucerin.

History. In the year 1063, after having defeated a large Byzantine army drawn up between Halab and Ma'arrat Mar' in, Abu Ubayda [q.v.] conquered this town, which surrendered on the same conditions as Halab [q.v.]. In the Abbadid period, under the caliphate of al-Mutawakkil (d. 247/861), 'Amr b. Hārbar, originally from Ma’arrāthā al-Buraydiyya, a locality near Ma'arrat al-Nu'mān, held the office of governor of Ma'arrat Mar' in. A century later, in 357/968, a revolt against the Abbasid caliph Malik al-Rummān was suppressed by Sunfcur al-Bursuki [q.v., governor of Mawān, formerly served as the market for this region which was the capital of a fief of the Banū Kilab, sent one of his amirs, Abū Maṣrūn Sulaymān b. Tawil, to attack Ma'arrat Mar' in; the place was captured and its commander taken prisoner. In 454/1062, a short time before the death of Ma'izz al-Dawla Thālib, the Byzantines succeeded in making themselves masters of the town by trickery. Asad al-Dawla 'Atiyān succeeded his brother in Halab but, in 457/ 1065, his nephew Maḥmūd b. Naṣr, with the help of the Kilābīs, was successful in turning out his uncle and setting himself up in his place. However, some discontented Kilābīs helped 'Atiyān to attack Ma'arrat Mar' in in 458/1066 and recapture it from his nephew. In 496/1007 the Franks besieged Antiyya, where the Saldjukid governor Vaghi-Siyākī resisted them. During the siege, the Franks went in Saraf 497/January 1008 to pillage some of the towns of the Djazr and notably Ma'arrat Mar' in. In Djumādā II 497/June 1908, Antiyya was taken; Vaghi Siyākī escaped, but he fell from his horse at Armanāz, not far from Ma'arrat Mar' in and, mortally wounded, is said to have been killed by some Armenian woodcutters who carried his head to Bohemond.

After having taken Harim [q.v.] in Shābān 492/July 1008, Raimond Pilet, with a detachment of the army of the Comte de Saint-Gilles, crossed the Rūdā and captured the town, which was integrated into the Frankish defences to the east of the Orontes. When Baldwin of Edessa had been taken prisoner, the Frankish garrisons were attacked in 497/1004 in the district of the Djazr by the inhabitants of al-Fu'a, Sarmlu and Ma'arrat Mar' in, who inflicted heavy losses on them and drove them out of the region. Richān of Halab received a good reception and occupied the town, which came to play the role of frontier-post (Magże) for the Muslims. In 505/1115 the population of Ma'arrat Mar' in, which had been left by the Shāh Isma'ilis, who were numerous in the district; two years later, in Dhū 'Alī-Khađa 507/ April 1117, a group of Isma'ilis recruited in Ma'arrat Mar' in, Aflunīya, or Mar' in, and Ma'arrat al-Nu'mān, tried to attack Shayzar during Easter, but were repulsed by the Banū Munīkīn.

In 514/1120 Tughlaqūn and Igbūlūn, lords of Halab, arrived to besiege the Franks who had withdrawn to Ma'arrat Mar' in; when Baldwin proceeded to the rescue of the Crusaders, the antagonists reached a peace agreement granting the Westerners a certain number of places, including Kāfārākh, al-Bār [q.v.] and Ma'arrat Mar' in, whence the Franks could keep a watch on the Turkomans. The Frankish fief of al-Aṭārib extended as far as Ma'arrat Mar' in at that time. In Radjab 520/August 1126, when Ak Sunqūr al-Bursuki [q.v., governor of Mawān, invaded the territory of Sarmlu, he found the Franks camping in front of him near the cisterns (baṣād) of Ma'arrat
Magra; they retreated several days later to their territory because of their lack of provisions.

For several years, the region of the Djaaz was to witness the constant passage of Crusaders and Muslims. In 524/1134, Imad al-Din Zangi, having become adab of Mawjil after the assassination of Ak Sunkur, profited from the conflict which broke out between Alice of Antioch, widow of Bohemond, and her own father Baldwin II, to acquire the most outstanding parts of Ajnabir and Ma'arrat Masrin, which he captured for a while from the Franks. In 527/1134, the amir Sawak, lieutenant of Zangi in Halab, undertook a plundering expedition against the Djaaz and the citadel of Zandamah; he surprised the Franks near Harim, invaded the territories of Ma'arrat Masrin and Ma'arrat al-Nu'man, and returned to Halab loaded with booty.

In 57/1127, Salih al-Din, in order to bring the Imam of Haddhahyya to reason, mounted a punitive expedition against their territories of Samra, Ma'arrat Masrin and the Diabal al-Summah, which inhabited him massacred; he then entrusted to Shihab al-Din al-Harimi, his maternal uncle, the district of Hamat [q.v.], which was rich in fortresses.

In the Ayyubid period, Ma'arrat Masrin often changed masters; in Dmaikd 1 60/July 1222, al-Malik al-Salih, son of al-Malik al-Zahir Shuhdu, acquired the territories of Shughur and Bakas, Rafa' and Ma'arrat Masrin, which he was to exchange later, around 622/1227, for some places situated to the north of Halab, such as Asyatub [q.v.], and Ramlanda. In 617-8/1219, the region was devastated by the Khazarimans (see KHARAZIMIANS).

In the modern period, the town seems only rarely to have been visited by travellers. The consul J.-B. Rousseau speaks of it in 1814 in his description of the part of the region that is one of the most fertile and rich in the world. To the west of Ma'arrat al-Nu'man, since classical times there has been cultivation of olive trees and vineyards; near the town, in the gardens, grow pistachio and almond trees, while to the east, stretch fields of cereals (corn and barley). The region produces three essential commodities: corn, olives and raisins for immediate export, which leads to "recruiting concentrations in great masses of these specialized products" (Chelemba, 1910, p. 70). If one accepts the identification of Ma'arrat al-Nu'man with Ara, the existence of a human settlement on the site of the present town very near to Tell Mammis dates back to the first millennium B.C. In fact, Ara is mentioned in the Assyrian texts among the conquests of the empire in 738 B.C. There is no doubt that it is the same town which appears under the name Ara as one of the Greek-Roman cities of the Antonine itinerary which is identifiable with the Megara of Strabo and which becomes Mursa in the Latin chroniclers of the Middle Ages, while the Western historians of the Crusades call it La Marre or La Maire.

According to the Arab authors, the form Ma'arrat al-Nu'man designates in the Umayyid period a town and a district situated in the fourth climate and belonging to the Khand of Hims; then, from the time of Harun al-Rashid, it was incorporated in that of Hims in [q.v.]. This is why the geographer Ibn Khuwaridjih (d. before 278/891) designates this region as one of the "Bakhtiyar" [v.]. According to the "Baladhi" (d. ca. 275-862), it is situated on the eastern fringe of a massif similar to that of Hims, called "alkhiz" [v.]. In the period of the Fatimids, the region was at one time called Dab tu Knisk "the town of palaces", al-Dimashki speaks of Dab tu Kusru, "the one with two palaces".

The second part of the name of the town, according to the "Baladhi", repeated by al-Harawi, is taken from a Companion of the Prophet, al-Nu'man b. Baqrd al-Anuwi [q.v.], who, in the sulpah of Mi'inawin, was governor of Kifta and the region of Hims and who was killed in Ma'arrat on the death of Yazid, the governor of Ma'arras is said to have been Nu'man b. Baqrd, who himself died in 68/688. There is another tradition according to which the second name is taken from al-Nu'man b. Baqrd al-Sufi, of the Banu Tanbih family who lived in the town and the region. Ma'arrat al-Nu'man, since its establishment, has become an important crossroads and active economic centre. The town is situated on the north-south axis, which, from Homs at the foot of the Taurus, goes as far as Palestine passing via Halab, Harim, Hims...
them, but was taken prisoner at nl-Buraghithl.

b. Sa'Id, commander of this place, went to meet nomads penetrated into Syria from Na^irt: when they killed many people there and took captive of Ma'am t aI-Nu

Safi Yahya al-Maghribl whom Saladin visited. This was a place of pilgrimage frequented in the 7th/i3th century. It is in this village that there lived the

buried in Dayr Sam*ftn ia al-Xakira to the south-west.

...
Maarrat al-Nu'man was to change hands several times. In 431/1041, the Hamdanid Nasir al-Din Ali confronted the Mirdasid Thimãl, master of Halâb, and took possession of Ma'arrat al-Nu'man. In 452/1060 Thimãl, in the course of an expedition against his nephew Mahmûd, stayed in the town whose inhabitants had to suffer the enemy occupation. Five years later, after entering Halâb, Mahmûd the Mirdasid, sent Hârân, a Turkish leader, to capture Ma'arrat. On 478/1085, and in September 666, Nu'mân penetrated into the town with more than 7,000 men comprising Turks, Duyaml, Kurds and men from the al-Awdî tribe. They had established their camp on the walls in front of the gate where public prayer was performed. These troops were disciplined, and respected the olive groves and vineyards, only taking water for their beasts without paying. They left the town to help Mahmûd in his struggle against the Kilâbîs.

The first attacks from the Byzantine territory advanced in 524/1131, under the command of Sundân, against Halâb; they went as far as the Dijaz and devastated the territories of Ma'arrat al-Nu'mân, Kafar Tâb, Hamât, Hims and Rafânîyya. Shortly after, the Saljûqids made their appearance in North Syria. In 572/1176-78, Tutûg, brother of the sultan Malik Shâh, made the inhabitants of Sarml in and Ma'arrat al-Nu'mân, whose eastern villages he plundered, pay large sums. In 580/1187, Ma'arrat belonged to the 'Ukaylîs; at the beginning of Rabî' II/August, Salûmûn b. Kuthumûn who, the preceding year had seized An-rajal al-Bira, set about sacking «Msrâj Shâh, made the inhabitants of Samûl and Ma'arrat al-Nu'mân, whose eastern villages he plundered, pay large sums. In 592/1199, barefoot, as leader of the Pilgrimage, he re-established on the town and demolished the ramparts. Raymond of Saint Gilles returned, gathered his men and abandoned Ma'arrat, which he evacuated on 22 Safar 592/13 January 1100, barefoot, as leader of the Pilgrimage. In 592/1199, Monsieur and Tûgûshîn, abâbî of Dimashq, allied against Halâb, and marched to Ma'arrat al-Nu'mân, whose region was at that time part of the numbers of the Assassins (see al-mu'assasat al-Hâkîmîn). On 25 Rabî' II 593/13 September 1100, Bursûk of Ma'arrat was defeated by Roger of Antioch at the Battle of Tall Dûnî, to the north of Ma'arrat al-Nu'mân, on the road from the Euphrates to the Mediterranean. Two years later, after the assassination of Lu'lu' at Halâb, the Franks controlled the roads linking this town with Dimashq. In 524/1131 Baldwin II marched on Ma'arrat al-Nu'mân, and in the following year, Ridwân concluded a treaty with the Franks of Antioch according to which Ma'arrat al-Nu'mân, the Dijaz situated to the north of the town, Kafar Tâb, al-Bâra and part of the Dijal al-Sumûrât revolted to the Franks. Several years later (592/1199) there is mentioned the escape of an important group of Muslim prisoners from the citadel of Ma'arrat.

At the beginning of Dümâdâ I 559/560 of April 1153, Zangi captured Ma'arrat al-Nu'mân and drove the Franks out of the citadel; he re-established on their lands the Muslims who could show their titles and deeds, and for those who had lost them he checked the payment of háshîd in the land registers before restoring their lands. The following year, at the beginning of Şa'ban/mid-April, the Basileus John II Conomos traversed the territory of Ma'arrat al-Nu'mân, without attacking it, and proceeded swiftly towards Shayzar which he besieged in vain.

During the great earthquake of 524/1131, of which Hamât was the epicentre, Ma'arrat al-Nu'mân was seriously damaged. Nûr al-Dîn visited it in Ramadam 552/October 1157. In this prince's time, this town was situated on the southern border of the Halâb region and the customs dues (mu'âlîd) on merchandise were paid there. Nûr al-Dîn founded a dovecot there, a resting-stage for the pigeon post before being suppressed at the beginning of the 15th century.

In 574/1179, certain villages of the bâna of Ma'arrat were given in 492/1157 by Salûmûn to the amir Shams al-Dîn Ibn al-Mu'azzâm. In the Ayyûbid period, Ma'arrat al-Nu'mân, due to its position on the border of the territories of Halâb and Hamât, changed hands more than ten times in less than a century.

In 545/1153 Salâmîn went from Halâb to Ma'arrat al-Nu'mân in order to go on pilgrimage to the Shaykh Abu Zakariyyâ al-Maghribî, who lived near the tomb of the Caliph 'Umar b. 'Abî al-Asîl. In 587/1191, al-Malîk al-Muzaffîr Tâht al-Dîn 'Umâr seized Ma'arrat to the detriment of al-Mu'azzâm, and died shortly afterwards. Two years later it was given by al-Malîk al-Zâhir Ghâdî al-Mu'azzâm Muhammad. In 596/1199, Ibn al-Mu'azzâm was in possession of Amûfiya, Kafar Tâb and 25 places in the district of Ma'arrat al-Nu'mân. The following year, during a campaign against Hamât, al-Makîk al-Zâhir Ghâdî sacked the surrounding area and plundered the town, which sporadically formed part of his domains. In 592/1199 an agreement was reached between al-Malîk al-Adîl, sultan of Egypt, al-Malîk al-Zâhir of Halâb and al-
Malik al-Mansûr Muhammad, who received Ma'arrat al-Nu'mân. This town is situated to the north of Shayzar, Alânâya and Kafar Tab, three possessions of al-Malik al-Zâhir, the amir of Halab, whose forces, together with some Bedouin allies, pillaged the territory of Ma'arra from time to time.

In 604/1207-8, the governor of the town was Mursîj b. Sâlim b. al-Muhammadîbîb, vassal of al-Malik al-Mansûr Muhammad. After Babbara, with the agreement of the Sultan al-Âqal, to al-Malik al-Nâşir Kîlîlî Arsân [q.v.], lord of Hamât. In 620/1223, al-Malik al-Muâazzam ʿÎsâ, prince of Dimashq, attacked Ma'arra: al-Nu'mân, whose governor fled, leaving the task of negotiating to the notables, who included the father of the historian Ibn Wâsî. Al-Malik al-Mu'azzam nominated an administrator.

In the decade which followed, the town was disputed between al-Âqal Môsâ of Damascus and al-Mâgazzar II Mâmûd of Hamât. The latter reconquered the citadel of Ma'arrat al-Nu'mân in 637/1240. In 655/1258, on the death of al-Malik al-Kâmîl in Cairo, Ma'âra and its citadel were seized by al-Malik al-Nâşir Yûnûf of Halab after a short siege assisted by mangonels. Expelled by Cîngî Khan [q.v.], the Kâfurâzmaân crossed the Euphrates in 638/1240 and entered Syria, passed to the south of Halab via Dâbiâl and Samâm, and plundered the region as far as Ma'arrat al-Nu'mân, governed at the time by al-Malik al-Mansûr Muhammad. After Baybars' victory at Ayn Dâjût [q.v.], the al-Malik al-Mu'azzam Kutuz [q.v.] in 658/1259 handed over to al-Malik al-Mansûr the towns of Bâfîn and Ma'arrat al-Nu'mân, which had been taken from him by the amir of Halab. From this time onwards except for short periods, the town and its region was to remain in the hands of the princes of Hamât: Abû ʿUrdâ, an Ayyûbî prince, geographer and historian, also received them in 685/1285 from the sultan Muhammad b. Kâliân in 700/1300; but three years later he was forced to cede them to the ruler of Halab. This is why, in 718/1317, he gave up to the sultan as a donation in the proper official style, the town and castle, which did not prevent him from ceding the town to Muhammad b. ʿÎsâ at the end of the year.

Under the Mamlûks, at the beginning of 742/1341, the principality of Hamât was suppressed; the province belonged from then onwards to the ruler of Egypt, and the district of Ma'arrat al-Nu'mân constituted a milâkî of this province. After the Battle of Marjî Dâbîk [922/1516] the town became Ottoman, in 928/1518 it was on the northern border of the province of Dimashq. A century later, the traveller Pietro della Valle (ii, 156) passed by Ma'arrat al-Nu'mân, where he found a prince of the Ottoman dynasty.

In the 17th century, Ma'âra was situated on the southern border of the passâûli of Halab and the northern border of that of Dimashq, where the road from Bâls passes to the Mediterranean, crossing the Orontes at Dîlâr al-Âqal. Ma'arrat al-Nu'mân was in 1583 as a "poor town commanded by a 'sangiac',", and says that it is surrounded by walls (Voyage, vi, 703; Suite du Voyage, iii, 97-8). Franz Ferdinand von Troilo, a German traveller in the middle of the 17th century, found in the town "two fine inns, one dilapidated, the other in quite a good state" (Reise Beschreibung, Dresden 1676, 428). It is in this period that an Arab family settled there coming from the region of Kûyûa, sc. the al-ʿÂzm family who, in the second half of the 17th century, were set out on a political career which was to be prolonged into modern times. About 1650, two of its members, Kâsim and Ibrâhîm, reached Dimashq, then went on to Hamât and Ma'arrat al-Nu'mân. Ibrâhîm, a dînîdî, served in the Ottoman army, settled in Ma'âra and was put in charge of organising the defence of the town against the attacks of the Turkomans. His son, Isâmîl Pasha b. al-ʿÂzm al-Nu'mân, was born in Ma'âra in 1707/1708-60, where he occupied himself with agriculture, and in the town of Dimashq in 1725, where he held a sufficient family figure to be nominated governor of Dimashq, on 23 Dîmâhkâ II 1137/9 March 1725 (being removed at the end of Dîmâhkâ I 1143/December 1730). In this period, Pococke, who visited Ma'âra, describes it as a poor town with an independent agha who was paying a tribute to the Porte and levying taxes on travellers. (A description ..., ii, 145-6). Isâmîl had two sons, As'ad Pasha and Sa'id al-Dîn. The first was born in 1171/1760, and was first muftîsulam in Hamât and then governor of Dimashq in 1263/1847. In the 18th century the city, like Hamât and Hamât, was one of the lifetime grants (masâbîr) of the pâshas of Damascus, who held it from the sultan and who himself sub-let it to an agha. In Radjab II 1750/October 1771, ʿUmmân Pasha al-Kurdî, governor of Damascus from 1760, was removed, and lost the masâbîr of Ma'âra, which Muhammad Pasha al-ʿÂzm then received.

In the middle of the 19th century, Ma'arrat al-Nu'mân was the most northerly locality of the passâûli of Halab, which was then governed by a muqadda, then it became a hadîd of the îmâm of Halab and, in 1873, the residence of a kâfin-muhammadî. According to Sachau, who visited it in 1879, the town had about 400 houses, and led an easy life in the midst of a well-cultivated region. On the other hand, Max van Berchem, a few years later, saw only "a large, miserable-looking village ... in a well-cultivated plain." In 1913, one of the rare telegraphic offices of Syria made Ma'arrat al-Nu'man the link between Hamât and Halab.

From the time of the establishment of the French mandate in the Levant, this town became an active centre of resistance by the Syrian nationalists. In 1929, the Mawâlli shepherds tribes held much of the lands through which one had to pass between Ma'arrat al-Nu'mân and Halab. Since 1963 the town has benefited from the economic, industrial and agricultural development of the Hamât-Hamât zone.

Monuments. The town of Ma'arrat al-Nu'mân has protected by a wall which was often attacked and damaged, and then repaired; it had seven gates like many cities of the East: Bâb Halab, Bâb al-Kabîr, Bâb Shîbî, Bâb al-Dîmân, Bâb Hûnak, Bâb Hîms and Bâb Kâfiîah. Defence was also assured by a mediaeval fortress of circular plan called al-Kal'a, built on a mound serving as its foundation and dominating the countryside to the north-west of Ma'îra. It was situated at the entrance of "the great ravine which, from al-Bârs, traverses the eastern side of the mountain, followed by the road which linked the inland plains of the west with the valley of the Orontes" (Tchalenko, iii, 123). After the Crusaders' attacks, it was restored by Zangi in the 6th/12th century. A dovescote (lurdî al-hamâm) set up by Nûr al-Dîn in the 6th/12th century linked Hamât and Halab by means of travelling pigeons until the beginning of the 9th/15th century.

The Great Mosque of Ma'arrat al-Nu'mân occupies the site of an ancient temple which had given way to a church which was turned into a mosque after the arrival of the Muslims. Built on a height in the middle of the city, it was reached by 13 steps; ex-
tensive re-use of ancient remains bears witness to the antiquity of the sanctuary, whose roof is flat. In the courtyard, two kiosks are supported by shafts of ancient columns; the cupola which protects the abductions basin and its fountain rests on ten ancient columns, and the drum which provides a passage between the decagon of the ground plan and the circle of the cupola, is pierced by semi-circular bays. The square minaret of the Great Mosque, one of the most beautiful in Syria, bears on its west face the signature of the architect Kāhir b. ʿAlī b. Kānit al-Sarmanī, who in 559/1166 built the town's Shafiʿi madrasa. Creswell attributed this date to the construction of this monument. Herzfeld, stressing the strict relation which exists between the decoration and construction of this five-storeyed minaret and that of Halab, built between 485/1090 and 487/1092, dated it from 550/1155 at the latest. There is every reason to believe that Nur al-Dīn had it repaired after the great earthquake of 555/1166. Later, this minaret, after the quake of 565/1170, was to undergo other damage and to be repaired in 595/1199 by the architect of the Shafiʿi madrasa.

Some stelae of very ancient origin surround the Great Mosque, and in the city there are still some remains of covered, vaulted streets like Jerusalem. At the time of his visit to Maʿarrat al-Nuʿmān, Naṣir-i Khusraw saw an ancient column to cubic height, with an inscription in non-Arabic characters which was regarded as a tabletman, as at Ḥimṣ and Aţantkiya, protecting the town from scorpions. According to Albert of Aix, quoted by Cl. Cahen (La Syrie du Nord, 163, n. 5) there was in the period of the Crusades, in the southern part of the town, a church of St. Andrew, of which some foundations still survive. According to Syrian texts, there was also a Monophysite monastery, whose location is uncertain. There are in the town and its environs a large number of sculptured balustrades and columns in basalt originating from ancient Christian tombs.

To the south of the Great Mosque is situated a Shafiʿi madrasa, whose foundation is some time attributed to Nūr al-Dīn. Following a sculpted inscription on the lowest course of the arch of the doorway, it was built in 595/1199 in the reign of the Ayyūbid prince of Ḥamāt al-Malik al-Manṣūr Ibn ʿAlī Muhammad by Abuʾl-Fawāris Nadjī. The building also bears the signature of the architect Kāhir b. ʿAlī b. Kānit. This madrasa is entered on the east side by a door which is a trefoiled arch opening on the vestibule covered by a pyramidal cupola on pendentives. In its axis, facing an oblong court, there is a very large khanqāh, at present encroached upon by dwellings. On the south, the prayer hall opens on the courtyard by three doors; the khanqāh, a large niche, is preceded by a cupola on pendentives creating a zone passing from the hexagon to the circle of the cupola. On the north side, some rooms are laid out and, at a north-east angle, is placed the tomb of the founder surmounted by a cupola. Also at Maʿarrat al-Nuʿmān should be noted a gate of the Ottoman period which lies to the south of the Great Mosque in the eastern part of the town. It is a great, square khanqāḥ in cut stone with huge stables and a small mosque in the middle of the courtyard. An inscription above the fine southern doorway, dated 974/1566-7, informs us that this building is due to the generosity of Mūsā ibn Saʿīd, deified diār al-Anatolía (d. 981/1573-4). A second inscription at the vaulted north entrance is a poetic text giving in a chronogram the date 1166/1752-3, presumably the time of Aḥmad Pāgha al-ʿAzm.

There are many places of pilgrimage or oratories in Maʿarrat al-Nuʿmān: the Makki Ṣabī al-ʿĀlī Sinān b. Nūr, often cited as a ǧīḥmī or mukhāṣṣ, is situated outside the south walls of the town. The tomb of Yūṣuf (Joshua) is probably on the site of an ancient pre-Islamic sanctuary. Yūṣuf says that this is not the tomb of Yūḥaṣa', which is actually in the vicinity of the modern town. The minaret of the Great Mosque, built by the architect of the Shafiʿi madrasa, crowned by a cupola, is pierced by semi-circular bays. In the bay above the door, that this place of prayer was reconstructed on the order of al-Malik ʿAlī al-Ṣadrī while Murshid b. Saʿīd al-Muḥāṣṣib governed Maʿarrat al-Nuʿmān. The ground plan of this small-scale makām is little different from that of a madrasa with its rectangular court, its deep façade facing the entrance and the north and south faces occupied by the inner chamber and prayer hall. Above the entrance arch rises an octagonal minaret with a small cupola supported at the top by four columns. The modern mausoleum of the illustrious blind poet, Ibn ʿAlī al-Maʿarṣīr [r.u., where there is a part of his epitaph on a stele fragment in stone, is situated in the town.

In the vicinity of Bāb Shīh, there is the tomb of Sīh, third son of Adam, who spent part of his life in Syria. The tomb of ʿAbd Allāh b. Anāmīr b. ʿUṣayr, grandson of a Companion of the Prophet, is mentioned in Maʿarrat al-Nuʿmān by al-Baladhuri, and again by Ibn Bāṭtūta and Yūḥaṣa. There was also a Monophysite monastery, whose location is uncertain. There are in the town and its environs a large number of sculptured balustrades and columns in basalt originating from ancient Christian tombs.

In 1953, Tchalenko remarked on the subject of Maʿarrat al-Nuʿmān: "Due to its situation as much as to its urban character and the importance of its mevala monuments, this site demands a special study, like several other small towns situated on the edge of the massif."

that I could not discern a full grown camel from a tender young camel, recently born" (see his correspondence with Abū Nasr b. Abī `Isā, Amīr, the Dī'ī, 'Iṣā', in Yākut, i, 296, cf. D. S. Margoliouth, Abū 'l-`Alā' al-Ma'arrī’s correspondence on negotian,

In J.R.A.S. [1920], 317). This defect was, however, more than compensated by his extraordinarily retentive memory, which in later biographical collections was to reach fabulous dimensions. Ibn al-`Adīn [98], who is otherwise very reliable, inserted in his monograph concerning Abū 'l-`Alā' a "Chapter about deep understanding, natural ability, quick and brilliant memory, shining thought and penetrating insight in connection with Abū 'l-`Alā'" (al-`Inda', 531-84). That Abū 'l-`Alā' started his career as a poet at the early age of 11 or 12 years, is not at all surprising to us in view of, for instance, similar statements which concern youthful poetry by al-Mutanabbi [98], cf. R. Blachère, Abū 'l-`Tayyāb al-Mutanabbi, en poète arabe, Paris 1935, 27. Abū 'l-`Alā' completed his religious, linguistic and literary education, in that he read the text materials required, under supervision of different scholars, in the first instance those at Ma`ṣara and Aleppo. Among his teachers were, according to Ibn al-Kifli, Ibn Khālid, in Tarīf, al-bu‘aydā', 3, "companions from the circle of Ibn Khālawayh's friends", as one of the participants in the literary reunions at Sayf al-Dawla's court in Aleppo. This grammarian and expert on Karānim readings died in 379/980-1, when Abū 'l-`Alā' was still very young. None the less, we find Abū 'l-`Alā' regretting Ibn Khālawayh's loss to Aleppo in rather strong terms: "Would that God might protect Aleppo, because that town, after Abū `Abd Allāh b. Khālawayh's death, ceased to wear any ornament, neither spangle nor bracelet; thus it was found to be far removed from `alāma`" (Risālī al-Ghūfrān, 518, cf. 518-9). Among his teachers should further be mentioned Muhammad b. `Abd Allāh b. Sa`dī, who was a hawīya of al-Mutanabbi's poetry. Ibn al-`Adīn mentions (al-`Inda', 518) how Abū 'l-`Alā', at one time reading al-Mutanabbi's Dī'ī under his supervision, corrected Ibn Sa`dī's rūṣā. By comparing the passage concerned with that found in a manuscript from Ṭārīf, Abū 'l-`Alā' s correction was proved to be justified. From this incident we may conclude that Abū 'l-`Alā' had already at an early age some acquaintance with the poetry of al-Mutanabbi, for whom he was to entertain great admiration at a more advanced age.

Regarding the next phase of Abū 'l-`Alā',s life, up till his journey to Baghdad, `Adīn express two different opinions. Some historians suppose the poet to have travelled to some other cities apart from his Baghdad journey. They would have him visit Antioch and Syrian Tripoli so that he might profit from the local libraries. According to Ibn al-Kifli, Ibn Khālid, in Tarīf, 30, and other historians following him, the poet on his way to Tripoli made a slight detour to a monastery so called in memory of Jesus's birth (Greek: Ιόνιου, see Ibn al-Kifli, loc. cit., n. 4). There he listened to a monk discussing Hellenic philosophy, producing in his mind certain doubts which could afterwards be recognised in his poetry. Some other historians however, are of a different opinion. For example, Ibn al-`Adīn is one of those who deny the poet was under the influence of any religious school. As far as Antioch is concerned, Ibn al-`Adīn bases his argument on the political situation in Syria: during all Abū 'l-`Alā' s life-time Antioch lay inside the Byzantine frontiers. From the ex-
pulsion of the Muslims by Byzantine authorities from that a town, Ibn al-Adim infers that "it is neither conceivable that a library should have existed there nor a librarian, as much as that town is inconceivable for somebody to travel to in order there to pursue knowledge" (al-Iṣāf, 555). Concerning the supposed existence of a library at Tripoli, also an alleged motive for Abu 'l-'Ala's travelling, Ibn al-Adim points out that such a library was only founded in 471/1080-80, many years after the poet's death (op. cit., 555). Despite Ibn al-Adim's strong arguments, recent researches after all tend to accept the possibility of an actual visit to the towns mentioned, as may be deduced from certain allusions in Abu 'l-'Ala's poetry (see H. Lacout, La vie et la philosophie d'Abu l-Hasan al-Adim, Paris, 1961, 235). The poems of the first half of Abu 'l-'Ala's life were collected in his Dīwān, which was called Sa'd al-sund ("The first spark of the tinder"). Here and there in this collection, the poet's reactions to contemporaneous political developments in Syria may be found. About that time, the dynasty of the Hamdānids (q.v.), with Aleppo for their centre of authority, began to lose much of its power, which having attained its utmost degree in Sayf al-Dawla's days, under his successors gradually was to vanish, finally making place for another line of heirs, the Mirdānids (see S. Zakkar, The end of Aleppo 1049-1094, Beirut 1957). Meanwhile, the relative independence of the northern Syrian territory was increasingly threatened from the north by a renewed access of Byzantine military power and from the south by the appearance for the first time of the Fatimids (q.v.). At the same time, there was hardly any support to be expected from the Būyid ṣarī'is and their nominal overlords, the 'Abbāsid caliphs in Baghdād. During the reign of the successors of Sayf al-Dawla, in particular Sa'd al-Dawla and Safi al-Dawla, the Fātimid ṣarī'īs began trying to extend their influence from Egypt into northern Syria. Especially at the time Sa'id al-Dawla started his rule, Aleppo came to be the object of several prolonged but futile sieges (Ibn al-Adim, Zubdān al-balad wa ta'rikh al-Dar al-Islām, Damascus 1951, i, 185-92). Abu 'l-'Ala took keen interest in these developments, as is apparent from at least four laudatory poems found in his collection, the Sābi al-sund. In these poems, important personalities from either party at war are the subjects of his praise. Thus he eulogizes one Bābālātālān, who was a Fātimid general, in his poem with rhyme-word ẓannahm (Shurik Sakf, i, 600), while in two other poems of his (the one with rhyme ḥa ṣarī'ī, Shurik Sakf, iii, 1087, and the other with rhyme wa ṣalū, op. cit., iii, 1096) a certain Abu 'l-'Hasan 'All b. al-Husayn, one of the Banu I'mām (q.v.) is lauded. The latter had originally acted as a ḥa ṣīd and waṣīl in the Hamdānids' service, but having betrayed his masters he filled the Fātimid post of financial and administrative superintendent of the army (mustaḥbī al-dāwā) to try to conquer Aleppo for the Fātimid cause. On the other hand, it is interesting to note that Sa'īd al-Dawla, too, who only with great difficulty stood his ground in Aleppo, can be found at a nasīṭah in Abu 'l-'Ala's poetry. In the rāḥil of a ḥāṣida, even his name is mentioned, though in a rather allusive way, "[10] The camels kept asking me, upon which I answered, saying, Our destination will be Sa'id [however, the name excepted, sa'īd also means "fortunate"]). Thereupon the amir's name came to be their good omen" (from the poem with rhyme mālīd, Shurik Sakf, i, 25). All these laudatory passages are, however, rather curious, because they do not fit the image given by Abu 'l-'Ala himself in the Preface to his Dīwān (Shurik Sakf, i, 10), where he says, "I have not knoced so as to be heard at the doors of great lords, whilst reciting my poetry, no more did I praise with a view to acquiring a reward". This contrast between explicit intention and real practice may be explained by the assumption that the poet in such cases had been pressed to compose this sort of poetry against his will (cf. Ibn al-Adim, Baghbat al-albāb, l. 2152a). It was in 395/1004-5 that Abu 'l-'Ala had to sustain the painful blow of the death of his father, Abu Muhammad 'Abd Allah b. Salāyim, who had been the first one to teach him. This date given by 'Imad al-Dīn, Khorādat al-bāyār, ii, 5 and Ibn al-Adim, al-Iṣāf, 394, 5, is corroborated by Yalcut, Udabī, i, 165, who erroneously mentions 397/1006-7, which year is correspondingly given by the majority of Western biographers (about the chronology, see 'Aqīsh ibn 'Abd al-Rahāmīn, Bint al-Ṣ̄̄aḥīf, i, 195, 50-72). Reacting to his father's decease, the poet composed an elaborate elegy ( rhyme 'ādājī, Shurik Sakf, ii, 907), in which we find him praising his father's poetical talents in glowing terms: "[36] O master of rhymes! How much did their obedience to your wishes contrive, that in your view eloquent Persia hardly surpass the level of the evocative barbarians!" Three years after this event Abu 'l-'Ala is reported to have left Ma'arra in order to settle at Baghdād, where, however, he was to stay for merely one-and-a-half years. The poet himself pointed out what motive was prompting him to travel to Baghdād, for in his letters it is explicitly mentioned that nothing more than the libraries in that place excited his interest (Margoulho, Lettres 40 and 44, cf. Risālät al-ʿalāmīn, 147, 289). From his Sābi al-sund we may know the poet to have been in touch with several personalities employed in Baghdād libraries. One of these was Abū Manṣūr Muhammad b. 'All, who was a custodian in the Dār al-Ṣ̄̄if (q.v.), and for whom Abu 'l-'Ala composed a long ḥāṣida ( rhyme ṣ̄̄iḥat, Shurik Sakf, iv, 1046). Another librarian and scholar was Abū Ahmad 'Abd al-Salān al-Baqrī, "who had been entrusted with the supervision of Dār al-Ṭabāʿ at Baghdād" (Ta'rikh Baghdād, xl, 57-8), and to whom Abu 'l-'Ala having returned to Ma'arra was to address a poem ( rhyme ʿarwā, Shurik Sakf, iv, 1527) in which he ventilates his melancholy remembrance of Baghdād and mentions their weekly conversations on Fridays. About both these librarians, see Lacout, La vie et la philosophie ..., 127. Despite the benefit he might have reaped from a prolonged stay at Baghdād, it was not long before the poet again took his departure. It seems that he got into trouble financially, which need not surprise us in view of his unwillingness to compose laudatory poems for the Baghdād nobility, in which aspect he shows himself quite different from, for instance, al-Mutanabbi. Another reason why he did not stay any longer in Baghdād is given by Abu 'l-'Ala himself, in addition to the one already mentioned, in a ḥāṣida ( rhyme bi-tāhbita, Shurik Sakf, iv, 1654) addressed to Abu 'l-Kāsim 'All b. Muhammad al-Tamūlī, son of the well-known author of Nihāyāt al-muḥāsarah (see Yalcut, Udabī, v, 301-9, vi, 25, 67, cf. Broekelmann, I, 232), the poet later on explains his uneasy position in one poetical line, "[36] There were two reasons which caused me to leave you: a mother whom I have not been able to meet after all, and money reduced to the amount of uselessness."
Apart from these explanations explicitly given for his permanent departure, some other events are mentioned by the Arabic historians, which also might have induced him to leave Baghdad. Thus an incident is reported to have happened in the literary salon of an important ʿAlawi sheikh, al-Muʿtadā, brother of the Shīʿī poet al-Rādi (Brockelmann, I, 404, S I, 704, and I, 82, S I, 132). Having expressed some strong criticisms of al-Mutanabbi's poetry, al-Muʿtadā had been the target of a concealed but none the less a very severe attack from Abu l-'Alāʾ, who was a fanatical admirer of al-Mutanabbi. As a result, al-Muʿtadā had him dragged by his feet out of the salon (for details, see Margoliouth, Letters, p. XXVII, and Abu al-Rahmān, Abu l-'Alāʾ, 168). On the other hand, some late authors, among whom Ibn Kālidī (36.) in al-Bīdāyā, xii, 73 (sub anno 449), report him to have been expelled from Baghdad by the local fāhād. The poet is said to have aroused their anger by asking some critical questions concerning the application of certain rules of fāhīh. For an evaluation of this, as it seems, rather anecdotal report, see Lamotte, La vie du musulman, p. 26, 195, and al-Rādi, Abu l-'Alāʾ, 15-16.

In Ramādān 400/1010, Abu l-'Alāʾ began his return journey, but having come home he found his mother already dead. His Dīwān contains two elegies (rhymes iḥlās, Shuṭū el-Sayf, iv, 1729, and rhyme ḥamāmī, iv, 1453), in which he gives expression to his feelings of sorrow: the announcement of her death was a terrible blow; he would have preferred to precede her into death, but now the only consolation left is for him finally to be buried near her tomb. He is hoping to meet her again on the final day of resurrection, the day of goat shearing, which was a mode of celebration and idem, al-Insāf, 566-8. What happened in Maʿarra and the poet's reaction to it make it already evident that Abu l-'Alāʾ did not totally seclude himself. In the context of his house became the goal of frequent visits by matricies, scholars and pupils, whilst at the same time he kept up an extensive correspondence in prose by way of his Risālas. However, his poetical correspondence such as is found in his first collection of the Sāḥi al-sand probably belongs to the pre-Baghdad period. From those with whom the poet was in contact, the following personalities may be mentioned:

(1) The governor of Aleppo, appointed by the Fāṭimid, Abu Shuʿayb Fārābī b. ʿAbd Allāh al-Rādi, ʿAbd Allāh ʿAziz al-Dawla (reigned 407/1017-9 till 417/1027-8), Ibn Ibn al-ʿAdm, Zubdat al-ḥalab, i, 213 ff.). Abu l-'Alāʾ, who was a fanatical admirer of al-Mutanabbi, the Shīʿī poet and a waxir appointed by the ruler of Mayyafār-Sīr, tried to discuss with the poet an invitation from the Fāṭimid Imam al-Hakim for Abu l-'Alāʾ to go to Cairo, but the poet finally decided against the suggested stay in Egypt (see al-Insāf, 570-4, 577-8).

(2) Abu l-ʿĀṣim al-Maghrībī, who was a son of Abu l-Ḥasan al-Maghrībī, the Harmandānī kāhir mentioned above. In 407/1017-9, at the time when al-Hakim had almost all members of the al-Maghrībī family executed, Abu l-ʿĀṣim succeeded in escaping the massacre. After many persecutions he was finally appointed a waxir in Maryāfār-Sīr. He was the addressee of several Risālas (i.e. Margoliouth, Letters, numbers I, II and XXXII) written by Abu l-'Alāʾ, who finally dedicated an elegiac poem to him on the occasion of his death (see Lusīṭ, ed. Zand, ii, 431 Bombay, 346, rhyme l-ṭirāṣah).

(3) Abu Nasiʿ Ahmad b. Yusuf al-Munḥīz, both a poet and a waxir appointed by the ruler of Manyāfār-Sīr (cf. Ibn Khalīkīn, 56, ed. E. A. B. J. in Taʾrīf, no. 59). When visiting Abu l-'Āṣim, this poet is said to have asked him some rather critical questions regarding his ascetic way of life (Ibn al-Kīṭīb, Ibn, in Taʾrīf, 63).

Among Abu l-ʿĀṣim's school of pupils should be reckoned Ibn al-Sid al-Balṭāyawi, who in the Muslim West was to write an excellent commentary on Abu l-ʿĀṣim, Abu Shuʿayb Fārābī b. ʿAbd Allāh al-Rādi, ʿAbd Allāh ʿAziz al-Dawla (reigned 407/1017-9 till 417/1027-8), Ibn Ibn al-ʿAdm, Zubdat al-ḥalab, i, 213 ff.). Abu l-'Alāʾ, who was a fanatical admirer of al-Mutanabbi, the Shīʿī poet and a waxir appointed by the ruler of Mayyafār-Sīr, tried to discuss with the poet an invitation from the Fāṭimid Imam al-Hakim for Abu l-'Alāʾ to go to Cairo, but the poet finally decided against the suggested stay in Egypt (see al-Insāf, 570-4, 577-8).

(1) The governor of Aleppo, appointed by the Fāṭimid, Abu Shuʿayb Fārābī b. ʿAbd Allāh al-Rādi, ʿAbd Allāh ʿAziz al-Dawla (reigned 407/1017-9 till 417/1027-8), Ibn Ibn al-ʿAdm, Zubdat al-ḥalab, i, 213 ff.). Abu l-'Alāʾ, who was a fanatical admirer of al-Mutanabbi, the Shīʿī poet and a waxir appointed by the ruler of Mayyafār-Sīr, tried to discuss with the poet an invitation from the Fāṭimid Imam al-Hakim for Abu l-'Alāʾ to go to Cairo, but the poet finally decided against the suggested stay in Egypt (see al-Insāf, 570-4, 577-8).

(2) Abu l-ʿĀṣim al-Maghrībī, who was a son of Abu l-Ḥasan al-Maghrībī, the Harmandānī kāhir mentioned above. In 407/1017-9, at the time when al-Hakim had almost all members of the al-Maghrībī family executed, Abu l-ʿĀṣim succeeded in escaping the massacre. After many persecutions he was finally appointed a waxir in Maryāfār-Sīr. He was the addressee of several Risālas (i.e. Margoliouth, Letters, numbers I, II and XXXII) written by Abu l-'Alāʾ, who finally dedicated an elegiac poem to him on the occasion of his death (see Lusīṭ, ed. Zand, ii, 431 Bombay, 346, rhyme l-ṭirāṣah).

(3) Abu Nasiʿ Ahmad b. Yusuf al-Munḥīz, both a poet and a waxir appointed by the ruler of Manyāfār-Sīr (cf. Ibn Khalīkīn, 56, ed. E. A. B. J. in Taʾrīf, no. 59). When visiting Abu l-'Āṣim, this poet is said to have asked him some rather critical questions regarding his ascetic way of life (Ibn al-Kīṭīb, Ibn, in Taʾrīf, 63).

Among Abu l-ʿĀṣim's school of pupils should be reckoned Ibn al-Sid al-Balṭāyawi, who in the Muslim West was to write an excellent commentary on Abu
Abū l-`Alāʾ's 

Abū l-`Alā' had a much more serious, though indirect, intellectual contact in his fairly extensive correspondence with Abū l-`Alā'. As the poet advises a practical ascetic way of life, there Abū l-`Alā' rejects the eating of fish, meat, milk, eggs and honey, at the same time declaring himself to possess some esoteric knowledge which should remain concealed. The resulting exchange of letters was finally stepped as a senseless business by al-Mu`ayyad. The latter in his last Riāda made it clear that indeed, Abū l-`Alā' at no time whatsoever might be expected to give any details concerning the esoteric knowledge claimed by him; see Margoliouth, Abū l-`Alā' in his correspondence (p. 53). It so happened that Abū l-`Alā' died in 449/1058 just after this correspondence, and therefore it need not surprise us that some Arabic historians try to find evidence for a connection between the correspondence just mentioned and the poet's death. For instance, Ibn al-Habbāriyya (q.v.) in his (lost) book Fuhl al-marā ăn (apud Yahyā, Uṣdāba', 1, 194) says that he committed suicide in order thereby to avoid being deported by command of the Diwān, who intended, the author suggests, to punish the poet for his heretical ideas. This rejection of it is at the same time he died from natural causes, and this opinion finds some corroboration in a report which mentions that the physician Ibn Butlān (q.v.) was in attendance at Abū l-`Alā' s deathbed. In his very last moments, the poet asked a member of his family present to get pen and writing-paper, so that he could dictate to him something. But in doing this, Abū l-`Alā' committed, as against normal expectation, some errors in his dictation. Thereupon Ibn Butlān declared the end to be at hand, "Abū l-`Alā' is dead already" (Ibn al-Kifṭ, Ḥadīth, II: Taṣfīf, 63). In many passages of his poetry, the poet has shown that he regarded procreation as a sin, and that he preferred universal annihilation as the best hope for humanity. He therefore never married, and is said to have desired that the following verse should be inscribed on his grave: "This wrong was by my father done to me, but never by me to anyone". A great deal of Abū l-`Alā' s work is supposed to have been lost as a result of the Crusades, which caused much devastation in Syria, at Ma`arra included (cf. Ibn al-Kifṭ, Ḥadīth, II: Taṣfīf, 63). A list of all his works, either lost or still remaining, can be found in Moustapha Saleh, Lûte des œuvres d'Abū l-`Alā', in BEO, xx (1970), 275. From these still existing, the following works may be mentioned in chronological order, as far as possible.

1. The Sabh al-sand contains states labatory poems, some of which have been mentioned above. In this Diwān the poet often follows the tripartite division of the classical ḥabīd into masbūb, ṭahlīl and mašīb, but occasionally he rejects the masbūb or eliminates it completely. In this respect, however, he cannot be compared with the poet Abū Nuwās (q.v.), who all his works, either lost or still remaining, can be found in Muṣṭafah Sāliḥ, Lisāt al-awār al-Abhari is reported to have read as a pupil under the supervision of Abū l-`Alā' in the works of the master for a period of four years (Ibn al-Adīm, al-Insāf, 920). To the tradition of this scholar a third commentary called Diwān al-Sabt, was written in the Muslim East, at Samarkand, by Sādīr al-Adādī al-`Asmī b. al-Husayn al-Khārizmī (see Sūrak Sabt, 1, 18, for al-Khārizmī s chain of tradition, and in general, Broekelmann, I, 255, 8, 452-3, for all the different commentaries preserved).

For further names of those who came into contact with Abū l-`Alā', see the two different chapters by Ibn al-Adīm, the one "Treating of those who read under Abū l-`Alā' s supervision and transmitted on his authority, i.e. 'ibn, ūbūd and ṣaḥīḥ" and the other "About the great respect which is paid by them to Abū l-`Alā' in his Sabh, the poem ... two different chapters 420). To the tradition of this scholar a third commentary called Diwān al-Sabt, was written in the Muslim East, at Samarkand, by Sādīr al-Adādī al-`Asmī b. al-Husayn al-Khārizmī (see Sūrak Sabt, 1, 18, for al-Khārizmī s chain of tradition, and in general, Broekelmann, I, 255, 8, 452-3, for all the different commentaries preserved).

Some (c. 800 years later) Abū l-`Alā' had a much more serious, though indirect, intellectual contact in his fairly extensive correspondence with an important Ismāʿīli propagandist, the Poet (being blind) is asking his travelling-companions to trace a distant flash of lightning in the land of the beloved, but when sleeping he himself can discern her deceitful phantom visiting him. The ūbūd in his kashfīs is usually most elaborated: one may find all sorts of descriptions, like emaciated camels tired by long travelling, the mirage; among the animals found in the desert, are mentioned the antelope, sand-grouse, ostrich and chameleon. His
The subject matter of the poem is the poet's own life and works, which he describes in great detail. The poet's own life is described as a series of events and experiences, including his travels, his acquaintances, and his relationships with other poets. The poet's own works are also described, including his poems, his letters, and his conversations with other poets. The poet's own thoughts and ideas are also described, including his views on life, death, and the hereafter. The poet's own experiences are described as being full of challenges and opportunities, and he describes how he has learned from these experiences.

The poet's own works are described as being full of beauty and wisdom, and he describes how he has used his experiences to create something new and original. The poet's own thoughts and ideas are also described as being full of creativity and originality, and he describes how he has used his own experiences to create something new and original.

A more recent treatment of the poet’s philosophy as it appears from a number of passages in Luzim is found in I aoust, ‘La vie et le philosophe d’Abu l-Fufi’al-Ma’arri, in BEO, x, (1943-4), 119-56. In the lines cited, Lautus supposes an influence of certain ideas eclectically elaborated and found at the outset of the philosophical and religious school of thought of the Bāṭinīyya (fufi’), which was to be contain a number of chapters every one of which contains strophes with their endings always in one particular letter.

This one gets Fasāl qaṣībat humāma, Fasāl qaṣīyat ba‘th and so on, following the order of the Arabic alphabet. A major part of this work is lost, only its first four having been discovered in 1918-19 in a not quite complete version, to be edited later by Mahfūz Hāssan Zanāfī, Cairo 1356/1938, in a critical edition. The book holds among various other subjects thoughts about God: His omnipotence, justice, goodness and eternity, in addition to and contrasting with a sharp observation of the inescapable changes of fate which dominate man in his ordinary daily life. The idea of God is frequently seen as connected with unavoidable predestination and eternal retribution, which in its turn exhorts man to practise asceticism. The use of rhymed prose, the warnings against impeding judgement and the oaths applied now and again by way of confirmation, may all be considered a reason why later historians supposed this book to be an emulation of the Kūrā’s: the author allegedly aimed, in writing it, at excelling the Kūrā’s in its āyāt (q.v.). In this context, some late historians who apparently never saw the Fasāl with their own eyes are even found altering its title to al-Fasāl wa l-qaṣīyat ma‘nā (or fi ma‘ṣīḥiyya or ma’ṣī’īn) al-BAṣīr wa l-qaṣīyat (i.e. “Chapters and endings and/about the emulation of Bāṣīr and the scholarly eminence”).

For the harmonisation method, may all be considered a reason why later historians supposed this book to be an emulation of the Kūrā’s: the author allegedly aimed, in writing it, at excelling the Kūrā’s in its āyāt (q.v.). In this context, some late historians who apparently never saw the Fasāl with their own eyes are even found altering its title to al-Fasāl wa l-qaṣīyat ma‘nā (or fi ma‘ṣīḥiyya or ma’ṣī’īn) al-BAṣīr wa l-qaṣīyat (i.e. “Chapters and endings and/about the emulation of Bāṣīr and the scholarly eminence”).

In the lines cited, Lautus supposes an influence of certain ideas eclectically elaborated and found at the outset of the philosophical and religious school of thought of the Bāṭinīyya (fufi’), which was to be contain a number of chapters every one of which contains strophes with their endings always in one particular letter.

For a supposed coherence between the internal rhyme in a strophe and its contents, see R. Hartmann, Zu dem brief al-fasāl wa l-qaṣīyat des Abu l-Fufi’al-Ma’arri, in Abh. Pr. Ak. W., Phil.-hist. Klasse (Berlin 1944). A more recent treatment of the poet’s philosophy as it appears from a number of passages in Luzim is found in I aoust, ‘La vie et le philosophe d’Abu l-Fufi’al-Ma’arri, in BEO, x, (1943-4), 119-56. A very restricted number of letters written by Abu 7 ‘AU’ on several occasions and addressed to various members of his family and acquaintances (see the biography above). The letters have been composed in a very flowery style, overdone with proverbs, rhymed prose and illustrative verses. There exist two editions of the Rasā‘ūl, the first by Shāhān ‘Atīya, Beyrouth 1894, and a second one, with English translation preceded by a Preface containing the biography and a discussion of part of the work, by D. S. Margoliouth, The Letters of Abu l-‘A lawsuits, Oxford 1898. Further, a critical edition of Letter XXX (Margoliouth’s numbering) has been prepared by Ḥasan ʿAbd Allāh, Rasā‘ūl fi taswī‘iyāt Abu l-‘A lawsuits, Cairo n.d., but later than 1945.

Rasā‘ūl al-Šāhīd wa l-qaṣībat (Letter of a horse and a mule), which among other works now lost was addressed to Abū Shugā’ Fāṭik ‘Aṣiz al-Dawla, the governor of Aleppo, on behalf of the Fātimid emperors (see above). This supposedly lost Rasā‘ūl has recently been discovered in Morocco and subsequently edited with a critical apparatus and introduction, by ʿAbd al-Rahmān “Bīn al-Shātī‘” (Cairo 1975). Abu l-‘A lawsuits completed this voluminous Rasā‘ūl in about 411/1021, i.e. the year of al-Mahmūd’s disappearance, when the imām al-Zahrā’i acceded to the throne in Egypt (cf. op. cit., 553 where the author qualifies the letter as amīr al-muwāminin).
Another important development, reported upon in the *Risdlal*, occurred in 468/1077-8, when `Aziz al-Dawla ordered `Abd b. Mirdas, a Bedouin leader and afterwards founder of the Mirdasid dynasty, that he should bring his (i.e. `Abd's) mother inside the walls of Aleppo (*Risdlal* al-`Abd, 220, cf. Ibn al-`Adil, *Zaidat al-Madhjib*, 201). This move was meant to reassure the inhabitants of Aleppo, in view of rumours about a threatening Byzantine attack. The tension caused among the population in North Syria is a theme in the *Risdlal*, in which Abu `I-`Ali`a gradually introduces a number of animals who, being gifted with speech, give among other things their opinion on the political situation in Syria under `Aziz al-Dawla's reign. A direct reason for the composition of the *Risdlal* was a problem of taxation. Then the question of land owned by members of Abu `I-`Ali`a's family, for the use of which they would owe a certain amount as taxation due to the *bayt al-mdl* (p.7) in Aleppo. At their request, Abu `I-`Ali`a is writing his letter in order to ask for the annulment of the amount imposed, considering that the land concerned is a waterless tract, giving only a small yield. Then Abu `I-`Ali`a describes a mule, al-`Abd al-Dawla, which, blindfolded, is drawing water in order to continually fill a cistern, without, however, profiting from its own labour so as to quench its thirst. Such an animal is described as grumbling at first, but then it starts talking. While thus introducing the first of his speaking animals, Abu `I-`Ali`a explicitly bases himself on quotations from the *Kur`an* (XXVII, 28, 29), where an ant in the valley of ants and a hoopoe are described as talking, with Sulayman understanding their utterance. On the other hand, Abu `I-`Ali`a elsewhere in his *Risdlal* compares favourably `Aziz al-Dawla with Sulayman, both of them adhering to the same qualities of wisdom and understanding. Next to the mule, a number of different animals appear on the scene of action, among these a horse, a camel and a fox. The mule wants the horse to convey a complaint to `Aziz al-Dawla about the mule's hard life, but the horse, referring to its noble forefathers, haughtily refuses this mission. In the second instance, the camel declares himself prepared to convey the mule's complaint. The mule being erudite, at first intended to cast its complaint in a poetical form, but with respect to the camel it drops its original plan for a reason which reflects Abu `I-`Ali`a's own attitude towards poetry, "I do not like being insulted with the image of human beings bringing poetry with them, in order to aim at some profit." (K. al-`Sahi`i, 219). Instead of this, the mule then wants the camel to convey strange tidings, which have one meaning directly evident in hearing them, although in reality they have a second esoteric meaning (loc. cit.). The message appears to consist of sorts of riddles involving words with two different meanings (cf. the *ta`ari`fa* in Abu `I-`Ali`a's poetry). When finally the fox arrives on the scene, the situation alters; a vague clamour is suddenly heard from the nearby town, and at the mule's request the fox undertakes to make a reconnoissance. Then the clamour heard is explained by a suddenly-developing panic among the population in view of an impending Byzantine military expedition. Abu `I-`Ali`a now begins to make frequent allusions to various political developments of the contemporary period. He mentions, for example, the joint-rule of Basil II Brugarocous and his brother Constantine VIII. He further speculates on the settlement of the succession within the line of the Macedonian dynasty. In view of this, and being aware of the fact that the elder brother remained without children, whereas Constantine had only three daughters, the author wonders whether the Byzantines will deem it suitable to appoint a woman as their Empress (R. al-Ghfran 450, 606). In his *Risdlal*, Abu `I-`Ali`a seems somewhat to ridicule the governor of Aleppo, who is continually designated with honorific formulae after his name, such as "May God prolong him for ever" or "May God give him a great victory". With some humorous feeling, the author mentions a group of slightly more than 30 slaves (shimrus), who either had been bought at some time by `Aziz al-Dawla from the Byzantine emperor or had been granted by the latter. The exact number of these slaves, and then their circulation as enjoined by the Fikihid governor, are correspondingly compared with the number of *'arajah* (sarad here meaning "last metrical foot of the first half-verse") formally given by Arabic prosodists, and with the reduction (kaddif) of metrical feet (R. al-`Sahi`i, 691-2).

Finally in his *Risdlal*, Abu `I-`Ali`a has somebody make a remark on the exceptional dexterity of `Aziz al-Dawla, who is able, whilst horseriding, to handle two swords at a time; but then it is remarked upon as much more wonderful that this prince was once seen reading in the *Risdlal* al-Qarqur [*rab*] by Khall b. Ahmad [p.7], see (R. al-Ghfran 700-5). In this particular interest shown by `Aziz al-Dawla that Abu `I-`Ali`a pretends to introduce many sayings relating to the principles of metrics. Besides a great display of erudite learning in technical terms for various phenomena in metrics and rhyme, one also finds in the *Risdlal* many quotations of poetry which in some way frequently contain descriptions of animals. Such a display of learning and the poetical lines quoted, though originally composed via association, often tend to interfere with the smooth and logical development of events in the *Risdlal*. The same phenomenon can be found in the *Risdlal* al-Qarqur which was composed at a later date. On the other hand, the *R. al-Ghfran* is distinguished from its predecessor, the *R. al-`Sahi`i*, by a much greater amount of irony and derision at its protagonist, who is Iba al-Karrib—as compared with `Aziz al-Dawla in the first *Risdlal*—and also by its greater interest shown in religious questions. For further details, see P. Simon, *Enigmatic allusion and double meaning in Masarr's newly-discovered Letter of a Horse and Mule*, in JAL, xii (1981), xiii (1984).
given (cf. the meaning of the Risāla's title "Letter of Forgiveness"). While travelling in the Hereafter, Ibn al-Kārīb is able to pay a visit to Hell, where he is described having discussions with the devil, Iblīs [q.e.], and the poet Bashāhī b. Būrū [q.e.], marked out as a heretic. Among the general aspects of the R. al-Ghafūr, in its full extent, may be mentioned here, first, the delights of Paradise, which can be reduced to words like 'Ains, relating to all possible morphological variations of Death. For example, where it says in the Kurān (LV, 25 ff.), "We have made them grow up new and made them virgins, loving and of equal age, for those on the right . . .", Abu 'l-ʿAʿlā is found having them grow like fruits of the tree in Paradise (R. al-Ghafūrān, 289-8).

Another remarkable aspect of the Risāla is the idea of compensation granted for any harm suffered during one's earthly life, this compensation being extended to both human beings and animals. To the latter belongs, for example, a wild ass, killed and skinned by a hunter during its existence on earth. Thereafter its hide was used for the fabrication of a well-bucket, of which in their turn pious men took advantage for their fāhēm (193). Thus there appear to exist in Paradise two completely different categories: first the material of Paradise, represented by the virgin promised in the Kurān, and by animals, for the purpose of hunting, both of these destined to increase the joys of the blessed; and in the second place there exist human beings and animals destined to enjoy themselves in all eternity on account of their earthly sufferings. As concerns Ibn al-Kārīb, the ironic attitude of Abu 'l-ʿAʿlā is very evident, where he is describing the formal act of Ibn al-Kārīb's Ṭābāna being testified by official witnesses in a mosque at Aleppo and the subsequent rejoicing in Hcaven (517-22). For the comparison between the R. al-Ghafūrān and Dante's Divine Comedy, see the now rather obsolete study by Miguel A. Palacios, La Escatología de Dante (1924). For a comparison between the Risāla and Dante's Divine Comedy, see the now rather obsolete study by Miguel A. Palacios, La Escatología de Dante (1924).

8. Risāla al-Mulmānīyya is especially concerned with questions on the morphology and etymology of certain Arabic words. Thus in the Muḥaddidain of this Risāla (ed. I. Kravkovskiy, Leningrad 1934), a reply is indirectly given and based upon a realistic and literal interpretation of the pronouncements given in the Kurān and Tradition. For example, where it says in the Kurān (LVI, 35 ff.), "We have made them grow up new and made them virgins, loving and of equal age, for those on the right . . .", Abu 'l-ʿAʿlā is found having them grow like fruits of the tree in Paradise (R. al-Ghafūrān, 289-8).

9. Mulmās-s-sabil ("What is scattered on the road") is a very short work which was always to remain well-known after Abu 'l-ʿAʿlā's poetry. Especially in the Muslim West, it has frequently been the object of attempts at emulation (mawṣūda). The titles, and some short quotations from, such emulations are given in Hamid al-Dīn Ahmad b. Ahmad al-Muṣṭafā, Muṣābāt al-magāfirān li-Mulmāṣ-s-sabil, in Tāʾūf, 455 ff. For the edition of a complete mawṣūda of Abu 'l-ʿAʿlā's Mulmāṣ-s-sabil, see the one composed by Ibn al-ʿAbdār, in Saḥāf al-Dīn al-Munajjī, Risāla al-Ghufrān, 95-5. Beirut 1963, 33-72. The Mulmāṣ-s-sabil consists of tiny paragraphs containing rhymed prose, which alternate with other paragraphs containing some poetic lines, with, however, the restriction that each paragraph of rhymed prose is more or less identical with the subsequent paragraph of poetry as far as its contents are concerned. Thus contents are not very orthodox nature and no break can as yet be discerned with traditional morality and literary tradition. The editor Ḥasan Ḳurān Ṭābāna says that there may be a work of the poet's old age, in which he is shown to revert to the original religious principles (cf. Kravkovskiy, Iṣṭāʿara s-suṣūna, ii, 85).

Finally, let us consider the author's surviving commentaries existing up till now on the Diwan of other poets.

1. Muṣābāt al-bihām is a commentary on the complete Diwan of Muṭanabbi, which Abu 'l-ʿAʿlā probably wrote in the prime of his life. This rather simple commentary, of which so far no edition is available, has been discussed by Kravkovskiy, who also gives some examples from the Arabic text of this commentary, in Al-Mutanabbi ʿAbd al-ʿAʿlā, Petrograd 1910 = Iṣṭāʿara s-suṣūna, ii, 63-115.

2. Al-Lāmī al-ʿAttār or al-Thābit al-ʿAttār is a very extensive and as yet unread commentary on a great number of verses selected from al-Mutanab-
recited their respective poetry; see Tammam al-Buhlutl, Damascus 1978.

Abu ‘Abd Allah al-Walid b. Abl 'Ublda al-Walid was a commentator on verses selected from the Divan of the poet al-Bubturfs poetry. It was written by Abu l-'Ald al-Ma'arrl, and therefore quite different from the Diwdn, critical ed. by As'ad in the 457/1065 (on him see further and only died in 541). It is available in the critical editionSharb id-Khallal al-'Iibrtzl, critical ed. by M. 'Abduh al-Insdj, Cairo 1944. 25-6 of the editor's seals is khdss" in the context of the French Marquis de Bussy, but army offices in BerAr and then as chief minister of the Deccan in the service of the first NigSml of Haydar-Ahmad. His policy in the latter post extended scale and was unfinished at the author's death, hence completed by his son Mir 'Abd al-fjayy in 972, which is a slightly revised version of a previous study, Abu 'l-'Aid al-Ma'arrl, see above; it was conceived on an early representative of Kadarl ideas. For further reference, see Moustapha Saleh, Abu 'l-'Aid al-Ma'arrl, bibliographie critique, in BEO, xxii (1979), 379-397 ("Deuxnme partie: etude critiques modernes").

Bibliography: Storey, i, 1904-1909. (Ed.)

The text of 'Abd al-Hayy's recension was published in the Bibliotheca Iranica series, ed. Maulavi 'Abdur-Rahim and Maulavi Ashraf 'Ali, 3 vols. (Beirut 1982-93). The whole work has been much used for the many studies which have recently appeared on the Mughal nobility and landholding class.

Bibliography: Storey, i, 1904-1909.
executed after the insurrection of Ibn al-Ash'ath [q.v.], in 83/793. He was probably born around 20/640 or even earlier. He had contacts with Mu'awiyah (r. 66/669-85), and 'Abd al-Malik appreciated him so much that he sent him as an ambassador to Byzantium and entrusted him with the education of his son 'Abd al-Aziz. According to a rather detailed, but perhaps fictitious report he played a certain political role as early as 38/66, during the negotiations between Abu Musa al-Ash'ath and 'Amr b. al-As at Damascus after the Battle of Siffin. His reputation was based on his juridical competence. Traces of his Jatuq are still found in our sources. In his use of precedents he obviously did not differ between prophetic tradition and the sunna of the caliphs; he adhered to decisions of Mu'awiyah (on attitude which later jurists were completely unable to understand), and some of his hadiths go back to Ummay (reigned 23/643-650) whom he may still have met personally. Although probably born in Kufa, he did not appreciate the juridical tradition connected with 'Ali (if it existed already at his time); his father, a companion of the Prophet, had already attracted the attention of his Kufan neighbours by his Ummayi leanings. We do not know why and when, in spite of his favoured position at the court of 'Abd al-Malik, he joined the ranks of the Kadariyya, a movement which soon affected the entire city of Mecca together with his brother Sa'id, and evidently executed by order of the caliph himself, at Damascus.

Later tradition tended to explain his fate by his Kadari convictions. But this must not have been his primary motive. We do not have any detailed information about his thinking; he was not a theoretician like his younger contemporary al-Hassan al-Basîf [q.v.]. Much of our material results from a damnum memoriae which was initiated by predestinarian circles. But this was a slow process which did not begin before 190/709, when al-Hassan al-Basîf had died, and was only finished in the second half of the second century when the Kadiariyya [q.v.] as a whole was boycotted by the majority of the ahî al-hadîth. A decisive moment for the development was apparently the Kadiari take-over under Yazid III in 116/734; anti-Kadari groups in Syria as well as in Basra then discovered Ma'bad as a bad example of a doctrinarian who had tried to push through his ideas by means of a revolution. According to them, he had been "the first who talked about kadar in Basra". Later on, not earlier than 126/748, this statement was modified by the assertion that he had taken over his ideas from a Christian or a Magian convert among the Aswara by the name of Siman or Susayha (also other forms are given). The persons responsible for this campaign are to be found in the predestinarian wing of the school of the Hasan al-Basîf (e.g. 'Abdullah b. 'Ubayd, died 130/749 or 140/759; 'Abd Allah b. 'Awn, died 151/768). They wanted to detract the attention from the fact that their master himself had been close to Kadiari theories. For them, the decisive point was that al-Hassan al-Basîf, in contrast to Ma'bad al-Diuhan, had not drawn negative political consequences out of them.

Biography: A detailed "biography" is given by Ibn 'Asakir in the unedited part of his Ta'rîkh Dimashq, but there are lots of other (normally short and biased) reports. The material available up to now has been used in J. van Ess, Ma'bad al-Diuhan, in Islamwissenschaftliche Abhandlungen Festschrift zum sechzigsten Geburtstag, Wiesbaden 1974, 49 ff. Cf. also W. M. Watt, The formative period of Islamic thought, Edinburgh 1973 (index s.n.; Redwan Sayed, Die Revolle des Ibn al-'Abbâd und der Konradier, Freiburg 1977, 360 and passim. (J. van Ess))
Kumkard), states that Ma'bar "means the crossing in 466), "the coast of the Cholas). Bibl., from their capital ut 'the realm Colatnapjalain, but not exactly, to the Coromandel coast (the latter terra Ma'bar to the Coromandel coast occurs iu *Abdation from Indian and Chinese vessels (in this context, the west of Cape Comorin, root with serious competi¬tion must be considered less satisfactory than explanation must be offered by Yule who was cl An alternative has been widely interpreted as being a reference to crossing point. In its application to Coromandel this has been widely interpreted as being a reference to crossing point. In its application to Coromandel this	
MANNAR...This is the third of three or four days journey to the east of Kollam (Quilon), the first locality in Ma'bar belonging to Rä Kumhuri (Cape Comorin) (tr. in Nainar, op. cit., 55).

Al-Ma’bar’s description of the geographical extent of Ma’bar corresponds more closely to the Coro¬mandel coast than that offered by Wassyf and Rashid al-Din, and indeed, after Abu ’l-Fidä’s time the term Ma’bar seems to have become increasingly associated with the east of South India east of Cape Comorin rather than east of Quilon; nevertheless, Ma’bar, even in this truncated form, may not be considered synonymous with Coromandel. The latter is defined by Hesbon-Jobson (1862-8) as: “the Northern Tamil Country, or... the eastern coast of the Peninsula of India from Point Calimere northwards to the mouth of the Kistna, sometimes to Orissa”; thus Ma’bar extended south of Coromandel to include the shoreline of the Palk Straits and the Gulf of Mannar.

The term Ma’bar, although originally an exclusively Arab designation, gained considerable currency beyond the confines of the Muslim world; thus Marco Polo (ca. 692/1292) writes at some length concerning "the great province of Maabar which is styled India the Greater; it is best of all the Indies and is on the mainland" (Yule, Marco Polo, ii, 327-50). In a letter also dating from 692/1292, or possibly one year later, John of Monte Corvino describes the coast of Malabar. The compilers of Hobson-Jobson (1862) suggest that ‘Ma’bar’ may simply be an at¬tempt to give meaning in Arabic to a local South Indian name; however, no suggestion is made as to a possible Dravidian etymology. A fourth possible explanation is that the "crossing" referred to was that from the well-known Arabian Sea to the less familiar Tota al-Rih (i.e. "beneath the wind", the Bay of Bengal and the seas of Southeast Asia), a region where Arab merchants power, supreme to the west of Cape Comorin, met with serious competition from Indian and Chinese vessels (in this context, note the descriptions of Ma’bar offered by Yäkût and Wassyf, below).

According to Yule, the earliest application of the term Ma’bar to the Coromandel coast occurs in Abd al-Latif’s short description of Egypt (al-lajab wa'l-jifār fi tūmār al-masābdhah wa'l-bawladhā al-mudīyāna bi-vand Mur, see De Sacy, in Bibl., 31), a study written ca. 600/1200, when the Chola rāja, Kulottunga III still ruled over the eastern Deccan. Although it is not certain for its mat-weaving industry, mentioned in this passage, see P. K. Nambiar, op. cit. in Bibl., passim.

Mediaeval Arab scholarship in unclear as to the exact extent of Ma’bar. According to the geographer Yäkût, "Ma’bar is the extremity of the land of Hind, then come the cities of China, the first of these is Java" quoted in Nainar, op. cit. in Bibl., 55. In his Tarjūyat al-anjar mu‘izz al-dīn al-tāhirí (700/1300), the historian Abd Allah Wassyf states that Ma’bar extends in length from Kollam [Quilon] to Nilavari (Nilgore), nearly 500 parasangs (i.e. 1,800 km.) along the sea-coast (in fact, the distance is nearer 1,200 km. (tr. in Elliot and Dowson, iii, 32).

In his Dībdī al-tawārīkh (710/1310), Rashíd al-Dīn repeats Wassyf’s description of Ma’bar almost word-for-word, but elaborates somewhat on the products of the region, mentioning alken stuffs, aromatic roots and large pearls (tr. in ibid., i, 69). According to Abu ’l-Fidä, Khōl Khājem al-bulūdī (ca. 731/1330), Ma’bar is the third shībān of Hind, beginning at about three or four days journey to the east of Kollam (Quilon), the first locality in Ma’bar being Rä Kumhuri (Cape Comorin) (tr. in Nainar, op. cit., 54).

Abu ’l-Fidä’s description of the geographical extent of Ma’bar corresponds more closely to the Coro¬mandel coast than that offered by Wassyf and Rashíd al-Dīn, and indeed, after Abu ’l-Fidä’s time the term Ma’bar seems to have become increasingly associated with the east of South India east of Cape Comorin rather than east of Quilon; nevertheless, Ma’bar, even in this truncated form, may not be considered synonymous with Coromandel. The latter is defined by Hesbon-Jobson (1862-8) as: “the Northern Tamil Country, or... the eastern coast of the Peninsula of India from Point Calimere northwards to the mouth of the Kistna, sometimes to Orissa”; thus Ma’bar extended south of Coromandel to include the shoreline of the Palk Straits and the Gulf of Mannar.

The term Ma’bar, although originally an exclusively Arab designation, gained considerable currency beyond the confines of the Muslim world; thus Marco Polo (ca. 692/1292) writes at some length concerning "the great province of Maabar which is styled India the Greater; it is best of all the Indies and is on the mainland" (Yule, Marco Polo, ii, 327-50). In a letter also dating from 692/1292, or possibly one year later, John of Monte Corvino describes the

According to Yule, the earliest application of the term Ma’bar to the Coromandel coast occurs in Abd
the arrow of any holy warrior had not yet reached") (tr. in Elliot and Dowson, iii, 85-6).

During the first half of the 7th/13th century, however, the powerful Chola Kingdom which had dominated the south-eastern Deccan for over four centuries, entered a period of final decline. In ca. 656/1259, Bébêndra IV, the last Chola monarch, fled from power; his territories were divided between two rival Hindu kingdoms based on Madurai and Mysore (Basham, op. cit., in Bibl., 26). In 708/1308 the third Khâdîj sultan, ʿAbî al-Dîn, having defeated the invading Mongols, felt it time to turn to the military conquest of the Deccan. Under the capable generalship of Mâlik Kâfîr, the Muslim armies subdued the Yâdava rulers of Devagiri and the Kâkâtiya rulers of Warangal; in 710/1310 Kâfîr broke through to the southern Deccan, and for the first time Muslim armies were able to despoil the great Hindu temples of Malabar: It was a direct consequence of this victory that Ibn Battûta, who visited the Deccan in or about 729/1328, found the Dravidians of Maʿbar under the rule of a Muslim sultanate with its capital at Madurai (Gibb, op. cit., in Bibl., 261-5).

The success of Muslim arms in the southern Deccan was nevertheless to be shortlived. Within a few years of Maʿlik Kâfîr’s invasion, the independent Hindu kingdom of Vîjâyânagar was established in 731/1336. Maʿbar passed under the control of the rulers of Vîjâyânagâr in 772/1370 (Thapar, op. cit., in Bibl., 1, 325); under a succession of Hindu rulers, the region was to maintain its independence from the Muslim north until the early 15th century. Ibn Battûta, who visited the Deccan in or about 729/1328, found the Dravidians of Maʿbar under the rule of a Muslim sultanate with its capital at Madurai (Gibb, op. cit., in Bibl., 261-5).

Mâbēn (A. mā bar) “what is between”, in the organisation of the Ottoman palace, the intermediate appartments lying between the inner courts of the Saray and the Harem, a place where only the sultan, the eunuchs and the womenfolk could penetrate and where the corps of secret pages known as mâbēn, an elite group from amongst the forty köşg adâlîs, waited on the monarch for such intimate services as dressing and shaving him (see knsâh 99a).

Till the end of the 11th/17th century, the Mâbēnîs were headed by the Sîlaâdâr Ârba or Sword-bearer, as chief page. But under Ahmed III (1223/1713-1757) there was a reorganisation of the palace service, involving the decline of the white eunuchs’ influence, elevation of the Sîlaâdâr Âska’s position...
and depression to some extent of the Ḥubbaydīya, henceforth regarded as inferior to the principal pages of the Ḥaṭayy Oda or Privy Chamber. Hence there were now three grades of pages there: (1) the Ḥubbaydīya Ḥaṭisi or Superior Ḥaṭasi (so-called because they were gilded or silver-plated daggers, ḥbild, in their belts); (2) the Ḥubbaydīya; and (3) the Inferior Ḥaṭasi, with no special designation. Writers from the late 18th and 19th centuries, such as the Ottoman historian Şafi and the European D'Ossion, mention several specific offices held by the principal ones of twelve Ḥubbaydīya (thus numbered by D'Ossion), headed by the Bey Cuhaddar or Head Vazir, the Ṣir Ḥakib of Confidential Secretary (both still highly influential because of their close contacts with the sultan), the Ṣarıkeli Ḥakib or Chief Turban-folder, the Ṣarıkeli Ḥakib or Chief Coffee-maker, etc.

(C. E. Bosworth)

MADAGASCAR, with its 627,000 km², the third largest island in the world, after New Guinea (695,000 km²) and Borneo (639,000 km²). Its area is slightly greater than that of France (550,880 km²), of Belgium (30,000 km²) and of Holland (33,000 km²) combined. The large African island is oriented from north-north-east to south-south-west, measuring 1,000 km at its greatest length and 380 km at its greatest width, with a coastal perimeter of 4,900 km. It has a population in excess of 8 million inhabitants which is increasing at a fairly rapid rate (3.2 %).

Although the Comoros (see KOUR) are entirely Muslim, Madagascar's Muslim population is confined to the north-west coastal region and the south-east, where the descendants of the first Muslims to arrive on the island remain. However, archaeological studies have shown that the Muslims of the Indian Ocean were the transporters of the initial African population, and were responsible for trade between the Great Island and the rest of the world from the 10th to the 18th century. In the 19th century, Indian Muslims engaging in commerce settled in their turn.

In the religious sphere, Malagasy Islam has always tended to be absorbed by the traditional religion, to such an extent that continual contributions are necessary for the maintenance of Muslim establishments. Most curiously, in the south-east of the island a tradition of Arabic-Malagasy manuscript writing is perpetuated.

The island has been known by the names of Malagasy by the Arabs; Buki, literarily, the place where there are (mi Buki) by the Beraters of neighbouring East Africa; Isle of St. Lawrence by the Portuguese who discovered it in 1506 on the feast-day of this saint, to August; and finally Madagascar, according to the narrative of Marco Polo. The un-vocalised spelling Jiyamr has given rise to the play on words Ḥayrat al-kamar "Island of the Moon" which was employed by Portuguese historians in the 16th and 17th centuries and which apparently survived until the end of the 19th century among the seafarers of Southern Arabia.

The name of Kour seems to figure for the first time in the Kitâb Sīrat al-Murad of Muhammad b. Musá al-Karazmi (d. 290/855 or 230/845), in the context of the famous "mountain of Kour" (Daqbāl al-Kour) which was believed to be the source of the Nile. But the interpretation as Dajbal al-Kamar "mountain of the moon" was ancient as early as the 9th century, since it is encountered in the Ψργνώνεκραία of Ptolomy, whom the majority of Arab geographers and al-Karazmi in particular took as their model. The mountain known as that of Kour or the Moon is mentioned by all the Muslim geographers who have described East Africa. It is totally different from the homographic term Kour, which in the 17th century, as Tringham has shown, signifies the Great Island, but also the neighbouring archipelago of the Comoros, which alone has retained this name to the present day.

In his study on the Ψργνώνεκραία en les ancienures navigations interocéaniques dans les Mers du Sud (in JA, xil-xiv [1910]), Ferrand suggested an association with the name of the Kmers and that of the island of K'un-lun of the Chinese texts, a daring association, even though these Chinese texts are by no means ignorant of Africa. More interesting for our purposes would seem to be the comparison, by the same Ferrand, of Wāk-wāk with μακάκα.

The term Buki, which denotes Malagasy in Swahili, and Bokini, Madagascar, have been madaciously linked with Buki (people of the Celebes) by J. C. Hébert. In Madagascar, the term appears in literature for the first time in 1625, in the writing of the Portuguese Father Luis Mariano.

The current name of Madagascar is revealed to us in the writing of Marco Polo under the form Madigascar (cf. The book of Sto Marco Polo, ed. H. Yule, revised and corrected H. Cordier, ii, 471 ff.). As was demonstrated by Yule a long time ago, Marco Polo did not visit Madagascar, spoke of it only through hearsay and presented under this heading certain information relating to the neighbouring East African coast. In this sense, the question may be regarded as settled. As Ferrand already indicated in studying ares this chapter of Marco Polo, Madagascar is without doubt a slightly incorrect compound, the name善良者 Zangbdr, Zangdr, Zangbdr, meaning "land of the Malagasy", in the same way that the former has the sense of "land of Zang or the Zangs" (cf. Trois mytologies malagascies, in Mémoires Soc. de Lingu, de Paris, xiii [1905-6]). This reconstruction is based on the following facts: in the previously mentioned account, Father Luis Mariano tells of a kingdom in the south-east of Madagascar which he calls Matusassi, Matisassi, Matusasi (or Matakasi). Three years later, in 1625, Father Almeida, travelling in the same region, also mentions a kingdom of Mutasasi. In his Relation published in 1651 by Morisot (Relations véritables et curieuses de l'Isle de Madagascar et du Brésil, 10, 49, 99, 124, 127, 134), Cauche refers to a province called Madagache and known by others as Madagas, whose inhabitants he calls Malaques and Malagues. He also employs the name Madagonaros, but in the broader sense of the inhabitants of the entire island. Flacourt (Histoire de la grande ile de Madagascar, 1661, i) says: "The Island of Saint-Laurens is called Madagascar by the geographers, Madagasse by the inhabitants of the land, Mauhtias by Ptolomy, Cerne by Pliny... but its true name is Madagasse". Later writers have all been inspired to a greater or lesser extent by the work of Flacourt; therefore, there is no purpose in employing their testimony. These variant readings may be reduced to two: Madagascar and Majagasi.
which correspond exactly to the two major categories of dialect: dialects with voiced dental (ṣ and dialects with liquid dental (r). It is the latter form that has prevailed throughout the island, sometimes with the shibbant Madagasari, sometimes with the fricative Malagasi. Both are paroxytones. In addition, the modern colloquial language frequently employs the alliterated form mada-gasi and even gasi. These observations seem to justify the interpretation proposed above for the name of Madagascar which we owe to Marco Polo.

The doublet Malagasy-Madagasari, Madagascar-Madagasari remains obscure. According to the morphology of the language, it may represent a compound mada or mada-gasi which resembles nothing known, since it consists of the voiced form mada-gasi, or of the unvoiced form noted by the Portuguese mada-kasi. Furthermore, it is not known whether this is a western Indonesian construction or a Banu construction. Whatever the case may be, it is likely that here we have a foreign tribal name, the origin of which, eastern or western, cannot currently be explained by reference to the ancient and modern language.

The account of the Periplus of the Ethiopian Sea, probably written by a Greek of Alexandria in the 3rd century A.D., describes a voyage along the eastern coast of Africa as far as the port of Rapa. Madagascar seems to be unknown to the author of the Periplus, and it is probable that it was still uninhabited. Indonesian and African migrations seem to have populated the island only in the 2nd or 3rd centuries of the Hijra, at the earliest.

In about the year 943, the island of Zabag, probably situated in the archipelago of the Comoros, was the object of invasions by marine pirates possibly based on Madagascar. The book of The marvels of India by Buzurg b. Shahriyār, a Persian of Rumhurmuz, states in fact: "Ibn Lākit tells me that he has seen the people of the Wāk-wāk perform amazing things. It is thus that in 334/943-4, they came upon them in a thousand ships and fought them with the utmost vigour, without however achieving their end, since Zabag is surrounded by a strong defensive wall around which stretches the water-filled estuary of the sea, so that Zabag is at the centre of this estuary like a fortified citadel. When people of the Wāk-Wāk subsequently came ashore there, they asked them why they had come specifically there and not elsewhere. They replied that this was because among them there were to be found products sought after in their country and in China, such as ivory, tortoise-shell, panther hides and ambergris, and because they were seeking out the Zandj, on account of the ease with which they endured slavery and on account of their physical strength.\r\n\r\nThis Periplus, however, does not contain the reference to the mountain of this name situated in eastern Africa, which the author devotes to the history of Aden, particularly in 626/1228. From Madagascar to the coast of India, at the end of the 13th century, Ibn al-Muqaffa wrote a geographical treatise, of which the Bibliothèque Nationale of Paris possesses, under no. 22.34, a copy once belonging to Abu l-Fālād and dating from 714/1314-13. This treatise contains an interesting association between the Arabic people and the people of Kunr, which Ferrand summarises thus: "The Kunr, who have given their name to the mountain of this name situated in eastern Africa, as brothers of the Chinese. They dwell originally with the Chinese in the eastern regions of the world, that is to say, in the interior of the continent of Asia. Discord having broken out between them, the latter drove the Kunr towards the islands. After a certain period of time, with dissension erasing among the Kunr who had emigrated to the islands, the king and his family emigrated again, made their way to the large island of Kunr — Madagascar and the king established himself in a town of this large island called Kunriyya. These Kunr, having arrived on the large island, grew in number and proliferated in the various capitals of the island in question; but new divisions provoked a new exodus and a large number of them departed to settle in the south, at the commencement of the inhabited territory, along the mountain range which bears their name." (Ferrand, Relation, p. 157-158.)

A contemporary of Ibn Sa'd, Ibn al-Mudhhafīn al-Shaybānī of Damascus, wrote his Tartībih al-Mustasbirīn in ca. 1230 (B.N. ms. 6021). In the 25 folios which the author devotes to the History of Aden, there is mention in folio 72 a-b of voyages by the Kunr from their country of origin to Aden and, in particular, in 626/1228, from Madagascar to the coast of Africa and to Aden (cf. J.A., xiii [1913], 406-81).

The following authors al-Dimashqi (ca. 723/1323), al-Nawwārī (d. 732/1332), Abu l-Fālād (1273-1331), Ibn al-Muqaffa (no. 1275) and al-Wardi (1356-1422) tell us nothing of substance about the island of Kunr. The place which some of them place on the great African island are in fact situated in Ceylon or further east, or are unidentified (cf. Ferrand,
安全;从 6 点的 Tikk Na'sb 是在 6 点的 Ihsba (= 罗 440, the coast is entirely to the south, Na'sb is at 8 点的 Ihsba; Bandar IladOda, on the western coast, at 4 点的 Wabaya (?) (according to others, at 9 点的 Ihsba; the island of Malta, on the eastern coast, and Bandar Kdxl, on the western coast, at 9 点的 Ihsba). The eastern coast consists of the inhabited island called Munawwara (one of the southern Maldives). To the south of the island of Kumr, its numerous islands called Tirsalgha (the Mascareen group?); they are at 12 点的 Ihsba (= 36 hours of travelling from the island of Kumr.)

In his Kitab al-Muhandis al-fakhar (fol. 73 b of the same manuscript), Sulayman al-Mahri provides a second description of the island of Kumr which does not differ from the foregoing. Four pages previously, in fol. 72 b, the same author mentions some other ports of the island of Kumr with their latitude calculated according to the elevation of the Great Bear: Island of Munawwara at 12 点 Nasa' (the Sfascareignes group?); they are at 12 点的 Ihsba; the island of Anjouan, which is at 20 点的 Ihsba; Birmaruh, on the eastern coast, Ashmil, on the western coast, at 9 点的 Ihsba; the island of Jibril (Jibril al-Sarbar), on the eastern coast, and Bandar al-Nuf on the western coast, at 8 点的 Ihsba; Nohjin (?), on the eastern coast, and Malawin (?), on the western coast, at 7 点的 Ihsba; Manshara, on the eastern coast (true latitude 22° 08° 30'), and Bandar al-Shub (part of the shoals), at 6 点的 Ihsba; Bandar Hadda, on the eastern coast, and Bandar Kuf, on the western coast, at 4 点的 Ihsba; Wabaya (?) (according to the Turkish text of Suyyid Ali; this name is illegible in ms. 2539), on the eastern coast, and Bandar Hit (or Hayt), on the western coast, at 3 点的 Ihsba; Bandar Hadda (ise), on the eastern coast, no name known on the western coast at this latitude, at 2 点的 Ihsba; and Bandar Kus (or Kaws), on the eastern coast, and the bay of Kuf, on the western coast, at 1 点的 Ihsba.

A number of these ports, including Sa'da, Manzaladh and Birmaruh have been rediscovered and have been subjected to archaeological studies. Those of the north-west were also known through an oral tradition,
In the light of recently discovered data, the settlement of Madagascar may be summarised as follows. Between 700 and 1000, Indonesians and Africans created through biological and cultural cross-breeding the proto-Malagasy civilisation in the north of Madagascar and, no doubt also, in the archipelago of the Comoros (especially at Mayotte).

From this period onward, Muslim seafarers of the Persian Gulf and the Hadramawt took part in migrations and in commerce. In particular, they taught navigation to the Bawlil peoples of the east coast of Africa, as a result of which Bantu migrations were extended to the islands. The Muslims established after the 10th century contacts between Siraf and Suqar on the one hand, and the Malagasy Comoran ports on the other. A green ceramic, called Sassano-Islamic, has been discovered at Irodo, in the far north of Madagascar, a site dated to the 10th century by the RC 14 test.

Between the 12th and 14th centuries, Muslim establishments frequented by the latter proliferated, especially at Bemaraha, Arambarotelo and Mahalaka. The ceramics imported then were of the sgraffiato type, very similar to that of Takht-i Sulayman. The first stone-built mosques appeared at this time, as well as ston-built houses, fortifications and well-shafts. At the turn of the 14th century, the influence of the Hadramawt became perceptible, corresponding no doubt to the monopoly control of the gold trade in the region by the Mahdali.

The 14th and 15th centuries constituted a golden age for the Muslim settlements in Madagascar. The towns of Vohemar, Sa'da, Langail (Manzaalagi) and Kingani were particularly prosperous. They imported fabrics, pearls and Arab and Chinese ceramics. They exported rice, livestock, and chlorite slate.

At the end of the 15th century, the Portuguese invaded the Malagasy coasts. They sacked Kingani, Sa'da and Langail. Despite certain vicissitudes, the Muslim settlements of Madagascar were never to be subjected to the Portuguese crown. Progressively, commerce developed with other foreign nationals: French, English, Dutch and even Danish.

In the 16th century, the slave trade became important. Settlements controlled by Malagasy signified as Sa'da, but enlivened by native-born or immigrant Muslims, became intensely prosperous. African slaves were imported to Madagascar to cultivate the crops of Sakalava farmers; but, at the same time, Madagaskans taken prisoner in the course of internal wars were exported to the Mascareignes (Filliot). In the 17th century, Langail declined, but commercial activity continued at Boeiny. Vohemar was prosperous at this time, but it too declined in the 18th century. In the second half of the 18th century, Boeiny was supplied by Majungs which, together with Nosy Be, has remained a major commercial centre until the present day. Indian Muslims settled in Madagascar in the 19th century in the course of trade missions to Majorca and Nosy Be. Malagasy Islam is active among the Antakarana and the new converts (mordis/mumari), especially following the conversion of Tsimaro in 1843.

In the south-east, certain of the Antambahoka and Antaimire, possessors of sorato (Arabico-Malagasy manuscripts) still respect the authority of Islam, while also professing Malagasy customs.

Finally, still among the Madagascar of old stock, there should be counted the descendants of the former inhabitants of the Muslim trading-stations of the north-west called Antakaize. Among them live some Malos, more recent arrivals from Africa and many of them converted. These various Malagasy Muslim groups may be numbered at around 100,000. They live in the coastal towns, but also in the urban settlements of central and western Madagascar, the descendants of Indian Muslim immigrants. 15% of these Indians are Sunnis; some of these Sunnis have introduced a ceramic type from Sind which has gradually replaced the local Malagasy pottery of the north.

Among the Shi'ite Indians, predominant are the Sokofis (q.e.), the most numerous (about 5,000); the Khodja (on whom some 2,500 arrived shortly after 1900 with Amode Khodja by way of Majunga, but whose most active centre is at Nonotsana; and finally, the Agahas [q.v. see AGHA MAHRJ] (5,000), who arrived ca. 1885 and are linked to a remarkably structured international organisation.

Among the foreign Muslims of Madagascar, there are a number of Somalis and Yemenis who have settled since the colonial period, and 25,000 Comorans who live mostly in the north-west, but no longer dwell in Majunga, which they evacuated following the tragic events of December 1976.

The inhabitants of Madagascar all speak an Indonesian language modified by a Bantu substratum. Vérin, Kortak and Gorlin (1968) have acknowledged three groups of dialects, giving a separate place to the group of the north, apparently more isolated in ancient times than the centre-east and west-south groups.

In the article on Madagascar in EB, Ferrand clearly showed the lexical contribution of African in Malagasy, whereas the Arabic contribution was minimal, which could emanate from the language ancestral to Comoran and Swahili, but also from more recent borrowings from Swahili, at the time when, in the 15th century, this language was commonly spoken in the Muslim coastal settlements.

The basic vocabulary of Malagasy is 90% Indonesian, but in addition to Bantu expressions, there exist some words of Sanskrit origin; scholars are divided as to whether this Sanskrit lexical stock was brought to the island by the original Indonesian immigrants, or was absorbed through later contact with Indian civilisations.

Certain words of Arabic origin have made their way into Malagasy through the intermediary of Swahili (e.g. sokony, Ar. sakhsa "rudder"). But others have been introduced directly through borrowing.

Among these borrowings from Arabic are the following:

1. Some commercial terms, e.g. misana (misain) "scales", but also the names of days of the week, described by Ferrand in the following terms: al-d'um (xotna, asabofsy, talata, alarobia, alakamtsy), al-sabt (xi-kkantis, al-d'um). Among the Shi'I Indians, predominant are the Sokofis (q.e.), the most numerous (about 5,000); the Khodja (on whom some 2,500 arrived shortly after 1900 with Amode Khodja by way of Majunga, but whose most active centre is at Nonotsana; and finally, the Agahas [q.v. see AGHA MAHRJ] (5,000), who arrived ca. 1885 and are linked to a remarkably structured international organisation.

Certain words of Arabic origin have made their way into Malagasy through the intermediary of Swahili (e.g. sokony, Ar. sakhsa "rudder"). But others have been introduced directly through borrowing.

Among these borrowings from Arabic are the following:

1. Some commercial terms, e.g. misana (misain) "scales", but also the names of days of the week, described by Ferrand in the following terms: al-d'um, talata, alarobia, alakamtsy, sona, asaboy, alakadhy (Ar. al-ihtaynay, al-thaladh), al-arbid (al-khamsa, al-d'imma, al-sabi, al-abed). It will be noted that the Arabic definite article has been retained for Monday, Wednesday, Thursday, Saturday and Sunday and omitted for Tuesday and Friday. The names of the days are given here in Merina dialect; the forms of the other dialects show only minor phonetic variations.

2. The names of the twelve months in the dialect of the Merina and that of some other tribes reproduce the Arabic names of the twelve signs of the Zodiac: alakaday, alaoro, aladisoa, asoetoey, alabaxy,
and difficult; it has however been successfully achieved under satisfactory conditions. The Malagasy phonemes b, d, f, h, l, m, n, r, s, have been transcribed by their Arabic equivalent; d is represented by a subpointed s. The other phonemes are rendered thus: Malagasy g by ژ, gutturals by ی, and sometimes by j; the group دگ also by ژ, the phonemes t and r, as in the English drive and travel (they are pronounced further back in the non-Merina dialects), generally by ژ, sometimes by ی; with a samim (for example antemery “date-palm” is rendered by ی and only the context indicates whether ژ should be read dr or t). Malagasy h is represented by و, the phoneme ح by Arabic ـ; Malagasy ح by ـ, but Arabic ـ is also pronounced ـ; Arabic ـ, when used in the current language, is pronounced ح by ـ and in modern Arabic-Malagasy sometimes by ـ. The non-Semitic Islamised peoples who have adopted the Arabic alphabet and have found it necessary to transcribe the occlusive ـ, have recourse to various notations. The Malays have rendered it by ـ. The Persians, and following their example, certain Muslims of the Comoro archipelago, by ـ. The Swahilis of East Africa by ـ. The Malagasy adapted an unexpected solution; until the 18th century they rendered ـ by ـ, meaning the appearance of a vertical naklidh, then by ـ. Unlike in Malay, each letter is vocalised, which facilitates the reading of Arabic-Malagasy texts, in spite of graphical variants which are too numerous to be mentioned here.

The Arabic names of the lunar mansions have therefore become the names of the 28 days of the Malagasy month. When mentioned in conjunction with a day of the week, they replace the name of the day of the week, which the Arabic-Malagasy texts very rarely indicate by a figure. This method seems already to have fallen into disuse in the current language, and is hardly ever employed except in witchcraft.

4. Shikili (dialectal variants shikly, sikidy; At. شكل “figure”) is the divinatory art. It has as its object the finding of remedies and is practised throughout the island, with minor variations, between one tribe and another; shikli, to use the form generally employed, is a direct derivation from the قلم al-tram “science of sand”, or Arab geomancy (cf. the Kitāb al-Fasl fī mā'ill al-akram of the shaykh Muhammad ibn al-Zamāl, Cairo 8th n.d.).

Although today it constitutes nothing more than a precious relic, Arabico-Malagasy remains an essential element of the patrimony of the Great Island. The manuscripts which exist emanate from the regions of Vohiopeno and Fort-Dauphin. The most ancient are stored in the Bibliothèque Nationale of Paris, but some also exist in various European countries (Norway especially), and naturally enough in the Malagasy Academy, as well as in the region of Vohiopeno (south-east).

At the beginning of the 19th century, the king Andrianampoinimerina invited some Antainoro soothsayers to the court of Tananarive, including the eminent Andriamahazonoro. Arabico-Malagasy was thus held in high regard in Fueva until the beginning of the reign of Radama I. The latter subsequently had the Latin alphabet adopted for the writing of Malagasy.

The enterprise of adapting the Arabic alphabet to the transcription of Malagasy was both delicate...

al-MADANIN, *"the cities" (pl. of al-madina),

Kottak and Gorlin,

Music de l'Homme, Paris

The native population of al-Maddin was fairly

The Exilarch and Catholics remained there and in

By the late 1st/early 8th century it was also a Manichaean

The main change was the replacement of the

Sasanid upper classes by a small Muslim Arab

garrison posted from Kufa (300 horsemen in 43661,

led by Kufan notables (Baghdad), the tribal leaders of Aaq and prominent early Muslims

(buyid al-nasr) who married local women at first

and acquired local land. Their Friday mosque was in

Madinan al-Atkha.

In the early Islamic period, al-Madina was con-

sidered the key to the Kufan territory because it con-

trolled the main road to the east and served as the

administrative centre for the Diyala region (and

Diyah) under the governor of Kufa. Salman Al-

Farsi, who died there in the caliphate of 'Uthman

(23-35/644-656), was an early amir. Hudhayfa b. al-

Yaman, the first fiscal agent there under 'Umar,

established the tax rates for and Duiibah and died

at al-Madina in 36/657. However, early Muslim
government at al-Madina often combined the re-

sponsibilities for war, worship and finance, and resided

in the White Palace. Al-Madina al-Atkha was also

a mint for post-reform Umayyad dirhams.

Because of its proximity to Kufa and the Muslims of al-Madina appear consistently as pro-4^Alid and anti-

Sharijfi. Sa'd b. Mas'ud, 'Ali's governor 56-40/666-

660 secured the city against the Khawarij in 37/657.

In 42/662 al-Hassan b. 'Ali retreated there and stayed

in the White Palace before coming to terms with

Mu'awiyah. In 43/664 the governor, Simak, prevented

the Khawarij of al-Mutawwar from crossing to the

eastern city from Beharay. The Muslims of al-

Madina supported the 4Alids in the second fitna

and in 65/682 Sa'd b. Hudhayfa, an early caliph there,

joined the "Penitents" of Sulayman b. 'Sa'd with

170 Shi'is from Kufa who had settled in al-Madina. The

Shi'is of al-Madina suffered the consequences of

their partisanship later when the Azdjar Khawar-

rijid sacked the city in 68/682 and massacred the

Muslim population. The city was also occupied by

Shabib in 70/696. By the 3rd/9th century, the

Shi'is of al-Madina were extremists (ghulat). The

Harmaniyya sect which believed that whoever knew

the Imams could do as he liked was founded there and

supported the 4Alid rising of 103/724. The extremist

labaliyya sect was there in the 4th/10th century.

Although al-Mansur (135/751) stayed briefly at al-

Rumiyah, where Abu Musa was in 137/754

killed, al-Madina declined in political and commer-

cial importance after the foundation of Baghdad

in 145/762. Most of the population, the Catholics

and the Exilarch moved to Baghdad. The White

Palace was partially demolished by al-Mansur, and

although he ordered it to be rebuilt in 128/772, it

remained ruined. Its demolition was completed by

al-Muhtadi (289-95/902-8) in ca. 290/903, and the

materials used to build the Taj palace at Baghdad.

By the 3rd/9th century, al-Madina's importance was

more agricultural and the position of al-

Madina tended to be combined with that of Baghdad

and other places, although the tombs of Salman near

the Iwan and of Hudhayfa near the river had been built

at Aspand by then. By the 4th/10th century, al-

Rumiyah was deserted, but the rest of the town on

the east bank was a flourishing suburb of Baghdad,

with brick buildings, markets and two Friday

mosques, while there was a large fire temple on the

west bank.

Encyclopaedia of Islam, V
There was still a small town on the east bank in the 5th/6th and 7th/8th centuries. The office of Šāhāni was held by local people and the tomb of Šāhān was visited annually on 15 Shabān by Sufis and barbers of Bagdad and on variable dates by Shāfīs. There was a village of Šāhāni, situated on the west bank and come found at Tell Baruda confirming settlement at Behrāsī as late as the 7th/8th century. Behrāsī remained a small Sawāt town in the 8th/9th and 9th/10th centuries.

The tomb of Šāhān was rebuilt by the Ottoman sultan Murād IV (1932-1934) and restored in 1904. The village of Šāhān Pāk has grown up around the tomb in the modern period, with Sufis for Šāhān pilgrims who often stop there when visiting the other Šāhāni shrines.

On 23 November 1915, in the battle of Ctesiphon, the Turks defeated the Anglo-Indian army of General Townsend, stopping its advance towards Bagdad at a time east of the ruins of the Iwan.
This procedure is certainly to a high extent pos-
tated already by the working method of his sources; in opposition to Abü Mişqaf for instance, 'Awâna b. al-Ĥakâm [q.v.] hardly ever gives isnâds which go back to the account of an eye-witness. Sometimes isnâds even fall altogether, and this again may depend on the nature of the source at our disposal in which al-Madâ'ini is quoted. Even in passages where al-
Mādâ'ini summarizes the accounts of several authorities (see al-Tabârî, ii, 1236, 1236, 1308, ii, 35), or in an 'adab work like the Kitâb al-Tâ'amî, the style of giving information does not change; there is only the detailed rendering of the stories without com-
mentary. Not the subtle saying or the polished turn of speech seems to be important, but the historical framework in which the words quoted were uttered.

Al-Madâ'înî pertinently compares al-Madâ'înî with the latter's contemporary al-Dîdîbîz when mentioning al-Dîdîbîz's death (Mura'id, v, 33 f. — § 3145):

"Among the transmitters (râwîn) and scholars no one has written more books than he (al-Dîdîbîz). To be sure, al-Madâ'înî too has written very much, but he limits himself to reproducing what he has heard, while the works of al-Dîdîbîz— notwithstanding their well-
known (dogmatic) deviations—illuminate the mind of the reader."

The variety of al-Madâ'înî's interests brings about the fact that he refers to a considerably larger group of authorities than Abî Mişqaf, the historian of the preceding generation with whom he may be compared in that their working methods show resemblances. But when describing events which are interrelated through causality, he apparently relies on a smaller number of authorities. He then turns on works of, among others, 'Awâna b. al-Ĥakâm, Abî Mişqaf, Abî Bakr al-Îdâhî (Salâmî b. Abî 'Abdî d. 319/937, see ibid., x, 28 ff.), Hammad b. Salâmî (d. 167/783, see ibid., iii, 11-6), Abî T-Yâkânî (see ibid., i, 216 ff.; for the list of his works, see Fihrist, q.v.), al-Mubârakî al-Dâbbîî and Allâ b. Mişqaf. But, as is shown—among other things—by the descriptions of interrelated events, he also makes use of earlier works by authorities who have not yet become renowned to us as historians.

As direct transmitters of al-Madâ'înî's works are mentioned Abîdîrâhîm b. al-Îsâhî al-Îsâhî al-Kîfî (who is said to have heard the reading of all the books of al-Mâdînî, see Vâfûh, ibid., i, 407 ff.), Abî Bakr al-Îmâmî, Abî Khâyâthbîna (who is reported to have learnt from him all about the âyât al-nîsâ, see ibid., i, 198 ff.), and al-Ĥârîrî b. Abî Usânî (ibid.), Al-Bâliqâ'î (q.v.), 'Umar b. Shâbba (q.v.), Khâlîfâ b. Khâyâthbî (see ibid. Khâyâthbî al-Îsfâsî) and Išhâb b. Târîkhî al-Mâsîlî (q.v.) also prove to be his direct transmitters.

In the quotations from al-Mâdînî's works there are parallel passages which are nevertheless divergent from one another. In order to explain this it should be kept in mind that, during his long life as a scholar, al-Mâdînî certainly revised and completed his earlier works in later years, and that they have been transmitted as such. The material is overlapping, due to the fact that he wrote monographs on individual persons (like for instance the Kitâb al-Ĥârîrâh al-Unâdîdî b. âYâsîf) or on separate subjects (like for instance the Kitâb al-Tâ'amî, in which al-Îdâhî b. Yûsîf is also taken into account), as well as compendia (like the Kitâb al-Îkhâr al-
shu'ufîa' al-kafrî, It is possible that al-Mâdînî himself is responsible for the different forms and lengths with which material appears in the various
The two works which have been preserved are: Kitāb al-Mudaffāʼ mān Karayk, ed. Abū al-Samā‘ al-Harrūn, in Nava‘dī al-maddahiyya, i, Cairo 1951, 57-60, and Kātib al-Ta‘ādī, ed. Ibn ‘Abbās al-Mubarrad, Damascus 1950/1956 (see Index), so that those parts which have not been preserved in the manuscripts of al-Madā‘in’s work can be reconstructed. In the two instances which have come down to us, the author uses footnotes and refers to ca. 80 authorities (a few transmitters, other scholars and mainly persons who can be traced in al-Tabarī’s Tarīq) mostly just for one quotation. From a comparison with al-Mubarrad’s work, it becomes clear that al-Madā‘in compiled from abundant historical material about the way in which the caliphs, prominent and learned men sought consolation, for themselves or for others, for the death of a close relative or friend: poems, philosophical or lexicographic explanations are hardly sought consolation, for themselves or for others, for the latter’s work are also found in the Kitāb al-Ta‘ādī (d. 286/899), ed. Muhammad Dibadji, 471; al-Iṣlām, Ta’rīḥ Nadjaf 1965.

There are certain titles, include: A‘. al-Faraj b. Ya‘qūb (see below) quoted by al-Mubarrad. It is, however, probable that in all cases “Abu Muhammad al-Madā‘in is meant.

Bibliography: ii, 19, 204, 249, viii, 271, 272, 273, 278; Ibn Abī ‘1-Hadīd, iv, 34-53; see U. Sezgin, K. al-Mu‘āwīya and Muhammad b. Sirin, it may rightly be assumed that this material was also to be found in the monographs which he wrote on these men. The description of the epidemics of the plague was certainly also found in the Akhbar al-qādīn (see below, quoted by) Ibn al-Maddā‘in.

declined: in Tripolitania, e.g., the number of zawiyas decreased from more than 12 in the 1880s to about 9 in 1918 and to 7, all in the town of Misrata, in 1925 (L. Massignon, Annuaires du monde musulman, Paris 1923, 97).

Today, the original Madaniyya seems to be limited to Egypt, where it is under the direction of a grandson of the order's founder. Its followers are encountered mainly in the coastal area between Sidi al-Barrani, where this grandson lives, and Alexandria. Active lodges existed (in 1961) in both of these towns, in the towns of Marzé Mattréh and Eimg ar-Alarab, and in the oasis of Siwa.

plunging his foot or his fingers into the sea and withdrawing them. For their part, the Rasul of the Chwis al-Salaf attributed the tides to the heating of the rocks on the sea bed by the moon's rays. Ibn Rushd (d. 592/1196), in the Expositio media of the Meteorum (cf. Aristotle, Osmera opera. Averroes' Commentary, vi, Venetiis, 1560, 29-30) seems to have been influenced by the theory of haterothemes relating to the straits, for he says that the waters flow into the Ocean from the seas higher than it and it flows into the lower seas; meanwhile, in the latter, the waters are set in motion by the winds which arise in their midst because of the moon's heat, and flow towards the Ocean in an upward movement, while the Ocean sinks. We know that the establishment of harbours is presented for the first time in a graphic and systematic manner in the Atlas cartographi of 1375 (see D. Gnechen, Les indications relatives aux mers dans les anciens xivies du mer, in AITS, xxxviii [1949], 671-71), but in some earlier Arabic texts, particularly those which concern the Indian Ocean, some passages figure which allow us to state that the phenomenon was known and put to good use by sailors: also, for example, in § 17 and p. 16, n. 2 of the Relation de la Chine et de l'Inde (1871), ed. French tr. J. Sauvaget, Paris 1948 (in the rest of the world, cf. Bede, apud Duham, in S.M., iii, 204, note, in Science et civilisation en Chine, iv [1965], 912). It is hard to know to what extent the Arabs were aware of these theories, for we do not know the chain of possible transmitters. In any case, we find in Arabic texts an echo and development of certain doctrines sketched in antiquity. Also, Ibn Khurradadhbih (250/864) gives quite a fair explanation of the phenomenon, and al-Khul (d. 268/883) wrote a Risala al-Madd wa l-Djazr (cf. E. Wedemann, Al-Khul's Schriften über Ebbe und Flut, in Annales der Physik, lxii [1922], 374-89) which is not the same as that which, bearing the same title, was studied and translated by the author of the present article (in Mem. de la Real Acad. de Buenas Letras de Barcelona, xiii [1971-3], 125-22; a résumé of this Risala, Barcelona 1959). The explanations given by Abū Ma'ṣūr al-Balkhi (d. 272/886) in his Kitāb al-Madd al-Madlul (translated into Latin as Introductorium in astronomiam) are interesting as having rapidly become known to Christian authors. Also, for example, the text attributed provisionally by R. C. Daies (see Isis, livi [1966], 455-74) to Robert Grosseteste, is, in the order and arrangement of the ideas and despite the mention of the Brijdijh which it contains (see 439, 460, etc.), in large part derived from Abū Ma'ṣūr, as can be appreciated by comparing it with the Introductorium (see 465, 466, 465, 466, 467 of Daies and the résumés of L. Martinez Martin, art. cited, passim). For Abū Maṣūr, the tides depend on the movement of the stars and are due to the "attraction" of the moon: the waters of the tide come up holing from the sea bed, which explains why they are warmer than those of the ebb; he analyses the inequality of the ebb and flow in the two hemispheres and establishes eight distinct causes for it, of which some very reasonable ones are of an astronomical or topographical nature.

As for al-Maṣūdī (d. 346/956), he sometimes follows the Introductorium in his Murūj al-ghubab (i, 244-55 = §§ 259-69) and presents all kinds of theories, of which some are purely para-scientific; in the Tanbih (French tr. Carra de Vaux, 196-45), he states that there are some authors for whom the tide is due to an angel who produces the ebb and flow by

the intensity of the marine currents, especially in straits, asserted that the seas had variable levels which were due, like the tides in the Ocean, to the height of the moon: when it rises and sets, the flow begins, and when it passes by the upper or lower meridian of the observation place, it ends. It was also observed that the height of the tides depended on the position of the sun and moon on the ecliptic (opposition, conjunction, quadratures) and on the position of the observation place (Seleucus, Hipparchus).

However, the classical author who is most interested in these problems is Posidonius of Apamea (135-50 B.C.), who arrived at a series of generally exact conclusions after having studied the authors mentioned above and having listened to the accounts of the sailors of Cela. His opinions were adopted by Pliny, Seneca and Cicero. On the other hand, Pompomius Mela (ca. 42-5 B.C.), if he clearly accepted the moon's influence, also presented two other hypotheses: for him, the tides were the result of the earth's breathing (which is also asserted by Brunetto Latini, d. 1293) or of the cavities in it (cf. R. Altamagia, La conoscenza del fenomeno delle maree nell'antichita, in AITS, xxxviii [1949], 893, and La doctrina della maree nell'antichita classica et nel medio evo, in Memorie della Reale Accad. dei Lincei, 1904). It is hard to know to what extent the Arabs were aware of these theories, for we do not know the chain of possible transmitters. In any case, we find in Arabic texts an echo and development of certain doctrines sketched in antiquity. Also, Ibn Khurradadhbih (250/864) gives quite a fair explanation of the phenomenon, and al-Khul (d. 268/883) wrote a Risāla al-Madd wa l-Djazr (cf. E. Wedemann, Al-Khul's Schriften über Ebbe und Flut, in Annales der Physik, lxii [1922], 374-89) which is not the same as that which, bearing the same title, was studied and translated by the author of the present article (in Mem. de la Real Acad. de Buenas Letras de Barcelona, xiii [1971-3], 125-22; a résumé of this Risāla, Barcelona 1959). The explanations given by Abū Maṣūr al-Balkhi (d. 272/886) in his Kitāb al-Madd al-Madlul (translated into Latin as Introductorium in astronomiam) are interesting as having rapidly become known to Christian authors. (L. Martinez Martin)

MADDAH (Turkish médall), an Arabic word which means “pamphletist”; the term was used by the Ottoman Turks as a synonym of hkbah-khān (Arabic ḥāfiz) and skghnma-khān to designate the professional story-tellers of the urban milieus; it was used in the same way by the Persians, but more rarely; as for the Arabs, they used it, in a fairly late period, to designate the “begging singers of the streets” (see Köprüüzade M. Fu‘ād, Médallbbr, in Türküyati Mecmüs, i [1935], 11-12). In North Africa, however, the médall is a kind of “religious minister” who goes to festivals to sing the praises of saints and of God, and holy war, and who is accompanied on the tambourine and flute” (Dossy, Supllm., a.v.); he is also the hāl of the éde (q.v.), who, at a late date tours the country and cities, recounting heroic legenıes and stories drawn from the répertoire of the story-tellers of the Middle Ages, sometimes recited today by bands, and which are sketched out very often without any connection with the subject of the story. The activity of the médall, his technique and his sources, would merit being made the object of thorough research.

In an early stage of the evolution of their art, the Turkish médalliks or khānma-khās derived their themes either from the traditional epic, the skγhmanma (whence their name of skγhmanma-khān) and the historico-legendary works relating the acts and deeds of the champions of Islam such as Hamza, All, Abu Muslīm, Baṭṭāl, or the first Turkish conquerors of the land of Rūm, such as Dānishmand Ghāzī. From the 11th/12th century onwards, the term médall begins to take on a more specific meaning to designate the teller of realistic accounts drawn either from old, classic collections such as the Thousand and one nights or from popular stories, or else inspired by scenes from the everyday life of the cities of the empire. The teller of edifying stories on religious and heroic themes, called khānma-khān or skγhmanma-khān for preference, retains the monopoly of the epic-romantic narration in the urban milieus, sometimes in simple sessions of declaiming. However, Evliya Celebi, when he describes (Scyphat-nāme, i, 325) the procession of the guilds in Istanbul, mentions the médalliks and khānma-khāns under the same rubric, as numbering eighty: it can be deduced that in the 11th/12th century, the two terms were still synonymous and the same artist could perform both kinds of narration. It is only from the 18th century onwards that the médalliks specialise more and more in the narration of entertaining narratives on realistic themes, and these supplant, at least in oral tradition, the heroic themes. The public audition sessions of this latter type survived until the second half of the 19th century; a document of 25 January 1884 informs us that at this date, in a Čekıldar café (on the outskirts of Istanbul) a “reader” of narratives drawn from the skγhmanma used to find an interested audience (see Metin And, Geleneksel Türk iritvaron, Ankara 1969, 69-70).

Numerous texts have come down to us of great heroic narratives of the chivalrous romance types of the Western Middle Ages; some, such as the A Aventi-nama [see Aانتار, شاهر], or the deeds of Abū Muslim and Baqīʾ [Baqiʾ], were translated or adapted from Arabo-Persian literature; the others, such as the Dānishmand-nāme were composed by Turkish authors; they attest, by their style and subdivision into chapters presented as auditory sessions on successive evenings (see I. Melkoft, La Geste de Melik Dānishmed, ii, Paris 1960, 16 and passim) that, from the earliest centuries of Turkish written literature, these works were not written only for the individual reading of the educated, but also constituted the narrative répertoire of the skγhmanma exercising their art before a collective audience.

As for the collections of realistic narratives, not a large number are extant and they are not of an early date. They are of two kinds: some, abridged texts of oral narration, sometimes written by the story-tellers themselves with a certain pedantry of style, to be offered to the sovereigns or dignitaries, and to be read individually by an elite public: the others appear as outlines to serve as an aid to the memory of the story-tellers themselves. The oldest of the collections of realistic narratives go back to the 10th/11th century, and, for the most part, they remain unpublished.

Of the poet Dženāni (d. Mubarraz 1004/September 1594) there has come down to us a collection entitled Bešeyfi al-alhār, composed after 998/1589 as an offering for Murid III. Information on the biography and work of this poet, gathered by Köprüüzade (op. cit., ii) informs us that his collection of realistic and fabulous stories had been used by a médall of the court nicknamed Egledge to divert the sovereign during narration sessions. A copy dated 1073/1663-64 has been preserved in Cambridge University Library (Brown, Supplementary hand-list, Cambridge 1922, no. 1555/6, Cr. 685/8).

The work of Dženāni contains accounts of very varied themes: scenes from everyday life, “true life” adventures of his contemporaries with djinn or vampires, accounts of journeys combined with themes of popular stories and legends. The author is, very often, anxious to inform us of the origin of his narratives and to mention his informants; on the whole, he drew largely on oral tradition. One of the narratives (fols. 19/19a) is the oldest version of a hik̄ayə [see ناى], iii of which the author of the present article has collected, under the title of Yarali Mahmud, three versions of the dažis of Eastern Anatolia (see P. N. Boratav, Halh hik̄yeyelî ve halh hik̄yeyefi, Ankara 1946, 19, 160-1). Two narratives of the collection (fols. 15a-17a and 19a-23a) are variants of stories inventoried in the international catalogue (A. Aarne and S. Thompson, Types of the folk tale [= AATh], Helsinki 1954, nos. 1310 and 938) and in the Turkish catalogue (W. Eberhard and Boratav, Türkervo Glansen Volks- märcken [= TTV], Wiesbaden 1953, nos. 178 and 136). In the same manuscript (fols. 19a-21b) is inserted the collection of a certain Nāḡrān (or Nāghān?) who was a contemporary of Selim II (1566-74); the compilation of his work would then be earlier than that of Dženāni’s collection (cf. fol. 19a-2b of the ms.). His narratives present the same characteristics as those of Dženāni; he says, in his introduction, that he has compiled his texts from the stories related in the evenings among friends. He has divided them into three chapters: (1) stories
about sovereigns and vizards; (4) anecdotes about poets; and (5) adventures with beautiful women. The Kitâb-i Kânât (2) of Zâin al-Geliz, dated 995/1586, is of the same period; the copy preserved in the British Museum (Cr. 7396) contains 88 leaves. It is composed of realistic stories drawn from oral tradition; some adventures take place in towns such as Istanbul or Samsun; there are also narratives inspired by folk tales (fol. 43a-44b; AaTh 1540, 1600, 1643, 1775; TTV 372, 374, 377, 399) and popular jokes (fol. 86b).

From the 11th/12th century we possess the texts, always in an abridged form, of a whole cycle of narratives, relating the adventures, in turn gallant and fantastic, of the bourgeois of Istanbul: people of various trades, courtiers, men of independent means, slaves, ladies of all categories are the heroes. At times, the sultans himself intervenes to arrange things to the satisfaction of the listeners—and readers—by chasting the wicked and rewarding the good. The composition of a series of those short novels of manners is attributed to the poet Tiili Ahmed Celâbi, a courtier of Murad IV (see Köprüsilâcie, op. laud., 33 fT). Four of these texts have come down to us: Lütfi-ı Alâiine, entitled Siyâhsâlî Kâmânos in a slightly altered version, with the names changed, Kanâl Süleimân, and Kâzım Muğâfi; the latter is lithographed edition issued, later, as printed ones—of the first three: a manuscript of the Sancas Mumâfif is preserved in the Istanbul University Library, no. 1286. It is to be noted that in the texts of these narrative works the story-teller himself is involved in the adventure; he is the principal character of Kâzîl Bahâcâ; and in all cases he is invited by the Pâgalhâ “to relate the adventure by word of mouth”. This particular characteristic of this genre is already attested by certain compilers of the 10th/11th century. Two other narratives with the same characteristic, Dâhiâ Celâbi and Tayyarde, of which we possess printed editions, belong themselves to the narrative cycle of the reign of Murad IV (see Boratav, op. laud., 122 ff.; O. Nutku, Meddâli ve medddhâ hikâyeleri, Ankara 1976, 69).

Other collections remaining unpublished, which were probably compiled as an aid to the memory for the use of meddâli—sometimes by the story-tellers themselves—deserve mention: from the 18th century, Kâzîl-i Dâhiâ u Dâhiâ (cf. the narrative of the same title analysed by Nutku, op. laud., 93, 100, reff. to fols. 16-19, 39-56, 179-209), composed by Şeyhâlî Muğâfi Dâsh, of 104 leaves (Brit. Mus. Or. 13326); copy mutilated at the beginning and end. — Kâzîlifâ (or Afdîfâ?) 19 adâm by the names of 16

The narrative technique of the meddâli followed a parallel evolution to that of the théâtre. Gradually as realists, as romanticists, as purists, the narrative was enriched by dramatic elements; the actor was substituted for the story-teller; he embodied the deeds, by miming and, by changes in the intonation of his voice, the various people of his narratives; and indirect speech gave way to direct speech animated by dialogues. It is this other aspect of the art of the meddâli which has interested specialists in the history of the theatre as much as the researchers on the narrative genre.

According to the testimony of literary and iconographic sources, as well as of direct observers, the meddâli used to perform his art in a public place (in a café usually), and used to install himself on a platform, at a higher level than his audience; he held in his hand a cane which he used for making a noise; a napkin placed on the shoulder was used to obtain, by its application to the mouth at the desired time, the various effects of vocal intonation of the person imitated. The meddâli began and ended his narrative with deditory formulas which contained, essentially, excuses for the situation in which the listeners might be vexed by the tortuous resemblance of
The later madhhabs of the beginning of our century attempted to enlarge their repertoire by drawing on themes in the popular novels of contemporary authors (see Boratav, *Turkische Volkserschliissigungen und die Erzahlerkunst* [German tr. of the Hokh buddeyye ve hokh khidyeysigig, Ankara 1946; Sft fl., 121 ff.; idem, *Bibliothek ve erzahlii, ii*, Ankara 1945, 130 ff., 176).

**AL-MADHARA**

name of a family of high officials and revenue officers, originating from [Al-Takhl, who held important positions in Egypt and Syria between 266/879 and 322/938. The name is derived from a village Madjaraya, in the neighbourhood of Wasi (see Alam-Safan, *Kisleh asdms*, fol. 495a; Vakht, *Muqajam*, iv, 382).

Abu Bakr Ahmad b. Ibrahim al-Madhara with the nickname of al-Atas ("the partially deaf one", see Lane, *Lexicon*, s.v.), was given the control of finances of Egypt and Syria in 266/879 by Ahmad b. Tuluun, and so became the founder of his family’s influence. He appointed his son Abu ‘l-Fath al-Faful, a member of the House of al-Madhara, as vizier by the caliph al-Radi, he appointed Muhammad b. Tushdi al-Ikhshid, who in Ramadan 323/August 936 was able to enter al-Fustat without fighting. Abu Bakr Muhammad went into hiding until Abu ‘l-Fath al-Fadl b. al-Furat came to al-Fustat and arrested the Madhara. He was forced to disgorge great parts of his wealth and the Ikhshid put him in prison until the death of Ibn al-Furat in 327/939. After his release, Abu Bakr Muhammad soon attained honour and influence again. Under the young Abu ‘l-Fath al-Fadl b. al-Furat he held the de facto position of vizier, but was overthrown and put into prison in 335/946 during a rebellion plotted by Abu ‘l-Fadl Danfar b. al-Furat. A year later he was set free by Kamar [q.v.] and retired into private life. He died in al-Fustat on 11 Shawal 345/16 January 957, having been a devout Muslim who, between 301/913 and 322/938, performed the pilgrimage yearly and was lavish in distributing favours to the inhabitants of the Holy Cities. With him died the last important representative of the Madhara.**

**MAHHIDI**

a large tribal group, now inhabiting in the main the areas of Chammar and Radif in the modern Yemen Arab Republic. The traditional genealogy, given by e.g. Ibn Durayd, *Fihihib*, ed.

Mādhīdj appear in pre-Islamic South Arabian inscriptions as maqām (see A. Jamme, Sabean inscriptions from Māshar Bīdūs (Mādrī), Baltimore 1962, 316, 372). In the year 510 contiguous tribes of the tribe accompanied the Ḥimyarite king Māḍīq ar Yūsuf on an expedition into central Arabia, and in 521 they were amongst the tribes nominally influenced by Ḫums and sent by Ḫān Nuwārī (q.v.) against the Christian centre of Najḍrān.

The tribal lands of Mādhīdj in early times are said by al-Bakrī to have been situated near a certain place called Tārī on the road to Yemen (see Māqām, Cairo 1936-7/1954-5, 309). In the period just before the rise of Islam they participated, together with their sister tribes Ḥadīf and Murūd (q.v.) in warfare against 'Amīr b. Sufār'i, which included a famous "dājp," much hymned in old poetry, at Fayy al-Rih (see al-Balād, iii, 528). Towards the end of Muhammad's mission in Medina, when he was extending his control over the outlying parts of Arabia, the Prophet utilised Mālik b. Murāh b. Ḥašāna as the component group Ḥašāna of Mādhīdj as an envoy to the south-western tribes; and in 506 he confirmed Farwa b. Musayvi of Murūd as Muslim governor over the tribes of Murūd, Mādhīdj and Zubayd (Ibn Hisbām, 950-60, 75). Whenby consequent demands of Zubayd, which in 513 he made to Muhammad for the dangerous and anti-Ḥumayd movement. At Sīfin, Mādhīdj and Ḥamḍān placed themselves under the leadership of Mālik al-Ashtar (q.v.) of the kabila Nakhṣ (or Mādhīdj); they fought valiantly as part of al-Ḥidaibāli b. Ebb Bakrī's "Army of destruction" in Afghanistan in 79/698 (see E. Bosworth, in Iṣā, 1 [1973], 277 ff.); and they took part in the revolt of the old Arab tribal aristocracy shortly afterwards under Ibn al-Ashtar (q.v.). They do not, however, seem to have produced any poets of great significance.

In the post-classical period, those elements of Mādhīdj or their kābālūd who had remained behind in south-western Arabia played a part in the torturous politics and military events of the region. For example, contingents of the tribe rallied to the aid of the Zuray'īd b. Sabīb b. 'Abī 'Sā'īf in his successful struggle against another element of the tribe, 'Abī b. Muḥammad, in 531/1136. In 541/1151 also, Mādhīdj, and particularly Dījan, joined the Zuray'īd forces of the Imām b. Trumān b. Ḥisān against the Ḥātimi family of Yām controlling the Šanīs'īs area. A long series of hostilities ensued, after which the Zaydīs and their Mādhīdj allies were repelled from Šanīsī and the latter, after a personal appeal to them in Dharām by Ḥātim b. Ahmad, swung round to the Ḥātimi side against the Zaydīs. Dījan were also prominent in relieving the Mādhīdj siege of Šabīb b. Zīmar b. Zayd b. Aden, begun in 561/1775. The Zuray'īd leader, Ḥātim b. 'Abī, having residual claims for seven years, journeyed to Šanīsī to enlist the support of 'Abī b. Ḥātim, the son of Ḥātim b. Ahmad, whose family of Yām, it will be recalled, controlled the area. They too were Ismā'īlīs, as were the Zuray'īds, 'Abī b. Ḥātim agreed to help break the siege of Aden, but only, he stipulated, with the assistance of Dījan from Dharām. The Zuray'īd, Ḥātim b. 'Abī won over Dījan, so that an alliance of his troops, those of 'Abī b. Ḥātim from Šanīsī and those of Dījan descended on Aden and were able to drive away the Mādhīdj, killing many. At this stage Dījan returned home, much to the disappointment of 'Abī b. Ḥātim, who appears to have had territorial designs on Mādhīdj land in Tihāna.

Mādī (Ar. "preterite", a technical term of Arabic grammar used to denote the verbal form devoted to the expression of past time; its counterpart is muddāri (q.v.), the term denoting the author verbal form "resembling" [the noun] and devoted to the expression of the present and future (bikārī, usūrīal).

The majority of Arab grammarians define the verb as a word which indicates the matching bātīd of a happening (lādīf) with a time (yamūdū). Already Shawkānī considered (Kūfī, 1, 11-12) that the verb is formed to demonstrate that a happening has taken place (mašā'ān) in time which has gone past (mādāla) or that it will take place in time which has not yet gone past (lām yamūdū). In regard to the past, one of the earliest definitions is that of al-Zādījī (K. al-Ṭāsī, 89): "an occurrence in the past is one which has already existed, and whose existence is formed to demonstrate that a happening has taken place (lādīf) and one in which gets information about it (khubub bi-yamūdū)." Ibn Yāṣīf sets forth the same idea (Shawk al-Mufassal, vii, 4): "an occurrence in the past is one that no longer has existence (ji'dmā) after it did in fact exist, and whose affirmation (bikārī) takes place at a time posterior to its existence".

However, the Arab grammarians very soon saw that the mādī was not used solely to express an occurrence in the past, and al-Ṭabarī (Shawk al-Mufassal, ii, 229) enumerates the different cases when this verbal form expresses a time different from the past. First of all, the mādī can express the future, viz. in a request (lādīf) by means of a prayer (đīfā'ī) or an order (nāmat), and in the expression of future happenings by determining (bātīd) their occurrence (muddāri), for in these two cases, the speaker positively desires the taking place of the occurrence, and it is as if it had already taken place and was past; in the reply to an oath (yamūdū), unless it is negated by (kāsaam), in the expression of a condition (bikārī), if it is preceded by (mā). In a circumstantial
clause, if it is preceded by mū — "so long as". The mādiḥ can moreover express either the past or the future when it follows the particle a- of equivalence (istina? in an alternative; the relatives hawā'yānā and kuddānā in a phrase comprising two parts; a particle of urging (thabidā) in an incitement; and the relative pronoun al-ḥādi, at the outset of a phrase comprising two parts, because in all these cases, there is a nuance (nā'da) of a condition. Finally, in an enunciatory (naddid) speech: utterance or a productive (kāfī) one, the mādiḥ has the value of a present; thus, for example, in bitru, the act of selling is realised (yaḥyakti) in the present (ḥiš) by means of this word which brings it into existence (mādiḥā lahu), whereas with abitru, the act of selling is realised by another word.

From the morphological point of view, the Arab grammarians consider that the form of the mādiḥ is "based" (mudhī) according to the vowel a or the vowel u in the third person, and according to the absence of the vowel u in the first person.

(G. Troupeau)

**MADIḥ, MADIḥ.** (ar.), the normal technical term in Arabic and other Islamic literatures for the genre of panegyric poetry, the individual poem being usually referred to as wadādi (pl. waḍāddi) or maddī (pl. maddī)). The author himself is called maddi or, as considered professionally, muddi. This root itself is sometimes used without lexical connotations, as also are commonly the various other roots signifying "praise": kāfīd, maddī, dī, dī, thīs, gīra-l, etc.

1. In Arabic Literature.

As both an independent unit and a component of the kudma (q.v.), the genre has been so widespread in Arabic literature at all times that only a few poets prided themselves on not writing in it at all, or as rarely as possible, e.g., Abu ‘l-Mu‘allā and al-Munāfī. Some, like al-Mu‘addibī, were panegyric poets before all else. The high proportion of panegyric in Arabic poetry has been one of the major obstacles to full appreciation of the latter by the average Western reader, who tends traditionally to be concerned with criteria of "sincerity", "criticism of life" and "seriousness of purpose". Such a lack of sympathy ignores the fact that virtually all pre-modern Arabic poetry had to be written, for socio-economic reasons, under patronage or to commission. "Political" panegyrics are still written in most Arabic-speaking countries.

The somewhat exiguous and sporadic written tradition of Arabic poetic criticism is usually more preoccupied with biography, excesses, prosody and tropes than with genres in any Western sense. But most discussions of poetry refer to the category of mādiḥ, and a few attempt to distinguish it from other genres, particularly its counterparts: fihāri, muqaddas, personal or group boasting; ridádi, marthiyā/marshid, elegance or lament, and kāfīdi, poet, like an actor, abuses some of the relevant articles (for each). The last (kāfīdi) is more rare than the converse of mādiḥ, while the other two may naturally contain elements of panegyric. In the case of the elegy, this is almost invariably so: some (e.g. the celebrated and courageous elegy by Abu ‘l-Hasan al-Anhlārī on the executed Būyid vizier Abū Tahrīr) are virtually pure mādiḥ, though it is usually obvious that the subject is deceased, and a note of sincere regret is often present, as in that particular instance. Special types of mādiḥ are numerous, two of the most common being poems of excuse or apology, and poems celebrating victories or other happy events (see below also).

Besides individuals, a panegyric might be addressed to a land, a city or a group. By no means all such poems were expected to produce immediate or direct material benefits; some expressed simple gratitude, some to a recipient with fine poetic taste of his own, and some were produced as an inescapable duty of one of pensioner status. When a panegyric did not produce an expected result, it would sometimes be followed up by an appendix (which some critics, again, would classify as a special type of "reminder panegyric"). According to period and circumstances, the panegyrist might claim his own poem, or might deputise a talented rādi to do so; or it might simply be received and read by (or to) the subject himself (al-maddī). The mādiḥ is usually (and was expected to be) exaggerated in statement and style. However, according to Kudāmā (see Bibl.), only personal and "moral" qualities might be praised; and all these (in men) are subsumed under the categories of intelligence, courage, justice and "modesty" (līfā). (It should be noted that the relatively rare poems in praise of women are classified by Kudāmā as "erotic"!) Al-‘Aṣūrī (see Bibl.) is in general agreement with Kudāmā, but Ibn Rasākh (see Bibl.) would allow praise of physical attributes and of ancestry and "association". Another corrective to excessively gross exaggeration is the generally agreed condition that the primary qualities praised should be appropriate to rank and function—courage in a military man, justice in a judge, and so on. On this basis, Kudāmā would even regard the mādiḥ as potentially applicable to vagabonds and bandits for the good qualities necessarily inherent in their style of life.

With all this, the mādiḥ tends in practice to a stereotypical homogeneity, so much so that some panegyricists (e.g. al-Bulharī on several occasions) had no difficulty in offering the same poem to a second or further patron, where the original reception was inadequate or relations had become strained in the meantime. Some panegyrics (as well as elegies) were obviously "rewritten" for general contingencies.

Tāhā Husayn (and others: see Bibl. under pseudo-Kudāmā) have argued that the above critical posture towards the mādiḥ clearly derives from Greek sources, particularly Aristotle. This position, however, seems to be seen as exaggerated; what influence there was can only have been—as with philosophical and scientific ideas—remote and indirect.

**Bibliography:** As indicated, most Arabic works of literary criticism do not really discuss genres as such, and the Western studies have tended to follow suit. The following are the essential items: Abu l-‘Abbas Ahmad Thālab, Kawsar al-‘Aṣūrī, ed. C. Schiaparelli, in Proc. of the VIIIth Intern. Congr. of Orientalists, ii (Semitics), fasc. 1, Leiden 1917, 473-84, also ed. M. A. Khafadī, Cairo 1386/1966; Kudāmā b. Ḏiya‘ar, Nahd al-‘Aṣūrī, Constantinople 1392/1983, also ed. S. A. Bonebakker, Leiden 1956; (Pseudo-) Kudāmā, Nahd al-nubb, ed. T. Husayn, etc., with valuable introduction, Cairo 1352/1933; ‘Abd ‘Abd al-‘Aṣūrī, Kitāb al-Ṣifā‘alayn, Constantinople 1320/1902; idem, Dīwān al-muṣīlī, Cairo 1352/1933; Ibn

(G. M. Wickers)

2. In Persian

It appears from the written records that survive—chronicles, official correspondence, and narrative poetry and prose—that formal, conventional praise (*madhī*, *siltāyih, shaddād*) of rulers and their chief officials was a pervasive feature of Islamic Iranian court life from its inception. The most-highly-developed vehicle for *madhī* was the panegyric ode, or *kasida-yi madhīša*, a genre that was already fully articulated by the time of Rūdākī. Indeed, Rūdākī’s joint panegyric of the Sāmānids ruler Nāṣr b. Ahmad and the Saffarid amir ‘Abd al-Dār (which is both the earliest example we have of a complete *kasida-yi madhīša* and a work of considerable stylistic maturity.)

The opening portion of the *kasīda*, called variously the *nasīb*, *tāghīb* or *taghazzul*, presents pleasing images that are usually drawn from a conventional repertory—the arrival of spring, the departure of winter, the lover’s complaint, the garden. Yet many *kasidas* celebrate particular occasions, such as the departure of the monarch on a hunt or a campaign, or his successful return from one, or the birth of a son or the receipt of a gift, and when they do, the occasion provides the governing metaphor of the *madhī*. The opening portion concludes with a line or two of transition that shifts the focus of the poem to the person of the patron (*ma‘amīdah*), whose name and title are mentioned—either fully or in part—in a line called the *gurun-gāz* or *tāghīst*, which marks the formal boundary between the opening section and the panegyric proper (*madhī*).

While the images of the *nasīb* have, in the majority of instances, a narrative or metaphorical unity, those of the *madhī* do not. They present the *ma‘amīdah* in a series of stereotyped poses drawn from the spheres of activity special to his office. For the monarch (*sulāh, amir, ‘abād*), the *madhū* of preference throughout most of Islamic Iran’s history, these were the court—in both its formal and informal aspects—the hunt, and the battlefield. Thus in any given *kasīda-yi madhīša*, the monarch will appear, in no particular order, as the chosen of God, a fearless and heroic warrior, a superb huntsman, the unyielding refuge of the weak and needy, a cheerful reveler, and, of course, a generous patron of poets.

In keeping with the stereotyped and iconic quality of these images, the metaphors employed in the *madhī* are richly hyperbolic. As a warrior, the *ma‘amīdah* can portray Rustam and Isfandiyār, the paramount heroes of the Iranian national epics, to flight, and even terrify the forces of nature. As a monarch, he is served by the rulers of the great empires of the world—the *bāyar* of Rūm, the *rā‘ī* of Hind, the *bāshā* of Turkistān and the *taghīh* of Cūr. As a patron, his generosity outdoes that of Hātim Tāp̄i, and even that of nature; and so on.

The final section of the poem is the *dū‘ā* or prayer, but there is usually a bridge passage between *madhī* and *dū‘ā* in which the poet addresses himself directly to his patron, either to plead for reward or to boast of his skill, or both. The *dū‘ā* itself is quite brief, no more than two or three stanzas. As its name suggests, it is a prayer for the enduring, indeed, the perpetual, prosperity and rule of the monarch and his court. This prayer is expressed in language that elevates the monarch above the sphere of the mortal to that of the semi-divine. He is identified with the enduring processes of nature, which undergo change, but not decline. “So long as *ma‘mār* comes every Spring, May you reign and prosper.”

As must be apparent from this summary description, the purpose of the *kasīda-yi madhīša* is to celebrate the institution of rule, not the ruler. One finds no individualised portraits of the monarch here, nor of any of the other officials who filled the role of patron and provided the model for subsequent rulers and their poets. Although Iranian courts from that time to this have generated an endless stream of royal patrons and eulogists, and the *kasīda-yi madhīša* has attracted master poets in virtually every period, no later court has achieved an exemplary status comparable to that of the Ghaznavids.

The Ghaznavid period also saw the appearance of what might be called the spiritual panegyric or anti-court *kasīda*. That is, the Ghaznavid bureaucrat and literateur-turned-Islamist propagandist, Nasir Rukhsar (762-1242), used the language of court poetry and the genre of the *kasīda* to compose works that revile secular rulers and rebuke court poets for devoting their art to praising them. His argument runs that since Mahmoud cannot assure the poets’ well-being in the next world, they should rather expend their skill in celebrating those rulers of eternal, spiritual power—the *Shī‘ī imāms*—who can.

The example of Nāṣir Rukhsar found few imitators in the centuries immediately after his death—although influence on the great *khūṣīr*-century *kasīda* writer, *Khūshā Shahravand* (d. 1248), can be seen in that poet’s pilgrimage *kasīdas*—but in the Safavid period, the spiritual panegyric virtually replaced the secular. Later dynasties reestablished the secular as the preferred mode. There was a final efflorescence of the *kasīda-yi madhīša* under the Kādis that was, in large part, stimulated by the rediscovery of the poetry of the Ghaznavid panegyrists.

Unfortunately, the fantastic exaggeration of the panegyric style has proved so unpalatable to
modern students of Persian poetry that they have not given the Ḷaṣīda-yi madīḥa the careful attention that its central position in Persian literary history merits. The prevailing approach to this substantial body of works is to treat the opening portion as the only true poetry, and to ignore the contents of madīḥ and ḵāṣīda—which make up two-thirds or more of any poem—as of negligible interest. The assumption is that court poets wrote panegyries only out of economic or political constraint, not sincere, personal conviction, and this want of sincerity vitiates the literary interest of their work. The studies by Gh. Yāsīn, Farruqī Shahtānī, Baghdad 1341/1963, and J. W. Clinton, Mazhdur: Damghānī, Edinburgh 1972, are among the few exceptions to this rule. None the less, even the madīḥ-as well as the ḵāṣīda—of every conceivable rhetorical device, the hyperbole and the paradox, became the paramount way for the literati to attract the attention of potential patrons for the purpose of securing employment or obtaining rewards and favours from them. The initial introduction of an aspiring poet, for example, to a grandee may have been through the introduction of an aspiring poet, for example, to a grandee may have been through the good offices of a friend or teacher, but ultimately it was the persuasive and pleasing madīḥ that forged the most lasting association with the patron or assured the most urgent favour. One may cite, among many other cases, the example of Muhīm Šara Faḍlī [q.v.], who launched a successful career as al-ʿālām secretary to several princes thanks to a ḵāṣīda he presented to Sultan Suleyman at the suggestion of his mentor Dīlūfī [q.v.]. On the other hand, the Persian Celebi, Tadhkira-yi Laflfl, British Museum, London, ms. Add. 24,957, fol. 28r, and Riyādī, Riyād-ı shuṭra, Nūrūsmaniyeh, Istanbul, ms. Šatīr, fol. 110, and the experience of the poet and vizier Ahmad Pāshā [q.v.] who, having been incarcerated for an indiscretion, secured his release with a panegyrical ḵāṣīda to Sultan Muhīm Šara Faḍlī II (see Laflfl, Tadhkira-yi Laflfl, Istanbul 1341/1861-7, 78, and Ali Nīḥār Ţarlan, Ahmad Pāshā darām, Istanbul 1936, 60-9).

In structure and form, the traditional ḵāṣīdas, including those composed by the Ottomans, remained fairly constant. Following the exordium (nasb or taʿlīf) and, sometimes, a short set of lyrical couplets (takhakkūl), the poet very ingeniously eased the reader or listener into the madīḥ by means of the device known as the gür-ḵūnā (see Gibb, Hist. of Ottoman poetry, 1, 84) in which the real purpose (maqāṣid) of the poem was revealed, either by openly naming the patron who was to be the subject of the encomium that followed immediately or by a clever allusion that barely left any doubt as to the identity of the patron (see Faṭār lā, Edirne, delebeşyunda nasn, Istanbul 1966, i/2, 73-80). The madīḥ was then followed by further praise in the daʿāʾī soliciting prayers for the patron and mentioning the poet’s name.

Frequently, the above format and sequence were disregarded in favour of the more direct approach. Forsaking the exordium and the gūr-ḵūnā, the panegyrist began his ḵāṣīda with the madīḥ (see Nadīm dawār, ed. Ḳaṣīf Nīḥād, Istanbul 2358/1920-2, 34-6, and contract 21-4, 22-8). This tendency became especially prevalent when indirectness and indirection replaced praise and adulation as the purpose of the poem. Particularly in the 19th century, when acclamation of new ideas or of a certain political point of view displaced the praise of the individual, the madīḥ became the essence and indeed the only section of the ḵāṣīda (see Muhīm Šara Faḍlī, Šīr taḥfīl, Istanbul 1969, 23-5, and Kenan Akyuṣ, Bes teʿṣirinde türk şiiir autolojisi, Ankara 1970, 61-3). As a feature of the ḵāṣīda, the message, spirit and language of the madīḥ was necessarily determined by its particular function and objective. It was made up of a varying number of couplets extolling such attributes or virtues, real, imagined or fabricated, of the individual or concept as courage, wisdom, justice, piety, generosity and benefits. It was mainly characterized by extravagant laudation that was often completely unjustified or misplaced, and by the use of every conceivable rhetorical device, the hyperbole of which was sustained by epithets and allusions that only those familiar with the elevated Islamic literary tradition could comprehend and appreciate. The epic similes and the imagery which were an intrinsic part of the madīḥ were considerably removed from the realities of a restricted social milieu.
that expected, accepted and even cherished ingenious flattery and procacious insincerity garnished with flowery language. However, the madāh, as some of the examples given above indicate, had a certain utilitarian function and, incidentally, may very well have met a need in its symbolism and reflection of an aesthetic ideal, as recently suggested by W. G. Andrews in his Introduction to Ottoman poetry.

It must be noted, at the same time, that it, along with many other verse forms, affords one many fine illustrations of the Turkish literary genius, versatility and inventiveness.

4. In Urdu

Eulogy probably existed in Urdu poetry from the earliest period of literary activity—certainly as far back as the second half of the 16th century A.D., though few early examples have survived. Two broad categories developed, according to the subject of the eulogy, sc. the secular and religious. The first was addressed to rulers, governors, nobles, and other rich or influential lay persons: it was usually termed madâh rather than madâh, other terms being 'a'rif and stisilâq.

The religious category had its own distinctive terminology, though usage was not completely uniform, and might depend, to some extent, on the vagaries of copyists and editors. Praise of God was called bând, that of the Prophet Muhammad wa'l. That of the fourth caliph, 'Alî, and of subsequent Shi' hūsân, was called manâkabât, whilst eulogy of other religious figures, living or dead, including the first three orthodox Caliphs, was generally called madâh or 'a'rif.

Like other major poetical genres in Urdu, madâh was derived from Persian. In some instances, Persian eulogistic odes were translated, or more properly adapted, into Urdu. More often, the same (metre and rhyme) of a Persian ode would be imitated in an Urdu ode. The debt to Persian models was no secret; from the 16th century onwards, there are frank admissions or indications by various Urdu poets that they are vying with Persian poets in the mastery of the madâh bâsîda. The chief poets to whom they were indebted were Aawâr, Khâkânî and Urb, Muhammad Khul Khub Shir (ca. 1568-1615) begins a ná't ode: "The name of Muhammad in the world is to me like a hundred Khâkân." It is worthy of note that 'Uff was court poet to the Mughal Emperor Akbar in Dihlî, and died there in 1590-1, when Khul Khop Shir was in his early twenties.

Apart from Indian local colour, including Hindu references, it is difficult to distinguish any single major feature in Urdu madâh which breaks completely new ground. Nevertheless, some poets achieved such mastery in it that they seemed to breathe new life into it, and thus they gained recognition for their originality.

Urdu madâh has been composed in almost all poetical forms, including muddârass, muddânas, muddâz, tarqî-kând, tarqî-kând, and, extremely rarely, even ghâzal. But the eulogy form par excellence was the bâsîda or ode. True, this form was used in other fields, particularly satire. But such has been the predominance of eulogy, that the term bâsîda is usually understood to mean eulogy", as an abbreviation of bâsîda-yi madâh khuwâ. Consequently, any account of Urdu madâh must, of necessity, show how the pre-Islamic Arabic ode, as modified in later Arabic poetry, and brought to India via Persia, was adopted and adapted to the new environment. Unfortunately, it is hard to find an account of the Urdu bâsîda form which is full and explicit without being discursive or biased. In some accounts, the pre-Islamic ode, as exemplified in the Mu'alla'âbâdî, is over-emphasised, and there is too much reliance on Ibn Khâtayba and Ibn Ragîh. What is lacking is a definitive comparison of the Persian and Urdu bâsîdâs. Though most Urdu eulogists were not unfamiliar with Arabic poetry, its chief influence on them was in vocabulary. Occasional mention of Arabic bâsîda-writers, such as Dhâwî's reference to Labîd, al-'Alîsh, Dîjâr and al-Ma'ârif, must be regarded chiefly as "name-dropping" designed to impress the hearer, rather than an indication of indebtedness.

It may be that al-Dînârî's Kastâlî al-bâsîda, which was translated into Dakhânî Urdu by Muhammad al-Râfî around the turn of the 17th and 18th centuries, influenced the religious bâsîda; and Ka'îb b. Zuhâyr's celebrated ode in praise of the Prophet, Dinât Su'dâd, was at times mentioned by poets and critics to justify the inclusion of an explicitly erotic prelude in ná't odes. But the bâsîda which came into Urdu poetry via Persia is as much akin to that of 'Abbâsî poets such as al-Mutânâbî, al-Bâjhîrî and Abu Tammâm, as to the pre-Islamic ode.

The form of the Urdu madâh ode was fully developed by the middle of the 18th century, if not earlier. Like its Arabic and Persian counterparts, it was a monochrome poem, usually in weighty metre, with elevated and rich diction, of roughly between 30 and 150 verses. The two hemistichs of the first verse, called the ma'dâh, also rhymed: and if the bâsîda were long, there might be one or more subsequent verses with this internal rhyme at irregular intervals in the poem, known as ma'dâh or sub-miadâh. The erotic theme was seldom used, and the poet's ability to sustain it was regarded as a proof of his skill.

There were four main sections to the bâsîda. The first was the tambîd or prelude, usually called tashbîh, a throw-back to the erotic prelude or madâh of the Arabic ode. The opening verse (ma'dâh) however, was considered so important in attracting the hearer's interest, that it is often discussed as if it were a separate section, not merely the start of the tashbîh. The erotic theme was seldom used, and was often ironized on unless it were chaste. A wide range of other topics was substituted, whether singly or in combination. Pride of place was given to the description of spring, an ode with such a tashbîh being called a bâsîda bahârîyya. This topic was considered particularly suitable, as suggesting youth and vitality, which were regarded as implicit in the term tashbîh, and flattering to the madâh or subject of the poem. Moreover, this topic allowed for description of natural scenes, gardens, flowers and birds, which was part of the poet's stock-in-trade.

This theme might be extended by a comparison
between spring and autumn. Further, the two might be depicted as kings or generals marshalling their armies to fight another, spring, of course, being the victor. Like practically all tahqīb topics in Urdu, this extension of the spring motif goes back to Sawdā (1742–51), who is generally regarded as both the pioneer and the finest exponent of the full kafīda form in Urdu. Amir Minā Ḥāwi (1858–1900) developed this theme further in one ode, by a vivid description of the actual battle. But, according to Sahar, (op. cit., in Bibl., 236), this had already been done in Persian.

Again, the tahqīb might be devoted to the days of youth, or complaints of the times in which the poet lived, or of his own misfortunes. Fikhrī (“pride, boasting”), philosophising and moralising were other topics. As the basic form of the kafīda was stereotyped, poets were always searching for fresh ways of composing the tahqīb: for it must be borne in mind that the madhī ode was frequently recited to the patron in public, in the presence of other poets and men of taste and learning. The poet’s reputation and his reward were at stake.

One interesting device was to turn the tahqīb into a disputation or manslaughter. In Persian, Asadī-ya Tūsī the Elder is said to have initiated this device, with mun BTC3urati between night and day, and heaven and earth among others. In Urdu, Sawdā has one between greed and reason, whilst Amir Minā Ḥāwi pairs knowledge and imagination, and comb and mirror. Into this category should go the mubattama (colloquy) favoured by ʿĀzīz Lakhnawi (1882–1935), as, for example, one between beauty and love (husn wa-ṣugh).

Occasionally the tahqīb consisted of an anecdote, possibly with dialogue, and somewhat dramatic. When intimate in tone and straightforward in language, it could form a charming contrast with the high-faux praise which was to follow. A fine example of this is Sawdā’s ode to ʿAlī Dawlā Rustom Dāng, chief minister of the Mughal emperor, with the rhyme-āmīn (Kulliyat 393 f.). The poet begins by relating how, prevented from sleeping or eating by the autumn, he consults Doctor ʾAjīl, who prescribes blood-letting and a purgative. The poet asks for an alternative prescription for his illness. He suggests that Sawdā take his complaint to the court of ʿAlī (that is, ʿĀṣīf al-Dawla) under whose protection the weak ant may be revenged on the elephant. Hearing this, and taking his kafīda as a present, the poet attends at court. This kafīda of only three verses leads to the praise, which is almost an ode within an ode.

The third section was called madhī or mansūd, and it was the most conventional. The qualities described had to be appropriate to the status of the mansūd. Thus a ruler or emir was praised for justice, manliness, nobility, virtue, fear of God, generosity and clemency. To men of religion, other qualities were appropriate—learning, asceticism, attendance to religious duties. But the distinction tended to be blurred when the kafīda developed in north India. Thus Khālīṣ Andjumān’s (op. cit., in Bibl., 261 f.) remarks that Sawdā hardly distinguishes between secular and religious subjects in this respect. In addition to the personal qualities of the mansūd, the poet could refer to his environment and associations, and the trappings of power and wealth. In praising a ruler, his sword, horse and elephant might be described. According to Ḥāghīnī (op. cit., in Bibl., 107), this was not so in the Deccan—though it must be pointed out that Kul ʿAbī Shāh certainly refers to ʿImām ʿAlī’s sword Ḥūj al-Ḥūj, and Wāḥī Dākaqk (1667–1707) to the mule Duldul given to ʿAlī by the Prophet. With Sawdā, sword, horse and elephant were described fairly briefly. But some later poets such as Dāgh of Dhiī (1631–1903) somewhat extended these descriptions, and turned them into separate sections, with headings such as dar ʿiśār-i ṣur and dar ʿiśār-i pil. A lesser 19th century poet, Kalk, of Memrāt (1832 or 1837–1859), includes such sections, admittedly shorter than Dāgh’s, in odes to fairly undistinguished recipients. To the present writer, this clear division of the kafīda into sections other than the four main ones was a continuing tendency which started before Sawdā. The latter interpolates a qaṣīda in one kafīda, but Wāḥī had already done this. Unlike Sawdā, however, he did not have several mansūds in one ode.

Thus the contents of the madhī section was restricted. Nor could the poet escape by making it brief, as is courtesy required that the tahqīb must not be longer than the madhī—so if the latter were curtailed, so must the former be. Hence the mode of expression was all-important in the madhī section. This was dependent on a rich and pompous diction, similes, metaphors, and all the apparatus of sawdā al-ṣawādā, with considerable play on words. Some of this was derived from Persian, but in any case, after Sawdā it rapidly became clichéd-ridden. To give but one
example, a ruler or minister was often compared with Solomon. Sawdā expressed this neatly in the eulogy of Āṣaf al-Dawla already mentioned:

Kuch ham nahein dhūdūn men Salaymān zān ṣādīqān Šūs al-dīn pī Āṣaf-i-Dawla hār thān nam. ("Your splendor in the world is no less than Solomon’s!), Although on (people’s) tongues your name is Āṣaf Dawla) (Kulliyāt, 295).

This verse loses part of its effect, unless one knows that, in Muslim lore Āṣaf [b. Barāḏīyā] [gr.] was Solomon’s Grand Vizier. Exaggeration in praise was taken for granted, though some 11th century poets such as Shāhīb (777–1066) disparaged it. Shiḥbī Na’il- мира in his famous study of Persian poetry, Shiʿr el-ṣāyṣ, (1968–1972) (Shāhīb, 200) allowed to lay down conditions for acceptable panegyric. Firstly, such as Qhālib (1797-1869) disliked it. Shibli Nil- мира, a ruler or minister was often compared with the person praised must be praiseworthy; secondly, the qualifications contained in him must be genuine; thirdly, the poet must describe them convincingly. Shiḥbī admitted that all these three conditions were never fulfilled by any Persian poet, and went on to commend the sincerity of Arabic madāʾī, in a way which would strike many Arabists as idealistic, if not naive. At the same time, Shiḥbī denied that the khāṣida caused subservience in the poet and egotism in his patron, since both realized that what was said was “pure exaggeration and word-play”. Shiḥbī was not speaking of Urdu madāʾī, but what he says of Persian could equally apply, and is often quoted by modern Urdu critics. Dhwāk (1769–1854) is generally regarded as second only to Sawdā as a eulogist, yet he exaggerated like other poets, calling the Mughal Emperor Akbar Shah II “shadow of God and deputy of the Prophet of God”. This poet’s biographer, Tāwāf Ahmad Shāhu (ed. ctd. in Bibl., 249–32), quoting this and other examples, justifies them by saying: “the person praised seems to be not an individual, but a symbol of his time. In this sense, Dhwāk’s praisé is very near to reality and realism.”

The final section of the khāṣida was called the ḥādīma: and the term madhī would be applied to it as a whole, or merely to the last verse or two—since an impressive ending to an ode was considered as important as an impressive beginning. In contrast to Persian practice, except with Ūrī, the Urdu eulogist usually gave his ḥādīmūs. This would normally be somewhere in the ḥādīma, though there are instances where it is given earlier, alternatively or additionally. Sawdā may be said to have realized the function of the final word of his eulogy of Āṣaf al-Dawla already quoted, and gives it again in the ḥādīma. Not is this the only khāṣida in which he gives his ṣabkūlūs in the first verse. The secular ode’s khāṣīma has two sub-sections, ṣabkūlūs and ṣawādī. The latter is the poet’s request for recompense, for which critics laid down various conditions. Summarised, they require the poet to steer a middle course between perfunctoriness and importunity—between taking the patron’s generosity for granted and implying that he was mean. Some poets disdained begging: Dhwāk, in his extant odes, avoids it, sometimes substituting the expression of his inability to praise his patron adequately. Sawdā also often avoided begging. Dhvāk ("prayer, blessing") was the expression of the poet’s wishes for long life and prosperity for his patron. In the religious khāṣida the ḥādīma was somewhat different. The poet might express his own faith, and ask for a blessing to maintain it; and he might pray for the triumph of Islam, with suitable variations where the manadābī was a Shiʿī imām. Here Sawdā was often fictitious, a good example being the manadābī to Imām ʿAlī with the rhyme ṣūr (Kulliyāt, 43–7), which ends with the four requests, the last being that all "friends in both the two worlds may recognize the authenticity of the pure imāms". Some indication of the style expected in the ḥāṣīda, has already been given. It was regarded as a linguistic and stylistic tour de force, and occupied a position in Urdu literature comparable to that of the maḥbūbī in Arabic. The poet was allowed to go to extreme limits of abstraction to demonstrate his skill and learning, using, in some instances scientific technical terminology. Thus Ḥuṣţī used much philosophical vocabulary. Ḥuṣṭī—the interpretation of extraneous material—was common. This often took the form of quoting from some other poet, Persian or Urdu, which suited the Indian environment, with its numerous languages, was for the poet to introduce homilies or verses in several languages. Every poet was expected to know Persian and Arabic, and he would normally know one or more of the other literary languages of the subcontinent. Ḥuṣţī was addicted to this sort of virtuosity, and is said to have incorporated material from ten or more languages apart from Urdu. Dhwāk was rewarded with the title of Khāṣīma-yi Hind by the Mughal emperor for a khāṣida in seven languages, of which only a few lines have survived. Thoroughly assimilated to his environment, Dhwāk’s praise is very near to reality and realism. The poet’s ability to write a good khāṣida was often said to be a hallmark of poetic skill.
argued (Tanwir Ahmad Jalawi, pp. 225) that should not be accounted a poet”. Thus it has been stages based on geography, and obviously overlapping in Urdu. Further information

him, but seldom equalled him and never surpassed j varied in theme and manner, his gur£z neat, and his is poet. His lamhid madth is concerned. For his ka*lda of any link so far as the

earlier. They are addressed to Hacjrat MIran Muhvl of conformity with the four-section form described only two, to Muslim saints, show clear signs of kafidas, 40 come to light, we must acquiesce with those who of the later kastda. They are all religious. |

GolkondS [sec

Imshd* wrote odes, and gave of his best in them, in

models. And there is no denying that he was, and

varieties, is in praise of King George III of England. During the same period, Musbafl wrote over 50 kafidas. He was definitely influenced by Sawd¢, and resembled him in the variety of his tashbib topics. But though he has a persuasive protagonist in Abu l-Laylj Sidhjl, he is not favoured by critics in general. He was the first famous eulogist of the Lucknow school. But, owing to political upsets in Dihll, due to Allah and Marthas incursions, many Dihll poets gravitated to Lucknow, including Sawd¢ himself at the age of 60.

Still, Dihll had its distinguished eulogists in the first half of the 19th century. Pride of place goes to Dhwaw [q.v.], considered second only to Sawd¢. Much of his mad/th poetry is lost. Of what remains—22 kafidas, a madh, and a few shorter poems and extracts—all is secular save a few fragments. The general scope of his eulogy poetry is narrower than that of Sawd¢. For example, it is nearly all addressed to the Emperor Akbar Sha¥a II and to his son Bahurdz Shah II. Whether or not Sawd£ does not show Sawd¢’s range, nor his ability to appeal by directness at times, he is by no means stereotyped. One tashbib, for example, is a delightful description of happiness. Dhwaw was a learned man, whose hobbies were astrology, music and medicine, and his language is both rich and dignified. His contemporary Ghali (r.v.) (1797-1869), often considered the prince of Urdu poets, is not generally included among the leading eulogists, and he too was proud to indulge in mad/th, except when absolutely necessary. S. F. Mahmud Ghali, 200 single quotes and comments, the tashbils of two early manhabat odes to Iwns All; and the originality and individuality present in his ghalal is found also in his mad/th. Yet another contemporary, Mu’min (1800-54) excelled in ghalal, but also wrote nine kafidas, only two of them secular. He has been praised by Briffl for his originality in the form. Finally, in discussing the Dihll school, Dagh [q.v.] (1831-1905) deserves mention. His Urdu dhusin contains six odes, all secular. Five of them are addressed to the Nizam of Hyderabad, at whose court he spent the last 14 years of his life. Mention has already been made of his inclusion of sections on horse and elephant.

Mad/th thrived at the court of the Nawaljets of Oudh [see AWADJ] until 1856, when the British exiled Nawaljets All Shah to Calcutta and the court of Ramb¢ took its place. Two types, or, more properly, two tendencies, have been mentioned by critics—the more forceful and dignified based on Sawd¢ and the Dihll school; and a softer type, influenced by ghalal, and by the licentious Lucknow atmosphere. Most of the poets of the Lucknow school of eulogists are now forgotten. Not so, however,

Encyclopedia of Islam, V
Amir Minał. It is sometimes said that the Urdu 'kaṣida' began with Sawādí and ended with Dhawk; but it would be truer to say that it ended—or nearly ended—with him. His poetic output was of considerable scholarship, compiler of the first two volumes of an Urdu dictionary which, if completed, would have been on a very large scale. His mastery of words stood him in good stead in his madīh odes, of which only 28 have survived. Of the two Lucknow types, they are more akin to that based on the Dihlí school. Most of them are secular, and have a dignity bordering on the epic, especially in the varied tashbīhs. His language is at times heavy; but in general, it is less intricate than Dhawk's, and superior in beauty and freshness. He spent 43 years as a court poet in Râmâyân. In 1710 he was invited to join Dīgh in Hyderabad, but died there shortly after his arrival.

By this time, the maddīh 'kaṣida' was becoming obsolete. After the Indian Mutiny, India came under British control, and those splendid courts which had nurtured eulogy poetry were a thing of the past; though some rulers of the "native states" patronised poetry, it was not on the same scale. Poets increasingly introduced their new poems to the public in mughāl 'gas', newspapers and magazines, or at meetings of cultural and learned societies. A new function to perform: by bringing to light virtues that played by Ahmad Sfjawld and Hafiz, unlike that played by Ahmad Sfjawld and Hafiz.

Yet the madīh 'kaṣida' was not merely a useless and regrettable by-way of Urdu literary history. At its best, it had a sort of Baroque brilliance. Its style, even when the kaṣīb was devoted to tаήnм, differed from that of qаάdа. It had a strength and dignity which, derived in part from the early narrative mаhмац, in its turn influenced the 19th century mаrкhааа. Its rich vocabulary and idiom influenced not only other poetry, however, but also prose. Without the kaṣīb, it could be argued, Urdu-e-maddīh—high literary Urdu—would have been much the poorer.

3. In Swahili

Praise poetry is an important category in the literatures of several Bantu peoples, such as the Zulu, Swazi, Tswana, Rwanda, etc. It is a general aspect of African oral traditions which has survived Islamisation in the literatures of the Somali and Hausa. In Swahili, some of the oldest preserved manuscripts contain praise poems, in the first place the famous Ode of Longo in self-praise. Praising oneself (Swah. hujianga, hujiunsa) is a common aspect
of many African oral traditions, and this includes extolling one's ancestors, commemorating their exploits as well as one's own. Liongo's Ode is composed in the waistami metre of 15 syllables in the line. Cf. v. 8.1: "If I am a young lion, I have instilled the wish to die in my heart! I fear only the disgrace when the enemy sees my back." The lines are arranged in couples of two lines, the last line rhyming in -ma throughout the poem; this is the oldest-preserved type of metre other than dance songs. This structure became the model for later poets who were Muslims (unlike Liongo) and who composed hymns to the Prophet Muhammad in verses. In particular, the Burda of al-Bajiri and the Hamzayya are still recited during Swahili ceremonies.

The Swahili word muda'ah is normally limited in meaning to the praises of God, many of which are nowadays sung in the mosques, for which reason they are simply referred to as dua. Numerous are the dua that have been composed in Swahili, some in the waistami metre, many in the easier but equally serious ukuwafi metre. Swahili verbs like sabihi and utenxi refer exclusively to the praises of God.

The verb sifu or older sijui corresponds with the noun sifa, which can mean "quality, description" as well as "praise name", as in Kulla sifa njama ndake Nabiiya 'All worthy praise names are for the Prophet', the first line of the Maulid of Barzanji. Sijui is used likewise for praising living men and women (for the praises of the dead, see MAFIDIN). These praise poems fall into two categories, those for religious leaders, such as saints and shaikhs and those for political leaders. Lamu is the centre for the poetry in praise of religious leaders such as the Egyptian Ahmad al-Badawi and 'Abd al-Karim [q.v.], as well as the founding shaikh of the mosque at Lamu. This poetry is published in Lamu and Mombasa in Arabic script.

Inserted in the Swahili epic songs there are many praise poems; one of the oldest is Ali's praise of himself in the Ulima wa Hericha (Hericlés) which is itself traditional: "I am the lion of God. He has given me the sword and the plaque. He made me the Breaker of Cities, He tool to punish the Kafirs. The Prophet praises himself in the same epic in the letter to the Emperor Heractés, and there are several passages in which he is praised by others, as the "first-created seal of the prophets, God's favours". Other heroes, like Umar and Mibidah also praise themselves and are praised in the epic.

The Swahili tradition of composing praise songs was put to good use by the German administrators, who encouraged Swahili poets to write praises on the German governors and even on the Kaiser; one successful poet was even sent to Berlin and received by the Kaiser and "richly rewarded", exactly as a Muslim prince ought to have done. The poet's name was Hamisi Auwi, and the refrain of the poem is "Who has the true authority if not the Kaiser?"

The First World War produced some interesting songs, one in praise of General Smuts, who defeated the Germans south of Mombasa, and a new category of political songs, called the Beni dance songs, in which groups of (originally military) dancers praised their own "regiment", and chided rival dance groups, with political allusions.

Since independence, political verse has seen a new prosperity. The preparations for the elections are not complete without songs of praise for the leading candidates. Many of these songs are simply referred to as "praise name", as in "All worthy praise names are for the Prophet", the first line of the Maulid, see Knapper, Four centuries of Swahili verse, London 1979, 92-4. For the Hamzayya, see Knapper, The Hamzayya deciphered, in African Language Studies, ix (London 1968), 32-8. For the Burda see Knapper, The discovery of a lost Swahili manuscript from the eighteenth century, in African Language Studies, x (1959), 1-39. On the Burda, see idem, Swahili Islamic poetry, Leiden ii, The two Burdas. For the Maulid, see idem, in Swahili metre, in African Language Studies, xii (1974), 108-29. For the Maulid of Barzanji, see Swahili Islamic poetry, iii, 339 n. For the Ulima wa Hericha and the Emperor Heraclés, see Knapper, Traditional Swahili poetry, Leiden 1967, ch. 5. For the exploits of Mibidah in Swahili epic, see J. W. T. Allen, Tenali, London 1972. For the poetry of the German period, see C. Velten, Prose and Poetics of the Swahili, Berlin 1907, 345, and J. Knapper, The antecedents of World War I in Swahili literature, giving a translation of the poem on Smuts. For an example of "election poetry", see idem, A survey of Swahili songs, Toronto, forthcoming. For the Beni dance songs, see idem, Four centuries of Swahili verse, 1979, 37-8. When President Nyerere met President Bandu of Malawi at Dar es Salaam Airport in 1964, a special song was sung in praise of the President. (J. Knapper)

**MA'DIN** [Ar], "mine, ore, mineral, metal". In modern Arabic, the word manmad jami' denotes "mine", while mu'addin means "miner" and dijamid is a mineral.

In the vast Islamic empire, minerals played an important part. There was a great need for gold, silver and copper for the minting of coins and other uses. Iron ore was indispensable for the manufacture
of iron and steel for arms and implements. Other 
mixerals such as mercury, salt and alum, as well as 
pearls and precious stones, were necessary for every
day life. The empire was richly endowed with the 
various mineral resources; the mining industry was 
an extensive one and the metals, whether precious 
or not, were the object of a certain amount of 
international trade.

The article is divided in the following sections:
1. Economic aspects
2. Mining technology
3. Mineral exploitation in the Ottoman empire
4. In Islamic art

1. Economic Aspects

In the period of the Umayyad and 'Abbasid 
caliphs, the output of the mines in their dominions was apparently sufficient to meet the demands for some of the most important metals. In later periods when the empire was dismembered into various kingdoms one often vying with the others, many of the Islamic countries needed one or several of the metals and had to import them from non-Islamic regions. This was due to the fact that the metaliferous ores were distributed over the Islamic countries very unevenly. Some of them had rich deposits of several metals, others almost none. Certain regions on the eastern fringes of the Islamic world were relatively rich in metals, especially IlAfic, FarghAna, Ushrusana, in Central Asia and the mountains near Hamyan (eastern Ghur). Also, Fars had many mines which were very productive. The same was true for the country on the western frontier of the dar al-Islam, namely Spain. Al-Kazwini (AlKazwini, i, 339) could write that in this Islamic country there were mines of gold, silver, lead and iron in every district. It seems that mining, which had somehow declined in the Visigothic period, was revived and flourished under the rule of the Spanish Umayyads.

In the times of the caliphs, there were still in 
Arabia a considerable number of mines, from which significant quantities of gold [see uhar] were derived. Egypt had the famous mines of Wadi al-Allaf1, on the eastern shore of the Nile [see AllAla'li]. There were also gold mines in Ushrusana and IlAfic, near Shash and at Harat. But altogether, the output of gold in the Islamic countries was not sufficient for the regular coinedage of gold didar, especially after Spain had slipped away from the 'Abbasid empire. This is clearly borne out by the slow spread of gold coinage in the eastern countries of the caliphal empire. In fact, the Islamic countries were always dependent upon the supply of gold from the present countries of Senegal and Mali. When they had established their rule over the whole of North Africa and with this, the northern terminals of the commercial routes which were the outlets for the trade with these gold-producing regions, the mints of Trak and Persia could be supplied with sufficient stocks of gold. Didar began to be struck in Marw in 842, in Rayy in 849, in Sa
tarkand in 861 and in Ashkarbaydjan in 884. The success of the Fatimids in gaining control over the former 'Abbasid province of Egypt was undoubtedly to a very great extent due to their riches in West African gold.

On the other hand, there were in the caliphal empire rich silver [see fatwa] or argentiferous lead mines which made it possible regularly to strike silver dirhams. Most of them were in the countries then contained in the extensive province of Khurasan. The most renowned were those of Panjalat, not far

from the eastern sources of the Kibbi river, and in 
Djarbij, in the same district. Others were in Andal
orah, to the east of Balch, in the neighbourhood of 
Tis, and in Farghana. The province of Fars also had silver mines. In the flourishing period of the 'Abbasid empire, in the 9th century, the output of all these mines must have been considerable, as the gold-silver ratio changed, silver becoming cheaper, although the quantities of gold increased. Spain, too, was rich in argentiferous ore. It was exploited in the districts of Murcia, Alhama, Cordova and Beja (in the present Portugal).

Copper (mulad) was derived from mines in several 
provinces of the caliphal empire; in Sardan in the province of Fars, in some places in Gilan, Ashkarbaydjan, Balkh, Ushrusana, Farghana; and in the Muslim West, in Ili in the Oud Saoura (in Western Algeria) as well as in Spain. The copper mines in Cyprus were always an important source. However, the accounts of the Arabic authors of that period leave no doubt that the copper production of the empire was not sufficient for the manifold employments of the metal. For copper was needed for the striking of locally-circulating small coins (falsa), the roofing of mosques, the covering of gates of towns and public buildings, but above all, for the thriving industry of fabricating copper utensils, e.g. kettles, receptacles and various other vessels. The big mudhurms of Samarkand and the copper vessels manufactured in Farghana and in many towns of Persia were renowned all over the Islamic world. So from early times, copper had to be imported from Europe. In the period preceding the Crusades, when trade between Khwarazm and Persia, on one hand, and Eastern Europe on the other, was intense, apparently great quantities of copper were imported from the Urals. A report of al-Idrisi obviously refers to that period.

Metaliferous ores which contained lead (hasa, 
aswah) and tin were not lacking altogether in the caliphal empire. Lead was taken from mines in the 
neighbourhood of Balch, at several places of Anatolia, Upper Mesopotamia, al-Madjdiana (in eastern Algeria) and at Cabra in Andalusia. But the demand for this metal was very great. It was used for aqueducts, for the installation of public and private baths and for the roofing of public buildings. So it is doubtful whether the production was sufficient, and whether additional quantities had not therefore to be imported from non-Islamic regions. This was certainly the case as far as tin (hadid, hadi) was concerned. Tin was found in Spain, in the province of Algarve, and in the Arabic Geniza letters, dating from the last years of the roth century and the beginning of the 11th century, testify to the export of copper, lead and tin from Spain to the Near East. But already in that early period, tin had to be imported both from Cornwall and Devon in Britain and from Malaysia. The name given to tin by the Arabs, viz. hadd (q. v.), after Kalah, a well-known port on the peninsula of Maleca, bears witness to this fact.

Iron (hadid) deposits were insignificant in the 
Near East but one could procure sufficient quantities from other provinces of the caliphal empire and neigh
boursing countries which were tributary to the caliphas and their successors or otherwise dependent upon them. Armenia had mines which produced excellent iron, such as that, for instance, used for the Kusali swords. On the eastern slopes of the Caucasus, near Darband, there were iron mines which supplied a flourishing industry of weapons with raw material.
The province of al-Mawrî, Fârs, Khurâsân (near Nîqâpur), Fârîhsân and Shâbân also had rich iron deposits. Even in Kîrmân there were some iron mines. In Spain, iron was taken from mines in the Guadaluquivir valley, near Córdova, Toledo and Murcia, and elsewhere. In the Maghrib, about ten iron mining areas were exploited, from Morocco to Libya; iron ore was produced and exported from Sicily, and some mines were worked in Nîbâa and on the Red Sea coast. The supply was sufficient for the production of various utensils, such as knives, needles, scissors, chains and lances. This industry was highly developed in Khârism, in the major towns of Khorâsân such as Harât, Nîqâpur and others and also in al-Mawrî and in Toledo in Spain.

The term talîsh (calcamine or trity) was used to denote the natural zinc ores, especially zinc carbonate, or the white zinc oxide which was obtained during the treatment of the ores. The major centres for talîsh were in the province of Kîrmân, but it was available also in various mining areas in Spain.

Mercury (nâfâ) came chiefly from Spain [see al-Mârî]; another source was Fârîhsân.

Salt (sâlîf) was produced in numerous localities and, in some areas, on a very large scale, notably in the southern Sahara [see arâlî]. Other important salt mines or production centres were in Khorâsân, Arabia and Armenia.

The alum (âzâlây) of Yemen was famous for its quality, but according to al-Ishfârî, the major source was in Chad; it was exported to all the countries of North Africa and to Egypt.

Egypt was further a major production centre for both alum and natron (nasrûr [g.v.]).

Among the many other minerals that were known and utilised was asbestos (tulîz) from Badakhshân, out of which wicks and fire-resistant cloths were made.

Coal (jebâm) was also known and was used in some areas such as Fârîhsân where it was mined and sold. It was used as a fuel for ovens (tânâmûr, pl. tânâmûr) and its ashes utilised as a cleaning agent.

Petroleum (naff [g.v.]) deposits were exploited on a large scale.

Precious stones of various kinds were mined.

Arabic works on lapidary such as al-Birûnî's K. al-Dîwâniyya are celebrated, and deserve detailed study.

Rubies were mined in Badakhshân and were also brought from Ceylon. Diamonds came from Hindûstân and Ceylon, agates from Yemen, emeralds from Egypt, turquoises from Nîqâpur, lapis lazuli from Egypt and nars from Yemen; Cornodhun came from Nîbâa and Ceylon. Rock crystal (hilâds [g.v.]) was mined in Arabia and Badakhshân. Diving for pearls was a flourishing industry, and coral was obtained from the coasts of North Africa and Sicily [see further, dîwâhân, in Suppl].

When the empire of the caliphs crumbled, the unevenness of the distribution of metal deposits resulted, of course, in some countries suffering a temporary or permanent lack of important raw materials. Although the countries which had belonged to the empire remained to a great extent an economic unity, exchanging their products and keeping their economic structures, the stopping of the supply of metals which served as raw materials for manufactured goods and bullion for the mints was used as a weapon in the political struggle. Medieval statesmen were of course aware that cutting off the gold supply of the enemy's country meant weakening its financial resources and that curtailing its supply of iron dealt a blow to the production of arms.

Already in the second half of the 13th century, the supply of the mints of 'Irâq with bullion for the coinage of gold dinârs was deficient, as the mines in the provinces which had remained under the sway of the 'Abbasid caliphs, or accessible to them, were poor. The dinârs of the later Buwayids of 'Irâq and southwestern Persia were debased on a large scale. Even the mines of Wâdî al-Âlîbâd yielded in that period insignificant quantities of gold. Ibn Sa'd, writing in the 14th century, reports that the gold derived from these mines was worth no more than the expenses paid for the work. Consequently, Egypt was during the Ayyûbîd and Mamlûk periods wholly dependent upon the supply from West Africa, that is, the gold mines of the countries called by the Arabs Ghâna or Tarkûr. This supply rendered possible the regular coinage of gold dinârs of full weight and excellent alloy until the 15th century, when the Portuguese diverted to themselves part of the West African gold. In the year 1425, the dinârs of the Mamlûks was debased for various reasons, one of them probably being the reduced supply of bullion. The coinage of 'Irâq and Persia became from the middle of the 13th century essentially monetarist, as the silver money predominated overwhelmingly.

Even the supply of the Islamic countries with silver was in the later Middle Ages very irregular. In the 13th century, silver coinage was still in use in some countries of West Africa, but the silver famine, so that the striking of silver dirhams had to be discontinued. The catalogues of recently-found coin boards of the Sâlîfûs, like that published by T. Khudjaniyâzov (Abshabad 1979), confirm the supposition of a great silver famine (see also M. A. Seyfeeddini, Monetisze deso i desmoten obrachczenie w Azerbajdzianie XII.-xiv. w., i, Baku 1975). There were several possible reasons for this phenomenon. It may be that the campaigns of the Mamlûk of Ghâna in India and the fall of great quantities of gold from the subcontinent to Afghanistan and to Persia brought about as a consequence the export of silver to the newly-conquered provinces (this being the opinion of Blake). According to another hypothesis, the silver famine resulted from the loss of enormous amounts of dirhams, which were used as payment for the commodities purchased by the Muslim merchants in Russia and were finally hoarded there. Against the latter supposition one can adduce the fact that the silver mines in the Islamic countries began when the trade with Russia had already considerably declined. Perhaps the technological shortcomings of medieval mining were a major reason for the silver famine; al-Ishfârî recounts in fact that work on the "Silver Mountain", on the way from Harât to Sarakhs, had to stop because of technical faults and the lack of wood for melting the ore. But it seems that the shortage of silver was in that period a world-wide phenomenon, which was felt in India too (cf. S. Digby in BSOAS, xxxvii. 449). Anyhow, at the end of the 12th and at the beginning of the 13th century, silver coinage revived in 'Irâq, in Syria and in Egypt. Apparently this was made possible by Central Asian silver being brought by the Mongol conquerors, or flowing to the Near East in the wake of their campaigns, when trade between Central Asia and the Levant had been intensified after the establishment of Mongol rule over Persia. This supposition would be enhanced by the fact that a new crisis which happened in Syria and in Egypt in the middle of the 13th century was overcome after a new invasion by the Tatars.
monetary system based on a silver dirham (of 1.29 gr.). In the early days of the Thalhîbî rule, the increase of good silver coins in circulation was a striking feature of monetary development. When Thalhîbî himself again struck gold dirhams, the profit rate was based on the gold-silver ratio of 1:21. That means that great amounts of silver were available and that it was consequently cheap. The bullion was undoubtedly supplied both by mines in the Middle East and in Central Asia. Hamd Allah Mustawfi, writing in the 1330s, has included in his Nushtal al-balâb a list of silver mines, most of them in Central Asia. But there were also, according to his account and to other sources, rich mines in Qumishkhîne, between Amasya and Erzindjian, and in Lâfî in Asia Minor. Ibn Battûta recounts that Syrian and Idrâfi merchants came to Qumishkhîne to purchase the white metal. But the quantities of silver recovered from these mines were by no means sufficient for the needs of the mints and the silversmiths of the Near East. Egypt and Syria were in the later Middle Ages supplied with silver both from Central Asia and from Europe. The American chemist A. A. Gordus has elaborated a method of neutron activation which renders it feasible to find out the origin of silver by establishing its gold impurity. By this method, he has found that the bullion used by the Mamlûk mint for striking silver dirhams was very diverse, coming both from Central Asia and from the European countries. Another silver famine from which the Near East suffered at the end of the 14th century and at the beginning of the 15th century came to its end some years after the campaigns of Timûr. So the supposition that this was due to the renewal of trade with Central Asia and the flow of silver therefrom to the Near East is at least a good working hypothesis. However that may be, the supply of silver to the Near Eastern mints was sufficient throughout the 14th and the 15th centuries, though it slowly diminished. The difference between the gold-silver ratio in that region, at most less than 10:1, against 21:1 or more in Europe, brings it home.

Just as the Persian and Turkish countries were in the later Middle Ages richer in silver, so the supply of copper was much more abundant. In these countries and in some neighboring ones, there were indeed mines which produced good and abundant copper. Some of them were in Aghardâvî, others in Armenia, Syria and Egypt, which urgently lacked copper deposits, had to import it from Europe. The abundant issue of copper coins in the manufacturing of manifold copper vessels would have been impossible if the Venetians and the Genoese had not carried to the Near East heavy shipments of the German, Slovakian and Bosnian copper. The countries of the Maghrib, on the other hand, could supply themselves with copper, produced in the mines of Morocco, such as at Dal and elsewhere. But they had recourse to the import of silver coins from Europe. The Near Eastern countries also lacked lead and tin and were reduced to purchasing these metals from southern European traders, who, imported them from Serbia, Bosnia, Germany and England. The Persian countries were supplied with lead from mines in Bakhâr, Ughrîsâna and Farghânâ.

Even as far as iron was concerned, the resources of the Near Eastern countries were utterly deficient, and they were dependent upon a supply from Europe, where this export trade was stigmatised by the Church as treason against Christianity, and transgressors were threatened by ecclesiastical and secular authorities with severe punishment. Neverthe-

(E. Ashtor)

2. MINING TECHNOLOGY

1. Islamic mines

In the vast Islamic empire, minerals played an important part. There was a great need for gold, silver and copper for the minting of coins and for other uses. Iron ore was necessary for the manufacture of iron and steel for arms and implements. Other metals such as mercury, salt and alum were indispensable for everyday life. The empire was richly endowed with the various mineral resources, and the mining industry was an extensive one. *Ma’din* (pl. *ma’dadin*) denoted "mine" in Arabic sources, and *mu’tadsin* means "miners". In modern Arabic, the word *madad* denotes "mine", while *ma’dadin* or *mu’tad* is now used mostly for "metal" or "mineral".

Information on Islamic mines occurs in geographical works, in alchemical treatises, in books on mineralogy and in various other sources. But these, and archaeological discoveries, have not yet been studied in the distribution of Islamic mines. We shall mention here only some of the minerals and a few of the mining centres, since it is not possible here to list all the mines.

Gold (*dhabab* [ق.غ.]) mines were found in western Arabia, Egypt, Africa and in some eastern Islamic lands. But the first major gold mining area was at Wādī al-‘Allākī, which is a right-bank tributary of the upper Nile. It lay in the Bugja country, which was between Egypt and the Felicion and Nubia (see *feg*). The mines were in a desert area between the Nile and the Red Sea. The nearest towns were Aswān (see *aswān*) on the Nile and *Ayyāb* (q.v.) on the Red Sea. The second major gold mining area was called by al-Bīrūnī the Maghrib Sudān. This is the area south of the Sahara in Senegal and on the Upper Niger in Mali. According to al-Idrīsī, *Wangara* was the most important gold mining centre on the upper Niger. Salt, cloth and other commodities were exchanged for gold.

Silver (*fajla* [ق.غ.]) was either mined individually or in association with lead ores. The major silver mines were in the eastern Islamic provinces. Prominent among these were the mines of the Hindi Khus in the towns of Pandjhir and Dīrājānā, both in the neighbourhood of Balkh. According to one report, there were about 10,000 miners working at Pandjhir. Other important silver mines were in Spain, the Maghrib, Iran and Central Asia.

Lead (*wurub, ra’sās*) was obtained mostly from galena (lead sulphide), which was of very common occurrence. This lead ore is often associated with small quantities of silver. Only two other lead ores have any importance as raw materials. One is cerasite (lead carbonate) and the other, which is of minor importance, is anglesite (lead sulphate). Lead ores, especially galena, were exploited in Spain, Sicily, the Maghrib, Egypt, Iran, Upper Mesopotamia and Asia Minor.

Copper (*nahad*) ore deposits were exploited in various areas, including the important mines of Spain in the west, and several deposits in the east, such as those in Sīdījīstān, Kūrīn, Marī, Farghān, Būkhār, Tūs and Harāt. The copper mines in Cyprus were always an important source.

The word calamine or tutia (*taḷ manière*) was used to denote the natural zinc ores (especially zinc carbonate), or the white zinc oxide which was obtained during the treatment of the ores. The major mines for tutia were in the province of Kūrīn in the east. Tūsia was available also in various mining areas in Spain.

Tin (*ra’ wa* [غ.غ.], *basīr*) came from the Malaysian peninsula, which was known as *Kāla*, hence the name *ra’ wa* for the metal.

Iron and steel were in great demand in the Islamic empire. Hence iron ores were utilised whenever it was feasible. These ores were distributed in most Islamic lands. Five major iron mining areas were utilised in Spain. These included the mines near Toledo, and near Murecia. In the Maghrib, about ten iron mining areas were exploited in Morocco, Algeria and Tunisia. These included mines in *Diqābal al-Hadīd* in the Atlas mountains, the *Rīf, Gawr al- Hadīd* in Algeria, and Madīnījīn al-Ma’dīn in Tunisia. Iron ores were produced and exported from Sicily. Iron ore was mined in the Libyan desert and in the Fārs. Egypt exploited those ores that were available, for example in Nubia and on the Red Sea coast. Syria was famous for its iron and steel metallurgy (*Damascus steel*), and the iron ores were obtained in the south and in the mountain ranges between Damascus and Beirut. The Islamic countries of the east (al-Maṣḥīrī) were better endowed with iron ores than Egypt, Syria and Ṭūrāk. The province of Fārs had at least four important iron mining centres. There were also iron mines in *Khūrīsān*, in Transoxania, in *Aṭharbāyjān* and in Armenia.

Mercury (*phēg*) came chiefly from Spain. Al-Idrīsī mentions the mines to the north of Cordoba, where more than one thousand men worked in the various stages of mining the ores and extracting the mercury. Another source was Farghānā in Transoxania.

Salt (*milb*) was produced in numerous localities. It was an essential commodity, and production was undertaken in some areas on a very large scale for export purposes, for example in the Maghrib, where the salt mines were on the desert edges in the south. Salt was produced and carried by caravans south of the Sahara to be exchanged for gold. Thousands of men and camels were involved in these operations. Other important salt mines or production centres were in Khūrīsān, Arabia and Armenia.

The alum (*daďab*) of Yemen was famous for its quality, but according to al-Idrīsī, the major source was in Chad. It was exported to Egypt and to all the countries of North Africa. Egypt was also a major production centre for both alum and natron. Among the many other minerals that were known and utilised was asbestos from Badakshān, from which wicks and fire-resistant cloths were made. Coal was also known and used in some areas such as Farghānā...
in Transoxiana, where it was mined and sold. It was used as a fuel for ovens (tanâyra, sing. tanâyra), and its ashes were utilised as a cleansing agent. Petroleum deposits were exploited on a large scale (na'ab 'al-kaš). The technique of drilling vertical shafts and horizontal tunnels was a familiar operation in the Islamic countries if we remember the great tradition of constructing the underground fanā'ī systems (q.v.), with the exacting technical experience which they require.

More often, however, in underground mining miners preferred to dig horizontal adits into the slopes of a mountain and follow the veins, rather than to sink shafts. This method was easier and less expensive for a miner who was working for himself. It is noticeable that the reports of mines with vertical shafts usually apply to mines owned by the state. A vivid description of the silver mining activities in Pandžīr in eastern Hindustan, where 10,000 men were employed in the mining industry, is given by Abu 'l-Fida'. He says: 'The people of Pandžīr made the mountain and the market-place like a stove because of the many pits. They only follow veins leading to silver, and if they find a vein they dig continuously until they reach silver. A man may spend huge sums of money in digging, and he may find silver to such an extent that he and his descendants become rich, or his work may fail because he is overpowered by water or for other reasons. A man may pick a vein, and it is possible that another man picks the same vein in another position. Both start digging. The cost is that the miner who arrives first and intercepts the passage of the other miner wins the vein and its results. Because of this competition, they execute a work that devils cannot achieve. When one arrives first, the expenses of the other are wasted. If they arrive together, they share the vein and then they continue digging as long as the lamps are burning. If the lamps are extinguished and cannot be relit, they stop their progress because anyone who reaches that position would die immediately. (In this business) you will see that a man starts his day owning one million, and by nightfall he owns nothing. Or he may start poor in the morning and by evening becomes the owner of uncountable wealth (Ṭabarīn al-bulūd, ed. Reinaud and de Slane, Paris 1849, 465).

The main tool of the miner was the pickaxe (rū'abār, šābara). It had a sharp end to peck the stone and a flat end to hammer or to drive wedges. There were also various hammers, chisels or wedges, crow-bars, hoes and shovels. Windlasses were used for hauling ores and materials out of the mines. An efficient and simple form of windlass was used in the iron mines in Syria, and is still used in constructing the fanā'ī system in Iran, in drawing water, and in the building industry. Here an assistant sits on a bench on one side of the mouth of the shaft or well, pulling the horizontal bars of the windlass towards him with his hands and pushing the opposite ones away with his feet at the same time. The ore is loaded into a small bucket about 30-35 cm. in diameter, which has two handles. The rope is attached to the bucket by hooks fastened at its end. More sophisticated capstans were used for haulage also, when loads were heavier. Oil lamps were used for illumination. The lamps were useful for aligning the direction of the digging, and were also good indicators of the adequacy of fresh air supplies, as was the case in the silver mines of Pandžīr. In Arabic technical literature, there are different designs of ingenious lamps. One such design, suitable for outdoor use and protected against being extinguished by winds, was described by the Banī Mushīj. Ventilation was an important problem. In Pandžīr,
as we have seen, with thousands of small miners working for themselves in a frantic search for silver, capital investment was kept to a minimum, and no provision for ventilation was usually made. The miner simply abandoned the digging if the lamps stopped burning. In the more organised mining work, especially in the state mines, a means of ventilation was always provided. This would be essential, particularly when miners were working for a long time without stopping. This is what we mentioned. Special ventilation shafts were provided. When installing a drainage system, several shafts were needed for this purpose, and these also served as ventilation shafts. Special ventilation shafts have been found in Iran, and some of these go back to pre-Islamic times. The problem of ventilating wells and mining shafts attracted the attention of Muslim engineers. They designed special ventilating machines. Al-Bīrūnī describes a device for a machine for use in wells which kill those who descend in them. If a man uses this machine in any well, it will neither kill nor harm him. This machine is suitable for wells that kill and for dangerous pits. If a man has this machine, which we shall describe, with him, he can descend in any well immediately without fearing it and it will not harm him” (Kitāb al-Hiyat, Arabic text ed. A.Y. al-Hassan, Aleppo 1981, 374, Eng. tr. D. R. Hill, Dordrecht 1970, 240).

The technique of water raising by water-wheels was highly developed in Islamic civilisation, and it flourished in North Africa and Spain. The above passage by al-Kazwīnī is important, and should prompt us to stay in water, even for days”. Archaeologists have found a screw pump in a mine near Cordoba with an oak screw and a barrel of sheet lead, but R. J. Forbes has expressed doubts as to whether this pump was really of Roman date (Studies in ancient technology, vii, Leiden 1966, 240).

We now come to a discussion of the drainage of ores. This is the next important step, the sifting and washing of ores. Such operations were usually conducted at the mines’ sites before the transport of the ores to the metallurgical centres. The ores were pounded or reduced in size, and in the case of gold ores they were crushed or milled to a finer degree. The milling operation was more important with the red gold which occurs in quartz veins. Milling or crushing of these ores was done either by querns or by water driven trip-hammers. Al-Bīrūnī in his Jamālsīr, 233, 4, discusses this operation: “Gold may be united with stone as if it is cast with it, so that it needs pounding. Rotary mills (kāṣifūn) can pulverise it, but pounding it by mashādjin is more correct and is a much more refined treatment. It is even said that this pounding makes it more red, which if it is true is rather strange and surprising. The mashādjin are stones fitted to axes which are installed on running water for pounding, as is the case in the pounding of flax for paper in Samarqand”. This is an important text since it indicates that water driven trip-hammers (mashādjin) were already established for crushing ores before the 4th/10th century.

3. Pearls and underwater resources.

The exploitation of corals and pearls involved very extensive activity. Pearls of the Gulf area were highly valued; the Chinese considered them to be the best pearls. The operations were organized by entrepreneurs. One of these would hire divers for two months and pay them regularly; such enterprises were often highly profitable. However, we read detailed description of the great dangers which faced the divers. Al-Bīrūnī gives in his Jamālsīr again (495-50) a detailed description of a diving operation, including a description of a new diving gear: “I was told by a man from Baghdād that divers had invented in these days a method for diving by which the difficulty of holding the breath is eliminated. This enables them to frequent the sea from morning to afternoon, as much as they wish and as much as the employer favours them. It is a leather gear which they fit down their chests and tie it at the [edges] very securely and then they dive. They breathe in the air from inside it. This necessitates a very heavy weight to keep down the diver with this air. A more suitable arrangement would be to attach to the upper end of this gear opposite the forehead a leather tube similar to a sleeve sealed at its seams by wax and bitumen, and its length will be equal to the depth of diving. The upper end of the tube will be fitted to a large dish at a hole in its bottom; two of these are attached one or more inflated bags to keep it floating. The breath of the diver will flow in and out through the tube as long as he desires to stay in water, even for days”.

An ingenious dredging machine was designed by the Banū Mūsā in their Book of ingenious devices. They say: “We wish to explain how to make a machine by which a person can bring out jewels from the sea if he lowers it, and by which he can extract things which fall into wells or are submerged
in the rivers and seas." This worked on exactly the same principle as the modern clamshell grab (Kišāb al-Ḥiyal, text 376, Eng. tr. 342).

Much information about metallurgy can be gained from the alchemical and chemical treatises. There was a close relationship between the work of the alchemists and the metallurgists, and the Arabic sources reflect the experience gained in the laboratory and in the metallurgical furnace.

Gold. Speaking about native gold which is collected from gold mines, al-Birūnī says that it is usually not free from impurities and therefore this gold can be refined by smelting only, or by other methods. He gives details of the amalgamation method that was used in the mines on a commercial scale: "After pounding the gold ore or milling it, it is washed out of its stones, and the gold and mercury are collected and these are put on a pail of leather until mercury exudes from the pores of the leather. The rest of the mercury is driven off by fire" (Dīnosāhir, 234).

He further describes how gold is mined from the deep waters of the Sind river: "At its sources there are places in which they dig small pits under the water, which flows over them. They fill the pits with mercury and leave it for a while. Then they come back after the mercury has become gold. This is because, at its start the water is rapid and it carries with it particles of sand and gold like mosquitoes' wings in thinness and fineness. Water carries these particles over the surface of the mercury which picks up the gold, leaving the sand to pass away".

The cupellation process was used extensively both on the laboratory and the industrial scales. The gold is alloyed with lead in a special crucible and it is then oxidised by means of a strong current of air blown on to the surface of the molten metal. The base metals such as copper are drossed, while the gold and silver remain as a button of silver-gold alloy. The separation of the gold from the silver was done by what is known as the salt and sulphur process. The liquation process was also used in combination with the cupellation process. What is new in these processes—and this was an Islamic innovation—is the use of nitric acid in the separation of gold from silver. Dīnosāhir b. Hayyān (907) described this process, and it was also mentioned by other later writers. Gold was tested by various methods. These included the touchstone (al-mashāk), measuring the specific gravities, and noting the speed of solidification of gold after it had been removed from the furnace.

Silver and lead. Unlike gold, native silver was not found in alluvial deposits or in the sands and gravel of rivers, but was to be sought in mountainous regions in embedded veins. In general, however, native silver was not abundant, and the main source was from galena (lead sulphide), which was usually associated with small amounts of silver. The first step would be to obtain the lead itself (which usually contains silver) from the earth and stones (i.e. the galena). This was done first by roasting, followed by smelting, oxidating to soluble sulphates. "The metals which were not among the original seven were obtained from the sulphide ores, on exposure to air in the presence of water, are oxidated to soluble sulphates. "The Moors then found that if water containing copper sulphate is allowed to run over iron, pure copper is deposited and the iron dissolved. As iron was cheap and abundant in Spain, this discovery yielded an efficient method of recovering copper from sulphide ore, and direct mining of copper ore became less necessary". (Singh et al., A history of technology, I, Oxford 1979, 11).

Sometime silver was associated with gold in what is called electrum. Here also, as we have seen, methods were adopted to separate these two precious metals. Silver was also obtained from its ores, or from lead or copper ores.

These different sources of silver necessitated the application of various techniques which were mastered by Islamic smelters and chemists, such as roasting, smelting, oxidation, liquation, leaching, cupellation, and amalgamation. Many of these techniques were given here, but these methods fascinated the alchemists and were largely responsible, in our opinion, for the vast alchemical literature that resulted from the alchemists' experiments with stones (abhād) and metals (mubād).

Tin, zinc, antimony and arsenic. Tin was one of the seven malleable metals or bodies. It was brought mainly to the classical Islamic countries from the Malaysian peninsula and, to some extent, from Southern Europe and Africa. Tin was not known as a distinct metal by the early Islamic metallurgists and chemists. It was first known, and used extensively, through tutān (zinc oxide) which was one of the stones (abhād). Later, as we shall see, zinc (rub al-tulīya) was known as a distinct metal. Tutān is usually the pure zinc oxide which is obtained from natural zinc carbonate. Various authors described the method of producing the pure product from the natural one. The ore is placed in furnaces which contain long ceramic rods. Upon heating the ores, the smoke of tutān ascends and adheres in films to the ceramic rods. Al-Muhammadī, 470, saw the "curious tall furnaces in the mountain villages" in Kirman. They later also attracted the attention of Marco Polo when he visited the same area. Before the roth/tenth century, rub al-tulīya (zinc) as a metal was known and was used with copper to form brass. It replaced kharsatīn as the seventh metal. Ibn al-Fadlī in the al-Taba'at Akhbarī gives several compositions employing rub al-tulīya (E. Windemann, Die ßslichen der Arabischen Wissenschaft, I, Hildesheim 1970, 706).

Antimony was obtained from antimony sulphide (Sb₂S₃) and was one of the constituents of copper alloys. Arabic chemical books described this process. Antimony was unimportant as a metal. But we read a description of the "preparation of the mercury of arsenic sulphide". This was a preparation of metallic arsenic from its sulphides. We may note that these metals which were not among the original seven were given such names as rub al-tulīya (or "mercury of arsenic sulphide"). The same remark applies to mineral acids, which were not classified originally, and hence were attributed to their salts.

Copper and its alloys. Copper was usually obtained from the sulphide ores. It seldom occurred as oxides or carbonates. These latter ores required only the simple treatment of heating with charcoal, while the sulphides (rubḥīl) required roasting, smelting with fluxes and partial oxidation. An interesting discovery took place in Spain. The sulphide ores, on expelling the air in the presence of water, are oxidated to soluble sulphates. The Moors then found that if water containing copper sulphate is allowed to run over iron, pure copper is deposited and the iron dissolved. As iron was cheap and abundant in Spain, this discovery yielded an efficient method of recovering copper from sulphide ore, and direct mining of copper ore became less necessary". (Singh et al., A history of technology, I, Oxford 1979, 11).
and others. The third group is the military treatises and chemical treatises of Djubir, al-Razi, al-Djildaki.

The second main group of sources is the alchemical authorities on this subject known until now being in particular, have been a source of controversy.

In the history of technology, the history of iron and steel, and the history of Damascus steel is exemplified in Sūrat al-Iladīr, LV 704-705.

Of uncertain composition. This uncertainty existed since al-Bīrūnī's days, but the general opinion is that it was a kind of copper alloy.

A cheaper quality of alloy was called by al-Bīrūnī and by some authors ray. This was a kind of bronze alloyed from copper and lead. It was also known as ray and was used for hardware.

Kūršūni was a metal (or alloy) which was listed as one of the seven metals of early Islamic alchemy. It was attributed to China. All Muslim writers said that it was not available and was extinct. A time came when it was replaced by zinc in the list of the seven metals. Some historians now think that Kūršūni was another alloy (or metal) of uncertain composition. This uncertainty existed even since al-Bīrūnī's days, but the general opinion is that it was a kind of copper alloy.

5. Iron and steel.

The importance of iron (ḥadīd) in Islamic civilisation is exemplified in Sūrat al-Iladīr, LV 25: "God sent iron down to earth, wherein is mighty power and many uses for mankind". Indeed, iron was considered as essential as food and clothing and it was always a source of power. Even after the sword had ceased to be a major military weapon, the manufacturing of iron and steel in our days is a basis for industrial civilisation and hence for economic and military power.

We have seen that iron mines in the Islamic empire were spread from Spain in the west to Transoxania and in the east there were famous steel production centres like Harāt, Bukhārā, Damascus, Yemen and Toledo. Iron and steel technology in the Islamic lands has had a long and flourishing history, associated with the sword until recent times, and the excellence of steel for these swords was represented by Damascus steel. As is the case with other major issues in the history of technology, the history of iron and steel, and the history of Damascus steel in particular, have been a source of controversy. Islamic iron technology was ignored and the important sources were not taken into consideration.

At one extreme, some writers have alleged that Damascus steel was alien to Damascus and to Islamic lands.

In this vast subject, we can only give extracts from some of the major Arabic sources, the best authorities on this subject known until now being al-Kindī and al-Bīrūnī, both of whom had critical minds that rejected legends and subjected scientific knowledge to actual observation and testing. The second main group of sources is the alchemical and chemical treatises of Diarbīr, al-Rāzī, al-Djildaki and others. The third group is the military treatises which discussed the manufacture of steel for swords, its heat treatment and the care for its ārid; but there are numerous other sources of information, all of which deserve attention.

Types of iron and steel. From studying some of these sources, we conclude that the following main kinds of iron and steel were utilised in the metallurgical centres: (1) Wrought iron (narmākht); (2) Cast iron (dāy); (3) Meteor steel (ghabrīkht); and (4) Manufactured steel (fālidh).

Wrought iron (narmākht) is soft and it is the "female". It could not be heat treated, but could be used where strength was not important, and it was used as a raw material for manufacturing steel (fālidh).

Cast iron (dāy). It is very important to know that cast iron was produced, since this was not realised by historians of technology as a mixed ignored. al-Bīrūnī says in his Diwandīr that dāy is the water of iron and that it is the liquid which flows during the melting and the extraction of metal from iron stones. Al-Rāzī defined dāy as water of iron. In a commentary by al-Djildaki on the Kitāb al-Hedus by Diarbīr, we read the following description of the production of cast iron: "Chapter. Learn, brother, that it is your comrades who found (yastubīb) iron in foundries [especially] made for that purpose after they have extracted it (i.e. the ore) from its mine as yellow earth intermingled with bare and various veins of iron. They place in the founding furnaces designed for smelting it. They install powerful bellows on all sides of them after having knuckled (yastubīb) a little oil and alkali into the iron. Then fire is applied to it (i.e. the ore) together with clinders and wood. They blow upon it until it is molten, and its entire substance (fuṭa) is rid of that earth. Next, they cause it to drop through holes like [those of] strainers, [made in] the furnaces so that the molten iron is separated and it made into bars from that earth. Then they transport it to far lands and countries. People use it for making utilitarian things of which they have need" (ms. 4221, Chester Beatty Library, fols. ra-ra-b).

The properties of this cast iron can be summarised from al-Bīrūnī's Diwandīr as follows: (1) It is quick to flow like water when smelting iron ores; (2) It is hard and whitish-silver in colour. Its powder had sometimes a pinkish reflection; (3) It cannot be forged to make swords; (4) It does not resist blows. Its shatters into pieces: "breakage and brittleness are characteristic of it"; and (5) It is mixed with wrought iron in crucibles for making steel. Dāy was sold as a raw material in the 9th/15th century. We learn that there were at least two commercial brands, one from Tirāl, the other from Istakhr.

Meteor steel (ghabrīkht) is often mentioned in early Arabic literature, with the comment that this was a rare material.

Manufactured steel (fālidh). Fālidh was usually manufactured in the molten state. It was made, in some cases, from wrought iron bars by cementation. The iron bars were packed with charcoal and heated until they absorbed enough carbon. In the molten state, steel was made in Islamic lands by the following methods: (1) By decarbonisation of cast iron; (2) By carbonisation of wrought iron; and (3) By the fusion of a mixture of wrought iron and cast iron; here we obtain two qualities of steel, depending upon the degree of fusion.

We have given above a text from al-Djildaki commenting on Diarbīr describing the production of cast iron. Let us now give the rest of the text to see
how the rods of cast iron are utilised to produce steel by carbo-nisation: "As for the steel workers, they take the iron bars and put them into the found ing-ovens (masafih) which they have, suited to their objectives, in the steel works. They install firing equipment (al-bahr) in them (i.e. the ovens) and blow fire upon it (i.e. the iron) for a long while until it becomes like gurgling water. They nourish it with glass, oil and alkali until light appears from it in the fire and it is puriﬁed of much of its blackness by intensive burning, night and day. Keep watching while it whirls for indications until they are sure of its suitability, and its lamps emit light. Thereupon, they pour it out through channels so that it comes out like running water. Then they allow it to solidify in the shape of bars or in holes made of clay fast. They like larger crucibles are left out of them reﬁned steel in the shape of ostrich eggs, and they make swords from it, and helmets, lanceheads, and all tools". This reﬁning of iron from its blackness is a decarboxylation process already. First, the Lisan al-`Arab states that steel (fil`ith) is reﬁned iron.

The other method of producing molten steel in crucibles by carbo-nisation wrought iron is described by the following text from al-Biruni in his al-Biruni, 256:

Al-Razi b. All, the Damascus blacksmith, (wrote) a book describing swords, specifications for which were included in al-Kindi's treatise. He commenced by dealing with the steel composition and the construction of the furnace (hiz) as well as with construction and design of crucibles, the description of the variety of clay, and how to distinguish between them. Then he instructed that in each crucible five rails of horsehoes should be placed, and their nails, which are made of marabukan (Pers. 'soft iron'), as well as a weight of ten dirhams each of nusab and golden marcasite stone, and brittle magnesia. The crucibles are plastered with clay placed inside the furnace (hiz). They are ﬁlled with charcoal and they (i.e. the crucibles) are blown upon with ﬁsh belows, each having two operators, until it (i.e. the iron) melts and whirls. Bundles are added containing siklabi (nyrobalan), pomegranate rinds, salt [used in] dough and oyster shells (sanafi al-lu`lu`), lit. 'pearl shells') in equal portions, and crushed, each bundle weighing forty dirhams. One [bundle] is thrown into each crucible: then, if the crucible is blown upon violently for an hour. Next the crucibles are left to cool and the eggs are taken from the crucibles'.

The third method of producing molten steel in crucibles by mixing cast iron wrought iron was also described by al-Biruni. This was the method of producing cast steel in Harat. Two qualities of steel could be obtained. One is obtained if the components are melted equally so that they become united in the mixing operation and no component can be differentiated or seen independently'. Al-Biruni says that "such steel is suitable for files and similar tools". A second quality of steel is obtained if the degree of melting of wrought iron and cast iron is different for each substance and thus the intermixture between both components is not complete, and their parts are shifted and thus each of their two colours can be seen by the naked eye and it is called firind'.

Some of the above important texts were conﬁrmed by observers and travellers who described the making of crucible steel in Bukhara in the last century. In 1530 Anossof, a Russian expert, was in Bukhara and found that crucible steel was made by carbo-nising wrought iron with charcoal and other organic matter. Later Massalski, another expert who was also in Bukhara, wrote in 1841 that Damascus steel was made there from a mixture of wrought iron and cast iron, as al-Biruni had reported 900 years earlier, from Harat. Observers thought that these reports were conﬂicting, but it is now clear that there is no contradiction; steel was made from different materials, and the quality obtained varied with these materials and with other manufacturing conditions. (P. Anossof, in Annuaire du Journal des Mines de Russie, 1841, 252-253; Massalski, in ibid., 257-258).

The Damascus sword and the Firind. C.S. Smith noted that "in comparison with the relative neglect of structure by the European metallurgists, the enjoyment and utilisation of it in the Orient is impressive. In the Orient, stel to display patterns depending on composition difference was in use contemporaneously with the European pattern-welded blade, and was therefore continually developed to a high artistic level" (A history of metallography, Chicago 1965, 258). The best achievement in this direction is the Damascus sword, which were made in all the Islamic centres and in India. Because of its excellence, its name was given later to all swords with a pattern. Islamic lands exported imported steel and swords. They imported from India and also exported to it. Al-Idrisi mentions that steel of eggs were cast in Harat and then sent to India. Al-Idrisi says that iron was exported from the Maghrib to India. In general, we may say that Islamic lands and India formed one area of Damascus steel culture.

Patterned swords (with a firind or ghamchar) were in use before Islam. Imran al-Kaysi (d. ca. 540 A.D.) describes the firind of the sword as resembling the tracks of ants. Another poet, Awn b. Radjar, a contemporary of his, describes the blade of the sword as if it has a water whose wavy streaks are like a pond over whose surface the wind is gliding. In fact, in Arabic poetry the beauty of the sword with the firind was always a source of inspiration. Damascus steel was thus a speciality of the Islamic world and India for many centuries; as Smith states, "The geographical distribution of these swords seems to have been practically coextensive with the Islamic faith, and they continued to be made well into the twentieth century" (op. cit., 14).

In Europe, steel was produced by heart-carbonisation of wrought iron rods. To imitate the firind or pattern of the Damascus sword, they resorted to placing together strips of iron and steel and welding these together; but these imitations never matched the qualities of the true Damascus steel.

Cast iron was ﬁrst produced in Europe in the 15th century A.D. and crucible steel in the 18th one. But a steel comparable in quality to Damascus steel was still required. For more than 150 years, a large number of metallurgists in European countries carried out extensive research on Damascus steel, including eminent scientists like Faraday, Smith, in a chapter "European attempts to duplicate Damascus steel", says that these attempts failed to reproduce true Damascus steel; what happened later was that the "interest in the duplication of the blade declined as European steelmakers developed their own techniques and the introduction of Bessemer and Siemens processes gave homogenous steel more adaptable to large-scale production".

There were, however, some advantages behind
The melting process; historians reported experiments of these metals. Iron melting was given special attention to elongate and hammering (to drive in) to obtain steel similar to that of the eggs that are obtained in Harâk by melting.

Furnaces, crucibles and other equipment.

We can learn much about Islamic metallurgical equipment from a study of the alchemical equipment. The isilând operation is mainly the melting of ores to obtain metals. There was, according to Al-Râfi‘, “equipment for melting metals (adâsid) and stones” and there was “equipment for the further processing of these metals”. Iron melting was given special attention in the alchemical apparatus. We can safely assume that the alchemical apparatus was the pilot-plant size of the actual metallurgical equipment. Sometimes the details in construction were identical, as we shall presently see. Iron production from ores was achieved by blast furnaces. Further research will reveal how the design of these furnaces had developed in Islamic lands. We know that cast iron was produced before the 4th/10th century. Al-Dîldîkî (see above) gave a description of the melting process; historians reported experiments on the casting of large field cannon from cast iron at the turn of the 15th/16th century in Egypt; and at the end of the 15th/16th century, a typical blast furnace in the Lycian mountains was 16 spans (3.84 metres) high by 7 spans (1.68 metres) wide and was constructed from masonry. Twenty men worked on the site. Layers of fresh wood and iron ore were stacked in the furnace; two horizontal bellows gave the necessary blast of air, each being operated by one man. The air from the bellows was combined in one outlet, and iron that accumulated at the bottom was taken out in small amounts. This iron was decarbonised in several hearth furnaces and forged on the same site in order to produce wrought iron for making useful articles. About 450 kg. a day were produced from this furnace; similar furnaces were in use in the Maghrib.

Crucible steel was melted in small crucibles. The text by al-Bîrûnî which was cited above on the making of crucible steel by a smith in Damascus shows that several crucibles were put in the furnace. Several bellows were used, each operated by two men. Such an installation was still used in 1840 in Bûghârân to make Damascus steel, and was of the same design as that described by Dâbir ten centuries earlier.

3. MINERAL EXPLORATION IN THE OTTOMAN EMPIRE

Our treatment of the subject of mining and metallurgy in the Ottoman Empire is based on the assumption that both in terms of the laws enforced and the organisational principles applied, and even the types of minerals exploited, Ottoman mining can be clearly divided into two distinct periods. The first period, the rise to Ottoman history up until the mid-17th century, while the second is concentrated in the last few decades of the existence of the Ottoman state as the mining industry developed under the impact of foreign investment. Because of the wide scope of the subject both from the standpoint of periodisation and the profusion of ancillary topics involved, the focus is limited to these time periods whose first-hand archival documentation we have studied most closely (i.e. the 9th-10th/16th-17th centuries) and those subjects which have been least studied, namely the history of the Ottoman mining industry. For the principal publications in the important fields of Ottoman mining law, and Islamic and Ottoman metallurgy, see Bibl., sections II-III, and for developments in Ottoman mining during the 17th century see V.

In what follows, mining law and administration are first discussed under the following headings: A. Administrative modes, and B. Organisation of labour, and then there is a description of the principal mineral types and their geographical distribution. In this second section, the principal subdivisions are as follows: (A) Classification of mineral types and (B) Marketing and distribution. A/I. Bullion and other smelted ores, i.e. 1. Gold; 2. Silver; 3. Copper; 4. Iron; 5. Steel (including some data on prices of the principal metals). A/I.1. Crystalline formations and other minerals mined from pits in their solid state, or extracted through a process of distillation from their liquid state, i.e. 1. Alun; 2. Sulphur and Saltpetre; 3. Salt [see Mlil]
Finally there is a short summary of major developments in Ottoman mining in the post-Tanzimat [1876] period, and brief discussion of mining technology in both the classical and the modern periods.

Introductory remarks on the economic importance of the mines and uses of metals in the Ottoman Empire.

Possession of and control of the sources of mineral wealth was of critical importance to the state. The Ottoman interest in the conquest of Serbia from the early 8th/14th century arose in part from a desire to secure the rich silver production of the Balkan mines, thus providing a vital financial basis for further expansion. In a very real sense, the mines were the ultimate source of prosperity for the emerging Ottoman state and an assured supply of metals of military importance such as lead, iron and tin was essential to state security. Because of the critical importance of their uninterrupted production, mineral resources were carefully protected and closely regulated by the Ottoman government (see below on market organisation, distribution and supply).

One of the principal uses for precious metals was to supply the imperial mints located throughout the empire, usually in the vicinity of the mines. While during the reign of Süleyman I (926-74/1526-66) the treasury enjoyed an abundant surplus, requiring even the opening of a treasury annex at the Yedi Rule fortress in Istanbul, in the 11th/17th century production levels lagged far behind money in circulation. Information from the state treasury budgets from the time of Murad IV (1032-75/1623-91) indicates that while the mines produced silver for striking some 160 million akçe, deficit spending at the level of 200 million akçe a year and more was common (see the Kepeci budgets listed in the Bilâl.). In order to balance the budget, recourse was commonly made to the practice of debasing the currency. The following list shows the steady drop in the silver content of the akçe over the 150-year period 1450-1600:

<table>
<thead>
<tr>
<th>Date</th>
<th>no. of akçe struck from 100 dirhams raw silver</th>

</table>

For an idea of the relative stability of the akçe’s silver content before the 16th century, compare the table in Inalcik (1951), 678.

Despite these measures, the surpluses stored in the Sultan’s inner treasury (hâshin-yi nderûm) periodically became depleted to dangerously low levels. According to the report of the Venetian bailo Conterini, after the large outlays for the Ottoman re-capture of Baghdad in 1458-66, the inner treasury reserve sank to only 15 million gold pieces (Barozzi and Berchet, Relations, 1, 353). No new sources of silver were discovered or exploited, and by the 19th century state bankruptcies became an almost chronic problem, leading in the end to the establishment of a foreign-controlled public debt commission (see suvrû-i uthûmûnu). Parts of the silver-producing areas of Spain had been ceded to Austria as early as the treaty of Passarowitz in 1718, and from that date the Ottoman mineral resource base in the Rumelian provinces continued to shrink.

According to Islamic law, minerals and hidden treasures made up a special category, rihâz, whose product was made subject to the payment of a one-fifth tax, the so-called hûm-i şerû (Halebi, 1, 130-5). Building on these principles laid down in the canonical law, the Ottomans introduced some refinements and customary practices in their own administrative law as it applied to mining, taking into account new conditions and changes as they occurred over the course of time. The reign of Bayezid II (886-928/1481-1512) was perhaps the most important period for the standardisation and codification of Ottoman mining law. Since there already exists a rich literature on this subject (see Bâlûc, section III), there is no need to enter into the details here except to emphasise the fact that Ottoman practice incorporated applied knowledge from previously existing Saxon mining law. The extent of their indebtedness to their predecessors in this field is indicated by the use in the Ottoman hâshin-names of Saxon and Slavic loan words for many technical terms and specialised skilled professions.

Administrative modes: the factors determining Ottoman mining activity through the ages.

There were three principal ways in which mining activity was organised in the Ottoman Empire and the choice as to which mode was to be employed was determined to a large degree according to the nature of the source of the capital invested to bring a mine into active production. The expenses for equipment, fuel to operate the forges and the wages of the mine workers were considerable, and since such large investments were beyond the means of the average individual, most large-scale mining operations tended to be undertaken either directly by the government itself or by means of investment partnerships. The three commonly used administrative modes were: (1) theven, direct administration of mines or mining districts through state-appointed superintendents; (2) iltâmân, farming out of mining revenues to investors on a short-term contract basis (the usual term for these contracts in the mining context was six years); and (3) Rihâz, long-term concessionary leasing of state lands for purposes of mining exploration to licensed individuals or mining companies. These broad generalisations may help to clarify the position of the lands administered under each of these headings, but in actual practice we often find that a mixture of government and private financing, as well as the phenomenon of subcontracting of mining leases, resulted in some hybrid form of two or more of these administrative categories. Nevertheless, generally speaking it may be said that direct state administration tended to be applied in the case of disused mines or those requiring a relatively greater level of investment to render them profitable. In such cases, after careful analysis of ore samples (dâgâsl) and estimation of requisite expenditures for improvements by technical experts, the state agreed to undertake all risks and meet all expenses for exploration and development of the mine. When, on the other hand, it was a question of operative mines with a known and regular yearly production which could be auctioned to private investors, the investor gambled that he would make up his original investment consisting of the bedel-i iltâmân payment on entering the contract
plus costs. The third category, zälle, seems to have been widely used only beginning with the 13th/14th century when new types of minerals came into demand. This system was used to encourage mineral exploration in abandoned (waadi) lands and lands of low population density. Although usually no previous mining activity would have taken place on such lands, after a determination had been reached on the basis of expert reports that they did possess a potential for development, the investor undertook to make whatever improvements were needed to realise maximum productiveness. According to the terms of the zälle system, the original investment consisted of the resmi berdi or ferman gherdi paid to register a claim to the land, but unlike the xildii system, the government then claimed only a small percentage of the mineral production realised, ranging from between 1-5% for unrefined ore found in scattered deposits, and between 2-5% for unrefined ore found in scattered deposits, and between 10-20% for unrefined ore occurring in concentrated deposits. Although we have no way of estimating the proportion of lands which fell into one category as opposed to another, the following table gives an idea of the extent to which the zälle method was employed in the 19th century, particularly for the mining of coal and other near-surface minerals.

* one dersit = 10 dönüm = approx. 2.5 acres.

From the above discussion, it may be seen that ability to invest was an important factor in determining the mode of administration selected for a given mining enterprise. A second factor which was critical in determining the intensity of mining activity at a particular time was the price of metals on the international market. The fluctuation in the price of metals in turn was tied to levels of production, both as a result of long-lasting disruptions in the heartlands of the European mining industry during the Thirty Years' War and because of continued upward pressure on prices based on rising demand for basic metals in the military and industrial sectors of the internal economy of the Ottoman Empire. Until now, it has been generally assumed (particularly among the Balkan historians, see Bibli., works of Dinic, Kovacevic, etc.) that the production of the Balkan mines suffered an irreversible collapse coinciding with the Turkish occupation of Serbia completed in 1450. The issue of mining decline is considerably more complex than that, and depends on a detailed study of price fluctuations of precious metals over the long term. Since this study has not been undertaken for the Ottoman Empire, it is at present very difficult for us to provide conclusive evidence or to chart accurately the course of periods of expansion and decline in the mining industry. A further factor to be considered, linked with the question of price and having a direct bearing on intensity of mineral production, is the application of new technology and mechanisation in mining. Since it was only when demand for a metal was high that investment in technical improvements was economically feasible, such improvements were usually introduced through state planning and initiative (examples in Refik, 35 [doc. dated 1299/1688], in which the government provides 150,000 liras to install four new water-wheels (zarik) to power the lifts and pumps of a silver mine at Inegöl; and Refik, 52 [doc. dated 1328/1716], in which the government approves the transfer of money from a provincial treasury to allow for continuation of work on a drainage channel which has been abandoned by private developers due to insufficient funds).

Dramatic improvements both in the quantity and the quality of mineral production were achieved in the 19th century as the result of the introduction of mechanical aids. While the purity of copper smelted in small forges equipped with hand-operated bellows was uneven at best, with the erection of large, state-built and state-operated smelting houses with mechanically-driven bellows, a consistent level of purity of 85% was achieved (for examples describing the impact on production of the building of state smelting houses at Ergani in 1866/1850 and subsequently at Tokat, see İhâdevâr-i mülîye, 1295/1907, 263; on the effect of mechanisation on mining yields in the 18th/19th century, see below). Nevertheless, the price was always the final determinant in deciding whether a proposed improvement was cost effective. When, as a result of downward market pressures of foreign competition the price of a metal fell, this could result in the closing of a mine which had been profitable and even worthy of investment for improvement under the earlier pricing structure.

The organisation of labour

In order to ensure that an adequate work force was available to operate the mines, workers in the state mining operations (m'adindjüs), like the guardians of the mountain passes (derbendjüs) and keepers of the way-stations on the imperial highways (men-şügjüs), were registered in the cadastral surveys under a special category of functionaries exempt from the payment of the extraordinary Sawrid [q.v.] taxes. As an example of how this system operated, a survey of 1285/1672 covering 155 mining villages attached to Srebucica is illustrative (EBA, KR 3175, pp. 60-2). In this survey, each individual village is assigned a specific duty in connection with the mining process. Some were assigned as excavators (keyvâdjiüs), others were charged with preparing charcoal for the forges (körûrûdjiüs) or as lumbermen and wood-cutters (domrûšûjiüs or odurândjiüs). Tasks ranged from the very specialised, as in the case of one village whose people were designated as makers of rope for operating the pulleys in the mine shafts (urkânândjiüs) to unspecified casual
labor (aylık). These villages were required to provide work crews as long as the mining operations in their region continued, and madendjiği status was even passed on from father to son and from generation to generation. In order to insure against production loss due to absenteeism, the madendjisi were also required not to leave the mine for any period of time without specific permission from the supervisor of the mine (Refik, 26). On the other hand, they were exempted from being called away for the performance of other kinds of labor, such as road repair and fortress building, which was required as a compulsory service (muḳallad hajmdet) in partial satisfaction of the "awbūd" tax obligation of other ṭibāyūn (see orders preventing summoning of these workers for other tasks on the day of al-Malik `Abd al-Rahmān, etc.). As skilled workers, the conditions under which the registered madendjisi performed their jobs in the mines were carefully specified in special regulations, and care was taken to enforce their application. In the first place, mining activities tended to be seasonal, most intensive work taking place in the 7½-month period between November (21 March) and Rūst-i Rādām (7 November). In addition, the working week was defined as lasting five days, the remaining two days being designated as idle days (andār) (Aḥbabā'ī, Nābūl, 7, 195, 244, 155, etc.); madendjisi with some experience were usually in short supply, their numbers had to be bolstered by the use of hired labor. Statistics from salt mining operations published by Güger suggest that the proportion of workers registered as inayjısı and enjoying a share of the mine's production (sometimes ½, sometimes ⅓) was about equal to those workers taken on seasonally and paid a cash wage (example in Güger, 206-7, citing the case of the Bejia salt works in Muğla province where a total of 415 workers 295 (47%) were registered inayjısı and the remaining 220 hired labor). Due to the hard physical nature of work in the mines, crews were normally expected to work only two-hour shifts with rest periods in between. By means of revolving duty, the mines could be kept in continuous operation on a 24-hour basis. A document of 1126/1714 (Refik, 50-2) suggests that a work crew of 20 men could be kept working for 20 days at this pace, but every 20 to 30 days a fresh crew would be called in to replace them. During the period in which they were engaged in working at the mines, mine workers were provided with food rations and half a begar of salt (see Murphey, 147). In 1126/1714, in addition to weekly wages amounting to one kurush for every simple laborer (ṣigah) hired to work in the mines, an allowance of two paraz each day was paid as a cash equivalent for food rations. Sometimes however the food rations were paid in kind in the following amounts: 141 pounds (50 wathiyah) of wheat per month per worker, with a weekly supplement of ½ pound (2 wathiyah) of leavened bread (khamīz). In an interesting document dealing with the terms of operation of a state salt works in Mugla province published by Handi (see Bibl.), we learn that working conditions and the share of workers in the profits of a mine could even become a subject for collective arbitration. In this example, the workers' share in the salt works had previously been determined as the product of three days' work, and the treasury share as the product of four days' work each week. However, on consulting with the parties concerned, the workers proposed a more equitable accommodation whereby they agreed to take their share in the proceeds of the mine each day in kind, in an amount defined in detail and guaranteed in the specific wording of their agreement (maddun). This latter system of apportioning shares in kind, rather than as the product of a particular day's work, protected both the workers and the treasury, since it was in neither party's interest to slow down or abandon production on the days devoted solely to the other's account. Other examples from different mining operations and forms of organised group labour show that the working conditions, and terms of recompense for workers, even those recruited for compulsory services such as fortress building, were negotiated so as to be equal to or better the current rates in effect at the time (see Murphey, Meşal, 167).

Apart from the simple labourers who did the hard physical work excavating the mines, there was a whole range of more specialised skilled workers and supervisors. Their positions, like those of the madendjisi, were confirmed by imperial diploma (hâdīs) and carried with them certain special conditions and privileges. As an example (BBA, Ibn ul-Emîn, Meşûdân, no. 108) a document confirming the inherited position as madendjisi-baqâl to a certain Meşêmî in charge of inspecting all the mining shafts and forges at Cûmâsh-bâhâne in order to ensure proper operation and to guard against concealment or theft of silver ore, states that the holder of this office was to enjoy a customary revenue (sawâdir) of one basket of ore for every forge under his inspection. The distribution of the mineral production between these various experts, foremen and inspectors working in a mine followed long-established tradition and was based on a division of the production of each mining shaft into 65 consistent shares (bjâpis) (Beidissanu 1935, 86, 87). However, further deductions (qaṣām) and fees both in pure metal and as cash assessments were set aside as the share of the money coiners (narrāfit) and other mint officials to whom the refined ore was usually sold.

Because of the risks and expenses involved in mining exploration, and the hard physical nature of the work, we find in some instances that the local populace deliberately falsified prospecting reports and tried to discourage the opening of new mines in their districts or the reopening of abandoned shafts (see Refik, 40-52, doc. dated 1121/1700, in which the populace of Sidrâkapsi opposed the reopening of an abandoned mine in order to avoid forced labour requirements). With the intensified production of the 13th/19th century, in particular in the coal mining industry, the labour situation changed completely (on this, see the study by Quaraqts in Bib.).

One should note as a preliminary that the sites exploited by the Ottomans were to a very large extent centres which had been known and mined since ancient times. In the pre-Ottoman period, the major mining centres were in Serbia (see survey by Jirošek based on records preserved in the Ragusan archives) and in northeastern Anatolia (for ancient times, see P. de Jesus; for the Byzantine period, Vryonis). Contrarily to what is sometimes claimed (in particular by the Balkan historians, see above), the establishment of the Ottoman state in these lands did not result in a collapse of the indigenous mining industry. In fact, with regard to the Serbian mines, for instance, we know from the observations of Jacopo de Premontorio in 1475 (cited by Vryonis, 15) that the Ottomans were responsible for dis-
covering and exploiting new sites which had previously lain idle, thus opening the way for a new period of expansion in Balkan mining.

Categories and regional distribution of Ottoman mineral resources.

In the fifteenth section of the Menâ'îdât al-'awdlim (Narosmaoioje ms. 3426, fol. 348b-351a), Mehmed 8'Ali organizes his information under three broad headings: precious metals (şahâlî), precious stones (âdâsârî) and precious oils (âdâsânî). In accordance with the traditional classification, the first group (fol. 347b-352b) is subdivided into the seven principal metals (hâsîl hâssî), i.e. gold, silver, copper, lead, tin, iron and speculum metal (âhâsîl hâshî [g.v.]).

The sources for gold mentioned by 8'Ali, as most productive in his time (fol. 349b) were the mines in the environs of Sijdijsâmâ (g.v.). Another source for fine quality gold used in the Cairo mint was in the same region at Ujdie (S. Shaw, The financial and administrative organisation of the Ottoman Empire, 128). An indication of the extent of the production of these mines is given when one remembers that the yearly treasury contribution (irâslâyû [g.v.]) of Egypt was fixed at 500,000 gold pieces (Shaw, op. cit., 284-5). Although a part of the irâslâyû was sometimes paid with other coins, it was typically made up of at least one-half gold (see ordeners to that effect to the governors of Egypt dating from the reign of Murad IV [1032-49/1623-39]; University Library, Istanbul, ms. T.Y. 6110, fol. 49b-47b, 8ca-8gb, 9ta-9gb, all dealing with khâmâyis.[g.v.]).

The principal silver mines of the Ottoman Empire were in the Balkans, with other important centres in Thrace (Sidrekapsi and Pravi Stasi) and Macedonia (Uskhî/Skojpe, Kratova, etc.).

The value of the annual production of ten of the largest of these mines is summarized in the following table:

Source: R. Murphey, Silver production, 82-5.

Although estimates for overall production levels of the silver mines in Rumelia vary considerably, official statistics from the turn of the 11th/12th century indicate an annual production of silver somewhere in the neighbourhood of 2,600,000 ounces (Murphey, Silver production, 79).

For Anatolia, silver deposits were to be found in the mines at Djandja near present-day Gümüşkâhâne. Register MM 922 in the Istanbul archives gives us an idea of the scale of this mine's production in the year 1081/1670. At this date, during a four-month period, a quantity of 158,049 dirhems or 1,460,827 troy ounces was produced. This indicates a yearly production of silver at Djandja of around the 450,000 dirhems level. However, after the 11th/12th century, silver was no longer produced in large quantities at Djandja. This was due partly to a failure to recover from disruptions during the Djuzeb rebellions (g.v.), period, and partly to natural exhaustion of the surface veins. Peysonnel's report of 1787 indicates a significant decline in the intensity of mining activity in the mines around Djandja, by stating that in his day only eighteen forces remained in operation (Peysonnel, 82). Both silver and gold were also produced in the mines at Ergani, in the northwest sector of Djuzebêrêgî provinces. A document dating from 1153/1742 (BBA, KK 5192) indicates that during a twelve-month period a total of 201,157 dirhems of gold (19,885,06 troy ounces) and 1,738,810 dirhems of silver (172,206,04 troy ounces) were smelted in 3,982 separate forges, each under the direction of an expert known as the 8'âjjâ Hâshîyû. Each region of the Empire was well provided with silver, but its yearly production was maintained well into the 19th century. Apart from gold and silver, with regard to other mineral resources the Ottoman Empire was in a particularly favorable position. Copper was supplied from the mines in the province of Kastamuni, in particular the mine of Kûre in the sanjak of Iriboul and the mines in the township of Cankiri (977) [Kastamounu vilayeti sindîmesi, sene 1716 H., 353-4]. Copper production at the Kûre mine is well documented from archival sources. The earliest account dates from 1619/1737 (BBA, MM 18,404) records that 3,210 forges were in operation, producing a yearly quantity of 134,582,5 dirhems (13,277 troy ounces) of gold and 322,672 dirhems (31,548 troy ounces) of silver. Unlike the silver mines at Djandja, at Ergani a high level of production was maintained well into the 19th century.

The production of copper is well attested in the records of the imperial arsenal in Istanbul, they cannot be regarded as accurately reflecting the overall output of even the mines of the Black Sea area. D. Urquhart writing in 1833 describes Kûre as "perhaps the richest copper mine in the world" and notes that its yearly production reached some three million obâs or 3,800 metric tons. One-quarter of this total was supplied directly to the imperial arsenal in Istanbul for gun casting, one-third was consumed by local industry, and the remaining surplus of about 41%
exported to foreign markets, in particular India. Peyssonnel (see summary statistics in Bibl.) also provides some information on copper exported from the Black Sea ports. Aside from Kârâb, we know from Edwards' account of Ottoman mining in 1914 (Edwards, 195) that there were rich copper deposits in the Hendek basin east of Adapazarı, in addition to which Solakian (62-70) speaks of dozens of small mining operation in the Hasar valley, near Trabzon. (For further information on copper production, see also the Farley report cited in Bibl., and Isawli 278-9.) According to Mehmed Aşkılık (Mendêrî al-sawâlim, fol. 351b), there existed some copper deposits in the Osogovska mountains near Kratovo and in various locations in the mountains of Bosnia.

Iron ore was excavated in large quantities in the mines of Samakov in present-day Bulgaria, and shipped to Istanbul for various uses in civil and military construction via the Black Sea port of Ahyolu (Barkan, Sâleyname Camii, i. 147). There were numerous other smaller mining centres throughout Bosnia which could also be mobilised in time of need (on the smaller iron-producing mines in the vicinity of Novo Brdo, see Bibl., Hanžić, 1976). An interesting example of the reopening of a mine at Kam dynamic in northern Bosnia is to be found in vol. xxi of the Muhittâne defters for the year 980/1572. The document is addressed to the governor of Bosnia and specifies that, in order to meet a pressing need for cannon balls at the front, the responsible authorities in the area are to recruit the necessary workers from the neighbouring villages without delay and resume production at the mine immediately. A fact which should not be overlooked when analysing the pattern of Ottoman mining activity is that, in addition to the richness of a given deposit, geographical proximity to the place where military need was the greatest could also be a major factor in determining which mines were exploited and also the level of production which was sought in particular locations.

Information about the two largest consumers of iron products, namely the imperial naval yards (ferâne-i vânîm) and the imperial arsenal (gibîek-khânâ) allow us to make rough estimates about the levels of production in the major iron-producing regions. In the case of the naval yards, a register dated 1073/1663 (BBA, MM 1680) specifies that 1,228 hâjars or about 73,000 kg. of raw iron were provided from Samakov at a cost of 623,260 akıbs or approximately 470 akıbs per hâjar. An em diffend of the Samakov mine covering a two-year period from Mulârem 1025 to ذي-ال-هَرَّاس (2026/1631) to December 1632 (BBA, MM 2069) indicates that the following finished goods were sent to the arsenal in that year: 1,024 shovel blades (hâjâls), 2,532 picks (hâmas), 2,000 axes (bagla) and 24 cowbards (kâsh). Eyleâd Câlî (Szydłâ-nâmî, vi, 218) speaks of a yearly quantity of 8,000 wagonloads of raw iron being sent to the central lands of the Empire chiefly via the seaport of Salonica. In Anatolia, one of the principal iron deposits exploited by the Ottomans was at Kîzî in the mountainous region southwest of Erzurum. (On the production of cannon balls and other finished iron products at Kîzî, see Murphey, The construction of a fortress... documentaries in the addenda.) Another centre of iron production in Anatolia, at least one that was active in the 19th century, was in the township of Zeytûn north of Marâşç. According to the yearbook for Aleppo province for the year 1321/1906 (446), there were two active mines producing a yearly quantity of 2,500 wâhîyye of raw iron (on these mines, see also Edwards, 193, and Solakian, 57-5).

The provenance of steel used in the Ottoman Empire was various. From the east, it was brought from India and Caucasus, in particular Derbend, and found its way to Damascus, where it was fashioned into various finished products, such as sword blades, by the celebrated artisans of that city (see Bibl., section iii). Some steel also came from Europe and was known as fêrîqi, although there were also indigenous centres in the Rumelian provinces at Buda and Samakov. Because of its foreign origin and the costly nature of the process by which it was refined, tempered steel, referred to as "Frankish steel" (âzîk-i fêrîqi), fetched the highest unit price among the base metals, commonly being sold at 4,000 akıbs per hâjar (91 akıbs per wâhîyye), and in one instance as much as 3,000 akıbs per hâjar or 98 akıbs per wâhîyye (BBA, MM 5760, register dated 1295/1877-8). The regulated prices as set in 1049/1639 fixed a maximum price of 70 akıbs per wâhîyye for the âzîk-i fêrîqi supplied to the rasm-makers' guild (tâmârîh-i yâkín) in Istanbul (Esâr defter, Topkapu Sarayi Library ms. Revâa 1934, fol. 107a-108b), but clearly there were extensive gradations in quality. The official price regulations of 1049/1639 established the following four categories:

1. fêrîqi âzîk - 70 akıbs per wâhîyye; 2. Peğâtî âzîk - 35 akıbs per wâhîyye; 3. Samakâti âzîk - 25 akıbs per wâhîyye; 4. âzîk of low quality not suitable for use by the file-makers - 20 akıbs per wâhîyye.

For the prices of various other metals used in the production of ordnance, an account register of the imperial cannon foundry (tezârîh-i Miyâr-i vânî) from 1006/1697-8 gives us some precise data (BBA, MM 6760). At this date, copper was supplied to the foundry at a price of forty akıbs per wâhîyye (x wâhîyye = 1.8828 kg.). Tin varied in price between 3,800-3,900 akıbs per hâjar (x hâjar = 44 wâhîyye), or 86-89 akıbs per wâhîyye according to its provenance. In one notation, an item of expense of 1,572 akıbs for the cost of a pack horse to transport tin from Semendire is recorded.

Other minerals

Apart from the seven precious metals (hâbîl-i hâbîl), another class of minerals was made up of ores of low intrinsic, but high practical value. Principal among these ores were alum (hâbîl), sulphur (hâbîl) and saltpetre (goberîlî). Alum was used in the textile industry during the dying process, as well as in the paper-making and other industries. Its manufacture in Turkey dated back at least to the 8th/14th century (İnalçik, Classical arts, 134; Cl. Cahen, Pre-Ottoman Turkey, 160-1; W. Hoyd, Histoire du commerce du Levant, 8, 365-71). Until alternative sources were discovered, Anatolia was the major and almost unchallenged supplier of alum to the European textile industry, principally through the intermediary of Genoese merchants. A Florentine merchant of the early 14th century lists five fully distinguishable grades and regional varieties of alum from Anatolia, as follows: (1) Kütahya alum; (2) alum from Karabük (= Şebnâ-Karabük); (3) alum from Phoca (= Yeğî Foca); (4) alum from around Umbi (ıd.) on the western shore of Apollont Gölü; and (5) impure alum from the various islands of the Marmara sea (known as
of Cyprus (= Kapudagh yarımada in Pergo- 
lotti, La trottola della mercatura, 43, 293, 366). 

(Por the reversal of this state of affairs with regard 
to the Turkish predominance in the production 
and supply of alum to the West by the 12th/13th 
century, see below.) The principal alum pits were 
found in north-central Anatolia at Sheblin-Karahisar 
and in western Anatolia in the area around Kutahya. 
The toponym Shabibâne still in use today in the 
city of Gêriz, and other variants such as Şabibi 
(near Tavshânî), attest to the former importance of 
the alum deposits in this region. Additional deposits 
were found at Marones near Gümüşhâne (g.m) in 
Trâncé (Warî help court records of Aleppo, Evremizi- 
saltaniyye, xiv, 70-1) and at Ispân (Singer, 85-91).

Since sulphur and saltpetre were two of the 
principal ingredients used in the manufacture of 
gunpowder [see also], it is not surprising that 
supply of these essential materials was controlled 
by means of a special regulatory system. The ac- 
counting system applied for securing gunpowder 
supplies was known as the objeldîk or special fund 
allocated for purchases and requisitioning of essential 
supplies (the same system was used to secure supplies 
for the imperial kitchens, the imperial navy and 
other branches of state service). The regions whence 
the essential minerals for the production of gun¬ 
powder could be procured within the Empire were 
limited. For supplies of sulphur, the government 
turned to either extreme of the Empire. A document 
dated 978/1570 indicates that a yearly quantity 
of 2,000 kannars was supplied to the government by 
the governor of Hakkâr province from his own 
region together with Erdjish (Refik, 7-8). On the 
other side of the empire, an indication of sulphur 
being mined in Selânik province is found in a budget 
for the year 1079-80/1669-70 (Barkan 1935, 249), 
where an expenditure of 33,000 akbârs is recorded 
for hiring of pack animals to transport the ore. 
Since we know from other sources (Refik, 7-8) 
that the standard rental fee for each draught animal 
was 200 akbârs, we may interpret these figures as 
representing 165 animals, each bearing the standard 
load of 18 batmans or about 300 pounds. Saltpetre, 
too, because it required specially humid climatic con¬ditions, such as those found on the edges of the salt 
lakes of Karâmân province, or in the Nile delta of 
Egypt, though more abundant than sulphur, could 
only be produced in certain places. Like sulphur, it 
too was supplied to the government by means of 
the yearly fixed contribution in kind. The level of 
this contribution was supposed to be constant, but 
additional extraordinary requests could be made 
in time of need. The yearly level fixed for Karâmân 
province as a whole was 500 kannars or 28,222 kg. 
(Konya, Sharîyye court records for the year 1040/ 
1630, 30). More often than not, the saltpetre was 
produced in a number of smaller workshops or 
distilleries called kanfar (Drelci, viii, 2744), to be 
collected and transported to centrally-located 
facilities for the manufacture of gunpowder. One 
such centre was at Bôr, which annually produced 
a quantity of 91,000 wakîyyes (approx. 3,000 kannars 
or 63,840 kg.) of finished gunpowder for delivery 
to the arsenal in Istanbul (Çümen, 211). Egypt's regular 
contribution (trasiyye) was 3,000 kannars (Ferdûn, 
ii, 201-2), but in some years it reached as high as 
10,000 kannars (see the order addressed to Tâbânî-Yâsîd 
Meşhed Pasha, governor of Egypt 1279-80/1668-69, 
in Sûmeri, fol. 43b-44a).

For the purpose of quick reference, a table follows which shows the scale of various mining enterprises in Anatolia. An accompanying map shows the geographical distribution of the principal minerals.

Market organisation: distribution and supply.

The principal purpose of the state regulation of mines was to ensure self-sufficiency, particularly in materials of strategic significance. It seems moreover that in order to achieve this, the state was even willing to sacrifice a measure of efficiency in production. This is most obvious in those mines administered by âdîdâm (see above and sultânem). Under this system, after deducting expenses for materials and payment of the treasury tithe, an investor was left with only some 60% of the production with which to pay his workers and realise a profit for himself. As is indicated in a memorandum on the subject written in about 1600 (see Murphey, Silver production, 90), this left little margin for experimentation with new techniques or investment in production-boosting improvements. In point of fact, the Ottoman Empire was independent of outside sources of supply for all significant minerals with the possible exception of tin (on the import of tin from the Cornish mines, see Ashik at i, 7053, and H. İnalcık, The socio-political effects ... 215 ff). Also, Ewliya Celebi mentions that the supply of tin for the Istanbul craft-guilds came from England (Seyyaâlât-nâmé, i, 579: Ingilîce diyyâîîdân). Modern geological exploration has determined that the only place in the Middle East where tin occurs in any appreciable deposit is the Lebanon (see de Jesus, i, 33, and ii, 195, map). However, there is no evidence that the Ottomans made use of this site (on the 18th century tin trade between England and Turkey, see Hedges, 845).

While mining production itself was also carefully monitored, strict government control was exercised, particularly in the marketing phase. One aspect of state regulation of the market place was the limiting or total prohibition of export of some mineral products at times when local stocks became depleted. Examples of the periodic imposition of trade restrictions in iron and lead, as well as other metals, are recorded in the well-indexed catalogue volumes of the Public Record Office in London (see Bibl). These trading bans were imposed only as an exceptional measure, but with regard to the sale and distribution of certain scarce resources within the empire itself there was a whole range of restrictive regulations, ranging from government price control to the enforcement of artificial market boundaries known as ârî.

To illustrate the fundamentally protectionist principles of the state with regard to mineral production and distribution, the conditions regulating the state alum mines are particularly revealing. Details on the marketing of alum mined at Shebin Karahisar (Karahisar-ı Şarkî) for use in the manufacture of gunpowder and other products are provided in the Şârî-iye court records from Aleppo. In an order dated i Muharrem 1194/1 January 1780 to the authorities in Aleppo, one of the restricted areas where the ore could be sold, the government barred the competition of European traders (Efnedîlî).
who sought to flood the market with cheaper alum. Ship captains were warned that if they persisted in attempting to sell their cargoes at the depressed price of six kurusha per kantar (56.44S kg), as opposed to the fixed price of forty-three kurusha per kantar set for the produce of the state-operated mines at Karabülgur, their cargoes would be confiscated (Dschambakḵ, Maḥbūba al-maqālim al-luṭfīyāt). Evidently, one could easily be made the subject of hoarding and speculation. Thus the sale and circulation of raw silver was strictly controlled by the government. A limit was fixed for the use of the jewelers and related craft-guilds (such as the içdibāy-i nāfšiyya) and unauthorised export of silver was also forbidden (on this question, see the references in Murphey, Silver production, 315). Furthermore, by periodic regulation of the coinage (magāz-i sülānīyya) to account for fluctuations in the value of silver, official government rates of circulation (mā'āsī) for all major currencies, both internally and externally-minted, were determined and were universally applied in all provinces of the empire. Thus all phases of Ottoman mineral production, minting, and circulation followed the same rule of strict government regulation and control aimed at preserving self-sufficiency and at assuring abundance in the supply of precious metals for the home market.

Concerning the distribution for use of mineral resources, it is clear that the greater part of the empire's mineral production was set aside and made directly available to the state for two principal uses:

1. military use
   a. the imperial cannon foundry (top-khātasy-i ʿāmīryāt)
   b. naval shipyards (icerāne-i ʿāmīryāt)
2. in civil construction
   a. buildings serving the public need
      (1) mosques
      (2) schools
      (3) hospitals
      (4) ṭamārās
   b. buildings reserved for state use
      (1) royal palaces
      (2) residences of high government functionaries.

A relatively smaller proportion was distributed to the craft guilds for the production of household utensils and consumer goods. Manufacture of common household items such as copper cooking pots (dastgāh), charcoal burners for household heating (mangal), and copper eatingware (ḫab) also used up large quantities of metal. According to Ewliya's list (Sevādel-nāma, i, 570) in Istanbul alone there were some 1,000 separate metal founders' shops (dubnawīyāt) employing some 3,000 skilled craftsmen. It was only when these workshops had been fully satisfied, that is to say, the needs of the state and the needs of the internal consumer market, with a substantial surplus kept in reserve in ease of emergency need, that the issue of export could even arise. When export did occur, the state also carefully supervised all aspects of these transactions in order to determine the appropriate trading partners, the volume of the trade, and the proper price level.

These peculiarities of the Ottoman marketing system are nowhere more in evidence than with respect to the distribution and sale of salt [see below]. For purposes of salt sales, each production district or ʿārī was further divided into sub-units called ʿādāms, to which salt was distributed for sale on the basis of carefully calculated population estimates. The purpose of such a system was obviously to guard against the occurrence of shortage caused by price speculation on the part of merchants who knew how to profit from a naturally occurring price differential based on the geographic proximity of their potential markets to the centre of production. Figures for several salt works in Anatolia and Rumelia published by Giger indicate that the distribution of salt typically followed a repeating pattern: 85% of the salt produced in a given production district (ʿarī) was blocked for distribution at fixed prices to local industries (bakeries, etc.), while only 15% made its way outside the confines of the ʿarī, either as a contribution to a state organisation such as the imperial kitchen (maftūk-i ṭarākīyya) or for distribution in another ʿarī experiencing a temporary shortage. Of the total 15% obtained locally, Giger was able to determine that 70% was sold directly at the mine or in its immediate environs, and a further 15% was sold in remote rural sales districts (dailyān) with limited access to the mines. Far from being oppressive, these sales restrictions were designed to ensure equitable distribution of commodities which were either naturally scarce or liable to become the object of price speculation.

Nineteenth-century developments in Ottoman mining.

In considering the development of Ottoman mining in the 18th/19th century, one should note the three areas of fundamental change:

(a) Mining law. (For this, see the relevant articles from the Daftar listed in the Bibli., section II.) On the law governing capital investment and ownership of land by foreigners, see Engellhardt, t, 217 ff., and Solakian, 90. On the concessionary regime, see İTTİHAAD.)

(b) New mineral types exploited in the 19th century and the role of foreign capital in the development of Ottoman mining.

(c) New technology and the impact of mechanisation. Only the major themes and issues relating to the last two topics, in particular, that of mechanisation in Ottoman mining (see below), will be treated here.

The exploitation of other mineral resources in the Ottoman Empire such as chrome and nickel and the more intensive exploitation of existing fields as in the coal industry, began on a large scale relatively late in Ottoman history. Under the impetus of increased demand sparked off by the Industrial Revolution in Europe, mineral exploitation rights in
Anatolia became the subject of intense competition between the various capitulatory nations and were often made a specific article of agreement in the bilateral negotiations for the financing of such large-scale projects as the Hidjaz railway. In order the better to coordinate the leasing and exploitation of the state mines and to increase their profits, a separate Department of Mines attached to the Ministry of Public Works (Nafiyiyya) was established in 1867.

The most significant development in the new period was the intensive exploitation of the empire's coal reserves with the participation of foreign capital. This sector of the mining industry has been thoroughly studied by Quaestor (see Bihî), so there is no need to enter into details here. Two points which should be stressed, however, are firstly that the marked rise in mineral output in the late 19th century was almost entirely used for export outside the empire and not to fuel internal industrial activity (according to Owen, 213, 80%–90% of all coal production was exported), according to Quaestor somewhat less, whereas Solakian (90) provides statistics from the first decade of the 20th century showing that minerals alone usually accounted for between 50–70% of all exports, and secondly that of all the minerals, coal was far and away the most important, comprising nearly 80% of all mineral output (see statistics in Ishaïyyit, 186).

Mining technology.

1. The earlier period. Some interesting details of the technological aspects of Ottoman mining are provided through the first hand observations of Mekteb ʾAşıkî, who was in residence during a three-year period between 594/1586 and 597/1588 in the mining town of Sidekapsî. According to his description, the mine shafts were typically dug to a depth of some 150 to 200 dhînâs (one dhînâ = approx. 75 cm). A system of mechanically operated surface pumps linked to the subterranean water channels was installed to facilitate drainage. The process whereby the ore was smelted and purified in small forges is also described by him. As the by-product of the first smelting, the ore was divided into pure silver ingots and a quantity of litharge. The litharge could then either be sold in its raw state or else further refined to produce lead for roofing or ammunition. As described by Mahemed ʾAşıkî, the forges at Sidekapsî were rather small in size, with a central heating chamber connected to an exterior collecting chamber where the smelted ore was left to solidify. The major technical difficulty seems to have been overheating, particularly in the winter months when the water circulation needed for cooling was impeded by freezing temperatures, which gave rise periodically to the explosion and collapse of the small, clay-built forges. A document which further describes the operation of the smelting houses (kal-bhânes) attached to the imperial mint and which specifies the percentage of metal lost during each stage of the assaying process, has been discovered in the Topkapı Sarayi archives (D. 5752) (see further, Beldiceanu 1964, 95–7). Éwilî Celebi's 17th/18th century description of the iron works in Sarnakoğlu gives evidence of the use of hydraulic power to work the iron-smelting furnaces (eyeâlibîseri, 182).

2. The 19th century. We have already referred to the application of improved techniques in order to raise yields, a notable example being the construction of a centralised smelting plant at Toliat to process ore from mines throughout northeastern Anatolia (see above). Alongside improved technology, mechanisation in key areas such as the transport and loading of ore had a dramatic impact on mineral output at the turn of the 20th century. To take an example from the Eregli coal fields, the building of a rail link and installing of cranes for rapid loading of the ships in the port are singled out by Quaestor as the critical factors leading to a three-fold increase in production within a few years of the establishment of the French company, the Société d’Hérasîde, in 1866 (see Quaestor; Owen, 213, taking a longer time frame, speaks of a better than ten-fold increase in coal output between 1855 and 1921). Proximity to existing railway lines also affected the decision to exploit known deposits in other sectors of the mining industry. The development of chrome mining in the province of Aydınoğlu, and intensified exploitation of the beds of schist at Hendek for extraction of copper, became economically viable only by virtue of the proximity of these areas to existing railway lines. In the case of the Hendek operations, we are told by Edwards (1950) that at the time of his report in 1914 there were as many as 26 separate concessionaires working in an area only 80 miles square. As a result of intensified mining activity and mechanisation in the industry, in a single decade at the turn of the 20th century overall mining production in all sectors of the industry doubled from about 600,000 tons to 1.15 million tons (Solakian, 9). This improvement in output was
achieved without a significant increase in the number of mines operated (Solakian, table at p. 9, shows that the number of mines operated fluctuated between 82 and 94 over the period 1901-10), and in the absence of new mineral finds of any significance between 1901-10 and 1906.

Bibliography: 1. Ottoman Mining. (a) Archival sources: London, Public Records Office, Calendar of State Papers and Manuscripts relating to English affairs existing in the archives and collections of Venice and other libraries of northern Italy (see index under "trade" where sub-headings for commodities include: iron, lead, tin, silver; etc.); Istanbul, Rıpsabanık Arşiv, (BBA) Malıyeden müdever (MM) 2067 = İddeb-i mehdüde-i yıldızı ve ihyâ-i imânı-i cübbüt-i Samâvâb fi sâne 1023-6; Kâmil Kepem, kayı (KK) 5167, First draft of a survey recording mining centres in Rumelia. This draft contains chancery notations indicating where comparative statistics from other years are to be entered. As an example, on p. 9 of this register, a single figure for the valuation of the tax-farm of Skopje/Ukub pertaining to the year 1003/1595 is given. Below this is inscribed the instruction 997, 999, 997, 994, 1919, 1924, 1925, 1919 in members dahil zâtiler: MM 22, 187 = completed draft of the above survey containing data spanning the years 990-1041/1582-1631.

State Treasury budgets from the KK series: KK 5167, budget for 1906/1697-8; KK 5171, budget for 1907/1698-9; KK 5177, budget for 1908/1699-100; KK 5175, budget for 1909/1700-1; KK 5172, budget for 1910/1701-2; Istanbul, Topkapı Sarayi Arşiv, Deter 5172 = a document dealing with the administration of the mint at Sirdeskap of the years 990-1041/1582-1631. For a brief description on archival sources on mining, see M. Sertoglu, Maddevi (bunched) Dergâh-ül Irâsî Arşiv, Ankara 1955, 78-81. In particular, see YBA, KK 5167, KK 5171, KK 5175, KK 5177, KK 5178, KK 5179, KK 5180 = registers dealing with the Rumelian mines, and BBA, KK 5190, KK 5191, KK 5192, KK 5196, KK 5199 = registers dealing with the Anatolian mines. In addition, see the Cevdet tasnif, Darbâne, op. cit., 70, and the collection of documents mostly from the 18th and 19th centuries dealing with the state mines and imperial mint transferred to the archives from the Department of State Lands (mülk endârisi), Sertoglu, op. cit., vol. VIII, p. 689. The instruction 997, 999, 997, 994, 1919, 1924, 1925, 1919, 1924 in members dahil zâtiler: MM 22, 187 = completed draft of a survey containing data spanning the years 990-1041/1582-1631.

2. Ottoman Mining: Narrative sources and modern works on mining and smelting operations in the copper mines. Particularly useful, since apart from statistical information, they give us an idea how the mines were physically operated. Particularly useful in this regard are İbne ul-Enâm, Meâdun, no. 17 = a report sent by the kâfi of Magna dated 990/1588 concerning mineral deposits in the vicinity, and İbne ul-Enâm, Meâdun, no. 205 = a report sent by the kâfi of Kârı in Rastamonı province dated 1003/1698 concerning the state of the mining and smelting operations in the copper mines. (b) Narrative sources and modern works on Ottoman mining: C. Agricola, De re metallica, Eng. tr. with annotations by H. C. Hoover, London 1917; R. Anhegger, Beitrdge zur Geschichte des Bergbaus im Osmanischen Reich, Istanbul 1945 (Istanbuler Schriften, nos. 2 and 14); Ankara, Meden Tarih ve İstatistik Enstitüsü Yayınları, no. 126, iron ore deposits of Turkey, Ankara 1964; no. 123, pyrites and sulphur deposits of Turkey, Ankara 1965. Mehmed Âşıkî, Muhteva sources on mining, see M. Sertoglu, Maddevi (bunched) Dergâh-ül Irâsî Arşiv, Ankara 1955, 78-81. In particular, see YBA, KK 5167, KK 5171, KK 5175, KK 5177, KK 5178, KK 5179, KK 5180 = registers dealing with the Rumelian mines, and BBA, KK 5190, KK 5191, KK 5192, KK 5196, KK 5199 = registers dealing with the Anatolian mines. In addition, see the Cevdet tasnif, Darbâne, op. cit., 70, and the collection of documents mostly from the 18th and 19th centuries dealing with the state mines and imperial mint transferred to the archives from the Department of State Lands (mülk endârisi), Sertoglu, op. cit., vol. VIII, p. 689. The instruction 997, 999, 997, 994, 1919, 1924, 1925, 1919, 1924 in members dahil zâtiler: MM 22, 187 = completed draft of a survey containing data spanning the years 990-1041/1582-1631.
984

MA'DIN

The relevant passages here are as follows: for copper, i, 80 (imports from the Crimea) an annual quantity of 2,500 bankas of copper was brought from Trabzon to supply the local industry, consisting of some 300 copper-smiths' shops; ii, 78: (Exports from Trabzon) the tithe of the copper production is estimated in contemporary publications indicating an annual production of at least 60,000 bankas; for saltpetre, i, 140-3: (Exports from the Crimea). After subtracting the quantities consumed locally for the production of gunpowder, an annual surplus of 40,000-50,000 obbals was available for export. (Note: since the purchase of saltpetre by foreign traders was forbidden at Istanbul, many merchants in Peyssonel's day availed themselves of this source of supply.)

Quataert, Social disintegration and popular resistance in the Ottoman Empire 1871-1908 (in press) (contains a detailed case study on the development of the Ereğli coal fields under the direction of the French company, the "Société d'Héraclee", beginning in 1856). In addition to all the above, contemporary newspaper reports and consular reports contain a great deal of useful information. See, in particular, Das Mineralwesen in der Türkei, in Österreichisches Monatsschrift für Orient (May 1905); Balkan geography and Balkan railways, in JGRS (September 1906); Mining conditions in Turkey, in Engineering and Mining Journal, lxxxvii (April 1909), 862.

Material and techniques.

In Muslim civilization as in classical antiquity, precious metals and alloys of copper, tin and lead were used for artistic purposes. We have only scanty information about the metals, and particularly about the alloys of which metalware was made. Our ignorance in this respect stems from a number of reasons. One is that most of the Islamic metal objects have never been properly analysed, and terms like "bronze" or "brass" are used indiscriminately in catalogues and other scholarly publications. Another reason is that the medieval Islamic terminology for metals and their alloys is often ambiguous and therefore difficult to evaluate (Aga Oğlu, A brief note, in JAOSt, lxv [1945], 283-285). It would seem, however, that from the early Islamic period to at least A.D. 1200, materials conform with those used in classical antiquity and with those mentioned by al-Dzâzârî, namely: gold (zâjâh); silver (sâfâd); with bronze (isfâdâb), from the Persian *sâfîd* *rîyâ*, a bronze with heavy content of tin, antimony and lead; bronze (yuf); brass (zâjâbâh); copper (nâsîh), and tin (nâsîh akbarsî). In early Islamic times the use of iron (kadîd) seems to have been negligible. It became important, however, for the production of steel for weapons and tools, and may have also been used instead of bronze for the plating of doors and city gates.

Together with the unbroken tradition in the use of metals and their alloys, there was a technical conservation in the fashioning of Islamic metal objects. Several methods of casting—one of the oldest arts in the world—were practised in Islam. One was the core-p Dew to lost wax process, applied in cases of closed shapes. An accurate, though somewhat sketchy description by al-Dzâzârî (q.v. in Suppl.), active in Diyarbakir in the second half of the 9th/10th century, testifies that in northern Mesopotamia the lost wax technique was well-established. Dated mid-9th/10th century objects indicate its use in Iran too (L.T. Giuzalian, *A bronze pâlamânî*, 97). Another method described by al-Dzâzârî was casting with green sand. This method, which is of obscure origin, is mentioned also in Chinese sources contemporary to al-Dzâzârî. (For the first description in Europe, see Birinciucci, *De la pirolithica*, 1140.)

Casting in open or piece moulds was used for works in the round or for more composite shapes, and required soldering. Hollow, primarily circular vessels, were often produced from discs or sheet metal, such as brass or white bronze, by burnishing the shape on a lathe. This technique, discovered by Roman artisans and known today as spinning, presumably passed to Islam from late Roman and Byzantine sources. No written documents on this technique, comparable to al-Dzâzârî's book on automata (see *Iwâl* in Suppl.) have so far come to light. The same applies to the widely employed method of raising—or sinking—in which comparatively thin metal sheets were transformed by hammering into jointless, hollow vessels of almost any shape. Among the objects fashioned in this technique are jugs, bottles, cups and bowls raised in precious metal or white bronze, covered brass vessels with fluted bodies and lids, and the like.

The most common method employed for decoration was punching, chasing andbossing, tracing, engraving and inlay. None of these techniques was...
The wider use of inlay with copper medium for inlay, was only rarely used with these wire, which in later centuries had become a common a cavity in order to mark the eyes or feathers of early bronzes, as for instance a pear-shaped ewer which was not popular before the mid-6th/12th century. The technique by which the artist enriches a metal object by overlaying parts of its surface with patterns is not related to any application of repoussé to bronze in order to create an over-all decoration, which was practised in the Near East since remote antiquity, was relatively rare in Islam. It is known foremost from a group of late 6th/12th to early 7th/13th century candlesticks and some stylistically closely-related rectangular tray-like objects (see also Rice, A Seljuq lamp from Konya, SIMW, V.). In modern times, chasing and bossing of brass and copper is practiced all over the Islamic world.

The decoration of the majority of Islamic metal objects was done either with chisels to produce grooves, or with gravers in order to remove the metal which once filled these grooves. Both techniques are not related to any specific material, and were employed singly and in conjunction with other techniques. They were used for unpretentious decorations of household utensils; for tracing intricate arabesque patterns; for preparing the grooves for copper and silver inlay, or to engrave a surface. No undercutting took place in the second method of inlay. In this method, which was employed for gold and is documented since the mid-7th/13th century, shallow grooves following the contours of the design were traced, and the thin gold leaf was secured by hammering it into the grooves. When larger panels were prepared to receive the gold, the bottom of the respective ornament was thoroughly roughened with a punching tool.

On the majority of medieval bronzes and brass objects, chased lines or background scrolls are filled with a black, bituminous substance the composition of which is not yet known. Similarly, the composition of the niello powder used in Islamic times on gold and silver ware is still unknown.

**Types of metalware**

Broadly speaking, Islamic metalwork falls into five categories. The first and largest are objects made for domestic and religious use. They are well represented in museums and private collections and therefore better known than the rest. The second group are doors and windows and their accessories. It includes knockers, locks, keys and window grills. Scientific and medical instruments, astrolabes, globes, knifes and scissors form the third group of metalwork. The interest in these instruments lies primarily in the history of science and technology. Yet in their excellent craftsmanship and beautiful decoration they are often real works of art. The fourth group are arms and armoury. They too are often of excellent craftsmanship, though for evident reasons they differ in design and workmanship from the former categories. The same applies to jewellery, which for technical and other reasons deserves a separate study (see MA'DIN, ii, in Sapl). The last three categories are therefore not included in this section. Artistically-outstanding examples will be mentioned below.

**Objects made for domestic and religious use**

1. Lighting implements. Islamic lamps fall basically into Byzantine, Mediterranean models. Two types, the common in pre-Islamic Iran, Syria and Egypt, had particular influence on the formation of the Islamic stands. The first is characterised by a post made up of baluster-shaped links, and is topped by a pan and a faceted spike to hold the lamp. The second type has a plain shaft which is bordered above and below by either disks, rings or a squat knob. Both kinds rest on three padded or hoofed animal feet. The base is formed by three curving trefoils with a raised sharp edge along the centre
or, more rarely, rises in the shape of a shallow dome. The artistic changes brought about by Islam did not so much affect the main elements of the Roman-Byzantine models than their stylistic transformation.

This is expressed in the preference for segmental shapes, faceted shafts, or geometric, flattened renderings of the zoomorphic feet or trefoil bases (Barrett, Islamic metalwork, Pls. 3, 4a). Another Roman variation, the plucked-type lamp stand, recurs primarily among early Mamluk specimens (cf. Lowre, no. 6030; Berlin, Museum für Islamische Kunst, no. I 653, repr. H. Gillies and E. Diez, Die Kunst des Islam, Berlin 1925, Pl. 441). In later centuries, lampstands of the above-mentioned types became less adequate as lighting utensils and are therefore rare.

Medieval Islamic oil lamps also follow the Roman-Byzantine tradition. Their oval, or occasionally bulbous, body has one or several nozzles for the wick, a hinged lid to cover the central filling hole, and is often applied with a handle at one end of the longitudinal axis. In contrast to the Roman specimen, the Islamic oil lamps were not made for a plucked stand, and are either footless or rest on a splayed, often faceted foot. This last form is generally regarded as an Iranian, particularly East Iranian feature and associated with 6th/7th to 7th/8th century Khurisian workshops. Many of them had animal or bird-shaped finals.

Zoomorphic oil lamps, too, were created both by Christian and by Islamic artisans. Yet whereas the shapes of the Byzantine and Coptic lamps were restricted to birds of symbolic content, in mediaeval Islam no clear preference for one or the other animal shape seems to have existed. The species of birds or quadrupeds became more and more differentiated and imaginative, and many are provided with burners attached to the breast or head of a fabulous creature.

In contrast to the lighting implements mentioned so far, the mosques or public institutions may have reached a height of more than 50 cm.—base and socket took an early 7th/i0th to 7th/i3th century Egyptian workshop. Many of them had animal or trefoil finals.

In a special category of Iranian 9th/i6th to 10th/i7th centuries, such vessels were widely exported to Italy and then produced by Mamluk artists who resided in Venice. Similarly-shaped incense burners occur already among Chinese silver vessels which are generally attributed to the Tang period. The Chinese specimens are, however, much smaller, and their relation to the Islamic incense burners is so far obscure. Some early 4th/i0th to early 7th/i7th century East Iranian incense burners with a square or cylindrical body seem to relate to a Buddhist, Central Asian tradition. They rested on low feet of a type also common in other East Iranian workshops, were either suspended or rolled on the floor.

To hold the charcoal they enclosed a small iron bowl which was set in gimbles to move freely when the incense burner was rolled or swung. In the 9th/i0th and 10th/i6th centuries, such vessels were widely exported to Italy and then produced by Mamluk artists who resided in Venice. Similarly-shaped incense burners occur already among Chinese silver vessels which are generally attributed to the Tang period. The Chinese specimens are, however, much smaller, and their relation to the Islamic incense burners is so far obscure. Some early 4th/i0th to early 7th/i7th century East Iranian incense burners with a square or cylindrical body seem to relate to a Buddhist, Central Asian tradition. They rested on low feet of a type also common in other East Iranian workshops, were either suspended or rolled on the floor. In a transitional period, such as lotus petals and blossoms are reminiscent of pinnacle decoration on Buddhist stupas or votive vessels. In a bulbous perforated body had a niche-like upper aperture with an arch-shaped opening, and the front of the semi-dome was flanked by a pair of flat, projecting bird heads.

Another type of incense burner was fashioned in the form of highly-stylized tangles or birds. These
vessels, which are generally assigned to North-East Iranian workshops, seem to have been in vogue throughout the 6th/12th century. Their body was hollow-cast and perforated. In the feline-shaped incense burners, the animal-head was removable to permit placing the incense in the body, while the bird-shaped examples had a drawer for the charcoal in the bird's breast. There is still much undetermined matter. The so-called 'cat heads' are from Fāṭimid Egypt. Although a considerable number of animal-shaped, presumably Fāṭimid objects have been preserved, their function is not always clear, and the group comprises fountain heads and objects which may have served various decorative purposes.

The identification of mediaeval Islamic bottles as perfume flasks (khumum) is often ambiguous. Among the extant flasks and bottles the following types almost certainly served this purpose. One is a group of Persian, 17-21 cm. high silver or parcel gilt bottles attributable to between the late 5th/11th and the mid-6th/12th century. They have a globular body resting on a low, splashed footing and a narrow, tubular neck. A small fluted cover with a ring, which probably once held a chain by which it was attached to the neck, has been preserved in some of these specimens. To prevent the evaporation of the perfume they would have required an additional stopper (Survey, Pl. 1356). A second group of Persian 12th century bottles is characterised by a funnel-shaped neck, a bell-shaped, longitudinally-fluted body, and a flat horizontal line between collar and neck (Survey, P1. 1311 B.E.). Other bottles of this type have oblique or rounded shoulders. Their bodies are cylindrical or faceted, and occasionally the mouth of the neck is sealed with a small filter. Similarly-shaped pottery and glass vessels with a pierced filter and a filling hole at the bottom make an interpretation of these bottles as perfume-sprinklers even more likely. Small, 8-9 cm. long bronze perfume flasks with a faceted filter and a filling hole at the bottom make an interpretation of these bottles as perfume-sprinklers even more likely. Small, 8-9 cm. long bronze perfume flasks with a faceted filter and a filling hole at the bottom make an interpretation of these bottles as perfume-sprinklers even more likely. Small, 8-9 cm. long bronze perfume flasks with a faceted filter and a filling hole at the bottom make an interpretation of these bottles as perfume-sprinklers even more likely.

In the second and smaller group the minor was further investigation.

(4) Inkwells and penboxes. The most common type of inkwell (dawdt or wasabara) had the shape of a cylindrical pot and was covered with a separate domed lid. It was used in Iran since Sasanian times, and only the proportions, the profile of the cover and the decoration changed in the course of the centuries. The earliest specimen fell chronologically into these groups. The first consists of Persian inkspots from the second half of the 6th/12th century. They are relatively small, 7 to 13 cm high. The base is either flat or has three low, almond-shaped feet cast together with the vessel. The cover has a fluted, dome-shaped centre, and lid and body are furnished with loops or tubular appendages for fastening the pot to the hand of the scribe. In the second group, which appears to have been used also in Syria in the 7th/11th century, the dome is hemispherical and rests directly on the level surface of the lid. In the last group, represented by Persian inkspots of the 12th/16th to 16th/18th centuries, the body is slender, and its width hardly exceeds the width of the domed cover.

Penboxes (balamadān) fall into several categories. The most common are rectangular boxes with a separate hinged cover and differently-shaped compartments for the ink and other writing implements. The shorter ends of the Iranian specimens were generally decorated. The shorter ends of the Iranian specimens were generally decorated. The shorter ends of the Iranian specimens were generally decorated. The shorter ends of the Iranian specimens were generally decorated. The shorter ends of the Iranian specimens were generally decorated.

(5) Caskets and boxes. The earliest preserved metal caskets come from 4th/10th century Spain. They are made of silver, mostly gilt and inlaid with niello, and their shape and proportions closely follow contemporary Spanish-Islamic rectangular ivory caskets with gabled lids (Migeon, Manuel, ii, 16-17, fig. 220). In the Eastern Islamic lands, silver caskets of this type are rare, and not known before the Saljūq invasions. Two particularly fine examples are said to come from a Persian hoard and are kept in the L. A. Mayer Memorial Museum in Jerusalem (Survey, Pl. 1352 A, B). A similar type was used by Ottoman officials.

Kur'an boxes are square and of larger dimensions. They are generally plated and not cast. The Manūli specimens have a bevelled lid (Berlin, Cat. 1697, no. 19, Pl. 69), while Iranian Kur'an boxes have been properly studied and further investigation...
have often flat covers. Along with angular, round and cylindrical boxes occur caskets of less conventional shape or exceptionally small size. To the last category belongs an oblong miniature box of remarkable artistic quality by Ismā‘īl E. Ward al-Mawsili, dated 591/1192 (Rice, SMFW, II, pl. XI), or a kidney-shaped box in the British Museum which is attributable to an Egyptian or Syrian workshop of the middle to second half of the 7th/9th century. Similarly unusual in shape are a shallow, but relatively large, hemispherical box in the Hariri Collection (Safar-ndna, pl. 1305 C) or a "casquet" in the Louvre. The last follows the shape of cylindrical, late 7th/9th century candlesticks with narrow, contracted waists, and has a low convex lid which is fastened to the container by hinges.

In the 8th/9th century, Persian metalworkers produced also a variety of polygonal caskets of various sizes. Among the preserved specimens are a small octagonal box (Safar-ndna, pl. 1306 A) and four larger dodocagonal caskets, all of which have been assigned to a workshop in Fars (Melikian-Chirvani, Le bronze iranien, 86-9). Mamlūk, usually oval-shaped lunch boxes form a category by itself. They consisted of one to three separate units which were placed one on top of the other, and had a lid with a handle that could also be used as a foot. To prevent food poisoning, they were made of tin (Melikian-Chirvani, Later Mamluk metalwork, II, in Oriental Art, N.S. xvii (1977), 55-64; Barrett, pl. 31).

(6) Ewers and jugs. In spite of the relatively large number of preserved ewers (ibid [g.v. in Suppl]) and their importance as art historical documents, they have not yet been sufficiently studied. The suggested typological evolution, and most of the chronological or geographical attributions, are therefore tentative. Particularly difficult is the classification of ewers from the first four to fifth centuries when one finds an exceedingly large number of shapes and combination of forms for which so far no models have been traced. Among these ewers are vessels with slender, oval and heavily bulging-out bodies; with and without shoulders; with elegantly contracted and long tubular necks, with tubular or bird shaped spouts and a large variety of straight, gently curved and zoomorphic handles. Between the end of the 4th/9th and the 6th/11th centuries new forms appear to have been introduced from the Eastern Islamic world, which include the use of ewers with an elongate spout like a spout in ancient Pārgānā and Ushūrānā by Russian scholars who dated them to the mid-5th/11th century. While these early examples were either plain or only little decorated, later 6th/11th to early 7th/13th century Khorasanian ewers of that type were inlaid with silver and copper, and attest to the new artistic trends of that time (Safar-ndna, pl. 1309A). After about the first half of the 7th/9th century, more emphasis was put on decoration, while shapes became more standardized. The Mecpetamian standard type of ewer with a pear-shaped body, a low, splayed foot and a straight, tubular spout was retained as a model for Iranian and Mamlūk ewers, which in Egypt and Syria developed more strongly swelling bodies, high splayed feet and top-heavy necks (for an ewer of Kāhā Bay, see Rice, SMFW. IV, pl. VII). The development of Safawid and Ottoman ewers is known from a small number of examples only. Among their typical elements one can tentatively single out curving spouts and handles, waisted necks with a bulging ring and boat-shaped openings, which presumably stem from the lamp-shaped openings of the earlier medieval tradition.

Jugs and pitchers (līgha, pl. līghāt), on the other hand, were fashioned in simple conventional shapes—a squat globular body and low foot, a short neck and a curved handle. The earliest extant models of gold and gilt silver date from the second half of the 4th/9th to the 6th/12th centuries (Safar-ndna, pl. 1345; 1349, now in Jerusalem; L. A. Mayer Memorial Museum. For a jug made for Samsān al-Dawla, now in the Cleveland Museum of Art, see Kühnel, Die Kunst Persiens unter den Byzändern, in ZDMG, cxi (1956), fig. 6). Safawid and Ottoman specimens basically conform to the Byzid prototypes. In addition to the conventional type of jug, there occur zoological hollow-cast vessels which resemble the European equivalents. The proportion of these objects is often ambiguous. Some have served for pouring water (bird in the Hermitage by Sulṭanān, dated 1260/1845; bird in Berlin, Cat. 1971, fig. 37; bird in the Monastery on Mount Sinai). Others were presumably fountain heads. Several specimens of the last category, such as "horses", "lions" or "horses" were either of Fitimid or Spanish origin.

(7) Bowls, cups and goblets. Mediaeval Islamic cups and bowls reflect a particularly long-lasting affinities to Iranian and Soghdian gold and silver models. Of particular interest in this respect is the continuity of hemispherical, either plain or fluted bowls, like the early 7th/13th century "Vaso Vescovalli" (Rice, Wade Cup, pl. 16), the "Wade Cup" (ibid, pl. 2) or a parcel gilt silver bowl in the Keir Collection (Fohfurdri, pl. G). In a more restricted sense this also applies to the continued use of ring handles with projecting thumb knobs. Although ultimately such handles appear to derive from Roman drinking cups, they too were introduced into Islamic civilisation via Soghdian silver vessels and persisted in metal cups until at least the early 9th/15th century (Melikian-Chirvani, White bronze fig. 13), while with ceramic cups this feature lasted even much longer. By the later 7th/15th century, bowls with strongly-projecting walls, similar in profile to contemporary ewers, as well as new types of cups, bowls and goblets, began to appear simultaneously in Syria, Egypt and Western Iran. Among the new shapes were cups with a strongly contracted base and a high, funnel-shaped foot turned upside down (Barrett, pl. 34); footless bowls with walls that project strongly up to about one-third or even more than half of their height, and bowls that have a nearly angular profile (Rice, Two unusual Mamluk metal works, I, pl. VII; Barrett, pl. 36 for a late 8th/15th century Iranian example). Bowls with strongly curving-out profiles continued to be made in Safawid Iran. However, many of the 10th/16th to 11th/17th century bowls hark back to the more gently-rounded 7th/15th century models, which seem to have more agreed with the taste of the time.

Doors and windows and their accessories.

(1) Doors. Although placing of doors was practiced since early times (Nasir-i Khusraw, Safar-nama, ed. and tr. Ch. Scheler, Paris 1882, 81, for door bearing the name of the Abbâbât caliph al-Ma‘āmân at the Alhâj Mosque, and p. 28 for iron-plated door in Dīyārbrakr; Dīzarht-Hill, 1954, 267-8 for description of later 6th/12th century door), no specimen made before the beginning of the 7th/13th century is as yet known. The earliest preserved door at the mosque of Cârâ or Dīzarht ibn Umar (C. Preussier,
The decoration

Although Islamic decoration follows some general, ubiquitous principles by which design was interchangeable between various media, one can nearly always detect certain strains which characterise any specific form of art. This applies also to metalwork, which seems to have developed certain preferences with regard to ornaments or decorative schemes as well as to iconographic themes.

(1) Geometric patterns. In addition to primary geometric grids by which the surface of every object was subdivided and its decorative elements organised, metal workers employed all the geometric forms used by artisans working in other media. Designs obtained by means of intersecting parallel bands to form an overall surface pattern of squares or lozenges, which could also easily be perforated, were often adopted for inlaid ornaments or decorative schemes as well as to iconographic themes.

Nordmesopotamische Bauendenkmäler, Leipzig 1911, Pl. 36 and p. 25) is inscribed with the name of Abu 'l-Kāsim Māhmūd b. Sangijār Shāh (605/1208?).

Nearly contemporary are three iron-plated doors from the constructions of the Ayyubid al-Za'farānī Ghāzī (606-9/1209-10) at the citadel gates of Aleppo. Bronze or iron-plated wooden doors were particularly widespread in Mamluk Egypt (for elements from door plates of Baybars, now in the Victoria and Albert Museum, see M. S. Briggs, Muhannadin architecture, Oxford 1924, fig. 239). Plaques from Mamluk doors as well as complete door wings are preserved in the Islamic Museum in Cairo. The 8th/9th century doors of the Mosque of Sultan Hasan, re-employed at the Mosque of al-Mu'ayyad in Cairo, are a very good example of its kind (Migeon, Manuel, ii, 82-4, fig. 299). While the majority of extant doors were plated with iron or alloys of bronze, some 10th/11th to 12th/13th century silver, or silver-plated, doors have also remained (Mayer, Metalwork, "Ilyās"; "Yahuda"). It may be safely assumed that earlier silver doors have been melted down and that their material has been re-used for other purposes.

(2) Doorknockers. In contrast to the plating, which was generally made up of flat bronze strips and polygonal elements, doorknockers were cast in heavy bronze. Aside from polylobed rings which were filled with arabesques in openwork (Sevilla, Puerta de Pardon; Cairo, Sultan Hasan madrasa), numerous zoomorphic doorknockers are known. Earlier specimen, like the doorknocker of the Ulu Cami in Clare (Quadrat ibn 'Umar) are formed by a pair of confronted dragons which are suspended from hinges attached to a lion mask (Ulicher Ergänzung, in Gönül Öney, Anadolu Selçuklu mimarisi ve esasları ve eserleri, Ankara 1978, 168, fig. 141). David Colin, Islamic art, Cat. Copenhagen 1975, 69. An identical knocker of unknown provenance is in the Berlin Museum. In later renderings, as for instance in a Mamluk example with the name of Muhammad b. Khalid in Herat, the ring is formed by a pair of facing dragon heads (a similar example is in the Louvre. See also knocker on door of the Mosque of Ṣafāvīs at Isfahān in Cairo, 883-8/1480-1).

(3) Window grills. Aside from a few silver and gold inlaid brass balls from monumental window grates, as window accessories have been preserved. The number of wooden accessories preserved in situ and in museum collections is however considerable. Three of these balls bear the name of the Ilkhānī Sultan Muhammad Šāh of Tabriz (963-9/1554-51). The rest cannot be precisely dated, although their resemblance to the inscribed specimen places them in the same category.

(4) Locks and keys. On the whole, little attention has been devoted to art historians to locks and keys. They are poorly represented in museum and other collections, and seldom signed or dated, and once removed from the area in which they were made, artisans are difficult to identify. For stylistic and other reasons, most of the preserved pieces are said to be Iranian, though for lack of information this cannot be verified. Most of these locks are padlocks and were intended for chests, boxes, trunks or similar containers. They are generally very small—the average proportions are 5 cm width and 3.5 cm height—and fashioned in a variety of shapes. Yet a typical Iranian preference for animal shapes, inherited from ancient times, has been retained until today. Judging from the recently-catalogued locks in the P. Tanavoli Collection (Parviz Tanavoli and John T. Wertime, Locks from Iran, the Smithsonian Institution and P. Tanavoli, 1976), certain animal forms were in vogue at particular times only, while others were invoked throughout the centuries. A special category of padlocks was used as amulets and bear inscriptions of protective character.

Keys of the Ka'ba form a class by itself (J. Sourdel-Thomine, Clefs et serrures de la Ka'ba, Paris 1972). Many carry names and titles of the sultan for whom they were made and are therefore dated or datable. On the whole, they are historical documents rather than works of art.
In spite of the common geometric language which metal objects share with other fields of Islamic art, there is a clearly noticeable difference in emphasis. In contrast to architectural ornament, in metal the geometric patterns are confined to close borders; they are generally combined with other designs, and only rarely form the main decorative feature. They either form a grid or a network into which other motifs are set, or function—like “swastika” or basket-weaving—as background pattern. In Safavid and Ottoman metalwork, certain geometric interlacings continue to fill medallions or other inscribed spaces (Rice, PI. 159). On the whole, these objects bear heraldically-composed arabesque and epigraphic decorations.

(3) The floral répertoire. As in other arts, media, vegetal ornaments on metalware fall into three main types: motifs derived from Hellenistic Mediterranean and non-Hellenistic Iranian models; infinitely curling scrolls and arabesques; and blossoms and foliations that stem from Far-Eastern prototypes. Motifs of the first type—roses, leaves, palmettes, vine scrolls or stalks bearing grapes or pomegranates—continue to figure in traditional and new compositions. One some early bronze and silver objects these motifs appear in sophisticated combinations (Dimand, Some early Islamic bronzes from Iran in American collections, in Atien 24, Intern. Orientalisten Kongress, 1957, Munich 1959, 347–9). On less ambitious objects, undulating stalks and branching-off shoots carrying vine and palmette leaves constitute the only decoration.

Fully-developed arabesques do not appear before the 10th/11th century. From this time onwards, two types of arabesques—a flowing, constantly changing design, and an arabesque based on axial symmetry—recur on metalwork of all periods. Another form of arabesque which gained much popularity on metalwork consists of pairs of knotted, bifurcated palmettes which blossom out from a crescent-shaped loop (Rice, The brasses of Badr al-Din Lutbî, fig. 8).

Modifications of such floral interlacings, in which a crescent-shaped loop is either substituted by a bar, or transformed into lotus blossoms, or even completely omitted, remain a favourite motif in 7th/13th and 8th/14th century brasses in the cast and west Iranian, 7th/13th to 8th/14th century metal objects these motifs appear in traditional and new compositions. One some early bronze and silver objects these motifs appear in sophisticated combinations (Dimand, Some early Islamic bronzes from Iran in American collections, in Atien 24, Intern. Orientalisten Kongress, 1957, Munich 1959, 347–9). On less ambitious objects, undulating stalks and branching-off shoots carrying vine and palmette leaves constitute the only decoration.

Winding, often hooked stalks, whose foliage is reduced to small buds and split palmettes, serve as background pattern and filling device alike. On Iranian, 7th/13th to early 8th/14th century metal objects these motifs appear in traditional and new compositions. One some early bronze and silver objects these motifs appear in sophisticated combinations (Dimand, Some early Islamic bronzes from Iran in American collections, in Atien 24, Intern. Orientalisten Kongress, 1957, Munich 1959, 347–9). On less ambitious objects, undulating stalks and branching-off shoots carrying vine and palmette leaves constitute the only decoration.

(3) Animals and imaginary creatures. On mediaeval metalwork, animals and imaginary creatures were one of the most conspicuous themes. The frequency in which these motifs were employed, as well as the species depicted, were determined by different factors. Yet even at this, when animal decorations did not constitute a major theme, they did not disappear from the repertoire. Because of their abundance, and often intricate iconographic implications, the present survey includes only the most current animal motifs and compositions.

Many of the animal motifs were carried on in Islamic metalware from Sasanian and Soghdian silver (Barrett, Pls. 1, 4b). The same is true for compositions, such as a single bird or quadruped inscribed within a round or polylobed medallion. The preference for heraldic compositions, inherent in Near Eastern and Iranian art, applies also to animal designs, even if the prominence given to these compositions varied. Broadly speaking, in earlier metalwork they are more monumental in size and style, while on later objects they are integrated in a larger decorative scheme. In many of these heraldic compositions the central axis is taken by a plant design or a curtailed “tree of life”, a knotted motif or other derivative of the “tree of life”. Pairs of ducks flanking a crescent-shaped motif are characteristic for North Mesopotamian, Manilik and Persian metalware from the mid-7th/12th to the second half of the 8th/14th century. Physically-linked pairs of animals or imaginary creatures do not occur on metalware after the early 8th/14th century, while the motif of heraldic birds or quadrupeds, set into cartouches or pendants, was carried on in Safavid and later metalwork. Other ancient Near Eastern animal motifs employed in metalwork are animal friezes, animals in combat (Barc, Indisci, particularly 206–8), and real and imaginary creatures revolving around a central axis. In 6th/12th and early 7th/13th century examples from Eastern Iran, Afghanistan and Northern Mesopotamia, the heads of the centrifugally-rotating creatures meet—or intersect—in the centre (Rice, The brasses of Badr al-Din Lutbî, figs. 7–5; Etthinhausen, Waffe Cup, figs. L, P, 21, 34). In later 7th/13th to 8th/14th century examples, the rotating creatures are no longer physically linked. In the last phase in the development of this pattern, the real or imaginary creatures are substituted by flying birds, and the rotating movement is no longer consistently adhered to (for a typical Manilik example, see Cairo cat. 1969, no. 58, PI. 8).

Another motif is that of animal (or soft–wool) scrolls, in which animal bodies or bushes are attached to, or amalgamated with a vegetal design. Spreading from Syro-Mesopotamian and Persian to Egyptian metalware, it appeared in the first half of the 8th/14th century (Hayward cat., no. 200) as abruptly as it disappeared in the last quarter of the 8th/14th century (for a late example, see E. Combe, Cinquièmes musulmans datez des XIIIe, XIVe et XVe siècles de la Collection Benaki, in BIFAO, xxx [1957], 56–7). On textiles and carpets, the motif survived, however,
in various related forms. See for instance, Survey, Pls. 1172, 1172A).

The animal decoration in later metalwork closely follows the mediaeval repertoire. Conventional themes, such as combatting or chasing animals, fowling, flying birds, peacocks or animals of prey were carried on and were supplied in modern metalwork (Survey, Pls. 1382, 1383, 1386B. For armory see also Pls. 1408 D, E, 1418, 1435-31 D).

(a) Epigraphy. Stylistic peculiarities. In metalwork, the first epigraphic bands which carry not only a message but have a clear decorative function occur on mid-9th to 4th/8th century mosaic lamps (Rice, S/M/W. V); for earlier inscriptions, cf. a 3rd/8th century bronze ever in the Tbilisi Museum, or bird-shaped vessel in the Hermitage, dated 188/766-7, and on 4th/9th to 8th/12th century bronze and silver objects (Survey, Pls. 1342, 1346-50). From this time onwards, particularly since the mid-6th/12th century, epigraphy remained a constant factor in the decoration of metalwork. The formal integration of the script, being set into continuous or compartmentalized bands, cartouches or medallions, complies with the general stylistic tendencies of the time. On Mamluk metalware, inscriptions appear not only in continuous and intersecting bands which may occupy a considerable part of an object, but also in a circular arrangement in which the haste of the lettering avoids the character. Starting from the mid-8th/14th century, such radiant inscriptions are most prominent.

The stylistic development of script on metalwork, and the possible divergencies from other artistic media, still remain to be studied. In the present state of our knowledge, there appears to be only one type of script which at least in its later stages of development is unique to metalwork. This is a script in which either the whole letter or part of it are made to assume human or animal forms. According to the figurative features which dominate in each of its variations, it falls into four types: ornithomorphic, human-headed, zoomorphic and anthropomorphic (Rice, Wade Cup; Baer, Metalwork). Out of these, only the first is known from objects other than metalware, occurring on Samland ceramics about 135 years prior to the first dated evidence of figurial script on metal, the "Bobrinski Bucket", which was made in Harat in 550/1163 (Ettinghausen, Wade Cup). The figural script had disappeared almost completely by the end of the 7th/13th century.

The integration of the script into the overall composition of a decoration, like its artistic development, is however only one aspect of these inscriptions. Aside from their artistic value, these examples are texts which, if properly read and interpreted, may provide valuable information which is not available from other sources. Although the general categories —eulogies, and dedications, religious inscriptions, moral dicta, inscriptions connected with the use or quality of the object and verses from Persian literature—are known, only a very limited number of inscriptions have actually been read. A proper investigation and evaluation of each of these categories has therefore been postponed until we possess a comprehensive corpus of inscriptions on metalwork (for some ideas, see Baer, Metalwork).

(b) The thematic repertoire. The thematic repertoire of mediaeval Islamic metalwork falls into three main groups. The first and by far the largest are representations of pleasure and pastime. They include, aside from banqueting scenes, dancers and musicians, a rich selection of hunting methods, falconry, hunting with the cheetah and phases of the animal’s training and fowling. Visual renderings of this last game are rare in other artistic media. Other pastimes, like polo games and travelling in a howdah on camel-back, have parallels in ceramics or miniature paintings. Sailing in a pleasure boat, a princely pastime which could be practiced only in Mesopotamia and Egypt, seems to have no analogues in ceramics, textiles and the like (Baer, Arabic vessels, 299-323). Representations of outdoor activities in a rural environment appear to be characteristic of a small group of early 7th/13th century Mesopotamian-style metal objects, while tournaments or battle scenes seem to have been a favoured theme in the later 7th/14th to 8th/14th century in Syrian, Egyptian and West Iranian metalwork alike. On the whole, these scenes were less popular on Iranian bronzes than on contemporary Mamluk objects (Rice, Bapstlifie). The second category are cosmic and terrestrial cycles. It comprises representations of the Labours of the Months, the planets and the zodiac, and scenes in which a princely image is shown in a cosmic setting. The first and the third theme are as yet known from metal objects only (for Labours of the Months, see Rice, The seasons and labors, 1-50; E. Atli, Two Il-khanid candlesticks, i-3j). Astrological signs on the other hand, are not limited to metalwork. It would seem that the actual design and the religious connotations of this last game are rare in other artistic media (Hartner, The Vase Versailles; Baer, An Islamic inkwell. For the princely image in cosmic setting, see Baer, Metalwork).

Epics, legends and religious themes serve as an inspiration for the third group. It comprises illustrations of certain episodes of the Shah-nama, and ornamental designs based upon popular belief and folklore. Both relate to pottery and the art of the book. The latter thematic programme of this theme is particularly rich and has no known analogues in other artistic media (Hartner, The Vase Versailles; Baer, An Islamic inkwell). For the princely image in cosmic setting, see Baer, Metalwork).

In a group of mid-7th/13th century North Syrian and North Mesopotamian metalware, Christian religious themes are combined with traditional Islamic decorations. In addition to saints or high church officials, they depict cycles of the life of Christ. Themes so far identified are "The Entry into Jerusalem", "The Nativity", "Baptism", "The Presentation in the Temple" and "The Virgin and the Child enthroned". However, the problem of Christian subjects on Islamic metalwork needs further research.

Workshop centres.

Our information on centres of manufacture of metalwork stems from two main sources. One is written evidence provided by mediaeval geographers and historians. It is generally reliable, but often exceedingly brief, and even when the author reports on his native town (cf. Ibn al-Faklh, 253, li., 201, 252), the products are often only listed but not described (for an exception see al-Majrili, below). The second source of information is inscriptions which figure on the objects themselves. Two types are particularly suggestive. One are inscriptions referring to the place of manufacture. So far only a relatively small number of places have been deciphered. Future systematic collection of these inscriptions may provide new evidence (the following place names appear so far on one object only: Bağra, ewer by Ibn Yazid, dated 69/688-9, Mayer, Metalworkers, 58; Kashan or Kusam...
The other type of inscription on metalwork is that of signatures giving not only the name of the artist but also his nisba. An often-made assumption that intrinsically the nisba means that the artisan was active in this centre has to be discarded. It may have been carried by an artist who had left his native town many years ago and was working hundred of miles away. It can therefore be considered significant only if taken in conjunction with other elements. One of the most striking examples for the continuous use of a nisba by artists who were active in another centre is the nisba al-Mas'ūlī, found on at least 30 objects made throughout the 7th/8th and the first quarter of the 8th/9th century, out of which only single specimen stems unequivocally from Mosul (Rice, Inlaid brasses). To Rice's list add a candlestick by 'Αll b. Kusayyrāt, working in Damascus, and a Kurūn al box by Ahmad b. Bāra, Cairo cat. 1969, nos. 56, 60.

On the basis of the above mentioned criteria, only three centres can so far be singled out. One is Damascus, which at least since the 8th/9th century and throughout Mamluk times exported metalwork to all parts of the Islamic world, including Cairo (al-Mukaddasi, 281, l. 7; Nāṣīr-i Khurrawā, Safar-nāma, ed. Schefer, 52, l. 13; al-Makrīzī, Khilāf, il, 212. For metal objects inscribed with this provenance, see Rice, Inlaid brasses, 306, no. 16; Cairo cat. 1969, no. 36).

The second centre, which, like Damascus, had flourishing workshops during the Mamluk period is Cairo (for a detailed description of the Market of metal Inlayers — in which bronze vessels were inlaid with gold and silver, see al-Makrīzī, Cairo cat. 1969, nos. 56, 60). The bronze kālīndan is, by antonomasia, an Important metal Inlayer but also his nisba. An often-made assumption that intrinsically the nisba means that the artisan was active in this centre has to be discarded. It may have been carried by an artist who had left his native town many years ago and was working hundred of miles away. It can therefore be considered significant only if taken in conjunction with other elements. One of the most striking examples for the continuous use of a nisba by artists who were active in another centre is the nisba al-Mas'ūlī, found on at least 30 objects made throughout the 7th/8th and the first quarter of the 8th/9th century, out of which only single specimen stems unequivocally from Mosul (Rice, Inlaid brasses). To Rice's list add a candlestick by 'Αll b. Kusayyrāt, working in Damascus, and a Kurūn al box by Ahmad b. Bāra, Cairo cat. 1969, nos. 56, 60.

The third reasonably-documented centre, famous for its richly-inlaid bronze objects, is Harātī (Kazvinī, Aghār al-bištā, ed. Wüstenfeld, 322, l. 30-323, l. 1). Two objects, the "Bobrinski Bucket" dated 557/1163, and an ewer in the Staatliche Museum of Georgia in Tbilisi, dated 557/1163, carry an inscription stating that they were made in Harātī (the exact text of the Tiflis over has, however, never been published. See Mayer, Metalworkers, 59; Mahmūd b. Muhammad; Ettinghausen, Bobrinski "Kette", in Gazette des Beaux Arts, 1945, 196). For other 8th/9th century inlaid pieces of metalworks, worked in similar style and technique, and signed by artists using the nisba al-Harawī, suggest that these artists had already left Harātī and were active in another centre. In fact, the location of manufacture is even more scanty. Places put forward by art historians should therefore be used with caution.

Eschscholtz, An Italian metalworker, 59, Mahmoud b. Muhammad; Ettinghausen, Bobrinski "Kette", in Gazette des Beaux Arts, 1945, 196. Five other 8th/9th century inlaid pieces of metalworks, worked in similar style and technique, and signed by artists using the nisba al-Harawī, suggest that these artists had already left Harātī and were active in another centre. In fact, the location of manufacture is even more scanty. Places put forward by art historians should therefore be used with caution.

Arabia and other parts of the Orient (see Yaf'ash, s.v.), and also found in the toponomy of the Iberian peninsula. Under the form Almadina, this term refers to the locality in the province of Ciudad Real, 125 km. to the north of Cordova, in the Sierra de Almadén. Dibahi al-Madina), which has one of the richest deposits in the world of mercury (A. Zipah and variants, whence Spanish azogue and the fullest form of the place name Almadén de Azogue). According to García Bellido (España y los españoles hace dos mil años según la Geografía de Strabón, Madrid 1945, 79-81), these deposits were already being exploited in the 4th century B.C., since the Greek philosopher Theophrastes (ca. 372-287) mentions the cinnabar of Iberia. At the present time, they still produce each year about 1,500 tonnes of mercury.

The Portuguese town of Almada, situated opposite to Lisbon on the southern bank of the Tagus, owes its name (A. Hisn al-Maddin) to the grains of gold dust thrown up by the sea on to this bank (al-Idrisi, Description de l'Afrique et de l'Espagne, text 184, tr. 223 = Gpsa geographicum, Naples-Rome 1973, v, 547).

AL-MADINA. Medina in French, residence of the Prophet Muhammad after the hijra and one of the sacred cities of Islam. Medina is situated in the Hijaz province of Sa'udite Arabia in latitude 24° 28' N, longitude 39° 36' E, about 160 km. from the Red Sea and about 350 km. north of Mecca. It has developed from an oasis on relatively level ground between the hill of Uubud on the north and that of Ay'ay on the south. East and west are lava flows (in Arabic barra (g.v.) or Bâba). There are several wadis or watercourses which cross the oasis from south to north. Though these normally contain water only after rain, they maintain a fairly high water table, so that there are many wells and springs. After heavy rains the central area of al-Munâshka used to form a lake, and a number of serious floods are recorded which threatened the stability of some of the buildings. On one occasion the caliph Uthman erected a dam as a protection against floodwaters (al-Bâghûrî, Fustûl, ii). Serious floods are also recorded in 660/40, 734/16 and 772/156. The water is in places salt and unpalatable, and in the past various governors of the town built aqueducts to bring good water from wells further south. The soil consists of salty sand, lime and loamy clay, and is everywhere very fertile, especially in the more southerly part. Date-palms were numerous before the time of Muhammad, and cereals were also grown. At a later date oranges, lemons, pomegranates, bananas, peaches, apricots, figs and grapes were introduced. The winters are cool with a slight rainfall, and the summers hot but rarely sultry. In former times, the air was reckoned pleasant but conducive to fevers (al-Bâghûrî, i, 1; Wensinck, Mohammedi en de Joden, 31; Goldschmidt, Musik, Stud., ii, 245). The Umayyades called the town al-hadâdah, "the dirty," in contrast to the honorific name of Yaf'ash, "the sweet-smelling," given to it by Muhammad (Goldschiter, op. cit., ii, 37; al-Bâghûrî, ii).

(d) HISTORY TO 1926

1. The pre-Islamic settlements

In pre-Islamic times the common name was Yaf'ash, but this is said to have been applied originally to only part of the oasis (al-Samhûdî, i, 8-10). This name occurs once in the Kur'an (XXXII, 13). Ithriya is found in Pirolay and Scopinus Byzantinians, and Yafâ in Minaean inscriptions. Al-Madina is properly "the town" or "the place of jurisdiction", corresponding to Greek medina. The word madina as a common noun occurs ten times in the Kur'an and the plural madâna six times, all in stories of former prophets. In four relatively late verses (IX, 107f.; 120f.; XXXIII, 60; LXIII, 8) al-madina appears, referring to the oasis now inhabited mainly by Muslims, but it is possible that it has not yet become a proper name. The same holds of its occurrence in the last clause of the Constitution of Medina (1bn Hâkim, ed. Wustenfeld, 347-9), since in the preamble and other two clauses of this document the name Yafârah appears by itself. It is often suggested that the name is a shortened form of madina al-nabî, "the city of the Prophet", but this is unlikely in view of its use in the Kur'an, especially in LXIII, 8, where it is spoken by Hypocrites. Of the poets of the oasis, the pre-Islamic Jâys b. al-Khaţîfîn (g.v.) speaks only of Yafârah, whereas Muhammad's contemporaries Hassân b. Thâbit and Kâthîr b. Malîk (g.v.) use both names.

Medina was at first not a compact town, but a collection of scattered settlements, surrounded by groves of date-palms and cultivated fields. For defence, several hundred large and small enclosures and strongholds (âjâbm, sing. ânum; also âdiyam, sing. âjum) had been constructed, perhaps about 200 in all. In these local inhabitants took refuge in times of danger. The idea of the âjâbm probably came from the Yemen (cf. H. Lammens, Tâfî, 72 = MFôB, vii [1922], 184).

The later Muslim historians (cf. al-Sâmûhî, i, 150-65; hâfî 3, fâsî 1) had no reliable information about the earliest history of Medina, and the views expressed appear to be conjectural; e.g. that the first cultivators were 'Amâliq (g.v.). It seems probable that before the arrival of any Jews there were some Arabs at Medina, doubtless the ancestors of those found subordinate to the Jews at the time of the settlement of al-Aws and al-Khazrajî. It was probable because of this close relation to the Jews that certain small Arab clans (Khatma, Widîâ, Wâjîf, Umâyya b. Zayd, sections of 'Amr b. 'Awîf) did not at first accept Muhammad as prophet.

There is also obscurity about the earlier history of the Jews of Medina. It seems probable that some were refugees from Palestine, perhaps men who left after the defeat of Bar Kockhîb, but others may have been Arabs who had adopted Judaism as a religion. Certainly, the Jews of Medina intermarried with Arabs and had many customs similar to those of their Arab neighbours. It is clear from the Kur'an, however (e.g. II, 47/4 ff.), that they claimed to be of Hebrew descent, despite the fact that the names of the clans and most of the names of individuals are Arabic. Early Arabic poems ascribed to Jews are indistinguishable in literary form and in content from those of desert Arabs (Th. Nöldeke, Beiträge zur Kenntnis der Poesie der alten Araber, 52 ff.).

While there may have been some simple agriculture before the coming of the Jews, they almost certainly developed the cultivation of dates and cereals here as in other oases such as Khaybar (cf. W. Caskel in G. E. von Grunebaum, ed., Studies in Islamic cultural history, Menasha 1954, 43; = American Anthropologist, lxvi/a, Memoir no. 76).

There were three main Jewish groups in Medina at the Hijra to the clans or tribes of Kurya, al-
Nadır and Kaynuṣa. Of these, the first two had some of the most fertile land in the oasis, while the third had no land but were armourers and goldsmiths, besides conducting a market. In addition, al-Samhudi lists about a dozen other purely Jewish groups, of whom the most important was the Bani Hadi, which was closely associated with Kurayya. He further mentions among the Jewish groups a few which are sometimes given Arab genealogies, such as Unayf and Marthad (parts of Balî), Muwaṭṭa b. al-Hārith (of Sulaym), and Dājjamā and Nāḡḥa (of al-Yaman).

The Jewish domination of Medina came to an end some time after the settlement of two large Arab groups, al-Aws and al-Khazraj (q.v.), sometimes called together the Banū Khayta, but mostly referred to as the Anṣār or “helpers” of Muhammad. They are among the Arabs said to have left South Arabia after the breaking of the clan of Maʿrib [q.v.]. At first these Arabs were under the protection of some Jewish tribes, and a sign of their inferiority was that Fīzyawm, the leader of the Jewish-Arab group of Thaʿlabâ, exercised a ṣūr prīmææ vacit over their women. This was resented by Mālik b. al-ʿAqlān (of the clan of Āwfa of al-Khazraj), and he revolted successfully and became independent. Subsequently, with help from either a Ghassānīd or a South Arabian ruler (according to somewhat legendary accounts), he enabled the other clans of al-Aws and al-Khazraj to become independent of the Jews. It is sometimes said that the Jews now became subject to these Arabs. This is not borne out, however, by the historical accounts of the period up to 627. The main Jewish groups, though doubtless now weaker than the Arabs, retained a measure of independence and continued to occupy some of the best lands. They were not politically united by their religion, but different groups were in alliance (ḥāl) with different Arab clans, and were sometimes involved on opposite sides in the fighting between Arab clans. Some of the groups of Judaised Arabs seem to have gradually become merged with Arab clans (as the Dānū Zārūṣ with ʿAbd al-ʿAṣchūl).

The historical accounts make it clear that the effective political units in the pre-Islamic period were not the tribes of al-Aws and al-Khazraj, but smaller units, which may be called clans. Those mentioned in the Constitution of Medina (see below) were al-Nabīt, ʿAmr b. Āwfa and Awās Manāt (later Arabs Allâh) among al-Aws, and al-Nuḍājug, al-Nuḍājir, al-Nuḍājir, and al-Nuḍājir among al-Khazraj. It is impossible to know whether these were al-Khazraj who came to Muhammad probably in 620. At the pilgrimage of 621 they brought a party of twelve men (including two from al-Aws), and were sometimes involved on opposite sides in the fighting between Arab clans. Some of the groups of Judaised Arabs seem to have gradually become merged with Arab clans (as the Dānū Zārūṣ with ʿAbd al-ʿAṣchūl).

The number twelve was probably suggested by the appointment of twelve “representatives” (ṣūbāḥ). The number twelve was probably suggested by the tribes of Israel and the churches of Jesus; but the fact that when the first representative of the clan of al-Nuḍājug died Muhammad took his place (one of his great-grandmothers had been a woman of al-Nuḍājug) suggests that the ʿṣūbāḥ were part of a political structure for Medina which fell into disuse. The effective structure of the community is doubtless that indicated in the document often known as “the Constitution of Medina” (Ibn Hisham, 159; e.g. Ibn Hisham, 159; etc.).
Cattani, Annali, i, 391-408; Watt, Muhammad at Medina, 221-8; E. B. Serjeant, *The Constitution of Medina*, in IO, viii (1964), 3-16; ibid., *The Surname Jamal, poets with the Yathrib Jews*, and the *Jahid of Yathrib*, in BSOAS, xii (1958), 1-42. The document is composite, as is shown by repetitions. In its present form it would seem to belong to a date after the Kurayya affair in 5/627, but some of its articles may go back to the Pledge of War at Al-Akaba. By this document all the people living in Medina are constituted a single umma or community in accordance with traditional Arab ideas of confederacy. There are nine primary members of the confederacy, eight local "clans" (three of al-Aws and five of al-Khazraj, and al-Umayya), and the group of Emigrants from Mecca. Although the underlying political conceptions were pre-Islamic, the confederacy was one of Muslims, since at least the leading men in each of the eight clans had accepted Muhammad as prophet. Many of the articles speak of "the believers", and there are several references to God. About ten distinct groups of Jews are mentioned in separate articles, and are confirmed in the practice of their own religion, as well as having certain rights and obligations. Even unbelievers or idolaters in the Arab clans appear to have been accepted as members of the community, though with restricted rights. There are some two dozen genera of articles dealing with various matters conductive to the smooth running of the community. Muhammad is given no special powers, but is recognised as prophet and is to have disputes referred to him. At least until 5/627 he could not issue commands but had to consult the clan leaders and get them to agree to what he proposed. After the conquest of Mecca in 8/630, however, his authority was unchallenged as a result of Muslim successes. When Arab tribes accepted Islam and became allies of Muhammad they were presumably included in the confederacy, and the Muslim community ceased to consist solely of the inhabitants of Medina. Al-Aws and al-Khazraj, as Muhammad's earliest allies, were called the Ansir or "helpers". The period from the Hijrah to Muhammad's death was characterised by a series of over 70 expeditions or razzias (mehdli, naqiz), in which the number of participants varied from a handful to 30,000. In the first few small expeditions, only Emigrants from Mecca took part, but in the expedition of 2/624 which culminated in the battle of Badr the Muslims of Medina, whether Emigrants or not, were included in Muhammad's force. After the victory at Badr most of the Muslims of Medina were committed to Muhammad's general policies, though, as a few, the Hypocrites (munafaqun, q.v.), opposed them. This opposition within Medina was dangerous for Muhammad when the Meccans invaded the oasis in 3/624 and the Muslims of Medina suffered many casualties, and again in 5/627 when the Meccans with many allies attempted to besiege Medina. There was also opposition from some of the Jews, and this led to the expulsion of the clans of al-Aws and al-Najjar in 2/624 and 3/625, and the execution of the men of Kurayya and selling into slavery of its women and children (5/627). Jewish verbal criticisms (5/627). Jewish verbal criticisms (muhaddithun) gave no further trouble. In succeeding years, many Arab nomads on accepting Islam came to settle in Medina and were attached to the group of Emigrants; and this further strengthened Muhammad against the "Anjar. On the whole, he managed to keep the peace between the rival groups in Medina, though at times he was able to use the hostility of al-Aws and al-Khazraj to further his own ends. After the conquest of Mecca and the acceptance of Islam by many of the leading Meccans, both sections of the Anjar felt threatened by these last (cf. the Higham, 834, 353 f.), and this division in the Anjar gradually ceased to be of political importance. The opposition to Muhammad from 'Abd Allâh b. Ubayy and his supporters, known as the munafaquun, seems to have faded out at the time of the siege of Medina, for 'Abd Allâh b. Ubayy participated in the expedition to al-Hudaybiya. About 9/630, however, another group of munafaqun appeared. During the expedition to Tabûk an attempt on Muhammad's life was planned, but was foiled. About the same time a mosque had been completed in the southern part of the oasis, the Masjid al-Dinâr or "Mosque of Dissension", but instead of honouring it by his presence Muhammad sent men to demolish it, having realised that it was designed to be a focus of intrigue against himself. (For the details of all these events, see Muhammad.) After the great expedition to Tabûk, Muhammad did not leave Medina except to make the Pilgrimage of Farewell to Mecca in Dhu 'l-Hijjah 10 (March 2/632. About two months later he fell ill, and asked permission of his wives to remain in al-Hijja's apartment (instead of spending one night with each in turn). He died on 15 Rabi' 1 11/8 June 632 and was buried in this apartment. He had made no arrangements for succession to his political authority, except that he had appointed Abu Bakr to lead the public prayers. The Anjar met in the hall (sadda) of the clan of Si'da and appointed the leading Khazraj, Sa'd b. Ubâda, as their ruler. 'Umar and Abu Bakr, however, heard of what was happening, hurried to the hall, and persuaded the Anjar that only a man of Kurayya could be accepted by everyone as head of the community. They then appointed Abu Bakr who took the title of "caliph (khilafa) of the Messenger of God". Abu Bakr continued to reside in Medina and to follow a policy of expansion by sending expeditions northwards. Most of his brief reign (11-13/632-4) was occupied in subduing revolts among various Arab tribes (the wars of the Ridda). His successor 'Umar (13-23/634-44) was about thirty years of age when he took power. He ruled for twenty years, and died in 4/644. 'Umar had already resided in Medina, apart from brief visits to recently conquered provinces. Medina was thus briefly the capital of an empire, but had little of the dignity associated with such a role. The caliph lived in his private house, and had no guards. Thus when insurgents from the provinces attacked Uthman in his house, his only support was from the sons of some of the leading men of Medina who had been sent as a token force. When the insurgents attacked seriously, there was virtually no resistance at all. The uprising was that of the Muslims of Medina accepted 'Ali as caliph, but they were now only a small proportion of the whole Muslim community, and their choice of caliph was not accepted in all the provinces. The Muslims of Syria Sawyer's government Mu'awiyah, while 'Abd al-Malik opposed 'Ali, first from Mecca and then from Basra. 'Ali, feeling constrained to counter the moves of these two, left Medina for Iraq in October 656 and never returned. In effect, Medina was replaced as capital by Kufa, and, after the acknowledgement of Mu'awiyah as caliph in 661, by Damascus.
expressed surprise that one of the participants in the battle of the Yarra [q.v.] also lived quietly in Medina. As already noted, some of the leading men of Medina disliked Yazid's succession to his father Mu'awiya in 680/683. Some may have been moved by the hope of a better life in Medina, as claimed by Yazid, and forced a thousand members of the Umayyad family and its supporters to take refuge in the quarter of Marwan b. al-Hakama [q.v.], the head of the family in Medina, though of a different branch from Mu'awiya. Yazid sent an army of 4,000 to 12,000 Syrian troops under Muslim b. 'Ukba, but when these arrived the rebels had allowed the Umayyad party to leave Medina for Syria. Muslim's army encamped on the Harrâ to the north-east of Medina and invited the rebels to submit. Instead they marched against him and were severely defeated, and Medina is alleged to have pillaged for three days by the Syrians. There seems to be some anti-Umayyad exaggeration in the accounts of this battle of the Harrâ [q.v.] and its aftermath. These events did not greatly alter the position of Medina, except perhaps to reduce its political importance for a while.

In 130/747 a group of Ibagiyya [q.v.] who had established themselves in the Yemen sent an army into the Hijaz and, after defeating the governor of Medina and a locally raised force, occupied Medina for three months until defeated by an army from Syria (Wilhenaussen, Die Oppositionsparteien, ch. 211; Eng. tr. The religious-political factions). After the establishment of Abbasid rule, Medina was the centre of two short-lived and unsuccessful Hasanid revolts, that of Muhammad b. 'Abd Allah, the "pure soul" al-nafs al-zawgya [q.v.] in 145/762 and that of Husayn b. 'All, the sabit Fakhkh [q.v.], in 151/768. Another incident that has been recorded was the attack in 230/845 by the Turkish general Bughâ al-Kâdir of the nomadic tribes of Sulaymân and Hâjî who had been making depredations in the region of Medina. About two years later they escaped from prison, but were put to death by the people of Medina (Tabari, iii, 557 f.; Ibn al-Athîr, §an'ah 230, 229).

For the first three centuries of Islam these are the main events involving Medina.

Even in the reign of Mu'awiya, Medina was becoming remote from the caliph and his government, and was beginning to attract those who wanted to keep aloof from political turmoil and maintain an attitude of neutrality between the opposing groups. Prominent among the neutrals was 'Abd Allah b. 'Umar b. al-Khathub [q.v.]. To Medina also came al-Mayyaj b. 'All [q.v.] after renouncing his claim to the caliphate in 41/660, and to Medina were brought al-Husayn's wife and son after his death at Karbala'.

Another son of 'All, Muhammad b. al-Kadiyya [q.v.], also returned to Medina in 75 A.H. and resided there. He was a member of the Umayyad family, not closely involved in the government of Mu'awiya and Yazid, and resided in Medina. Many others of the Quraysh of Mecca also settled there. Such people were able to enjoy the wealth brought to them by the wars of conquests, and life in Medina became notorious for its luxury. The caliph Marwan I expressed surprise that one of the participants in the rising of 287/745 had not been held back by the wine and singing-girls of Medina (Tabari, ii, 710).

At the same time, however, Medina became an important centre of Islamic intellectual life. From the beginning of Islam, it would seem, many had moved to mosques to discuss matters of religious interest. In Medina in the Umayyad period such discussions led to criticisms of current legal and administrative practice on the ground that these were not in accordance with Islamic principles. As these discussions and criticisms became more systematic, Islamic jurisprudence began to take shape. The early school of Medina seems to have been important (though J. Schacht, Origins of Muhammadan jurisprudence, Oxford 1950, 223, etc., thinks it was subordinate to the Hijâj schools). There are many references to "the seven lawyers of Medina", a group of men who died a little before or shortly after 169/785; the lists of the seven vary somewhat [see MAMMâL A-MADINNA A-SANA'in Supplement]. One of the most prominent was Urwa b. al-Zubayr [q.v.], who was also a collector of hadîth and of historical information about the life of the Prophet. Among his pupils were his son Higham and (Muhammad b. Shihhab) al-Zuhrî (d. 214/732 [q.v.]), one of the greatest scholars of the time in several fields. The real flowering of the legal school of Medina, however, came through the work of Malik b. Anas (d. 195/705) [q.v.], who was the founder of one of the four Sunni legal rites. The textual study of the Kur'an was represented in Medina by Nâfi' al-Laythî (d. 195/785), the authority for one of the seven canonical sets of readings. Ibn al-Kâliga al-Maghânum (d. 130/747) from Medina was also highly thought of for his textual studies. In the exegesis of the Kur'an an important place was held by 'Abd al-Rahîm b. Zayd b. Aslam (d. 195/785), who had been noted as a lawyer. A pupil of Malik's, Ibn Zabîl, wrote one of the first histories of Medina (Seggin, G.A.S., i, 343); it has not survived, but is occasionally quoted by al-Samhâdi.

No wall was built round Medina until it was felt to be threatened by the Fatimid conquest of Egypt. In 361/974 the Buwayhî 'Abd al-Dawn built a wall enclosing the central part of the town. This was restored in 514/1125 by a Zangid vizier, but a few years later in 517/1126 the Zangid Atabeg of Syria, Nur al-Dîn Mahamid, built a second wall of greater extent with towers and gateways. After the Ottoman conquest, Sultan Sulayman Kamal (1500-66) built walls about 1.2 m. high of basalt and granite, with a trench in front. He also built a covered aqueduct to bring water from the south. These walls were raised to 2.5 m. by Sultan 'Abd al-'Azîz (1861-76).

In 601/A003 the people of Medina were involved in a quarrel between the governors of Mecca and Medina, but, though there was some fighting, an agreement was eventually reached. Half-a-century later, in 737-8, Medina was threatened by a volcanic eruption. After a series of earthquakes, a stream of lava appeared, but fortunately flowed to the east of the town and then northwards. After this, little is recorded of Medina until the 15th century. In 1894 the Wakhâbî [q.v.] took the town, plundered the jewels, pearls and other treasures of the Prophet's Mosque and prevented pious "visits" to his tomb there. In 1813 it was recaptured for the Ottomans by Tûsùn, a son of Muhammad al-"All of Egypt, and in 1815 the Wakhâbî emissary, 'Abd Allah b. Sa'îd, recognised Ottoman sovereignty over the holy places in the Hijâj, and there was no change in this respect until the First World War. Shortly before that, in
1908, the Ottoman government built the Hijāz railway from Damascus to Medina. Though primarily intended for pilgrims, this had some military importance, and was the object of attack after November 1916 when the Grand Sharif of Mecca, Husayn b. 'All (q.v.), revolted against the Ottomans. A contingent of Ottoman troops, under Faḫr al-Parāṣa, however, maintained themselves in Medina until after the peace in 1918, not surrendering until 1 January 1919 with his 9,600 men (see A. L. Tibawi, The last knight of the last caliphate, in JQ, xv (1971), 259-63). In 1924 after the abolition of the caliphate by the Turkish republic the Grand Sharif (now King) Husayn assumed the title of caliph, but met with much opposition from Arabs and other Muslims. In particular, Ibn Su'ūd invaded the Hijāz in August 1924; Husayn abdicated in favour of his son 'Abd al-Madjīd al-“Mifa’īe”, was downgraded to a governor, and in January 1926 Ibn Su'ūd became “King of the Hijāz” as well as of Naj'd. Medina was thus incorporated into the Su'ūd kingdom.

The Wahhábīs (q.v.) zealots in the end served following the arrival of 'Abd Allāh b. Bulayhī, the chief Wahhábī bāḍī. He soon assembled the local “ulama' and asked them to give him, after due deliberation, an opinion on the legality of the elaborate tombs erected over the years in al-Baqī' cemetery. After some two weeks of discussion, a fatwā (q.v.) motivated partly by fear, was issued by Shaykh Muhammad al-Ṭayyīb al-Asāqī, with reluctant approval from his colleagues, which sanctioned the Wahhābī view that the tombs, cupolas, etc., should be destroyed. Shaykh Muhammad was for the rest of his days referred to with opprobrium as the Wahhābī. Ibn Bulayhī then had legal justification to implement the Wahhābī view. He had, however, a problem: there were almost no Wahhābīs in al-Madīnah, and the regular population was reluctant to implement the fatwā. In the end, he had to hire the Shī'ī pariah class al-Nakūhīlā (see below) to perform the task. When Eldon Ruttner visited the city just after these events, he found that al-Baqī' looked like a razed town. It was strewn with a rubble of earth, timber, iron bars, bricks, cement, etc., through which paths had been cleared. It was said that 10,000 of the Companions of the Prophet had been buried there, but all graves, from those of the Prophet's family, of Ulūmah, Mālik b. Anas and other well-known Muslims, to the palm-frond graves of the poor, were systematically destroyed. Some of the Nakūhīlā, who had never been allowed to bury their own dead in al-Baqī' cemetery, were still raking the rubble when Ruttner visited the site. Also, existing religious buildings such as the mosque of the tomb of Ḥanī was destroyed.
Ibrahim b. Salim b. Subhān was soon replaced, but there was one saving grace amidst the carnage. Full public security throughout the peninsula, unknown for long years, provided the basis for a future of far greater hope.

In 1946 King 'Abd al-'Aziz, to use his new title, visited the Prophet's city and conducted diplomatic negotiations with the British Agent and Consul, Mr. S. R. Jordan, but little came of them. 'Abd al-'Aziz, who had been absent from Nadu' for two years, had to return to affairs there. The only other high-level meetings which modern al-Madina has known was in early 1945 when King Farūk b. Fu'ād [q.e. in Suppl.] of Egypt visited King 'Abd al-'Aziz and invited him to visit Cairo, which he did in January 1946.

The population of the captured city was much depleted, but there are no exact figures. Estimates with source for the 19th and 20th centuries are as follows:

<table>

One could assume that by 1983 the population was approaching 200,000. Current estimates for the province of al-Madina are approximately 500,000, but it should be emphasised that the estimates are only guesses. The compulsory recording of births dates only from 1965. In 1972 it was estimated that average population density was 2332/km², with a centre-city density of 30-40,000/km². The population lived in clearly compartmented quarters (ḥusnā, pl. ḥusnāt) and, in addition to native Medinians, included North Africans (attracted by the tomb of Mālik b. Anas), Indians, black Africans (Takārīna), Mauritians (Shaikhṣa) and Central Asians. A newer "immigrant" group are tribesmen: those of Zarb are concentrated in the eastern ḥusna; those of Ḥdhayna in the western. In addition, there was a large Nahwīlā (sing. of the enmuck and other servants of the mosque (al-Haram al-Nabawi). These included imāmān, mawādādūn, caretakers, etc.

Religiously, the population is mostly Sund, of whom the large majority is Hindu with a few Arabian. There are also several groups of Shi'īs. One of the most interesting of these is the Nakhwīs (sing. Nakhwī). This is a twelver Shi'ī parish class who formerly had their own (ḥusnā), which was, however, broken up by the Suqūd régime first, apparently, in the late 1930s and definitively following serious communal disturbances in the mid-1970s when a large highway was run through it. The origin of the Nakhwīs, who are currently roughly estimated to number between five and ten thousand, is obscure. They themselves claim to be descendants of the Ansār; others believe they are descendants of African slaves, that they came from eastern Arabia or from Iran, etc. Some date their ostracisation from the time of the caliph Yazīd I. The name derives from their specialisation in cultivating palm trees. They also perform other menial services and, Rutter reports they were not allowed to live within the city walls, although they came in during the day to sell vegetables near Bāb al-Salām. In addition, the Nakhwīs were not allowed to pray in the Prophet's mosque, nor do they bury their dead in Bād, but rather in their own cemetery east of Kubā. Popular Sunní feeling, according to Rutter, was that they would pollute these localities. They practice mifta (q.e.), and it was said they rent the houses to Iranian pilgrims during the hajj season. It may also be noted that the late Ottomans effectively prevented them from participating in elections, and King 'Abd al-'Aziz, following a general protest against their participation in voting for the majlis al-ṣūrat in 1937, followed the Ottoman precedent. There are also a few Shi'īs of the Band 'Aš section of Zarb and the Band Ḥusayn of al-Sādāt. It may also be noted that there is a small upper class group of Shi'īs in al-Madina. These, originally from Ṭrāk, are to a considerable degree integrated with the local Sunnis, and has basically come from two families, ʿUmar and Muhīdīn. Among the well-known Sunnī families are the Khurayjīs, of Nadji origin but long connected with trade in al-Madina, who in the mid-1930s had the finest residence in the city; the Ṣaḥāḳīs, whose scon Umār was for some years Suqūd Foreign Minister, and newer rich families such as the Asādīs and the Kurḍūs who made fortunes in land speculation in the 1920s. The feudal modernisation of the 1950s, 1970s and 1980s, has largely destroyed all of the old ʿahmar and has promoted a considerable homogenisation of the people; but slums remain in certain parts of
the old city, and these continue to have ethnic settlement patterns. On balance, Philby's judgment continues to be sound, that the people of al-Madina, favoured as they are by location, water supplies, and relatively abundant agriculture, "lead more spacious lives" with something of the patrician and the patriarchal about them, in contrast to their neighbours in Makka.

The physical appearance of al-Madina has changed dramatically in the six decades since the Wahhabis first took it over. Rutter was told that the houses

in the oldest sections of the city around the mosque, but especially between the haram and al-Bakrī, were built so incredibly close together in order to prevent the samīm from penetrating them. These houses, which were built of granite or basalt blocks and some of which had pillared halls opening on bathing pools, were typically three or four stories tall. Almost every house had a well with a hole directly above it on each floor. The hole itself had a small room (bayt al-lāb)' built around it which served as a

Hāshimite King Husayn built another wall from the northeast section of the old city north and then westward, but the Hāshimite kingdom ceased to exist before the new wall reached the existing outer wall on the west. With the coming of the pax Sunnī, the whole system became obsolete, and gradually the walls disappeared before bulldozers. Philby reported in 1937 that they were gone, but some fragments still exist.

Modernisation has brought completely different

architectural approaches and materials, and much of the old has been swept away. Courtyards have been replaced by balconies, and cement and bricks are now standard. Sometimes old and new are combined, with traditional materials used on the ground floor and concrete blocks above. The latter, being lighter, allow larger rooms than would stone. The new construction is less insulating than the old, but air conditioning offsets this loss. Much of the growth of the city has been uncontrolled. Immigrants have settled on the eastern and western fringes and bidonvilles have emerged. Some of the more prosperous immigrants have replaced their shanties with substantial structures, but growth in these areas has been chaotic. Running water did not exist as late as about 1960; electricity reached the Marafi only about 1975.

By the 1960s, a city plan emerged. It features wide streets, street lighting, plantings, pavements for pedestrians and parks. Various new streets were cut, others were widened. The castle at al-Bab al-Shunum was demolished and replaced by apartment houses, and certain streets formerly connected by stairs were placed on the same level. The al-Mahdis disappeared; buildings were built across the water course that cut through the southern part of the city on a northwest-southeast axis.

In general, the central business district near the Prophet's mosque has not shifted, but there are satellite suburbs which have grown rapidly. These include al-Sawall to the southeast, Kubl to the south (which with its orchards and cafes is a suburb of the affluent), and Sayyid al-Shutahd to the northeast.

The old layout of the city continued to impose itself on some developments. The Hijaz railway station and the Ottoman barracks were both located in the southwest just inside the outer wall. The straight road, Shari al-Anbariya, which led to the centre of town at al-Bab al-Misaf, had also by 1925 attracted the public or Egyptian kitchen, the governor's residence, and other private mansions. In the late 60s, the barracks were demolished and replaced by a large government building. Other
multi-story buildings soon followed. The location of the residence of the amir exerted a pull on the location of upper-class housing. As long as the governor's house was in the south, the well-to-do lived there, but when in the 60s the amir's palace moved to the north of the city, Sultana Street, which led northwest towards the old (Sultan) airport, and the community of al-Uyun (7 km. away) began to attract affluent villas. The new airport located about 14 km. northeast of the city has also been an attraction northwards, and in general the area between Shari al-Matár (airport road) and Sultana Street has filled in. West of Sultana Street, Diabat Sala, a difficult and substantial rocky outcrop, improved development, but by the 80s villas were appearing north of it as well. To exemplify the overestimated inflation in land prices, one can cite a garbage area north of the outer (Husayn's) wall where no one would build. Cleaned up in the 60s, land was selling there for $2,500/m² by the mid-70s.

Other points of interest are that industry has generally moved outside the city where land was cheaper and there was room to expand. Public open spaces in al-Madina are below international standards (totaling, in about 1980, 2,321 m²), but this inadequacy is partially compensated for by recreational use of the green areas, which are themselves diminishing, north and south of the city.

Traffic has always been a problem in al-Madina. Rutter reports that streets in the old sections in 1926 were so narrow that on occasion a person had to walk sideways to pass. During the restoration of the mosque under Sultan 'Abd al-Majid (1848-60), a breach (al-Ayniya) was made in the inner wall, and a straight street driven through to near the southwest gate of the mosque (Báb al-Salām) so that columns and stone blocks could be brought in from Wādī al-Mu'in. As long as camels discharged their loads in the area (al-Mānitha) west of the inner wall reserved for that purpose and goods were then taken in by donkey or porter, the narrow streets could also be used by pedestrians, but with the coming of motor vehicles the situation became acute, especially as there was a severe shortage of parking space. One major parking lot does, however, exist in a portion of the old railroad yards.

Streets were added and widened in two stages: (1) 1950-5, when by private contract the asmeet and ashekh were greatly altered, by building new roads, especially Shari' al-Sulayman which runs north and south to the east of the old city, by widening others, and by asphalting others; (2) 1961-5, when the municipality itself carried the process a stage further, installing ilān al-ašra oneway traffic system in some sections and traffic lights. These in 1950s to be some unashphalted streets. The increase in vehicles can be gauged by the fact that in the period 1948-72, 6,517 vehicles were licensed, whereas in 1974-74, against 1958-59, 3,153 were licensed. In addition, at khaddir liyam the number of vehicles increased. One such, Shari' al-Khawājāt, which links, north of the city, the airport with Abyar 'All some 8 km. southwest of the city, where there are TV and power stations. Designed as a road which non-Muslim technicians would be allowed to use (hence its name), it has become the main truck route because it bypasses the heavy city traffic. The city boasts two bus stations and taxi companies (cabs can be ordered by phone). Traffic, however, apparently remains a serious problem. Makki reports that accidents and ensuing violence between drivers are common that parking fines are not levied, and that roads are hazardous for pedestrians.

The economy of al-Madina may be conveniently considered under three headings: agriculture, commerce and industry, and the pilgrimage. Agriculture and agricultural self-sufficiency have constituted one of the glories of al-Madina, and in the second stage, Palestine reopened early in June, and the main harvest was about a month later. The grapes, of which the best were a long white variety called Sharif, were also well known. Modernisation, however, has come disastrously close to ending the city's agricultural sector for three reasons. One is that urban sprawl in the 1940s overtook those farms which immediately surrounded the city. A second reason is the economic opportunity which the oil-driven economy of the country presented in other economic sectors; and the third cause is the fall in the water table because of unprecedented demands for water. By the 1950s, the formerly planted banks of Wādī al-Aṣākū had become barren and the desolation of the natural acacia forest, al-Ghriba, the traditional outdoor recreational area of the Medinese, and a source of wood, located some 7.5 km. north of the city, was well under way. This process was accelerated by the successive construction of small dams (al-Asig, 1950; al-Aṣākū, 1958; and Butbān, 1960) which prevented destructive flash floods in al-Madina, but also prevented water from reaching al-Ghriba. Makki believes (1982) that the process might still be reversed, but notes no sign of the required effort. The agricultural areas south of the city have held up more successfully, though some decline is noted there as well. The decades 1962-72 showed a total reduction in agricultural land of 13.8% from 3,14 to 6,77 km². Over 40% of the total is in al-Awâlīkh and Khid' south of the city. According to the Ministry of Agriculture, crop distribution in 1962 was as follows: 69% palm trees, 21% fruit trees, 14% alfalfa, and 7% garden vegetables, including tomatoes, eggplant, carrots, potatoes, squash, peppers, cucumbers, watermelons, cabbage, and cauliflower. It may be noted that the date trade was especially important as an export (to Syria, Egypt and the Indian subcontinent) crop. The dates in fact had a religious aura as a kind of blessing for the eater. There are many varieties, of which Rutter says the best three are al-Anbarī, al-Sa'ūdī and al-Hâwâ.

The estimated percentage distribution of the non-agricultural and non-religious work force is, after Makki, as follows:

Highlights of the local economy are as follows. Industrial activities are principally date packing and vehicle repair. These are located on the periphery of the city on a totally unplanned basis. In 1971 manufacturing firms numbered 107, most of which employed 10 or less workers. Of the total, 35 were in ear repair, 17 in building tile manufacture, 15...
The Haram al-Nabawi, of course, is the central focus of al-Madina, although other buildings and localities have high religious significance. The exact area of the sacred territory (Haram) from which non-Muslims are excluded is unclear. There is indeed a certain ambiguity about the haram area of al-Madina. Abu Bakr said it was not a haram. Rutter reports that "common opinion" held that the area is bounded by the hase fields on the east and west, by Djibali Ayr on the south and Djibali Hajar ("behind Obed") on the north, an area about 18 by 3 km. Phibey wrote in the early 1950s that the whole district from Kub'a to Djibali Uhad was haram. Mallino reports that, according to the Saudi Arabian Mining Syndicate convention, it was defined as a radius of 30 km around the walls of the city—a significantly smaller area. Non-Muslims now regularly travel the Shari'a al-Kawaaqib and stay in such hotels as the Sheraton.

When the Wahhabis first arrived, they discouraged the visit (asayr) to al-Madina as constituting idolatrous tomb worship, but King 'Abd al-'Aziz, for whom the revenues had some interest, justified it on the ground that he permitted pilgrims to pray in the mosque but not to visit the Prophet's tomb. For Rutter, the mosque with its green dome and golden apex ornament rising high above the walls to one-half the height of white minarets was "a picture of the most striking beauty and magnificence." Phibey opined that it was the "chief architectural feature not only of Medina but of all Arabia." Rutter noted that many of the religious students had fled, but others were still studying at the feet of such masters as Ahmad al-Tanjawi and Ibn Tabbar. Phibey asserted that all the tombs (other than those in the Haram) were in ruinous condition. He also reports that the Shias of India had offered King 'Abd al-'Aziz £50,000 to spare the tomb of Fatima, but that it, like others in al-Balad, was then almost gone. In 1934, when Shaykh 'Abd Allah Sulayman visited the city, many of the historic tombs were tidied up, and basalt borders and simple headstones set in place. As to the Prophet's mosque itself, it has undergone substantial changes under Su'a'di rule. The first known attention to it took place during 1934-8 when, largely through the generous efforts of Ta'if at Harb of Egypt, badly needed repairs were carried out. These included installation of a new marble floor, and a new wooden screen to separate the women's section from the much larger men's part. Major enlargements followed. On 13 Shaban 1336/14 June 1948 King 'Abd al-'Aziz wrote an open letter to the Muslims of the world (published in al-Madinah al-Musawwara, no. 307, 1 Ramadan 1348/F July 1948) indicating his intention to enlarge the mosque. A committee of notables was to assess the value of those properties that were condemned and, if possible, some 50 officials was established in Shaban 1339/ May-June 1949. For actual building, a team of 14 architects, 200 artisans and 1,500 labourers was assembled. A workshop area was established at Abyar, for the repair of equipment and also for making mosaics. Equipment and supplies were brought in from Ta'if and included cement, iron and 30,000 tons of timber. The foundation stone was laid on 13 Rajab 1 1352/20 November 1935 before 2,000 dignitaries, and the inauguration of the new structure took place on 5 Rajab 1 1354/ 22 October 1935 with King Su'ud, who had succeeded to the throne, officiating. The total cost was £11 million. The total new area added to the mosque was 6,000 m². Other new features included 424 square and 232 round pillars. The lengthening of the building to the north was 228 m. and the new northern wall is 97 m. long. Essentially, what the builders did was to double the size of the mosque by integrating a whole new building on to the northern end of the original one. The new section has its own courtyard plus minarets at the new northern corners. (The old Ottoman style minarets at the former...
northern corners as well as the minaret just north of Bāb al-Rajmah were torn down). The building itself is in neo-Moorish style; the minarets, neo-Manfilik. In addition, as the accompanying Figs. 1 and 2 indicate, the Su'ūdi builders straightened out the arcades bordering the exterior of the structure and rebuilt the east, west, and north structures surrounding the original courtyard. West of the reconstructed mosque a large permanently canopied area was built in 1974-8 to provide shade for the vehicles and bodies of the hundreds of thousands who visit annually, although many old residences in the al-Madīnah were thereby destroyed. Finally, in Ṣa'ban 1403/May 1983 King Fahd b. ʿAbd al-ʿAzīz ordered a further expansion of the mosque—basically on the east and west—from the present 26,000 m² to a staggering total of 82,000 m² with 90 m. minarets, the whole to be air conditioned. Little will remain of the old city.

There are of course other religious buildings and sites in al-Madīnah, and in 1989 they constituted about 1.8% of the total city area (down from 6.6% in 1950). The most important is al-Baqī', the cemetery lying to the east of the mosque. This tract, which has been used by all Medinees except the Nakha-willa since the Prophet’s time, was expanded in 1933 to an area of 52.743 m². It cannot in practice be mortgaged or sold, but again it is the property of the state. People. Makki estimates that bodies decompose in 2 to 3 months, after which a grave can be re-used. Sometimes at the height of the hadīdī, 2 bodies are put in one grave.

Other well-known sites include the mosque of al-ʿAbd-al-ʿArīf, the so-called al-Masjid al-ʿAbd-al-Rabbīn, and the mosque of Kubhī. In the city proper are also the al-Manṣūrah, Abū Bakr and ʿAll mosques near al-Manṣūrah street. A common characteristic of mosques in al-Madīnah is that they have a courtyard along with a roofed column. In addition to the cemetery and mosques, there are a number of so-called abwāyās or chapels in private homes. These often do have a door opening directly on the street, but by 1980 many had been abandoned. In Ottoman, ʿAbadd and early Su'ūdi days, the Ramadan cannon was fired from the Ottoman fort on Diabāl Ṣalāt, but with the modern growth of the city it could not be heard; other cannons were set up in various locations.

The logistics and management of pilgrims in al-Madīnah differs from that in Makkah, but still constitutes a major part of the economy of the city. In 1941 the number of visitors was 1,042,007 (of these 178,378 were from outside Su'ūdi Arabia; all others were Medinees). The main disputes for mode of travel to al-Madīnah in more recent years are not available, but a rough idea may be obtained from the following. In 1972 there was a total of 1,042,007 pilgrims to Makkah, of which 479,339 came from aboard and 562,668 from within Su'ūdi Arabia (of these 175,578 were from Makkah itself and presumably did not visit al-Madīnah). Of those who came from abroad, 20% came by sea, 40% by land and 30% by air. One could assume by 1980 that motor vehicles and aircraft brought all but the smallest handful of the visitors to al-Madīnah. Some idea of various charges paid by znard to the official reception centre; (b) to assist them to find lodgings and to move in; (c) to guide them to the principal shrines and to assist in devotions; and (d) to assist them in arranging onward travel (which is usually to Makkah, Dwddah, or Yanbu'). The 1972 regulations, as cited by Long, specify that the shrines as: al-Iṣnubr al-Nabāwi al-Shari, al-Baqī and the other shrines. "Offices of the Directorate of Hadj Affairs of the Ministry of Hajj and Wākīs are located at the main sites to bear complaints. Like pilgrims proper to Makkah, visitors to al-Madīnah have come by every form of transport, certainly not excluding walking and, before World War II, including the railroad. However, since the Su'ūdi takeover, the railroad from Damascus has remained scarcely used and walking has practically ceased. As early as 1929 the number of visitors who came by camel caravan had declined to about half, while most of the other half came by motorcar. The first visitors to arrive by air came in January 1926 as the result of a contract made by the Su'ūdi government with the Egyptian Misr Airlines (now Egypt Air). In 1937 the aircraft made two flights per day from Djiukā to the old Sūlāna airport with five passengers per flight. In all, 105 visitors came at a cost of £20,500, of which half was tax. In 1939 the aircraft developed engine trouble, and the service was discontinued. By 1940, according to Long, the camel had practically disappeared as a means of transporting pilgrims. Roads to the holy cities received very high priority immediately after World War II, and the Djiuka-al-Madīnah sector was paved by 1958. Exact figures for mode of travel to al-Madīnah in more recent years are not available, but a rough idea may be obtained from the following. In 1972 there was a total of 1,042,007 pilgrims to Makkah, of which 479,339 came from aboard and 562,668 from within Su'ūdi Arabia (of these 175,578 were from Makkah itself and presumably did not visit al-Madīnah). Of those who came from aboard, 20% came by sea, 40% by land and 30% by air. One could assume by 1980 that motor vehicles and aircraft brought all but the smallest handful of the visitors to al-Madīnah. Some idea of various charges paid by znard in modern times can be garnered. In the late 1920s, the round trip automobile fare from Makkah to al-Madīnah was taxed £7.50 (£36.00), but this impost was lowered by 1931 to £6 (28.80). Transportation fees, round trip (£ from Djiukā), were listed in 1948 as follows: first-class train (car), £24; second class (bus), £21; third class (truck), £8. In 1972 the fees are more exact:

By royal decree of 1384-85/1965, the fee for a dâlî was fixed at SR 10 (≈ $2.22; from 1378-79/ 1959 to 1970-71 the exchange rate was $ 1 = SR 4.5). Accommodation is a private sector matter, but there are government-sponsored prices. According to the 1957-72 regulations, SR 20 ($ 8.85) was the suggested daily rent for "a house." The Hâjjî Foundation Accommodation Control Committee of the Ministry of Hajj and Wafiq is charged with regulating abuse. In all, it has been estimated by Long that in 1972 dâlîs were paid SR 3.6 million ($ 867,470), assuming that 750,000 visited al-Madinah.

Al-Madinah had been famous for libraries and learning from early Islamic times, but Rutter found a mixed situation in regard to both. The library of 'Arif Hikmet Bey (q.v.), a former Ottoman mujadd al-Islâm who had also served as muftî of al-Madinah in 1239/1823 and following, was one of the richest in al-Hijâz, with estimated holdings of 17,000 volumes. Although Fu'âd Hammad opines that "in the Ottoman period" a considerable part of the collection had been removed, others do not corroborate his contention. Located just off the southeast corner of the Haram, the library was open to the public but non-circulating. Rutter describes it as a building composed of two domed rooms set in a walled garden. Access was through a large ornamental iron gate. Within, Rutter remarks on the cleanliness and high level of upkeep for the library's principal attendant and his assistant were both highly competent Turks, and several people were reading. Philby indicates that the library contained unique manuscripts. In regard to the very recent siege and Sukhâlî access to power, the assistant told Rutter that "we do not eat of the hand of the king, neither from the hand of Ibn Sa'd of the hand of al-Sâlim, could not be examined by Rutter because the key could not be found. Other libraries (Bâshîr Asbâh [2,063 volumes], the al-Sh admirable, was head secretary. He was a founder of al-Madinah al-Munawwara. (5) 'Azîz Dîya' al-Dîn b. Zâhid (b. 1353/1915-4), a poet and prose writer, who, following primary studies in al-Madinah, studied in the "health school" of Makka (closed in 1942-56). He became secretary to the Directorate General of Health and then went to the Directorate of Police. (6) 'Abd al-Hamîd Anbar (b. 1360/1948-9), a prose writer who both studied and taught at Madrasat al-'Ulum al-Sharîyya.

In mid-twentieth century, the Islamic University of al-Madinah has been the institution of highest learning in al-Madinah. This institution was founded in the early 1960s, with encouragement from members of al-Dîwân al-Muslimîn driven into exile by President Qâmil 'Abd al-Nâsir of Egypt, as an international seminary modelled at least in part on al-Azhâr and designed to propagate Islam. It contains both a secondary (madînat al-Dîmâr al-Islamiyya) curriculum and a university-level programme. The secondary section schedules 34 classes per week for three years, and the total hours per week per subject for the three-year curriculum are as follows: (5) 'All âshîr (b. 132 r/1905), a prose writer who both studied and taught at Madrasat al-'Ulum al-Sharîyya.

The university-level programme lasts four years. Students take 25 classes per week in the first two years and 24 in the last two. The total hours per week devoted to each subject are as follows: (5) 'All âshîr (b. 132 r/1905), a prose writer who both studied and taught at Madrasat al-'Ulum al-Sharîyya.

The university, led for many years by the well-known literary critic 'Abd al-'Azîz b. Dârî (and more recently by 'Abd Allah Sâlih al-Usayyad) is academically under a Higher Consultative Council, which in 1974 was almost equally composed of well-known foreign and Sukhâlî educators, 'Ilmî, or religious administrators. At that time these included, e.g., Hasanayn Muhammad Ma'hîfî, former muftî al-dîsâr al-Mishrîyya; Muhammad Amin al-Husaynî of Palestine; and 'Abd al-'ALîf al-Mawledî, former president of al-Qâmilî al-Islâmîyya of Pakistan. In 1973 the journal published by the university (Madînat al-Dîmâr al-Islamiyya) indicated that, at the university level, there were three faculties:
Kuhllyat-al-Sajarfa, Kuhllyat-al-Dawwa and Kuhllyat-Uslul-al-Fith, and that these faculties grant the "higher degrees" which Damascus to hold the same rights as equivalent degrees granted by the secular universities of the kingdom.

Despite the great increase in educational facilities, illiteracy continues to be a major problem. According to Makki's analysis of the 1974 census, about 74% of the Su'udi labour force in al-Madina was illiterate, and 5% of the foreign labour force was illiterate. A major explanation of continuing high illiteracy rates is the influx of illiterate people from desert and rural areas into the city. Medical facilities have also burgeoned in al-Madina since 1945—not least because of the pilgrimage, its medical problems and the public relations aspects thereof. One early milestone in this development was the establishment in 1336/1918 of an Italian-Muslim hospital under the auspices of the king of Italy. The hospital was under local control and was financed by a waqf from Tripoli, Libya. By the mid-1960s, a 50-bed hospital of tropical medicine as well as enlargement of the main general hospital were both under construction, and by 1975 a control station for schistosomiasis (bilharzia) had been opened. Patients treated in Medinese hospitals reached 503,635 in 1969, but declined in the subsequent year. Death rates have also generally declined, and the death rate of suqrarid dropped from 1.6% in 1942 to 0.31% in 1974. It might also be noted that the city gave its name to the parasitic Guinea Worm, as in Dracunculus medinensis, Vener medicinans or Filaria medicinans.

Modern communications in al-Madina cover the following: roads, facilities for air travel, tele-communications and rail service. Revival of the Hijaz railroad (railroad from Damascus to al-Madina) has been discussed by the Syrian, Jordanian and Su'udi governments throughout the post-World War II period. Periodical announcement of positive decisions have been made, but nothing has been done up to 1405-6/1985. The evolution of the telephone service has been steady since 1313/1896, when a line connecting the city with al-'Ula, Tabuk, 'Arman and Damascus was installed. In 1375-6/1956 a second line was put in place, and by 1336-7/1955 there was a 50-line exchange located outside al-Bab al-Shami and reserved for military use. Phiby reports that a wireless service to Dudda began under the Ottoman.

Partial suspension of the al-Madina postal service was referred to in 1322-3/1845-6, and a new station was established. It was to be composed of a president and four members. In Shafar 1345/1926 "fundamental instructions" on rules were issued by the still juridically separate Kingdom of the Hijaz. According to article 34, an administrative council (madfis idari) was established for al-Madina. It was to be composed of the kain mahmih (head of the amirial secretariat), his assistant, the heads of the various departments and four people nominated by the king. Al-Madina was one of only three cities in al-Hijaz that had police at the time of the Su'udi takeover; overwhelmingly, members of the police force were, all over the Su'udi realm, from Asir and Najd. Other administrative aspects may be mentioned. In 1346/1928-9, notaries (sing. hidsb al-wadi) were instituted in al-Madina as well as in Makkah and Dudda. (Elsewhere, hids perform this function.) Justice was, in the period till World War II at least, administered by a summary (mistu'a'dia) court under a single hidsi and had jurisdiction over petty civil cases and criminal cases not involving execution or loss of limb. The higher court (al-makhama al-Abda) has a hidsi as president and two substitutes. In cases involving death of person or loss of limb, the decision had to be pronounced by the full court. Al-Madina also had a customs office which was a branch of the Dudda office. Originally, waqf administration in al-Madina was independent and reported to the local amir; however, by a royal decree 1354/1936 the waqf administration in Makkah was upgraded to a directorate-general with the Medinese director to report thereto. Finally, because of the importance of water and its interrelation with various properties in and outside the city, a special authority, Hayat 'Ayn al-Zarki, composed of five members, was established. It was in part financed by special waqfs, but was also written into the state budget as early as 1926. The name of the authority was changed in 1928 to the Water and Drainage Department. Writing in 1936, Fuad Hamza (al-Bilad, 184, 186, 193, 236) gives the names of most of the then incumbents of the various posts.

By the 1980s, water was for most Medinese piped into houses, offices and apartments from desalination plants on the Red Sea coast, but when the Su'udis took the city over the situation was very different. Al-Madina's not unplentiful natural water
supply came from three main interrelated sources, but basically from the south: (1) south of the city in and around Kuba; (2) ground water throughout the area of al-Madina; and (3) north of the city in and around al-Uyûn. In addition, several wells intersect more or less in al-Madina and often generated destructive flash floods. These wells gradually have been dammed, starting with a dam built in the 1940s to the northeast of the city and including the 1966 dam across the upper course of Wâdi Buûtân which used to flood the city frequently. However, the dams reduce the water available in the northern agricultural areas and thus lead to a decrease in cultivation. Actual rainfall in al-Madina fluctuates greatly. From 1957 to 1978 it ranged annually from zero to almost 104 millimeters, yet averaged 51 millimeters. Throughout the years, the most important source of domestic water has been Ayn al-Zârkâ, which was actually a series of wells connected by covered conduits in the Kuba area, where they joined into a single double-decker aqueduct. The upper channel carried drinking water to ten public watering places (manhal, pl. manâlî). The lower channel was a drain for the upper channel and for the manâlî. North of the city this aqueduct emerged above ground, and the water was used for irrigation. The manâlî were about 10 m. below ground and were reached by steps. The aqueduct passed under only two buildings: the former al-Mîb al-Shâmî and the mosque. There were also ordinary salûts up until the early 1960s. The first pipes and public taps were installed in 1909, and in 1937 there were 49 of these taps (kabbâb, pl. kabbâdât) from which water was often led to individual houses by hose. By 1955 there were 1,500 kabbâdât, but by 1974 their number had declined to 600 because of the spread of indoor plumbing; those that remained were in outlying areas of the city and which watered gardens delivered to the poorer population. Water meters began to be used in 1959. In addition, in the earlier period brackish water was readily available at depths of 4-20 m. and most houses had wells to tap this water. Recent use has now lowered the water table significantly, and the supply is inadequate. All have been abandoned, as well as the unusual bayt al-âlî's architectural feature (described above) which provided summer cooling for generations.

The situation with agricultural water is parallel. The natural springs in the al-Uyûn area which irrigated palm groves dried up, most of the trees died, and all dried up. Owners have compensated for the decline in the water table by pumping. Philby reported that around 1934 pumping was well established and expanding, and Makki (on whom most of this analysis of water is based) indicates that 872 diesel pumps were in use in 1962. Makki pleads eloquently for the 'Ayn al-Zârkâ Authority to control well-digging and pumping. A further development has been the erection in 1968-71 of a large concrete tank on top of Dhaîl Salâ, whether water is pumped from the Kuba pump station. Other tanks on high ground also ensure adequate water pressure.

There are two additional pressures on the natural water supply. The first is the recent increase in paved and asphalted areas which, with their runoff characteristics, reduce infiltration; and the second is sewage problems. There was no disposal system prior to the 1970s. Rather, each building had its own cesspool (bayyûra) which was cleaned (î by the Naibûwâla) periodically. This practice made for special difficulties in the dams because it is difficult to dig to depth and impossible without dynamite. Most of the waste was dumped in an area east of the city called 'al-Mansâsî' (Makkî's spelling). Water pollution is a growing problem; at least one well has had to be closed. On the other hand, a full sewage treatment plant was inaugurated in 1970 and located behind Dhaîl Ummûh. By 1976 a considerable portion of the city had been tied into the system.

Shabir or Ramla, i.e. "sandy terrain" (in Spanish areal). This terrain is still called "Cortijo del Arenal", an important part of which, the "Pago de Tejavana", is easily identified with the main nucleus of the old city. Today the traces which remain are too far away significant, but they show us that the buildings of al-Madina al-Zahira were made of materials of mediocre quality—bricks, quarries stones, clay wall etc.—and, consequently, without possible comparison with the riches and majestic edifices of its rival Madinat al-Zahra*. However, the palaces of al-Zahira were notably endowed with fine, sculpted marble stateras in the form of Roman sarcophagi and intended as fountains, of which the museums preserve marvellous examples which were executed—as their inscriptions testify—at al-Zahira for the Banu Abi 'Amir (Shabir or Ramla).

Finally, it is worth noting that, according to the historian al-DabbI (Buglaye, biogr. no. 1544), the famous Munyat al-'Adniryya was one of the palaces of al-Madina al-Zahira and, consequently, was not located alongside Madinat al-Zahra*, as some contemporary authors presume, who confuse this maraya with the Munyat Wadd 'Umrun, given to the caliph al-Fakam II al-Mustansir by his great jato Duri al-Asghar in 362/973.

**Bibliography:** see principally KURTHA, and also L. Torres Balbas, Al-Madina al-Zahira, la cefal d'Israel, in *al-Andalus*, xxii (1936), 353-9 (with a very complete account of the historical notices concerning the city supplied by the Arab chroniclers and geographers).

(M. OcAa JIMENEZ)

**MADINAT SdLIM**, the Arabic name, which has become MEDINACELI, of a small town in northeastern Spain, on the railway from Madrid to Saragossa, and almost equidistant from these two cities; it lies at an altitude of more than 3,280 feet (1,000 m.), on the left bank of the Jalon. It owes its name to a Berber from the Masmuda, Salim, who repaired a Roman fortress which Târk (q.e.), according to Yâbuh, iii, 13, had found in a ruinous state.

The Arab geographers give brief descriptions of Medinaceli. According to al-Idrisi, it was a large town built in a hollow with many large buildings, gardens and orchards. Abu l-Fish¿ says that this town was the capital of the Middle March (al-thawr al-awsaf). Through its geographical position, Madinat Salim was of considerable strategic importance for the Umayyads from the 4th/10th century onwards. It was an many occasion, as the last stronghold on Muslim territory, the point from which forces assembled at Cordova finally started for expeditions against the Christians of the north-east of the Peninsula and to which they retired. Though somewhat decayed down to the reign of 'Abd al-Rahman III al-Nasir, it was rebuilt, if we may believe the detailed evidence of a chronicler quoted by Ibn 'Idhari, in 335/948; this ruler put the work in charge of his client, the general Ghâlib, and all the garrisons of the country lent their aid in the work. This Ghâlib remained governor of Medinaceli and all the Middle March until the power was seized by al-ManSîr Ibn Abi 'Amir (q.e.). It was in Medinaceli that this famous liéjih died on 27 Ramadan 392/10 August 902, on returning from his last expedition against Castile. In the following century, Medinaceli was frequently taken by the Christians and retaken by the Muslims, before being finally incorporated in the Kingdom of Castile.

Madinat Salim should not be confused with Madinat al-Sâlim or Ibn Sâlim, which was situated in the region of Seville, probably the modern Grazalema in the province of Cadiz (see the modern Grajera in the region of Seville, probably the modern Grazalema in the province of Cadiz).
northern part of the city, where the principal drawing-room of the caliph was excavated, richly decorated—which Ricardo Velázquez called the "Salón Occidental"—and, on the other hand, a large magnific—for its discoverer, the "Salón Oriental"—clearly marked by its austere decoration which proclaims a military purpose. The excavations carried out by Ricardo Velázquez were not conducted according to a preconceived programme, and it was at his death that a local commission was named in Cordova (Rafael Jiménez, Rafael Castejón, Ezequiel Ruiz, Félix Hernández and Joaquín Ma do Navascués) which had as its aim the delimiting of the extent of Madinat al-Zahra and the establishment of a plan of work to follow in future excavations. The survey of the ruins which flourished under the covering of vegetation allowed Hernández, the architect of the commission, to draw up, in 1944, the topographical plan on a scale of 1:800 of the terrain where the city was located. Later the same architect drew up, in 1926, a plan on a scale of 1:200 of the part explored by Velázquez, of which the drawing-rooms, courts, vaulted passages, etc., were enumerated following the chronological order of their discovery, and this order has prevailed until the present. Quite soon after, excavations were pursued and the two principal sectors discovered by Velázquez were gradually enlarged until they constituted a good deal greater than the original plan. At the beginning of the year 1930, the commission having been reduced to only two members, Castejón and Hernández, the reconstruction was begun, up to a prudent height, of the northern wall encircling the city. The same system was followed during the following years, with all the walls separating the terraces which had been discovered, before the re-establishment of the masonry in its broad outline. The civil war of 1936 paralysed the work until 1941, when it was pursued according to the system presented above. Simultaneously, excavations in the area undertaken where the then unexplored sectors belonging to the southern part of the Alcazar of the city, where in 1944, a magnificent reception magnificus was discovered, whose architectural work was a dreadful ruin, while its revetments of sculpted stone, although very fragmented, remained almost complete. This important discovery proved in an indubitable manner that the plunderers had pillaged everything that could be utilised for future constructions—known stones from the walls, capitals, shafts and bases of columns, etc.—and had dominated the surface decoration of the halls, generally composed of thin stone plaques which would be useless to dislodge and place in pieces in another construction. The year 1944 signals, in the excavations of Madinat al-Zahra, the beginning of a new age characterised by the reconstruction of halls by means of the preliminary recomposition of the decorative plaques and the restoring of these plaques on the walls and rebuilt arches. While the structure of the reception magnificus was rebuilt, excavations were pursued in the same sector and there was discovered, in the course of the following years, the whole architectural entirety of which the magnificus was the heart: a vast terrace, delimited on the east, south and west by a very thick wall fortified with towers; a small harem or pavilion placed opposite the magnificus and separated from it by a large pool; a hamam and steam bath, and some drawing-rooms with courts, staircases and public conveniences. According to the epigraphy placed at the time in this sector, the magnificus was built by Abd al-Rahmán III al-Nasir during the years 952-6, under the direction of his father Shemsay, as was the pavilion, but under the direction of the jābīb (the jā'far b. Abd al-Rahmán, who was to be the jābīb of al-Makram II). In 1964, Basilio Pavón explored, with the assistance of Hernández, the sector corresponding to the site of the gā'kūf of the city, perfectly illustrated in an autotopographical plan of 1924; this building had been totally destroyed by the plunderers, but all the principal elements of its structure have been identified and they will shortly allow for the reconstruction of the mosque. At the end of 1969 Hernández remained the sole director of excavations, which were then concentrated in a new sector located in the Western wing of the great Alcazar of al-Zahra and probably belonging to the house of Djasfar, the jābīb mentioned above. Finally, in 1975, on the death of the great master of Hispano-Moorish art Félix Hernández, the direction of the works fell to the architect Rafael Manzano, who has continued the enormous task of restoration begun by his predecessor. The Arab chroniclers and geographers have supplied us with excellent descriptions of Madinat al-Zahra and plenty of accounts and pieces of information acquaint us with the motive for its foundation: the choice of its site; the duration of its construction; the number of the workmen there, camels and mules and the materials and large sums spent on it; the palaces, reception halls, outbuildings, baths, pools, gardens, barracks, etc., built in its enclosure; the principal wonders contained in its buildings; the people who lived there; the bureaucratic services of the state which moved from Cordova to the new court; the memorable feasts celebrated in honour of the great dignitaries and ambassadors or to recall the memory of important events; the twilight of the city and, finally, its destruction and ruin. Furthermore, excavations have confirmed for us that the foundation of al-Nasir was a dazzling city built within a rectangular rampart which measured 716 m. from north to south and 1,500 m. from east to west, flanked by towers regularly spaced. This rampart was formed by two walls separated by a corridor, except in the central tier of its northern flank, where a single wall was defended, it seems, by another rampart placed in from of it up to the ridges of the neighbouring hills and attached to the general enclosure. The buildings constituting the Alcazar of the city—Royal Palace, Civil Headquarters, Military Headquarters and prodigious reception halls with their secondary annexes—were laid out on stepped terraces and adapted to the relief of the lower slopes of the mountain and supported by solid reinforcing walls. The area occupied by the Alcazar, the whole northern sector of the city, was approximately 45 hectares, of which only 12 hectares have been explored at present, although corresponding to the central part of this supreme architectural complex. Owing to the fact that the unexplored parts are, for the moment, greater (33 hectares) than those which have been explored, it is still not possible to identify the buildings discovered in terms of the documentation supplied by the texts; consequently, the Arabic names which have been given to these buildings are also gratuitous rather than definitive. For the moment we must be satisfied with contemplating the exceptional spectacle which, following the most recent work, Madinat al-Zahra offers to the visitor to the ruins: a reception magnificus of the 4th/10th century reconstructed with its origin-
al decoration, whose themes sculpted in stone and marble reveal the high degree of experience and exquisite artistic sensibility of all the artisans who worked for the great Cordovan caliph Abd ar-Rahman III al-Nasir.

García Gómez, Algunas precisiones sobre la evolución de la Córdoba omeya, in Al-And., xi (1947), 209-93; idem, Anales palatinos del califato de Córdoba al-Hakam II, por 'Isa ibn Ahmad al-Rašid, Madrid 1957, and H. Terrasse, Islam d’Espagne, Paris 1918. (M. OCAÑA JIMÉNEZ)

MADIRA (\(\lambda\)), a dish of meat cooked in sour milk, sometimes with fresh milk added, and with spices thrown in to enhance the flavour. This dish, which Abu Hurayra (7.a.) is said to have particularly appreciated (see al-Masudi, Murādī, viii, 403 = § 3562, where a piece of poetry in praise of madīra is cited), must have been quite well sought-after in medieval times (al-Dihrābī, however, does not cite it in his F. al-Bukhārī; see nevertheless al-Thālibī, Līdā'fī, 12, tr. C. E. Bosworth, 46). Its principal claim to fame comes from al-Hamadānī’s al-Makdimah al-mafrīyiyah (no. 22 in Muhammad ‘Abdullāh’s edition), in which ‘Isa b. Hīṣam records solely of an adventure which had happened previously to this last. In effect, this story is the satirical portrait of a nouveau riche who invites Abu ‘l-Fath al-Islāmī, having stayed there two months, apparently wanted to stay there, and, following him, Marmol, Africa, ii, 394, merely tell us that after having belonged to the sultans of Tlemcen who kept a garrison there, it passed into the hands of the sultans of Tanès, and then of the Turks when the Barbarossas [see ‘ADDAY] established themselves in Algiers. Under Hasan Khayr al-Din, Mēdēa became the capital of one of the three provinces (baydās) of the Regency, the baydā of the south or of Titteri, to which at a later date was added the lower valley of the Sēboun in Kubya. Down to about 1770 we therefore find the bey of this province alternately at Mēdēa and Borgj Sēboun. It was not until this date that the region of Sēboun having been incorporated in the Dār al-Sulṭān governed by the bey, the bey of Titteri settled permanently at Mēdēa, where he was in a better position to control the nomadic tribes of the plateaux. He had, however, no authority over the inhabitants of the town itself, who were under the authority of a hābīl appointed by the aqṣā of Algiers. The population, which did not exceed 4,000-5,000, among whom were many Kulughīs [see KUL-OQGUL] and Turks retired from the service, became wealthy through its trade with the south. Caravans brought thither the production of the Sahara and also negro slaves, who were sold to the citizens of Algiers.

During the years which followed the capture of Algiers, the French on several occasions (Nov. 1830, May 1831, April 1836) occupied Mēdēa, taking permanent possession, ‘Abd al-Kadhīr [q.v.] however placed a bey in it and had his ownership of it recognised by the treaty of the Tafnas. The outbreak of hostilities again between the amīr and the French led to the final occupation of Mēdēa by the latter on 17 May 1840. It was in Mēdēa that, shortly afterwards, the future poet Jean Richepin was to be born.

MADJALLA [see MEDJELLE]

MADJAR, MADJARISTAN, name given to the Hungarians or Magyars and to Hungary in the Ottoman period.

1. IN PRE-Ottoman PERIOD

(1) The names for the Hungarians and Hungary in the Arabic and Persian authors of the 3rd-8th/9th-14th centuries. The earliest mention of the Hungarians (Magyars) occurs in
the Kīlāb al-'Aṣāb al-nafla of Ibn Rusta (Ibn Rosteh), written between the years 290-300/593-613 on the basis of the geographical treatise of al-Diyāhānī (ca. 300 A.H.) who, used in the composition of this work, an anonymous historical account dealing with Central Asia and Eastern Europe and dating from the second half of the 3rd/9th century. In this source the Hungarians appear with the name of al-Madīgharīyya, i.e. the Magyars. In this period they inhabited the plains adjacent to the Black Sea, between the Don and the Lower Danube, their eastern neighbours being the powerful Turkish tribe of Başgird (Počenega). It was under pressure from this tribe that they were compelled to withdraw, in ca. 889-92 A.D., into the basin of the Carpathians, where they founded a state which survived, within its 9th-century frontiers, until the end of the First World War.

It seems that the same anonymous account of the 3rd/9th century is also the basis for the description of the country of al-Madīgharīyya (Ar. bīdūd al-Madīgharīyya) contained in the Kīlāb al-Maṣālik wa l-mamlūkā of al-Bakrī (ca. 460/1068). In fact, the Hungarians mentioned in this context lived in a nomadic existence, and their territories, situated on the Black Sea, bordered on the provinces of the Byzantine Empire and the Bulgar states. The treatment of the al-Madīgharīyya people is also found in the Taḥfīn of Ibn Rusta's and Sharaf al-Zaman Tāhir al-Marwazi (9th) composed in ca. 514/1120. Analysis of this description reveals that the period in question is prior to the years 889-92, a period during which the Hungarians were still a nomadic people inhabiting the plains of Southern Russia, between the rivers *Dūnu (Danube, erroneously in the Arabic text Rūz), and Atli or End (Don). The description of al-Madīgharīyya contained in the work of al-Marwazi is also based on the treatise of al-Diyāhānī.

The anonymous Persian geographical treatise entitled Ḥudūd al-ʿilām in 982 A.D. mentions the Hungarians with the name of Madīghar. According to the author of the Ḥudūd al-ʿilām, the country of the Madīghar was situated to the west of a range of mountains which corresponds to the Carpathians and to the north of a Christian people called Wunandar. This latter people must be identified as the Bulgar tribe of the Ongundurs who, in the 6th-century A.D., occupied the northwestern Caucasus, in the region of the Kuban. It is known from Byzantine sources that, under the command of Asparukh, part of this tribe left the region of Kuban and travelled towards the Lower Danube which it crossed over in 679 A.D., founding to the south of this river the Turk-Slavic state of the Bulgars. The new arrivals were baptised in 864. The information given by the Ḥudūd al-ʿilām concerning the frontiers of the territory of the Hungarians is therefore not derived from the Anonymous account of the 9th-century, but from another anonymous source composed later, in the 4th/10th century, after the conquest by the Hungarians of the Carpathian basin in 889-92 A.D.

The name Madīgharī or rather Madīgharīyān (the plural in Persian of Madīgharī) is also found in the Zayn al-ʿakhḍur, a Persian historical treatise composed in the years 444-450/1053-59 by Gardīzī (or Gardīzī). Gardīzī considers this people to be Turkish. In the paragraph of the Zayn al-ʿakhḍur devoted to the Madīgharīyān, Gardīzī has used two different sources, these being the Anonymous account of the 3rd/9th century compiled by al-Diyāhānī and an anonymous source of the 4th/10th century, the same one that was used by the author of the Ḥudūd al-ʿilām. The Bulgars of the Danube are here called Madīghārī.

In his Tāfseer al-खayāmān al-Marwazi also calls the Hungarians (whom he knew still in their ancient homeland to the north of the Black Sea, between two rivers which may be identified as the Don and the Danube) al-Madīgharīyya. He considers this people as being of Turkish origin. Like Ibn Rusta, he too has taken his account concerning the Hungarians from the Anonymous account, the work dealing with Central Asia and Eastern Europe compiled by al-Diyāhānī.

The name Madīgharīyya is also found in the Taḥfīn al-bulūdān, a geographical work by Abu l-ʿFidāʾ (d. 732/1331), in a passage probably derived from the Kīlāb al-Maṣālik wa l-mamlūkā of al-Bakrī. For this reason this author calls the capital of the said people Madīghārī.

In another passage of his Taḥfīn al-bulūdān, Abu l-ʿFidāʾ also mentions the Magyars under another form of this name, sc. Madījar. According to this passage, the people in question lived, alongside the Serbs (Ar. al-Surb), the Vlachs (Ar. pl. al-ʿUṣūl) and other *inflides* (Christian) peoples, in a mountainous region called Khāḏrī Tābī (Kashar-Dag), where the Danube (Ar. Tūs) has its source and which may be identified with the Carpathians, linked to the Alps on one side and to the mountains of the Balkan Peninsula on the other.

In his cosmographical treatise entitled Kīlāb al-bulūdān (al-ʿakhḍur fl ṣaddūb al-barwāt wa l-bahr al-Dinmahdī (d. 672/1372) also mentions the Madījar or Hungarian people among the tribes inhabiting the territories situated on the tributaries of Nahr al-Ṣābīla in the Don and the Danube and the Tisia, wrongly considered as tributaries of the Draper. Besides the Madījar, al-Dinmahdī also mentions among these tribes the Baghwarz, which he takes to be a separate people but which was, as will be demonstrated below, simply another name given to the Hungarians by the medieval Arab geographers.

The Arabic and Persian names Madīgharīyya, Madīghārī, Madīgharīyān and Madījār produce the Finno-Ugrian ethnonym Magyar which is also known from medieval European sources. Thus, for example, the Byzantine author Constantine Porphyrogenitus (writing in 949-52) mentions among the Hungarians who were settled in the basin of the Middle Danube, a clan called Magyrog (Hungarian Megey) the Hungarian Megey. The Hungarian chronicler Simon of Kēza (writing in 1282-5) states in his Gesta Hungarorum that the ancestor of the Hungarians bore the name of Mogor. It may further be noted that in the Gesta Hungarorum of the Hungarian author called Bela regis Notarius (ca. 1300), the territory occupied by the Hungarians before their arrival in the Carpathian basin (889-92) bore the name of Dente mogor (Hungarian Dente magyar). The second part of this name, i.e. mogor, corresponds to the name of the ancestor of the Hungarians according to Simon of Kēza, while the first part, i.e. Dente, seems to be the origin of the name of Dāna, known from the Kīlāb al-buldān of Ibn al-Fakhri (909/910) as being that of the territory situated on the Lower Don, and also the name of Tanat, mentioned in a letter of the Khazar king Joseph in the 10th century A.D. The Italian geographical charts of the 11th-14th centuries call this region Thaniah.

The second name by which the Arab geographers...
of the 9th-10th/10th-11th centuries designated the Hungarians as that of Bashkirs. The latter were in fact a Turkish tribe which had lived, since the 10th century if not earlier, in the territory corresponding to the old Russian provinces of Fenza and Orenburg; they had nothing in common with the Hungarians, who spoke and still speak a Finno-Ugrian language. Thus the use of the name Bashkirs to denote the Hungarians (in addition to the correctly-named Turkish Bashkirs) is an enigma which has yet to be solved, despite the efforts of numerous historians and linguists, Hungarian and others.

The Turkish Bashkirs were called Bashkird by the mediaeval Arab authors (thus for example in the work of Ibn Fadlan [p.e.], ca. 310/922). The same, or analogous, names were also used by the Arab geographers to denote the Hungarians.

The first Arab author to give the Hungarians the name of Bashkirs was al-Mas'udi (d. 345/956). Describing in his Murjji al-djabhan the war fought by the Hungarians and their allies the Pechenegs against the Byzantines in the years 320-32/932 to 434, this author denotes the Hungarians by two different but related names, these being Bashkird and *Bashkirda, making of them two different, though kindred, peoples.

In his Kildb Masdlik al-mamlak, al-Istawikr, the Persian geographer al-Baktr provides another description of Hungary, which will be discussed below, the ethnonym Bashkird being used by him for the same peoples. How, however, to describe the Hungarians as established, through kindred, peoples.

The name of Bashkird (written Bashghird as that of the inhabitants of the country called Unkaliyya [Hungary] is also encountered in the work of the Arab traveller and writer Abû Hamid al-Andalusî al-Garnalî (d. 595/1197-98) called al-Mu'ib tan ba'd 'aqidat al-Mazhilî. He arrived in Unkaliyya in 594/1199-1200 and stayed three years in it and left the country in 547/1153, leaving behind his eldest son who had married the daughters of local Muslims. This same author provides another description of Hungary in his second work, the Taijat al-ateibh. In this latter book, the Hungarians bear the name of Bashgirdh.

In his Mu'jam al-baladun, Yâkût (d. 606/1210) likewise calls the Hungarians and their country Bashghirdiya or Bashgirdh. This writer met a group of Bashghirdiya at Halab [Aleppo] in Syria. Yâkût also mentions, in this account, the European name of Hungary as al-Hunkar (al-Hungar).

Ibn Sa'id al-Maghribî (d. 685/1286) divides the Hungarians into two different nations: al-Bashkird (Bashkirs) who are, according to him, Muslim Turks and who live to the south of the river Dôna (correctly Dôna, in Hungarian Duna—Danube) and al-Hunkar who are Christians. He does not appreciate that the Bashkird and the Hunkar are one people which is divided only by religion. Ibn Sa'id's great geographical work in which these ideas are contained was used by Abû 'l-Fidâî in his Tahkîm al-baladun.

The Arab cosmographer Abû Shâmas Abû 'Abd Allah al-Dimashkî (d. 727/1327) also mentions, in his Nihâyat al-dârî fi 'alâ'îdîb al-bârî wa'l-bârî, the Bashkird people which he locates in south-eastern Europe alongside the Magiîr or Hungarians. He does not appreciate that they are in fact the same people. Possibly al-Dimashkî intended in this fashion to distinguish the Muslim Hungarians from the Christian Hungarians, as Ibn Sa'id al-Maghribi had done.

In his Atâr al-atîdî, the Arab cosmographer al-Kazwînî (d. 687/1287) also mentions the Muslim Hungarians whom he calls Bashgirdh.

The Persian writers of the Mongol period also use the name of Bashkirs to denote Hungary and the Hungarians. Thus for example, in the 'I'dârik al-Alâdîrî of Rashîd al-Dîn (d. 718/1318) Bashkirs are mentioned, alongside the Az (Yasi About the Rus' of the Russian chronicles) the Ura (Russians), the Çerek, the KipÇak and the Keler (in other words, Christian Hungarians, see below) among the subjects of these descendants of Chingiz Khân who dominated the western portion of his empire.

It has been stated above that al-Baktr uses the term al-Madjarîyya in his Kitâb al-Masdlik wa'l-mamlak to denote the Baktrians at the time when they were still leading a nomadic existence on the shores of the Black Sea (before 889/13). However, to describe the Hungarians as established, after the year 922 A.D., in the Carpathian basin, he employs two other terms which he has taken from the account of the Jewish merchant and traveller from Tortosa in Spain Ibn 'Alî b. Yâkût b. al-Turkî (355/965-6) [p.e.], these being al-Unkali (gen. pl. al-Unkalîyyin) and al-Turk (pl. al-Atârik). Leaving aside, for the moment, this last-mentioned name, which will be discussed below, the ethnonym al-Unkalîyyin/Unkalîyyin deserves attention. Now, Ibn 'Alî b. Yâkût mentions this tribe in a brief list of the peoples of Central and Eastern Europe, between the *Tiwaghiyyin (Germans) on the one side and the Badigfiyyin (Pechenegs), al-Rûs (Russians) and Khazars on the other, and stresses that all these peoples speak Slavic, in view of their close connections with the Slavs. Kunîk, the first commentator on that part of the geographical work of al-Baktr which deals with Central Asia and with Eastern and Central Europe, had already identified the Unkalîyyin with the Unkalîs or Unkalays, a tribe which was known until edited, very recently, by Abûrâhman Abî al-Hajî (Beirut 1397/1968). One such mention is contained in the paragraph entitled Tâktor batul al-Unkalîyyin which also seems to belong to the account by Ibn 'Alî b. Yâkût. Nor, according to the paragraph in question, was the Bashkir tribe (geres) settled in proximity to the Slavs, between the land of Buwaysa (Bavaria) and the kingdom of Bayaslaw, i.e. Bohemia I of Bohemia (935-67 A.D.). According to the same passage, the Russians were the neighbours of al-Unkalîyyin to the north, the Pechenegs to the east and the Bulgars to the south. There is no doubt that this localisation favours the identification of al-Unikalîyyin with the Hungarians. Al-Baktr also mentions another ethnynym written in a similar fashion, al-Turfî. It is cited in a paragraph of the Kitâb al-Masdlik wa'l-mamlak entitled Bidd I'blâg ("Land of
one of the Francs"). According to al-Bakr, these al-
Unūṣīya belonged to the al-Madīnīs [q.v.] (in this case
Danes and Norwegians) who were neighbours of the
Slavs (in fact, the Slavic tribe of the Obodrites who
formerly lived in what is now Mecklenburg were
neighbours of the Danes on the south-eastern side).
Now, these al-Unūṣīya had nothing to do with the
Hungarians; it is more likely that they were the
English who, shortly before the time of al-Bakr,
lived under Danish domination (1022-23). The name
al-Unūṣīyyin belongs to the same group of names
for the Hungarians as the Old Slavic Ŭgra (Ungri),
yet Byzantine Ungri, the Latin Hungary, Ungari,
Ungar, Ungaria and Ungaria and the Polish
Węgry (pronounced Wengry). All these names derive
from that of Ŭgra, a nomadic Turkish people
1 known from Latin and Byzantine sources of the 9th
century A.D. As for the transformation of the
phrase Ŭgra in the names Unháit & Ungari, this is
not an isolated phenomenon in the Hungarian
language. In fact, the Germano-Latin proper name
Gerard became Gellert in Old Hungarian (13th
century).

In the Kitāb Nuzūl al-mashābih, al-Idrīsī's geo-
ographical treatise composed in Sicily in 1127-24,
 Hungary bears the name Unhārīya, which probably
represents the Latin Ungaria or even the Italian
Ungaria. Belonging to the same group of names is also
Unkāraya (for *Ungaria or *Ongaria), the name
for Hungary employed by Abū Hāmid al-andalūsī
al-Ǧarnūsī in his al-Wuṣūbī. The name of the
inhabitants of Hungary was, in this treatise, as has
been observed above, Būghārīdī.

One of the names for the Hungarians employed
by Yākūt is al-Hunbars (for Hungary), a name derived
from the Latin *Hungaria. Another orthography of
this etymology is al-Hunbars (*Hungārī); it is
employed by Ibn Sāfīd al-Maghribī (d. 579/1186)
in the extract from his great geographical treatise
used by Abū ʿIffādī.

Besides al-Unūṣīyyin, Ibrahimī b. Yaḥyā also uses,
for those Hungarians not mentioned by the
Byzantines. In fact, Constantine Porphyrogenitus,
who was writing some fifteen years before Ibrahimī
b. Yaḥyā, calls the Hungarians Türkī and their
country situated in the Carpathian basin Türkīa.

To be mentioned finally in a wholly isolated
nomenclature, this being Kešar or Kittar, which
concludes the list of names for the Hungarians
and Hungary used by the Muslim geographers,
historians and travellers of the 3rd-9th/10th-14th
centuries. This nomenclature is mentioned several
times in Rashīd al-Dīn's Ḍīmān al-tawāridī as the
name of a people mentioned with the Bashkirs, the
Ās (Alans, Russian Yavl), the Þūrūk (Russians), the
Čerkess and the Śtelak among the subjects of the
carolingian Chronicles. In all probability, these
Kešar or Kittar are nothing other than the subjects
of the kirāy (Hungarian, "land") of Hungary. This
Hungarian word was already known to al-Ǧarnūsī,
who had heard it during his stay in Hungary in
1127-23 and who wrote it in his Muṣībī as kalī
instead of *k. rādī. It is possible that by the name
Ašal/Kivar, Rashīd al-Dīn understands the Christian
Hungarians, while he denotes the Muslim Hungarians
with the term Bāghārī.

(2) The Hungarian Muslims in the 3rd-
8th/9th-14th centuries. It seems that the most
ancient Muslim elements which may be identified
among the Hungarians appeared as early as the
second half of the 3rd/4th century, thus in the period
when the tribes constituting the Hungarian federa-
tion were still leading a nomadic existence between
the Dan and the Lower Danube, as neighbours
and allies of the greater Turkish state of the Khazars
[q.v.], whose capital Atīl [q.v.] or Tīl was situated
close to the estuary of the Volga. The population
of this state, which was of a heterogeneous nature,
included, among others, numerous Muslim groups,
among which were pure Khazars, partially Islamised,
according to the Arab chronicles, from the 8th century
A.D. onwards, Iranian Muslims of the Sarmatian
tribe of Arslīyīn (ancient Aorsi) who formed the
guard of the Khazar Khagans, Kīšarazmians, and
finally a great number of Muslim traders, of very
diverse origins, who lived in the Khazar capital
where there were mosques and Kurān schools.
According to the Risāla of Ibn Fadlān, there was in
Atīl a Friday mosque, and the leader of the local
Muslims was one of the pagers of the king of the
Khazars. According to al-Īstakhrī, there were in Atīl
10,000 Muslim inhabitants and thirty mosques.
Similarly, in the Khazar city of Samandār (situated
in what is now Dājestān) there were Muslims and
mosques. The Khazar state and the heterogeneous
population of this empire exerted a great social and
cultural influence on the tribes of the Hungarian
(Magyar) federation, especially at the time when
this federation was joined, in the second half of the
9th century A.D., by the great rebel Khazar tribe
known as Kābars (or Kavars) which took flight
following an abortive revolt against the Khazar
Khagan. It is known from the De administrando
imperio of Constantine Porphyrogenitus that the
Kābars played a leading role in the organisation of
the Magyar federation and that they were at the
head of this federation at the time when the Hunga-
rians decided on the conquest of the Carpathian
basin. It is also more than likely that this tribe,
which no doubt included both Jewish and Khazar-
Muslim elements, was the one joined by groups of
Arslīyīn and of Muslim Kīšarazmians, as well as
more or less numerous groups of Muslim traders
from Atīl and Samandār and the neighbouring
provinces of the 'Abbāsīd caliphate. But it should
be stressed that all of this is only a conjecture which
requires verification.

The earliest substantiated information concerning
the presence of Muslim elements in the midst of the
Magyar federation, at least in the context of written
sources, does not appear until the first half of the
14th/15th century, some four decades after the
Hungarians had conquered the land situated on the
Middle Danube and the Tisza which subsequently
became historic Hungary.

The first written information telling of Muslims
living among the Hungarians in historical Hungary
comes from al-Šafṣūfī's Murādī, in which he refers
to the subject in his description of the war waged
by the Magyars in alliance with the Pechenegs
against Byzantium in 1269-73 to 943-4. The
Pechenegs, who at this period were leading a nomadic
existence between the Don, the lower Danube and
the Carpathians, are denoted in the Murādī al-
Gūkab by the twofold name Būdānāth and Bādānī,
and the Hungarians (Magyars) are called here by
two different names, Bādānāth and *Bādārīn. An-
other two tribes there lived, if al-Šafṣūfī is to be
believed, numerous Muslims divided into
t wo quite different groups. To the first of these
groups belonged the Muslim traders who came from

[...]

1013
the land of the Škárs, also from Ardabil, from Báb al-Ahwâb (Derbend) and from other places situated within the 'Abbâsîd caliphate, while the other found its recruits among the Hungarians and Pechenegs proper who had been converted to Islam. In addition, it should not be forgotten that among the Magyars who had come to Hungary from the steppes of southern Russia and among the Pech- 

nega immigrants to this country there were also Iranian Muslims, including Khârazmians and probably also Arsiyya, descendants of the ancient Aorsi and kinmen of the Alans. At all events, the Khârazmians appeared in Hungary in large numbers at least as early as the first century A.D., at which time they are mentioned for the first time in Latin sources emerging from Hungary. As for the Muslim traders who came from the land of the Škárs and the provinces of the 'Abbâsîd caliphate and who lived, in the first half of the 4th/10th century, among the Hungarians and Pechenegs, these were so numerous that, according to al-Mas'ûdî, they were able to form the entire vanguard of the "Turkish" army, that is, the allied Pechenegs and Hungarians, in the war against the Byzantines.

Furthermore, the Hungarians living in the Carpathian basin during the 4th/10th century maintained political and economic relations with lands situated to the south of the Danubus and belonging to the 'Abbâsîd caliphate where their kinsmen lived. In fact, after the arrival of the Pechenegs in the steppes of southern Russia, the Hungarians, displaced by them, split into two parts, of which the first withdrew, in 889-92, towards the Middle Danube and the Tisa, while the second, less numerous, made its way towards the south-east in the direction of Transcaucasia. This is known from Constantine Porphyrogenitus who, in his De administrando imperio calls this second Hungarian group Sabartoi asphaloi; they were also titled, according to this author, "in the lands of Persia". These Sabartoi asphaloi (the meaning of the second part of the title, asphaloi, remains obscure) are known in the Armenian chronicles by the name of Svorcišk' (the termination -šk' is the sign of the plural in Armenian) and among the Arab historians of the 3rd/9th-10th centuries by the name of al-Sâwhidiyya (al-Balâdîbî) or that of al-Sîâyâdiyya (al-Mas'ûdî). According to the latter author, the tribe in question lived on both sides of the river Kur, on the frontiers of Adhar- 

bâdis and., under the rule of the Alans. Al-Balâdîbî knew them, furthermore, immediately before the year 799/802. According to Constantine Porphyrogenitus, the Hungarians established in the Carpathian basin often sent merchants to visit these Sabartoi asphaloi, who sometimes returned to Hungary with official messages. Little is known concerning the religion professed by the Sabartoi asphaloi but it is most likely that, living under Muslim domination, they were exposed to the influence of Islam.

The second author writing in Arabic who tells of the existence of Muslims in Hungary is Ibrahim b. Yaqûbî. In the course of a visit to the countries of Central Europe, this traveller made his way as far as Prague (Ar. Fârâb) and he describes, among other things, the commercial life of the city. According to him, among the foreign merchants who came to this city from Hungary, besides the "Turks", i.e. Hungarians proper, there were also Jews and [ahl al-islam], i.e. Muslims.

According to a passage in the Hungarian chronicle known as the Anonyma gesta Hungarorum compiled in 1176-1203, there arrived in Hungary, during the reign of the prince Taksony (955-972 A.D.), a group of Ishmaelites, i.e. Muslims, originally from terra Bular (Bulgaria), led by two semi-legendary figures, these being Billa (Ar. Bi Thâa?) and Bocclâs? The majority of scholars who have studied this problem are of the opinion that the reference here is to Bulgaria of the Kama, a land which had been Islamised several decades before. However, it is not impossible that the source used by the Anonymi gesta Hungarorum relates here rather to Bulgaria of the Danube, where there were numerous Muslims from as early as the middle of the 9th century A.D. In fact, a letter exists written by Pope Nicholas in the year 886, in which he orders the extirpation of the Saracens in Bulgaria of the Danube. The Bulgars of the Danube were a Turkish tribe, sister of the Bulgars of the Kama who settled to the south of the Lower Danube in 699 A.D., and soon adopted the Slavic language. It is interesting that the name of a settlement of people from terra Bular, according to the Anonyma gesta Hungarorum, bears the name of Pest (read Pešt) which without any doubt of Slavo-Bulg origin and signifies "furnace"; it is today a quarter of Budapest, capital of Hungary.

It seems that after the conversion of Hungary to Christianity, which took place during the reign of King Stephen I (997-1038), one group of Hungarian Muslims extensively adopted the Christian faith while remaining, in reality, crypto-Muslim. Prominent among this group were the Khârazmians (in Hungarian, Kâlia) who will be considered below.

In medieval Latin documents and in the ancient Hungarian chronicles written in Latin, the Muslims of Hungary are known by numerous names, which may be divided into four main categories, as follows: (a) Saracen (in the years 995, 1021, 1222), Saraceni, Saracinos, Saracenios, Saracenes, Saraceni, Saracenii, Saracenii. This is how the Latin sources emanating from Western Europe denoted the Muslim Arabs. These are also the names of the Byzantine sources. It is stated, for example, in the De administrando imperio that the Saraceni were a people who followed "the false prophet Moamen". The aristocratic Hungarian family Saracenii is known from documents dating from as early as the years 1168, 1191, 1215 and 1222.

(b) Islamitae (year 1331), Islamitae, (1122), Ismaelites, These are the descendants of Isma'îl, son of Abraham who was, according to the work of Constantine Porphyrogenitus, a *Nizaros (in the ms. incorrectly written *Zinaros), Arabic Nîzar, descendant of Isma'îl, was "father of all the Saraceni". It is not impossible that the name of Ismaelitae the ancient Latin sources of Hungary specifically designated the Muslims, the Islamised Pechenegs who had settled in Hungary (to be further considered below). If this is the case, the ancient Hungarians followed the view of the ancient Russians who considered (as emerges from the chronicle of Nestor, beginning of the 12th century A.D.), that the Pechenegs, as well as the Oghuz Turks ("Törkets"), the Turkomans and the Cumans (Polovtsy) were descended from the Biblical Isma'îl. In addition, the term "Ismailites" in certain Hungarian documents written in Latin also designated other groups of Muslims. It is known for example that the Hysmaelitae mentioned in a document of the Hungarian king Emeric in 1196, written on the occasion of the market at Eszei (the former county of Valto, currently Osijek on the lower Drava in Yugoslavia)
were not Pechenegs, but rather Kâlz or Khârizmians.

(c) Bisserminti, Bezeremanti, Biseramanti, Bezeremanti, Busurman. This is the transcription, in ancient Hungarian documents written in Latin, of the Hungarian word Bôszományi "Muslim". This is not the only usage of the term in Central and Eastern Europe. In fact, it is found in Polish, in Old Czech and in Russian, where the word busurman (busurman) biseremen and busurman (busurman) signify "Muslim". It is interesting to note that John Plano Carpini, the famous envoy of Pope Innocent IV to the Khan of the Mongols (1245-7), also mentions in his work a people which he calls Bisserminti, correctly identified by I. Horbek with the Khârizmians living on the lower reaches of the Amba-Darya. Thus it is impossible that the Bisserminti of Hungary may also be identified, at least in part, with the Hungarian Khârizmians. However, in two Hungarian vocabularies composed in ca. 1400, the terms Yemelit and biseremo and ismaelitico do not refer to any ethnic group but indicate the Muslims in general. It should further be added that the name Bôszományi is attested in numerous Hungarian toponyms, in four or five administrative districts of Hungary, within its historical limits, and also in certain medieval documents. For example, in a document of 1256, the Nobleman (in the Hungarian Nágy Bôszományi "the great Ëszomány) is the name of a village situated to the east of the middle Táza, in the district of Néris (Nyr).

(d) Calis (year 1111), Kalas (1156), Qualis (1256), Kizâles (1212), modern Hungarian Kaliszi, in the German chronicles Kostel, Costelone, Kolmiszi "Khârâzmaian". This name was mentioned for the first time in Hungarian sources in a Latin document of the year 1111, where there is a reference to people called "in Hungarian Calis". The Byzantine equivalent of this name is Khâlisit. According to the Byzantine historian John Kinnamos (writing 1150-65), this people was subject to the King of Hungary and, in the middle of the 12th century, as auxiliaries of the Hungarians, fought alongside the Dalmatians against the army of the Byzantine Emperor Manuel Comnenus. The opinions of this historian regarding the religion of the Khâlisit are very confused; in one place he considers this people as being of Persian (i.e. Islamic) religion, and in another he states that they profess the Mosaic faith. The Hungarian name of Kâliszi, as well as the Byzantine denomination of Khâlisit, corresponds to that of Khâlisit which was the old-Russian term for the Khârazmians and Khârâzmaian; it is encountered for example in the Russian chronicle of Nester composed at about the beginning of the 12th century. The Hungarian name of the Khârazmians is also found in that of al-Khazar al-khalilis, "the Khazar-Khalil", an ethnic group identical to the Khârâzmaians which included according to a 16th-century Russian historian, the Khârâzmaian Khârâzmaian-Khalil, the capital of the Khazar realm, with the kingdom of this state and his army. The Khârazmians-Khalilis appeared in the Khazar realm prior to the 8th century A.D. In fact, the bishop of Khosâlifis is mentioned in a list of bishops composed before the year 787 A.D. These were the bishops subject to the metropolitan of Doros in the Crimea, and the list probably includes all the bishops of the Khazar empire. The bishop of Khosâlifis is placed here immediately after that of Asel, i.e. the Khazar capital Aul. According to Kladovskoiy and Vasiliev, Khosâlifis was a town situated in the Khazar realm, near the estuary of the Volga and near the Caspian Sea, which bore, in the chronicle of Nestor, the name of Khârâzmaian-Khalil, "the sea of Khârâzmaian-Khalil" (it was perhaps the eastern part of the Khazar capital, of which the western part was called Asel (Atil). A section of the Khârazmians of the of the Khazar realm had probably joined, prior to the years 889-92, along with the Khazar tribe of the Kâpars or Kavars, the Hungarian (Magyar) federation and settled in historic Hungary after the conquest of this land by the Magyars. It seems furthermore likely that another group of Khazar Khârazmians joined the Pechenegs. In fact, al-Bakrî says that in his time (1068 A.D.), there were among the Muslim Pechenegs of which the main bulk was then leading a nomadic existence in the steppes of South Russia, considerable numbers of al-Khwarâzi (al-Khalil), that is to say, of Khârazmians. This was the name given by the Pechenegs, says al-Bakrî, to (Muslim) foreigners, slaves who had come to them from Constantinople or from other lands. The Pechenegs gave them the choice of staying in their country, where they could marry their daughters, or of leaving for another country of their choice. It may be added furthermore that Anna Comnena mentions, in her Alexiad, a Pecheneg chief named Khâlil. Nor should it be forgotten that the ancestors of the Magyars moved to the eastern part of the former Khazar realm. Such was the situation towards the end of the 11th century. This is known from the resolutions of the Hungarian Diet held at Szabolcs in 1092 during the reign of King Ladislas the Holy (cap. 9), which decreed that those Muslims who, after being baptised, reverted to Islam and were again performing the rites of this religion, must be removed to other villages. The successor to Ladislas the Holy, King Coloman III (1095-1114), was also the author of an edict containing resolutions directed against the Muslims. This was furthermore the time of the First Crusade, and it is easy to understand the hostility of the Hungarian clergy and Christian aristocracy towards Muslims in general in this period. According to the decree in question, all Ishmaelites caught in the act of performing their religious rites were to be taken before the king's tribunal, and a part of their property was to be forfeited to the one who had denounced them. According to the same decree, the inhabitants of Ishmaelite villages must build, in the middle of each village, a church which was to be maintained by the local Muslims. Besides this, half of these Ishmaelites must leave the village in question and settle in purely Christian villages in order to become assimilated with the local Christians. It was envisaged by the king that this scheme would lead to the conversion of these people to Christianity. Accordingly to another resolution of this decree, the Ishmaelites must give their daughters in marriage to Christians and, if entertaining Christian guests, must eat with them only pork. Obviously, this last requirement constituted a violation of one of the sternest prohibitions of the Muslim faith. Nevertheless, in spite of the decrees of Ladislas the Holy and Coloman III, a large number of the Ishmaelites of Hungary remained faithful
to Islam. It is even the case that in the 12th century there took place a major expansion of this religion in Hungary, especially during the reign of King Géza II (1144-61) who was, according to the account of the Arab traveller al-Gharnātī, a good friend of the Hungarian Muslims.

It is to this latter individual, both scholar and traveller, that there is owed an important illustration of the situation and the life of the Muslims in Hungary towards the middle of the 6th/7th century. Abū ʿAbdallāh al-Muʿrib al-Muṣṭaṣāfī (died 598/1200) of Damascus, where he died at the age of eighty.

It is argued that in the Muʿrib, there were the 'abīd al-Magḥiribīa "descendants of the people of the West" and 'abīd al-Muṣtarīmiyyīn "descendants of the Khārazmians". In the case of the first of these groups, their name al-Magḥiriba ("the Maghribis") remains mysterious. It is true that Abū ʿAbdallāh speaks of the existence of "sons of the Arabs of the Maghrib" (‘abīd al-ʿArab min al-Magḥirib) at Saqqāsh on the Volga, an important East European commercial centre, which could be true, especially as these people asserted, according to this author, the Mālikī law school like the true Maghribis; but in another passage of al-Muʿrib, he gives the name of abīd al-Magḥiriba "sons of al-Magḥiriba" to people with no connection whatsoever with true Maghribis. In the second case, it is a question of some thousands of people living in the vicinity of Mankermān "Kiev" who had "the appearance of Turks, spoke the Turkish language and shot their arrows like Turks". According to this passage of al-Muʿrib, the Maghribīs of the neighbourhood of Kiev also bore the name of Badjana, meaning Pechenegs (it may be recalled, in fact, that one of the two names given to the Pechenegs by al-Masʿūdī was Badjana, without final -a). Thus it appears that the Maghribīs of Hungary were identical to the al-Maghīrība/Badjana of the Kiev region, and that one is dealing with numerous groups of Pechenegs (Abū ʿAbdallāh counts these Magḥīrība/Pechenegs in thousands) living between the 10th-15th centuries A.D. in the Carpathian basin as a subsidiary people to the Hungarians. These Pechenegs (in the medieval Latin sources Bisseni or Byzessi, from the Hungarian Besenyő, read Bešenjov - Badjana/Badjene or Počanal/Počnje, or the Arabic sources) arrived in historic Hungary from the steppes of South Russia in several waves. The earliest of these waves apparently arrived in Hungary in the time of the prince Arpad, at the beginning of the 10th century A.D. The new arrivals who were, according to the Hungarian chronicles led by a certain Chaba, received from Arpad land situated in the Matra mountains. As for the second wave, a very important group of Pecheneg immigrants, it arrived in Hungary (if credence is to be given to the chronicle Anonymous Bocis Regis Notarii de gestis Hungarorum, composed in ca. 1200 A.D.) during the reign of the prince Zoltan who lived in the first half of the 10th century A.D. These Pechenegs were settled by Lake Ferto, near the north-western frontier of Hungary to protect the young Hungarian state against attacks by the Germans. Some years later, they arrived in Hungary, during the reign of the prince Taksöy (?595-74), a new and very numerous group of Pechenegs led by Thonuzoba, a person of princely origin. Taksöy gave him, as a seat, land situated in the vicinity of Kerey, extending as far as the river Tisza. During the reign of the prince Géza (972-7), there arrived in Hungary a new group of Pecheneg immigrants. This is known from the Gesta Hungarorum of Simoa of Keza (13th century), who calls the newcomers Bessi. The new wave was linked to the victory of John, comte of Sopron, a county situated in the
north-west of Hungary. In 1072, according to the Chronicle of Thures, the latter routed a large detachment of Pechenegs in the service of the Byzantine governor of Belgrade, taking prisoner several thousand Pechenegs whom he probably settled in his domain. The last wave of Pechenegs arrived in Hungary in 1092-3. These were the remnants of a large Pecheneg group which, in withdrawing from the steppe north of Russia, had attacked the frontier hereditary of the Byzantine empire and had been defeated by the army of that state. These remnants settled in Hungary under the command of their Khan, named Tatar. The newcomers were received very amicably by the Hungarian king Stephen II (1115-31). This was the last phase in the long series of Pecheneg immigration into Hungary which had lasted almost two hundred years. The Pechenegs who were settled as guards on all the frontiers of Hungary, as well as those who lived in the interior of the state, were required to supply troops of horsemen, who constituted the light cavalry of the Hungarian army. The first information regarding Pechenegs as forming a part of the Hungarian army comes from the year 1052 A.D., at the time of the Hungarian war against the Germans on the river Letha. In 1116 Pecheneg warriors are found in the army of Stephen II. Later, in the year 1146, the Pechenegs, who probably made up two detachments of the garrison troops on the Austrian frontier, were included in the formation of the Hungarian army during the war against Augustus Duke Henry (Jasonorrot), in the battle near Moson. They were commanded by two Pecheneg "counts". In the year 1150, the Pechenegs constituted, along with the Khilisians (Kharazmians) Hungarian auxiliary troops in the war of the Hungarians and the Serbs against Byzantium. The question of the participation of the Pechenegs in the Hungarian army has yet to be studied. However, it should be noted that in the battle between the Hungarians and the King of Hungary, Ladislay Ottokar II near Krassnenbran in 1260, the Pechenegs are not mentioned among the auxiliary troops of the Hungarians.

There were two different types of Pecheneg settlement in Hungary, these being settlements situated close to the frontiers and establishments located in the interior of the country. The colonists settled near the frontiers had the duty of defending the wooden stockades which surrounded the entire territory of Hungary. They were called in the Hungarian documents written in Latin speculatores or confinarius custodes. Pecheneg guards of this type existed as early as the time of St. Stephen (997-1038) and even before this period. They were settled in groups quite close together, not far from the western frontier of Hungary, notably in the counties of Sopron and Moson. This latter territory was even called, in ca. 1210, on account of the large number of Pecheneg military colonists, by the name of terra Blasconiarum ("the land of the Pechenegs"). The Pecheneg guards settled near the Bohemian frontier were somewhat numerous, in contrast to the northern, eastern and southern frontiers, where their numbers were relatively small. As regards the Pecheneg settlements in the interior of Hungary, these may be divided into four groups, these being the group of Fejervá-Tolna (or of Sarvitz), the group of Kócs and the group of Csanad or Aranka. The largest of these four groups of villages, and at the time the largest group of Pecheneg settlements in Hungary in general, was the group of Fejervá-Tolna situated between the Danube and Lake Balaton, along the river Sárva, in the southern half of the county of Fejervár and the northern half of that of Tolna. All these settlements had the duty of defending from the enemy the town of Székesfehérvár, the royal capital of Hungary under the Arpads (in the year 1192 Belgrade, 997 Alba Regia; in German Stühlenweissenburg). These Pecheneg villages enjoyed a degree of independence and various privileges. It may be added here that this last group of villages, in the territory situated between Lake Balaton and the Danube, numerous other villages of the Pechenegs are encountered. Thus it may be stated that the largest number of settlements of Hungarian Pechenegs was situated in western Hungary, to the west of the middle Danube. Besides this, there were more than ten Pecheneg villages situated in western Slovakia, about twenty on the upper Tisza, some fifteen between the Tisza and the middle Danube, another fifteen in the basin of the Maros and a further ten in Transylvania.

The Pechenegs who arrived in Hungary through numerous waves during the 10th, 11th and 12th centuries, were for the most part pagans professing the primitive religion of the ancient Turks. However, there were considerable numbers of Muslims among the newcomers, as may be judged from al-Ma'sudi's account regarding the war waged by the Bajandah/Baghjana in alliance with the Hungarians against the Byzantines in 320-343 to 943-4. This has been mentioned above. Later, however, Islam disappeared without trace among the Pechenegs of the steppes of South Russia, and al-Bakrl (600/1068) states in his geographical treatise that, according to the reports of Muslim slaves returning from Constantinople, this people preferred, until the year 900-909-10, the pagan faith (dn al-Madżjṣyya). However, immediately after this date, there came among them a learned Muslim fāth who succeeded in converting a number of Pechenegs to Islam. This, according to al-Bakrl, marked the beginning of an active Islamising campaign among the Pechenegs, which ultimately led to war between the new converts and their compatriots who had remained pagans. According to al-Bakrl's informants, the converts to Islam, who numbered only 12,000 warriors, succeeded in defeating the pagans. A large number of the latter were massacred, and the others became Muslims. According to al-Bakrl, this event took place prior to the year 460/1068. At this time there already were among the Pechenegs, if al-Bakrl is to be believed, fāthis, scholars and Kur'dn readers. If the account given by al-Bakrl is true, the conversion to Islam of the vast majority of the Pechenegs cannot have been other than superficial, with the retention of numerous pagan rites. In view of his account, it is not possible that the Pechenegs taken prisoner by the Hungarians in 1072 A.D., in the Hungarian war against the Byzantines, and subsequently established, probably as guards, close to the frontiers of this kingdom, could have professed, at least in part, the Islamic faith. Similarly, it is quite possible that the last wave of Pecheneg immigrants which was established in Hungary in 1122-3 A.D., consisted of people half-Islamised, among whom there were fāthis and Kur'dn readers. If this is a case of Pechenegs very superficially Islamised, the fact is also confirmed by the image of the Magārīshalījaqāna (Pechenegs) presented by Abū Hamid al-Andalusī al-Ibnānī in 1173-7. These people had only the vaguest ideas of the rites and duties of Islam. Thus, for example, they drank...
wine, which was forbidden them by Abū Ḥamīd. Before his arrival, they knew neither the Friday prayer nor the ǧubūla; they learned these only, this traveller boasts, after his arrival in Hungary. Nor did they practise, before the coming of Abū Ḥamīd, polygamy and concubinage as enjoined by Islam. As regards the former crypto-Muslims of Hungary (these were, for the most part, Bulgars and Khārazmians, converted to Islam and later, during the reign of Stephen I, officially compelled to renounce this religion), their knowledge of the principles of Islam must, no doubt, have been considerably greater. The general situation of Muslims in Hungary in this period was relatively propitious, since King Géza II who reigned at this time, according to Abū Ḥamīd, “loved the Muslims”. The Maghāribi Baʿdira were, like a great many of the Khārazmians, warriors, and Abū Ḥamīd speaks of their participation in the war of Hungary against Byzantium. They were very numerous, “thousands of people” according to this author, referring both to the crypto-Muslims and to the Muslims openly professing their faith. As for the number of places inhabited by these two types of Muslims, there were, according to Abū Ḥamīd, “more than ten thousand”; this latter estimate seems much exaggerated.

It is known that the Pechenegs established between the 10th and the 13th century in Hungary possessed their own aristocracy and nobility. In fact, the various groups of Pecheneg immigrants arrived in Hungary led by their khāns (dux in the mediaeval Hungarian sources written in Latin) who enjoyed, in the first period of the Pecheneg presence in Hungary, that is in the 10th-13th centuries A.D., considerable respect. Among these khāns belonged, for example, Zuljan, princi pis Bisseniun of the ancient Hungarian chronicles, as well as other Pecheneg khāns named in these sources, for example Aba, Kemeny, Botond, and the dux nomine Talar known from the war between the Pechenegs and Byzantium. In 1125, who settled in Hungary in the time of King Stephen II. It is known that the prestige of these Pecheneg khāns in Hungary was so great that one of these persons, Samuel Aba, became in 1044-7, king of Hungary. Later, the different groups of Pechenegs settled in various parts of Hungary were placed in the Hungarian royal court, there was for the aristocrats of Hungary a fair number of less exalted Pecheneg nobles.

The mediaeval documents mention several of these nobles, who are designated by the title nobili (for example, nobili bisseni de Kquesi). It seems that it is from these Pecheneg khāns who came to Hungary as immigrants that Ismāʿīl b. Ḥasan was descended. He was, according to Abū Ḥamīd, “the descendant of valiant Muslim princes” of Hungary, and he accompanied this traveller on his journey from Hungary to "the land of the Slavs", that is, to Kiev. Abū Ḥamīd also states that his eldest son married the daughters of two respected Muslims of Hungary. It seems that the persons in question here were Islamised Pecheneg nobles (nobili bisseni).

To return to the second group of Hungarian Muslims mentioned by Abū Ḥamīd al-Andalusī al-Gharinit, these are the Khārazmians (the Khārazmians, al-Khawārīzī or al-Khāzīs of the mediaeval Arabic sources, the Khāzīs or John Kimnamos and the Khāzīs of the Russian Chronicle of Nestor. According to Abū Ḥamīd, there were thousands of them in Hungary (this author even states in one passage that they were "innumerable"); according to him they were in the service of the king of Hungary. Officially, they called themselves Christians and they disguised their Islam, in contrast to the Maghāribī/Pechenegs, who openly professed the Muslim faith and served the Christians (meaning the king of Hungary) as soldiers. It is also known, from Hungarian documents, that the Khāzīs sometimes fulfilled the function of administrators of the royal treasury (sires regis fiisci, quos hungarice caluerant secretarii). One Calix (Khārazmian) named Efstratius (from the Arabic ʿĀliyāt [Allāh], who occupied this post in the county of Nyitra (Nitra) is known to us from a Hungarian document of the year 1331 A.D. In the same document there is reference to another Khāzī who was administrator of the royal treasury and at the same time count (comes) of the mint. His name was Maging (Ara. Madžād). These two individuals must have been, judging by their names, Muslims openly professing their faith. At about the middle of the 10th/11th century, Khārazmians (Kalâsh) lived, among other places, in the county of Szerém (in ancient times, Sirmium, currently Mitrovica in Slavonia) in the south of Hungary in its historic frontiers. The memory of this ethnic group is also preserved in some fifteen toponyms in the counties of Fejér, Veszprém, Zala and Somogy (all four of these being situated to the west of the Middle Danube), in the county of Nyitra (Nitra) in the counties of Nógrád-Szabolcs and Zemplén (both situated on the upper Tisa) and in the county of Pest situated immediately to the east of the middle Danube. The mediaeval Hungarian documents written in Latin also mention a road which takes its name from the Khārazmians (1211: in valle Kuanzā), located in the county of Fejér. A colony of these people (genematio Kalaz) also lived, according to a document of the year 1153, in the village of Budačkáss; it may be noted that the second part of this last name, i.e. -čkas, has also retained, since the formation of its former Khārazmian inhabitants. A document of 1285 also mentions a road called Kal₁szu (Kal₁szu) which in another document dating from the year 1298 bore the name of Callasztua. The road in question was an important highway which led from Szeged, a town situated on the eastern bank of the middle Tisa, to Batmonostor. In the Middle Ages, this road played an important role in the Hungarian salt trade and its name indicates that, in this case at least, the salt trade was managed by the Khāzī or Khārazmian.
sometimes hid themselves under the name of Bősör-
mény or "Muslims" (Bisserrumni of the Hungarian
documents written in Latin). It is thus very likely 
that the Bősörmény toponyms which are encoun-
tered in four or five counties could also designate 
villages formed by Kházaranians. In the 
Register of Várad (13th century), concerning 
the eastern frontiers of Hungary as it then was, 
there is mention of a Villa Nigerbassorum Ætate (1248).
According to the Register, this locality was the 
centre of the Islamic Chmaelites (Islamallinae) of Kyš, a 
territory extending to the north of Várad. It is not 
impossible that the name of this village denotes the
Kházaranians. It is very probable that the terms 
bezeremien and bazarman (B-account, the language of
is based on information which this author received
His account ,
by Yakut in his 
account of the period of Andrew II that there emerges
reference to
is from the period of Andrew II that there emerges
a village of the county of Bodrog 
(kházaranians) in a document of 1218. On the other hand,
and in 1206 
and converted to Islam) but to Muslims 
(1260), distinguishes the 

The situation of the Muslims of Hungary which 
was, if al-Gharnatî is to be believed, very prosperous in
1124-61, during the reign of King Géza II, and
continued to be favourable at the beginning of the 13th
century, in the time of King Andrew II (1209-
35). At first, this king also was a friend of the
Muslims, but later he was forced to change his attitude 
under pressure from the clergy. The Hungarian
Muslims were not in the same time area 
In fact, in a papal letter of the year 1232 there is a reference to mulitudo Saracenorum Hungaricae. It is
from the period of Andrew II that there emerges the
description of the Hungarian Muslims supplied by Yákóti in his Msjgian abullás. His account 
is based on information which this author received from
a group of these Muslims (Yákóti calls them
al-Băshghirddiya) whom he met at Halah (Aleppo).
The date of this meeting is not known exactly. It is
known, however, that Yákóti spent some time there 
in Óy jár 1232-17, in Óy jár 1232-18, in Óy jár 1224 
and finally in Óy jár 1222, shortly before his death. 
According 
that were also very rosy (here = white—Yákóti 
uses in both cases the Arabic word ghfr) they 
professed the law school of Abu Hanifa. Yákóti 
asked one of the members of this group for informa-
tion on their country and their way of life, and
received the answer that their country was situated 
beyond Constantinople among a population belonging 
to the Franks (in other words, Western Christians) 
who were called al-Hanbar or Hungarians. They 
were subjects (Ar. ra'iyya) of the al-Hanbar king, 
and were settled in the most distant parts of his 
domain, where they inhabited some thirty villages.
It seems probable that these were the Muslim 
Pechehens of which the most important groups had 
settled, in the 10th-13th centuries, in the counties 
of Sofron and Moson and between the middle Danube 
and Lake Balaton, in the western part of Hungary, 
on the Austrian frontier and around the ancient 
capital of the Arcaps, Székes-Fehervár. According to 
Yákóti’s informant, each of these villages was 
large enough to resemble a small town. However, 
these places were not surrounded by walls. In fact, 
the king of Hungary did not allow the local Muslims 
to fortify their villages with walls, for fear lest they 
rebell against him. According to the remainder of this 
account, the language of al-Hanbars, as of al-Băsh-
ghirddiya, has no particularities, and was the same as that of the Franks. It is very likely that Yákóti’s informant was thinking 
here of Latin, which was the official language of the 
Hungarian state in the Middle Ages. According to 
other information from this source, the al-Băshghir-
diya dressed like the Hungarians and were liable 
for military service, as were all the other inhabitants 
of Hungary. In fighting the enemies of the country, 
Yákóti states, the Hungarian Muslims were also 
engaged in the Holy War, the aljdhd, in view of the 
fact that they were Muslims hostile to Islam. Yákóti 
also asked his informant how the Muslims came to be living in Hungary, 
among infidel countries. He was told that according 
to the sayings of the ancestors of al-Băshghirddiya, 
there came to Hungary, from the land of the Bulgars 
(bisd Băqghân), in ancient times, seven Muslim 
individuals who settled among the al-Băshghirddiya 
and converted them to Islam. This tradition corre-
sponds to that of the Hungarian chronicle known as 
Ancywyma gesta Hungarorum, composed in 1156-1203, 
according to which there came to Hungary, during 
the reign of the prince Taksony a group of Islamic 
from terra Bulgar (Bulgaria of the Kama or rather, 
of the Danube). This has been discussed above. Yákóti’s 
informant adds that the Băshghirddiya who have 
performed the bdkj di are highly respected by the 
Hungarian Muslims, who entrust to them control 
of their religious affairs. He also says that the Băsh-
ghirddiya who engage in military service in Hungary 
shave off their beards, as the Franks do, in other 
words, Western Christians. However, this is the case 
as regards the others, those not performing 
military service. In view of the fact that the people 
met by our geographer at Aleppo had shaven beards, 
they would have belonged to the military caste. 
Elsewhere in Yákóti’s article it is revealed that the 
road leading from Hungary to Aleppo passed through 
Constantinople and was four months’ travelling 
time in length. It was already known, from 
the account of al-Gharnatî, that the route used by 
Hungarian Muslims in their travels in the Orient 
also passed through Könnya (Konya) in Asia Minor. 
It has been stated above that King Andrew II, who was initially well-disposed towards his Muslim 
subjects, was compelled, in the year 1222, to pro-
claim a charter, also known as the Golden Bull, defining the rights of the Hungarian people. The second edition of this Bull appeared in 1231, and the document contained numerous restrictions imposed on the Muslims and Jews of Hungary. It emerges from these documents that, until this time, the Muslims (Hymaedes, Saraceni) and the Jews of the country had the right to take on public functions, in particular, supervision of the mint and the salt works (year 1222: Comites camerei monetae, Salinarii et Tributati Hymaedes fieri non possant; 1232: Monetae et Salinarii, ad aiosis publicis officiis Saraceni non praefecturam; 1233: Saraceni praefecturam camerae et publicis officiis; etc.), which were forbidden them in the Golden Bull. However, all these restrictions, in the period 1222-32, existed only on paper, as is shown by an edict of Archbishop Robert of Esztergom dating from 1232, an edict declaring the excommunication of Hungary. According to this edict Andrew II, after proclaiming the Golden Bull, again appointed Muslim dignitaries to public offices; he also tolerated the presence of Muslims in his estates. According to another passage of Archbishop Robert's edict, it was a royal chamberlain named Samuel who was especially favourable towards the Muslims and the "false Christians", i.e. the Patari. The Archbishop forbade Christians to do business or maintain other relations with Hungarian Muslims, except those who had freed their Christian slaves (or slaves of the local Christian Church): "Comites autem Saraceni et Judaei in alia natione habente". They should, in future, be unable to buy or possess Christian slaves. The king further promised that each year there would be authorised, on behalf of the Dishosp, to take from the Saracens and the Jews any Christian slaves or Christian wives. According to the same undertaking by Archbishop Robert, King Andrew II repented and concluded, on 12 August 1232, an agreement with the legate of Pope Gregory IX, in which he promised that in future the Saracens would be forbidden to administer the mint or the revenues of the state, and would be barred from occupying other public posts. He also undertook in this pact that in future the Saracens and Jews would be obliged to carry signs to distinguish them from Christians. They would in future be unable to buy or possess Christian slaves. Thus it is probably from the year 1232 that there began the most serious oppression of the Hungarian Muslims by the Church, and it is only from this time onward that one can speak of the Christianisation of this part of the Hungarian population. This Christianisation is marked especially by the building of Christian churches and monasteries, which began at about the middle of the 13th century in villages occupied by the Pechenegs who until this time had remained superficially Islamised or even pagan. It is in the documents of this period that phrases appear such as ecclesia de Besunu or even ebraten de Besunu (from Hungarian Beszenyé "Pecheneg"). There is no doubt that the invasion of the Mongols (Tatars) in 1241 also contributed, in the highest degree, to the reduction of the Muslim element in Hungary, an element composed for the most part of soldiers in the service of the kings of Hungary. On account of its tenacious resistance, this element suffered particularly severe losses at the hands of the Tatars. This issue will be discussed further, in the context of an analysis of the description of Hungary given by Ibn Sa'id al-Maghribi.

It is quite possible that there were also Muslims (or at least people superficially Islamised) among the Comans (in Hungarian, Palencz), a Kipchak tribe which took refuge in large numbers in Hungary in their flight from the Mongols, who appeared in 1223 in the plains by the Black Sea where the Comans were leading a nomadic existence during the 12th-13th centuries.

Moreover, these were not the first Coman groups to settle in Hungary. In fact, it is known that as early as 1067 the Hungarian king Solomon summoned a military detachment of this people into Hungary, and that another Coman group settled in Hungary in 1220-22 probably in the Mátra mountains. These newcomers were exposed, in the staves of South Russia (like other Turkish tribes who led a nomadic existence there) to the influence of Islam. They could thus add to the number of Muslims (or rather of superficially Islamised animists) in Hungary. In this manner, the Muslim presence in this country was maintained in spite of pressure from the Church and in spite of the losses suffered during the Mongol invasion of 1241. It is stated, in fact, in a letter of the king of Bohemia Premysl Ottokar II, addressed to the Pope and giving a description of the battle of Kressenbrun which took place under the Hungarian King Béla IV (1260), that among the auxiliary units of the Hungarian army which took part in this battle, there were an innumerum multitudinem hoininum Comonorum et Ungarorum et diversorum Solonorum, Siculerum, et aliae gentes, Saraceni et Hymaedes qui in Mediterraneo Asiae in pede Grecorum, Bulgorum, Ruscicorum et Bosniae haeretarum. It has been demonstrated above that Bessermi is the name not only for Muslims in general, but also for the Khirazim (Kilik) and existed there are general animists and shamanists, to the influence of Islam. They could thus add to the number of Muslims in Hungary. It is from approximately the period of the battle of Kressenbrun that there comes the last Arabic source concerning the Muslims of Hungary. The source in question is a short account of Hungary (al-Hunbar) and of the Hungarian Muslims (al-Badshīrīyya) by Ibn Sa'id al-Maghribi. This account, part of his major geographical work, has been reproduced in the Takātim al-buldān of Abu 'I-Faraj. According to this text, Hungary was divided at this time into two parts, of which one, situated in the east of the country, was inhabited by al-Hunbar (the Hungarians), a Christian people, while the western part of the country was inhabited by another people, known as al-Badshiyy and professing the Muslim faith. This people lived on the river Dūnā (to be corrected to Duna, "Danube") as neighbours to the Germans. The capital of the budū al-Badshiyy, according to Ibn Sa'id, bore the name of Khir and was situated in the south of the country. It is probable that this word is supposed to be an Arabic transcription of the Slavic term god "town" and represents the second part of the name Bőigrad (the "White town") which was the Slavic name for Sčetěs Fehehvar, the capital of Hungary under the dynasty of the Arpads. This name figures, with different forms, in numerous Latin documents of Hungary in the 12th-13th centuries. Its medioeval Latin equivalent is Alba cívitas regia, in German it is Stettin/Königsberg in and in Hungarian, as has just been stated, Sčetěs Fehehvar. Al-Ḳarī calls this town...
Ballaghiyya or Balisaght. Ibn Sa'id adds that the al-Baghūrid people were converted to Islam by a Turkoman fiqh "who taught them the rites of the faith". It seems that the mission of this fiqh (who was not the first Muslim missionary to visit Hungary, a land where, as has been shown above, Islam had been present by the 11th century) cannot have taken place until after the end of the 11th century, a time at which the Turkomans, a Turkish tribe mingled with Iranian elements, was living in a primitive state in Central Asia, as neighbours of the Saljūq Turks. When the latter conquered Asia Minor towards the end of the 11th century, the Turkomans united with them and lived in this land, recognising the authority of the Saljūq rulers of Konya. During his stay in Hungary in 1152, al-Qarākhūfī saw the Turkoman mercenaries in the service of Byzantium taken prisoner by the Hungarians. Seeing that the route taken by Hungarian Muslims who, according to Abu Husayn, made their way to the East and especially to Mecca, passed through Konya, the arrival in Hungary of a Turkoman missionary, probably a native of Asia Minor, seems entirely probable. It may also be noted that Ibn Bāṭūtā (257/1258) uses the name Turkomans to denote the Ottoman Turks.

The biḥād al-Baghūrid was invaded, according to Ibn Sa‘īd by the Tatars (1241) who slaughtered many of the inhabitants. According to another passage in the work of this author, the Bākūrid, as allies of (or rather, subjects of) the Hungarians, took part, in the same year, in a battle near Sibenico (Sibenik in Croatia), in which the Tatar forces were annihilated. The facts given by Ibn Sa‘īd are also confirmed by the Latin sources, including the Rogeri Carmen miserabilis where there is reference to the appearance of the Hungarian Muslims against the Tatars. In another Latin document of this period there is mention of the Saracen district called Bēw which was entirely devastated during the Tatar invasion of 1241.

Little is known of the later history of the Muslims of Hungary because the Arab or Christian sources concerning this religious group become less and less numerous. However, it is stated in a Latin document that in 1290, at the time when the Hungarian King Ladislas IV left his capital, going to live as a monk with the Cistercian monks of the Matra mountains and in some other districts of Hungary, he handed over all responsibilities of state to a Muslim dignitary named Mizs (Ar. Muṣk?), who had himself baptised immediately after this appointment. As regards the Arabic sources of this period, the one most worthy of mention is the Ḥjar al-bilād of Kāzwinī who gives an interesting description of Hungary (he calls it "the land of Būgūrīd") composed on the basis of the account of the fiqh which was written during the lifetime of the country. This account was written, as can be seen from its content, some time after the Mongol invasion of 1241 (the fiqh in question calls the invaders al-Tātar). According to this account, the Bākūrid are a great people whose king has a large army at his disposal and of whom the majority is Christian; among them there is also a multitude (Ar. dijm, also "crowd", "mass of people") of Muslims who observe the law school of the imām Abū Hāmid. These Muslims pay a tax (ṭiyya) to the Christians, just as the Christians pay a tax to the Muslims in lands of Islam. Of less value is a text in the North-Hungarian al-dahr of al-Dimashqī. This author also mentions the Bākūrid people, which he locates in south-east Europe, alongside the Madījar or Hungarians. He does not take account of the fact that these are two branches of the same people. It is quite likely that he meant by this means to distinguish, as had been done by Ibn Sa‘īd al-Maghribī, the Hungarian Muslims whom he calls Bākūrid from the Hungarian Christians whom he calls Madījar.

It seems that Islam was maintained in pre-Ottoman Hungary until approximately the year 1340, the period in which the Hungarian King Charles-Robert of Anjou (1308-42) compelled all those of his subjects who were not yet Christians to embrace Christianity or to leave the country.

However, the Pechenegs, although converted to Christianity in the 14th century at the latest, retained until the end of the 15th century, even after the loss of their ancestral language (by this time they were speaking the Magyar language), some traces of Muslim culture. This is known from the work of A. Bonfinkius, who has provided a vivid description of the Hungarian Pechenegs in his 'Rerum Hungaricarum Decades', i. liv., p. 220, Hanover 1906. According to this author, "they wore long beards and long mantles and shoes in the Persian fashion, in tunics of silk that were ruffled by the wind."

K&ldy-Nagy, Budapest 1974, 53-74; A.A. Vasiliev, The Goths in the Crimea, Cambridge Mass. 1936. The process of re-organisation in Hungary cannot have been so fast as was suggested by I. H. Umemar-špliti, who claimed that the Turks annexed the Hungarian territory possessed by Janos Zapolya to the Ottoman Empire in 1541, converted it into the beglerbegilik of Buda, which consisted of twelve sandaks, and appointed the beglerbegi of Baghdad, Süleyman Paşa, to be its head (Osmanlı tarihi, ii, Ankara 1964, 344). It is true that the Sultan appointed Süleyman Paşa to be beglerbegi of Buda. This post, however, could not involve the government of twelve Hungarian sandaks because, besides the territory of the sandak of Buda, which was just being formed under the protection of the strongholds of Buda and Pest, it was only Titel which was in Turkish possession north of the line of the Drava and the Lower Danube at that time. Therefore, the beglerbegilik of Buda had to be formed from sandaks which were south of the line of the Drava and the Lower Danube, i.e. Eszterkö/Öské, Somendire, Ivornik/Zvonik, Alajhajász/Krudtvej and Valbatírin/Velbítno. If these remote sandaks had not been joined to Buda, it could have been governed only by a sandjak-beg in 1541.

Between 1541 and 1566 the Turks established the following sandaks north of the line of the Drava and the Lower Danube: Buda (1541); Mohács (1542); Szeged and István Belgrad, i.e. Szekszéthervár (1543); Eger (1544), although the fortress of Eger itself had not yet had been occupied, only its viliafite; Esztergom, Hatvan, Nógrád and Simontornyá (1546-8); Siklós (1549); Koppsány (1550); Beszé and Beszkerek (1552); Góörgő, Szekszárd, Temesvár and Csanád (1551); Szeged and Széchnok (1552-3); Székelyfalu (1553-4); Vasgrépánd (1554); Fülek (1555); and Gyula and Szegvár (1566).

In the meantime, they formed the beglerbegilik of Temesvár (1542) from the sandaks of Temesvár and Csanád (the latter including Beszé and Beszkerek), to which they attached the sandaks of Szentendre, Alajhajász and Vidin, later the sandaks of Lippa, Arad and Gyula, respectively. The backbone of the Turks' base in the central part of Hungary was the newly-occupied territory of Buda, but its upkeep against the Hapsburgs was very costly. According to the cash-book of the Treasury of Buda for the years 1559 and 1560, there were 10,900 Turkish troops in the fortresses belonging to the eyallet of Buda, for whose pay and equipment an annual sum of 260,000-80,000 gold pieces had to be brought in from Istanbul, because the taxes and duties obtained in Hungary covered but one-third of their expenses. The transport of money from Istanbul to Buda was necessary not only in the decades that followed, but also in the 17th century. According to Pécsei, the annual tax-yield of Egypt, 300,000 gold pieces, was sent directly to Buda (Ta’rıkh-i Pecelov, Istanbul 1283/1665, i, 36). The new campaigns also increased the expenses of retaining the Hungarian territories, and the burden which the newly-occupied fortresses imposed on the empire was clearly greater than the advantage they offered. Thus, e.g., when Eger (1596), Kanizsa (1600), or Váradi (1606) fell into Turkish hands, each of these fortresses had to be made the seat of a new beglerbegi, so that greater forces could be concentrated for their defence in case of emergency. In accordance with their custom, the Turks formed new beglerbegis.
ségélyek by a re-organisation of formerly-occupied territories. However, while earlier they were able to extend the boundaries of the new beglerbegilik by further conquests (see e.g. the beglerbegilik of Buda and Temesvár), they were no longer able to do so in the 17th century.

The decline in the military preponderance of the Ottoman empire is well-characterised by two episodes which happened in two phases of Turkish rule in Hungary, in the 16th and the 17th century respectively. In the first phase, when the Hapsburgs' envoy, Ferenc Jürkövid, appeared in a role of state and with a sword on his side before Sziget Pasha, beglerbegi of Buda, in 1557, the Pasha had the envoy's sword broken to pieces. In the second phase, however, when Gáspár Tassi, a deputy, went to Mártača Pasha of Buda in 1627 to lodge a complaint against the kádi of Hatvan, the Pasha immediately ordered that the kádi be given 500 lashes on the soles without hearing any witnesses. The Turks' attacks in the 17th century were chiefly mere flare-ups of enthusiasm. During one of them, the siege of Vienna in 1685, they deployed such military weakness that it was soon followed by the coalition of western powers and the eventual liberation of Buda in 1686. Within a decade after this, the Turks lost nearly all their conquests in Hungary except the beglerbegish of Temesvár, which they managed to retain until 1718.

The effect of the Turkish rule in Hungary on general European conditions is variously evaluated in the literature of the subject. According to a noteworthy statement by B. H. Slicher van Bath, the rise in meat prices in Europe after 1550, which was partly due to the growth of population, was primarily caused by the fact that the Turks had occupied Hungary and the import of cattle from South-Eastern Europe had decreased (The agrarian history of western Europe A.D. 300-1800, London 1963, 204). It seems likely, however, that the rise in European meat prices was due to other factors, because, according to Turkish customs registers, that part of Hungary which was under Turkish rule exported to the west 60-80,000 head of cattle yearly around the middle of the 17th century.

However prosperous cattle-breeding was in Hungary under Turkish rule, it was a negative phenomenon from the point of view of economic progress since it meant a return to extensive animal-keeping. The fields of a number of Hungarian villages destroyed in the Turkish wars lay uncultivated, deteriorated into pasture and were hardly fit for anything else than animal grazing. This explains how it was possible even after the Fifteen Years' War (1593-1608) for an English merchant to write the following words about the abundant cattle-stock of Hungary: "This Country doth make more meate out of the Land then the whole Fence of England. The Champaign of the land is so great, that they yearly sell to their neighbours 80 or 100 thousand Oxen" (Lewes Roberts, The merchant maappe of commerce, London 1637, 177). When evaluating this attractive figure, however, one has also to consider the fact that such significant towns in southern Hungary as Pécs and Tolna lost the greater part of their vineyards, the source of their former wealth. For example in Tolna, a town with 5000 inhabitants, where, according to Turkish financial accounts, a yearly amount of 6,900 hectolitres (about 150,000 gallons) of wine was produced in the 1560s and 70s, wine-growing completely lost its importance in the course of the 17th century. The worsening of the economic situation can be traced on the basis of Turkish sources, not only along the Danube but also in the area of the River Tisa. For example, in the villages of Győr and Tápió, two imperial glass-estates near Szeged, both the number of the inhabitants and the amount of their agricultural production had dropped to one-half of the original figure between 1530 and 1670, although these figures could have doubled in 120 years.

The demographic conditions of Hungary in the period of the Turks can be fairly well estimated on the basis of the tahrik defterleri. After their first conquests, as soon as they had strengthened their posts in Hungary, the Turks started to make written records of the settlements within the sanjak, which they established with rather vague boundaries. As was written in one of the Sultan's instructions to the sanjakbég of Mohács in March 1545: "The state of the local settlements and the conditions of régya must be examined in the same way as in the other provinces" (İstanbul, Topkapı Sarayi Müzesi Arşivi D. 12211, p. 141). The first registers were made in the sanjak of Mohács and István Belgrad in the beginning of Czacho's time, who was newly appointed; he had been sent to Hungary by the Khan. Of these two tahrik defterleri, only the one of the sanjak of Mohács has survived to this day. In the same years, Khálli Beg prepared the registers of the sanjaks of Buda, Esztergom, Nógrád, Hatvan, Szeged and Sinaotornya as well; these tahrik defterleri and the timar defterleri compiled on their basis are all extant today. New registers of the sanjak were usually made every ten years up to 1590. Later, however, the administrative organisation of the Ottoman empire became so loose that new registers were made only in the newly-occupied territories, while in other parts the old registers were re-copied. This is evident from certain income figures; e.g. a timar's income in the sanjak of Buda was exactly as many akits in 1676 as in 1590, although the value of money had considerably changed in the meantime.

In the first half of the 16th century, the Turkish tahrik defterleri still presented a relatively favourable picture of Hungary's demographic conditions. In the town of Szeged, for example, where there were 1,149 families in 1546, the number of households after the battle of Mohács and the first Turkish occupation (1546) was doubled, i.e. the population of Szeged decreased by only about 100 families after the battle of Mohács and the first Turkish occupation. After the subsequent wars and devastations, however, the Turks could levy the gáme tax on no more than 351 heads of family in the same area in the last years of the century.

Of course, this does not mean that the greater part of the Hungarian population perished, because, as is well-known, the so-called "Czecho-Slovaks" who escaped to territories of Hungary which had not passed under Turkish rule. As one can read in a Hungarian letter written as early as 1550: "The people of the land, especially in the country of Pest, left their homes in multitudes, seeking refuge in the counties of Zala and Somogy" (there had already been Turks in the country of Pest, but not in the counties of Zala and Somogy as yet). In spite of all this, there were relatively few Turks who came to settle down in Hungary. It is true that a few towns such as Esztergom, Visegrád and Nógrád, were evacuated after their occupation for strategic reasons and were inhabited almost exclusively by Turks in later times as well. Besides such places, however, it was only in Buda, Pest, Vác,
only a faint memory of former Turkish rule. Subsequent wars destroyed them but because the Turks of the Ottoman period, and this is not because sub-

verttallung,
The Milky Way was known to the Arabs in their classical period; cf. a collection of classical and post-classical Arabic verses naming al-madjarra, in Wiedemann [1], 673-5 (see also Ibn Manṣūr [2], 118 f.). In lexicographical texts, the positions of several fixed stars are described in relation to the Milky Way. Abū Ḥanīfa al-Dinawarī (d. 282/895) gave a description of the course of the Milky Way in the sky as seen by the Arabs in their "pre-scientific" period (Abū Ḥanīfa, in al-Marzūkī, ii, 9 f.; tr. Wiedemann [1], 66-9). Further, it was observed and mentioned by the Arabs that the position of the Milky Way in the sky changed in different seasons according to the annual revolution of the sky (Abū Ḥanīfa, in al-Marzūkī, ii, 10 f.; tr. Wiedemann [2], 666-81; Ibn Kāṭiyya, 124; al-Kaṣwīnī, 21 f. - tr. Ethē, 44). A late description based on personal experience was given around A.D. 1490 by Ahmad b. Mādjīd, the famous navigator of the Indian Ocean (see Ahmad b. Mādjīd, 149 f.; tr. Tibbēts, 140). It should be noted that some of these non-scientific authors understand the Milky Way as a dense accumulation of faint stars that appears to the observer's eye as a nebulous mass, a theory which seems to have originated from independent observations not influenced by the teachings of Greek philosophy (cf. Ibn Kāṭiyya, 124; al-Kaṣwīnī, 21 = tr. Ethē, 44; Ahmad b. Mādjīd, 149 = tr. Tibbēts, 140).

A scientific astronomical description of the Milky Way was given by Ptolemy in his Almagest (book xxvii, § 2), which became known in Arabic through a series of translations from the end of the 2nd/8th to the end of the 3rd/9th centuries. Abū Ḥanīfa's description, however, apparently was not influenced by the Almagest, since he uses descriptive elements of pure Arabic origin only. Also, his description of the Milky Way resembles that of Scorpius, near the ecliptic, whereas Ptolemy's description begins and ends in the constellation of Centaurus, in the southernmost region of the sky visible to him in Alexandria.

Cosmological theories of the Milky Way were conveyed to the Arabs by translations and paraphrases of Greek philosophical works, as, e.g., Aristotle's Meteorology (for the chapter on the Milky Way, see al-Tafhim li-nūd al-tanjjim, f. 140; ed. A. R. Badawi, Cairo 1961), Astronomical verses, Al-Fārābī, (written around A.D. 950) says that, contrary to the teachings of Aristotle and his followers, al-madjarra is of the same height (above the earth) as the fixed stars because the moon and the planets are not influenced by it when crossing in front of it, as should happen if the Milky Way was below them, and because it shares all the peculiarities of the fixed stars as described by Ptolemy, viz. that it is found in their sphere and unvariably keeps the same relations in distance and shape just as the fixed stars do (al-Bīrūnī [2], ii, 949, 17-93, 1; nearly identical with this is the quotation from Barhebraeus (cf. Ibn al-Haytham and al-Bīrūnī). Especially interesting are the scientific deductions of Ibn al-Haytham (d. ca. 1041), who arrived at the conclusion that the Milky Way does not form part of the air (the sublunar sphere) but must be far out in the space (see Wiedemann [1], 672, and the literature quoted there). Also, al-Bīrūnī in his al-Fārābī, al-Madjarra (written around A.D. 950) says that, contrary to Aristotle and his followers, al-madjarra is of the same height (above the earth) as the fixed stars because the moon and the planets are not influenced by it when crossing in front of it, as should happen if the Milky Way was below them, and because it shares all the peculiarities of the fixed stars as described by Ptolemy, viz. that it is found in their sphere and unvariably keeps the same relations in distance and shape just as the fixed stars do (al-Bīrūnī [2], ii, 949, 17-93, 1; nearly identical with this is the quotation from Barhebraeus (cf. Ibn al-Haytham and al-Bīrūnī).
deviating from its original meaning and use, its opposite being ḥāṣba ("verbal expression").

In Arabic literature, the different modes of expression labelled as madjaẓ by the Arabic theorists were divided into twelve categories by Fakhr al-Dīn al-Rāzī (d. 606/1210) without, however, following a consistent system of criteria (cf. al-Suyūṭī, Muṣārara, ed. Cairo 128a, i, 171). A more refined and detailed version of this classifying system was put forward by al-Suyūṭī (d. 911/1505), a younger contemporary of al-Rāzī, in his Kitāb Madjaẓ al-Kurān by Abū Ḥubayrā (see Sezgin, GAS, i, 35 ff., 48).

Parallel to the purely philological studies, research on Kurānic hermeneutics was undertaken by theologians, whose investigations seem to have had a still greater bearing on the development of the madjaẓ theory. All theological groups, in fact, resorted to the Qurān in order to support their statements, since the text allowed quite contradictory interpretations. Rāzi, Muhammad b. al-Tanāsfūn (d. 1026) already pointed out in his anti-Kaddār discussions that occasionally in the Qurān an effect proper to God is ascribed in its cause to a created being, and he thus anticipated the notion of madjaẓ ṣakt (cf. Van Ess, Anfänge muslimischer Theologie, Beirut 1977, 105, 108 ff.).

An instance of this phenomenon is given in the verses "The spring-time made the herbage come forth", the effect of bringing forth herbage not being ascribed to the Creator but to the spring (see al-Ma'ānī wa l-Bayān). If credence may be given to the Ta'wīl al-Qurān (ed. al-Muṣṭafī, 30, II. 5 ff.), it likewise happened that in discussions with other religious, attempts were made to shift the difference from the text to the verbology, thus making use of the madjaẓ theory. Ibn Qutayba actually thought it convenient to deprive the Christian term "Son of God" of its shockingly by taking refuge in a tropical interpretation (Ta'wīl, roe, II. 5 ff.).

It was, however, due to the theological aspects of the Qurānic madjaẓ that the question was raised how far tropical expressions might be valuable and useful. One of the major reproaches brought forward against the use of madjaẓ was that tropical language was likely to falsify the image of reality. Already Ibn Qutayba drew attention to this fact (Ta'wīl, 122 f.; see also Suyūṭī, Idāḥ, 510, 11 ff.)

It proved more rewarding, however, to tackle the positive aspects of the problem, as tropical expressions used in the Qurān were liable to express more clearly and more completely the intended meaning than would have been possible by means of a veritative expression. A number of excellent single studies relating to the above subject were brought together by al-Sharīf al-Raḍī (d. 496/1007) in his Ta'wīl al-Qurān (cf. Van Ess, Anfänge muslimischer Theologie, Beirut 1977, 105 ff.).

It thus happened that the discussion on madjaẓ was shifted into the field of interest of the inimitability of the Qurān (iḍāḥ al-Kurān).

**Bibliography:** Shorter or longer treatises on madjaẓ are to be found in all manuals and studies relating to rhetoric or the rhetorical art since the 5th/11th century, but especially in the works of the school of al-Sakhākī (see also al-Ma'ānī wa l-Bayān). The madjaẓ literature equally includes everything written on isṭāfā; see particularly W. Heinrichs, _The Hand of the modernist_, Wiesbaden 1977.
In Persian literature. — The use of the term madjāz by Persian writers has always been subject to the influence of the Arabic doctrine outlined above. A distinction between more borrowing on the one hand and autonomous development on the other can in each instance only be made on the basis of extensive and chronologically differentiated data which are not yet available. For that reason, no more than a rough sketch of Persian usage can be given here and questions concerning the origin and the history of specific aspects must be left aside.

The first writer who dealt with madjāz as a rhetorical term was, to our knowledge, Shams-i Rāyš, a contemporary of al-Sakkākī. He defined it as an inclusive category of figurative speech being opposed to the category of literal, "true", speech (hassāš). His definition also comprises the necessity of a common aspect (madjāz-i sādhī) providing a link between the figurative and the literal meanings of an expression by means of which the real intention of the speaker can be established. The most important type of madjāz is the metaphor (istīfarāt) which can be used in all kinds of speech. Another type consists of allegorical devices occurring especially in poetic descriptions such as the temzone (munshīra) in which imitative objects or animals are introduced as speakers in an exchange of arguments (al-Muṣāfūm fi madjāzī āghār al-sādhi, ed. Tehran 1358/1979, 395 ff.). A much more complicated terminology is presented in the textbooks of the post-classical period, e.g. in the Haddūzal al-balāgha of Mir Shams al-Dīn Fakhr-i Dihlavi (1414-31/1703-28), a digest which was made by J. Garcin de Tasso, Rhetorique et prosodie d/s langurs de l'orant musulmān, Paris 1873, see esp. 40 ff. and 66 ff.). Recently, a summary of inter-Persian theory has been given by Diālī al-Dīn Hurmāz (Fārsī al-balāgha va madjāz-i adabi, Tehran 1354/1975, 247 ff.). Two technical terms among the many dealt with in these surveys deserve mention here. The presence of a clue or karina (also called karina-ī pārīsa, as it "leads" the mind the intended meaning) is required to express the relationship (sādhī) between a madjāz and the corresponding ḥashāšī. Such a clue is either implied in the context or specifically added, e.g. in the example nīrī-ī shahānšahān in which the adjective points to the actual meaning of "valiant warrior". If the trope is not based on a similarity of form but reflects the place where it manifests itself, a whole and its parts, a cause and its effects etc. it is called madjāz-i mursal ("free trope", according to the interpretation of Hūnāt).

An especially Persian use, for which the authority of the early lexicographer Faṣīḥ-i Kawwās (fl. ca. 700-700 in India) is invoked, restricts the application of madjāz to metaphors based on terms which either refer to an accident (ārād) or to imaginary things (mutaffara). For al-Maladīnī, Koshkī sīlahālī al-fārisī, Calcutta 1872, ii, 505 f.)

In Persian grammar, a connection of one substantive to another by means of the hasra-ī idāfa is called "figurative" (idāfa-ī madjāz) if it reflects only an estimation (istīhār) of the speaker. This includes the idāfa-ī ṣagbāsh in which the particle of the idāfa denotes a comparison (e.g. ẓanīn-ī nāh, "an eye like that of a gazelle") and the idāfa-ī isṭīrā' (e.g. hāqī-ī sadāl, "the sword of death") which implies a metaphorical personification (see further, M. Muṣīn, Idāfa, Tehran 1341/1962, 430-52).

Outside lexicography and philology, ḥashāshī and madjāz have been used frequently for literary ex-pressions in mystical terminology. Real love (ṣawād-ī ḥabīb), directed towards the Eternal Beloved, has as a counterpart "figurative" love (ṣawād-ī madjāz), which concentrates on another object but only as a temporary substitute for the true goal of mystical love (see for early instances Sanā'ī, Dīwān, Tehran 1341/1962, 797; ʿAzāz al-Dīn Nassafī, Kūsh ʿImān al-hūnāt, Tehran-Paris 1964, 145 ff.). Similar terms were coined to indicate the distinction between as well as the interdependence of the sphere of divine existence and the present world. Expressions like wujūd-ī madjāzī, ḥassī-ī madjāzī or sārā-ī madjāzī reflect the view that the latter can be predicated to be in existence by way of a trope only.

Bibliography: In addition to the works quoted in the article, see in general M. Muṣīn, Fārānk-ī fārās-ī mutawassī, Tehran 1535/1966, iii, s.v. madjāz. (J. T. P. De Bruijn)

In Turkish. — Although several neologisms, such as addəqanın and defi̇səme have been proposed since 1948, this Arabic term continues to be in vogue in the sense of "trope" or "figurative language" as one of thousands of literary terms acquired from the Arabs and Persians by the Turks as they became practitioners within the Islamic literary tradition. In the process of borrowing, they also inherited much of the confusion and ambivalence that characterised the periodic definition and classification of the three divisions of the science of balāgha (q.v.). By the end of the Middle Ages, when the Turks began to formulate their tropological utterances according to the Islamic perception of figurative language, they also accepted the assignment of madjāz to the "expression" (išâyā [q.v.]) division of the Islamic system of rhetoric.

Until the 19th century, the Ottoman Turks did not produce any literary manuals of their own, preferring instead to refer to the standard Arabic and Persian texts or to their Turkish translations of these. This reliance on the works of their literary mentors was especially marked in the case of rhetorics, the productions of al-Dzirjānī (d. 471/1078), Shams-i Rāyš (fl. 600-27/1204-30), al-Sakkākī (d. 625/1228) and al-Taftāzānī (d. 771/1369) [q.v.] apparently amply meeting their need for reference works on this subject until the Tongunşū period (1839-76). Thereafter, the new generation of Ottoman writers and teachers, now under strong European influence, began to create original works dealing with all aspects of literature. Reference works by literary innovators like Ahmed Djewidet Pasha [q.v.] and Ekrem Bey [q.v.], who wrote mainly for the new schools, and the efforts of their continuators since the Republic (1923), point to an understanding of the meaning and use of the trope that is more in keeping with the syntax and morphology of the Turkish language. This activity, however, did not entirely eliminate the problems of definition and classification. Nowhere is there a clear agreement on the division of tropes into two major classes as of madjāz-ī mursal (synecdoche and variants) and istfāra (metaphor and extensions).

(1) Madjāz-ī mursal (Mod. Tkish. kassamu-lama addəqə) in which the objects featured in the figurative expression have a relationship that is not described in terms of direct comparison. This type of trope is itself broken down to several variants of which the most frequently encountered are:

a. "umutniyya-xasūsyya, the particular for the general, geasa for species, etc., and vice-versa,
"Every sail on the Marmara is flying merrily."
b. awaliyya, referring to the projected state of the object, "Light the fire!"

c. titiya-sababbiyya, position and locale conjunctive, "Emerging from prayer, they went to the promenade area."

d. sababbiyya-mawjudbiyya, cause and means relationship, "This shop has earned much money."

(2) Isi'dara (isgireleme) in which the comparative elements of the relationship between objects are stressed in various degrees. There is no uniform agreement as to exact relationship and classification of these. The generally accepted two major divisions are:

a. isi'dara-i massa'alaba (amzg isgireleme) or explicit metaphor, in which the comparison is achieved by direct reference to an object, "Our lion is no match to the battlefield."

b. isi'dara-i mahziyya (hapa tal isgireleme) or implicit metaphor in which the comparison is achieved by reference to an attribute of an object without mentioning the object itself, "A cool stream sang tirelessly."

Each of the above divisions is subdivided even further on the basis of other pertinent considerations affecting, or affected by, the nature of the attributive relationship between the referent and the referred objects.

MADJD AL-MULK — AL-MADJDJAWI

Bibliography: *Camb. hist. of Iran*, index; C. L. Klaunzer, *The SELJUK empire*, a study of civil administration 1055-1194, Cambridge, Mass. 1923, 42, 45-9, 92, 105-6; C. E. Bosworth, in *Encycl. iranica*, s.v. al-Baladáni. (C. CAMER)

**MADJDUB** ("the attracted one"). In Sufi literature the name for the representative of a type of piety which is chiefly of a passive nature (passif-ascétique) in contradistinction to the active (sifî) "striding one" (sâlik), a characteristic which is expressed in numerous other pairs of opposition, like: murâdâh-murâdâh, maktab-taktab, makâmânî-makâmânî, makhrîz-kikhrîz. While the madjdub, on the way to God, may abandon himself to be drawn by divine attraction (*dadkhâja, dadkhâjât, Perisan khajâr*), the sâlik depends on his own exertions (*kâfîgâh*), a gift (bâshâfî) of God. Usually, mixed forms occur, as is clear from the works of Nâdir al-Dîn-i Kuhârî [790] and Nâdir al-Dîn-i Dâya, for whom the "strider" is the one who, while striding, is attracted gently, and the madjdub the one who, while striding, is attracted intensely. Others, like 'Umar al-Sahrawdi, Mahmûd-i Kâhânâ and 'Asîz-al-Nasuli, speak of a "strider who is attracted" (sâlik-i madjdhib) when the striding came earlier in time, and of an "attracted one who is striding" (madjdhib-i sâlik) when the being attracted came earlier in time. The problem, as is clear from the works of Kadjm al-Dîn-i Kubra, is that who, when merely striding, nor the one who is merely attracted, is qualified to be a âghây or to lead others on the mystical path, since the former has never arrived at his aim, while the second, as being only attracted, has never stridden along the path by himself. With regard to personal progress, it is true, the word of the Prophet holds good: "One single attraction by God is equivalent to the activity of men and beings, but only the one who has personal experience of striding, its labours and dangers, is able to assist others in advancing. In more recent literature in particular, madjdhib is a frequently used extenuating and excusing designation of eccentrics ecstacies, love-maddened persons, holy fools, and despisers of the law. Occasionally, the term is also used as a nickname, like in Ibrahim-i Madjdhub (7th/13th century).

**AL-MADJDUB** is a common name of a Moroccan holy man whose complete name is 'Abd Zayd 'Abd al-Rahmân b. Ayyûd al-Sânâhîji al-Farâdî al-Dukkâlî. He came originally from Tlît, in the district of Azemurâm, but lived in Fas, where one of his disciples was in particular Abu 'I-Maabdîn Yusuf al-Fâsi, whose great-grandson, 'Abd al-Rahmân b. 'Abd al-Kâdî [see AL-FAS, in *Suppl.*] left behind a work called *Ithâlahâl al-buluk bi-khabar al-aghây*. Abu 'I-Maabdîn mu-ghaybîtik al-Madjdhub (extracts in ms. Rabat 5242; see Lévi-Provençal, *Catalogue*, 252). 'Abd al-Rahmân al-Madjdhub died in the Gharb in 796/1589 and was buried in Mohâbê. He is especially famed for his gnomic poetry which took the form of quatrains in dialectal Arabic [see HAJDUN] and which, towards the end of the 17th century, attracted the attention of H. de Castries (*Gnomes de Stûr Abû-Rahman al-Madjdhub*, 1856). His work on personal and civil administration in various works, 'Abd al-Kâdî Nûr al-Dîn has had lithographed in Algiers (at the beginning of the 19th century) *al-Kawâl al-mo'dur min hådâm al-aghây* 'Abd al-Rahmân al-Madjdhub, which contains 127 quatrains with a commentary in classical Arabic; they have been published, translated and commented upon by J. Scelles-Millie, *Les quatrains de Madjdub le sarcastique* (*poète maghrab de XVIe siècle*, Paris 1956).

Following the example of his father who had lived for a long time in Morocco where he had studied and taught, especially at al-Karawiyîn [790], before returning to his native city to practise there the duties of kâfî, al-Madjdjawi travelled to this country at a very early age. At Tangier and later at Tetouan he undertook classical studies which he completed at Fâs as a pupil of distinguished *alumâ*âf, including Mâhiy Muhammad al-Alawi, Muhammad b. al-Madjdun Gâñnm, Sïâh al-Shawâl, Ahmad b. Sûdâ and Djâmar b. 'Idrîs al-Kattânî. Returning to Algeria in 1869, in 1873 he was appointed *mu'darîs* at the Sîdl al-Kattânî mosque of Constantine, which he left in 1877 for the official *madrasa* of the town, where he spent more than twenty years. His very conscientious teaching was already complemented by personal scholarly work. Transferring to Algiers in 1896, he was in addition entrusted with the duties of muftî and *kâfî* at the Sîdl Ramâdân mosque. His widespread knowledge and cultured personality attracted to him the affection of numerous disciples, among whom it is appropriate to mention, in particular Hamâm al-Wâlî, who was to become the patron of 'Abd al-Hamîd Ibn Bâdis, al-Mâwûdî b. al-Madjdub, a teacher at the madrasa and Malkî *ra'ûfî* of Constantine, *Abd al-Karîm Bâsh Tacîl*, Hanâfî *muftî* of the same town, Hamâm b. al-Dârâdî, Hanâfî *bâshî* of Algiers, and Muhammad Saîd Ibn Zokrî, a teacher at the madrasa and Malkî *muftî* of Algiers.

A teacher by nature and by profession, al-Madjdjawi revealed his views on educational issues in three monographs (see below). On the other hand, his tastes as well as the specialised responsibilities of the two chairs that he occupied in Constantine and Algiers led him to take an interest in the traditional disciplines of law and of religion. Deeply committed to orthodoxy, he allied himself with scholars who, in the name of the Kur'ân and of the Sunna, denounced superstitions practices, impious innovations (*bi'dâ*), and the popular demon-
strations encouraged by the leaders of the Saffi brotherhoods. He also tackled with equal confidence such varied subjects as morphology, syntax, rhetoric, astronomy, cosmography, mathematics and economics. Through his writings, al-Majdjid aims to present the image of an 'Ulama of encyclopaedic learning. To this end, he introduces into his texts numerous and lengthy quotations not only from the Kur'an and from hadith, but also from the works of jurists, philosophers, historians, poets and even of obscure writers. Faithful in this respect to scholastic method, he demands from the ancient scholars more than simple references or entertaining curiosities. His borrowings have a relevance that goes beyond words and forms; he is inlaid to the Arabo-Islamic tradition which provides him with the models for life and thought, and he takes it upon himself to convey this tradition in its entirety to his contemporaries.

The corpus of al-Majdjid's work comprises eighteen titles, of which the list is as follows: 1. 
2. 3. 4. 5. 6. 7. 8. 9. 10. 11. 12. 13. 14. 15. 16. 17. 18.

only to that with British India. It was through this connection that Majjid's sister Salma succeeded in making contact with one of the employees of the German consulate, Heinrich Ruse, whom she subsequently married. In 1861, Majjid led an expedition to reassess his authority in Pate, which had rebelled; but he failed in 1866 when there was a similar, but more determined, rebellion in Witu. A learned ornament of the British claim, originated by (Sir John) Kirk, is not well-known, and it is not known exactly what was the "reception hall of a caliph, high dignitary or other personage" and "a session which is held there", "a hall in which a professor's courses are given or a judge's sentences delivered" (hence "praetorium, tribunal"), or further where the debates of an assembly take place (hence "council").

1. In social and cultural life
2. In Insulin "usage"
3. In Indian "usage"

In the sense of representative institutions

A. In the Middle East and North Africa
B. In Afghanistan
C. In the Indo-Pakistan subcontinent

1. In Social and Cultural Life

From the pre-Islamic period, majdjl designated an "assembly or council of the tribe's notables" [see Badaw, III, c] and this institution is still alive (see e.g. J. Chohlo, Le droit dans la société bidouine, Paris 1971, 32), sometimes under another name [see Badaw; below, 4. E. In Afghanistan; 5. In the Middle States of the Middle Ages, an elaborate governmental structure contained a series of majdjlis, councils given precise powers (see notably al-Kalkaghani, Suhb, index, 422-3). This usage plainly justifies the adoption of this term to designate in the contemporary age any council (majdjlis al-baladiyya "municipal council", m. al-umara' "council of ministers", etc.), an elected assembly (m. 'al'a'khi "constituent assembly"), a chamber of deputies (m. al-mu'munah), a senate (m. al-ayyil al-ur-ad-din), etc. The historical account of the legislative assemblies and parliaments in the Muslim countries will be the subject of section 4 below, and the present notice will be limited to a brief survey of the majdjlis which played a rôle in the social, religious and intellectual life of the Muslims of the Middle Ages.

The first to be considered is that of the sovereign who dedicated part of his activity to "public or private meetings (majdjl, pi. majdjlal), where political and judicial decisions were adopted, plaintiffs, penologists and other visitors gathered, and questions of literature or law were debated—for this was also regarded as a normal function of the head of state" (R. Brumachiv, Hafisider, ii, 37). These sessions followed a ceremonial which varied according to the dynasties and the character of the monarchs. The etiquette of the court under the Umayyads is not well-known, and it is not known exactly what respective place was occupied by the representatives of the different social classes regularly admitted to the caliph's majdjlis. For the Abbasid period, we possess as an official text the Kitab al-Tadi (ed. Ahmad Zakl Pasha, Cairo 1939; French tr. Ch. Pelliot, Le Livre de la couronne, Paris 1954; cf. F. Gabrieli, Eichetta di corte e costumi Sassanidi nel Kitab al-tadi al-mujtah di al-Cabi, in RSO, xliii [1952], 197-247), which sets forth, mainly for the people and part of the aristocracy unfamiliar with the customs, the rules of royal protocol of the Sasanid court which it was proper to adopt, and supplies us with information derived from Islamic history only on the entertainment
sessions. For the Fāṭimids (see M. Canard, Le cérémonial fatimite et le cérémonial byzantin, in Byzantion, xxi [1955], 353-400), the information is more detailed. The caliph habitually held a public audience on Mondays and Thursdays each week and sat on a golden throne separated from those attending by a grill (dshobbākh) and a curtain (sad) which was raised to be lowered as he approached. Among the title-bearers with public and private functions who had their places, according to their rank, in the reception hall, there must have been the presence of a sāhib al-madjas, a high-ranking eunuch entrusted with organizing the session and advising the dignitaries as soon as the caliph had taken his place on his throne (al-Salākhāndi, 133, i, 390-8; cf. B. Lewis, Islam from the Prophet Muhammad to the capture of Constantinople, New York, etc., 1974, i, 203-8). We also possess some information on the status of the people admitted into the audience chamber: for Muslim Spain, e.g., it consisted of elements constituting the khāṣṣa (see al-ṣaṣṣa wa l-tāmmā); for Tunisia in the time of the Hafsids, see R. Brunschvig, op. laud., ii, 28-9.

In these public audiences, plaintiffs and petitioners were present, but poets and scholars who were admitted to the ruler's presence also participated, and for those who solicited the same honour it was an occasion to be introduced to this privileged circle of men by the mediation of someone already established at court, to recite a panegyric and receive an immediate reward.

The crowning of this process was well on the way when the ambitious man was retained at the royal table after the public audience or at another time of the day. The majority of caliphs actually were accustomed to surrounding themselves with a group of mulāmān (pl. of mulām), companions who had in theory to respect quite strict rules, of which one can gain an idea from the Kitāb al-Tādīl (17-20, tr. 29-39) and to possess a certain number of qualities and kinds of knowledge that al-Mas‘ūdi detailed in his Aḥkār al-tamān (see Murādī, viili, 103-4 = §§ 3290-30).

A long account will not be given here of the entertainment evenings which many of the Muslim rulers organised regularly and in the course of which they gave themselves up to 'pleasure' or jarab provoked by the music, singing and drinking. The Kitāb al-Tādīl (31-9, tr. 39-66) enumerates those who, surrounded by women slaves and eunuchs, hid themselves behind the music, singing and drinking. The ruler gave himself up to "pleasure" or amir, which he reaped after he was seated. Among the title-bearers, poets and scholars frequently attracted by the music, story-tellers, grammarians or fukūhī, to rejoice in the victory of some and sneer at the discomfort of others. The ruler's madīlīs also became a circle which J. E. Bencheikh (Les voix d'une création. Essai sur la poésie arabe à Bagdad dans la première moitié du IIIE siècle, thesis Paris 1971, 190; idem, Poétique arabe, Paris 1975, 22 ff.; idem, Le cénacle poétique du Califat al-Mu‘āwīdhis ... in BELO, xxix [1977], 32-52) describes as "a court of legislation", adding that the creator confronts there a well-informed prince, formidable men of learning, uncharitable colleagues; in short, criticism is made immediately and pronounced without appeal. On the other hand, it plays a basic role in the diffusion of masterpieces: the scholars comment on them, the musicians are inspired by them, the listeners spread their renown*. These general considerations inspired by the study of a limited period of the history of poetry in Bagdad are perfectly applicable to the majority of courts of Muslim sovereigns who were friends of letters and the arts to any extent and concerned about their reputation as patrons.

In addition, before even the dismemberment of the ‘Abbāsid empire was accomplished, parallel to the caliph's madīlīs, there were some literary groups directed by provincial governors and high dignitaries who had it at heart to gather around them, to ensure their prestige, poets and scholars frequently attracted by ethnic or politico-religious affinities, but also for basely material reasons, for the isolated man of letters or scholar could only live sparsely, if he were without fortune; in any case, if he were not particularly ambitious, he had to appeal to a patron, who, in default of the caliph, he could find in the provinces, then at the court of the dynasts who flourished from one end to the other of the Muslim world.

This necessity was undoubtedly prejudicial not only to the quality of the work at least of the poets, but also to their dignity, for they could not help but compromise themselves, to obey the tastes of the patrons and their entourage, and to adopt at times a politico-religious attitude contrary to their own convictions. In any case, the study of patronage in the history of Arabo-Islamic civilization (which remains to be undertaken, for it has only been so far sketched out, e.g. by R. Blachère, HLA, iii, 344-57) would be really instructive; based on the literary groups and salons in evidence from the Middle Ages to our own days, it would provide a global idea of the influence that the latter exercised on the evolution of literature.

In a society where, as R. Blachère (Moranabbī, 130) writes "the life of the salon occupied an important place, no one could aspire to public admiration, if he were not also a man of the world, an agreeable conversationalist with a lively mind and prompt at repartee, skilled in creating situations which he could turn to his advantage". These remarks, valid for the madīlīs of kings and princes, hold
good for those who, at an inferior social level, stayed simply in the home of well-to-do poets and writers and even in the shops of merchants who practised in their own way a form of patronage. So some madialis were and still are constituted which are real literary salons, where good speech is honoured and extemporisation reigns.

When the person who held session was a professor, his madialis, which could possibly be transformed into a coterie, was the place (mosque, madrasa, personal home, etc.) where he dispensed his teaching; the same term designated the whole body of his audience, the session during which he dictated his lessons, and, finally, the course itself; his lessons, once recorded by his pupils, were "published" most often under the heading amili "dictations" (see madialis al-frikma), was the place (mosque, madris, his madialis, homes or, more properly, in the house of well-to-do poets and collections function of the Fatimid age, the TayyibI of the F&timid age, the Tajaddun, the Madialis Mustunsiriyya, of 'Abd al-Halim Sharar, these included the madialis (reciters), recounting the virtues of the Prophet's family; the madialis narrators of anecdotes), describing the misfortunes of those martyred at Karbala, the madialis (singers of dirges), who were accomplished musicians. Among these various activities, the singing of dirges, in particular, enjoyed much popular appeal, despite its disapproval by the religious leaders. In its literary role, the madialis contributed to the development of the marthiya in Urdu, as illustrated by Anb (1802-74) and Debr (1803-75), the recognised masters of that genre (see MARTHIYA, 4. In Urdu).

3. IN INDIAN SHI'I USAGE

This term is especially used in the Indian subcontinent for the Shi'i mourning assemblies held during Muharram to commemorate the tragedy of Karbala. These assemblies are organised in private homes or, more properly, in the imam-habias, where miniature replicas of al-Husayn's tomb at Karbala, made out of paper or other material, are kept throughout the year. The madialis, though dating back to earlier times, acquired real prominence in the 19th century, with the imperial giveaways by the Nawab of Awadh or Oudh (1722-1856). Under these rulers, Lahriyaw (g.e.) or Lucknow, which was the seat of administration, became the undisputed centre of Shi'i culture in India and a place where the madialis found its full development. Since then, the madialis has retained much of its traditional character. The central theme of the ceremony is the recital, in prose or verse, of the events connected with the martyrdom of al-Husayn, followed by lamentations and the beating of the breast, in which the whole assembly takes part. The service ends with the distribution of sherbet, sweets or food to all those present in the madialis. An important outcome of the institution was the emergence of individuals performing distinct functions in the madialis proceedings. As related by 'Abd al-Halim Sharar, these included the madialis (reciters), recounting the virtues of the Prophet's family; the madialis (narrators of anecdotes), describing the misfortunes of those martyred at Karbala; the madialis (singers of dirges), who were accomplished musicians. Among these various activities, the singing of dirges, in particular, enjoyed much popular appeal, despite its disapproval by the religious leaders. In its literary role, the madialis contributed to the development of the marthiya in Urdu, as illustrated by Anb (1802-74) and Debr (1803-75), the recognised masters of that genre (see MARTHIYA, 4. In Urdu).

4. IN THE SENSE OF REPRESENTATIVE INSTITUTIONS

A. In the Middle East and North Africa

The terms Madjlis (Arabic), and Madialis (Ottoman Turkish), Meclis (Modern Turkish) and Madilis (Persian), meaning "Parliament", appear in various word-combinations as indicated below. In Arabic, the synonym Barjama (borrowed from the French) has also been in frequent use. As has Parlamento in Ottoman Turkish (from the Italian), Parlamento in modern Turkish (mostly used for parliaments outside Turkey) or Parliament in modern Persian (from French), Madjlis (usually in Madjlis al-mawadda, or Madialis shahr al-mawadda) assumed this connotation in the 19th century, as the concept of parliamentarism became widespread, thanks to the impact of Western influence on the Middle East, without, at least initially, implying parliamentary government. While it is not certain when the term was first used in this sense, its first official use appears to have been in 1866, with the promulgation of Khedive Ismail's Hudud wa-nifdam-ndmat madilis al-adab Mist al-Fatimiyya, Cairo 1950, 23-41; S. M. Stern, Cairo as the centre of the Esmaili movement, in Colloque international sur l'histoire du Caire, Cairo 1974. (W. MASEOLING)
minorities, such as Israel and Cyprus. In certain countries, parliamentary bodies were convened in response to growing demands for political participation by individuals or groups impressed by Western patterns of democratic government, who hoped to use such bodies as national instruments for obtaining (or preserving) independence, overall progress and especially for curbing absolutism. The above were established by local rules, usually in response to popular demands. Sometimes, they were established by the local ruler on his own initiative, originally in an advisory capacity only; in this latter case, these bodies eventually showed greater political awareness and demanded more than anticipated. During the colonial period, especially in Arab areas under British and French control after the First World War, parliamentary institutions were set up by the foreign Power. Elsewhere, as in Iran and Turkey, they were established by independent regimes, generally during the first half of the 20th century. On the whole, the latter proved to be more durable than the former. However, when adapted to the social, economic and political realities of the country, all such parliaments did continue to function, even those which were colonial creations, as in Lebanon or the Maghreb.

Parliaments in the Middle East and North Africa, whether dating from the colonial or independent era, in general were modelled on Western patterns and functioned with varying degrees of effectiveness, especially given the history. Most parliaments in Arab states were considered mainly consultative bodies by the government. In recent years, under the new, revolutionary, highly centralised regimes they have lost much of their effectiveness (after having been challenged by Islamists and right- and left-wing groups). In many cases, party competition has all but disappeared and the role of parliament (if at all extant) in the initiation of legislation and public policy-making has diminished, as have its representational attributes. In reality, parliaments in Iran and most Arab states—eagerly hailed by nationalist movements both as symbols of emancipation and desirable vehicles for political expression—had failed, largely because of their inability to resolve or even regulate the sharp conflicts rooted in socio-economic, ethnic and political differences. Such parliaments had indeed identified with the status quo forces. On the other hand, that of Turkey, with a longer parliamentary tradition, has maintained its importance to date (1956).

In summary, parliamentary institutions in each of the countries discussed below have reflected the local political culture of the time. Their impact on national affairs, however, has been merely marginal in most cases, as parliaments in the Middle East and North Africa (Turkey and Israel excepted) have rarely provided political leadership, except through legislation. Their probable main function has been to legitimise the new states, moderate internal conflict by allowing argument and integrate diverse elements. Most Middle Eastern parliaments have succeeded only partially in carrying out these functions, especially the last one.

Abd al-Jafar Muhammad II, granted by ". . . at the instance of Midhat Pasha [g.v.] and his supporters. The Sultan convened a parliament for two principal reasons: firstly, Ottoman reformists and liberals were firmly convinced that a Western-style parliament, anchored in a written constitution, was essential for curtailting absolutism and propelling the Empire on its road to its salvation; secondly, representatives of the European Powers, then meeting in the Constantinople Conference, would thus be impressed with the Ottoman Government's earnest desire to rule more democratically and guarantee individual freedoms more effectively.

The 1876 Constitution stipulated that parliament, or Medfis-i mecb'edn, would comprise an elected Chamber of Delegates, Medfis-i umumi, and an appointed Senate, literally a Chamber of Notables, Medfis-i askiya. The former Chamber, although intended to play the major role, was nevertheless limited chiefly to debating, since initiation of legislation was to be a prerogative of the Ministers who were not responsible to the Medfis; also, a Member of the Chamber of Delegates could initiate a bill only via the Grand Vizier's office, which then forwarded it for the Sultan's approval, while the Sultan retained the right of veto. Consequently, the Chamber remained the sole meaningful task of the Chamber of Delegates, and even this could be circumvented. Consequently, the Chamber's real importance was not in its powers, but rather, in its very establishment as a debating forum rendering it a possible restraint on despotism.

According to an irida dated 28 October 1876 (the draft of the electoral law was promulgated only in 1908), elections for the Chamber of Delegates commenced in December 1876 and continued throughout the Empire for several weeks—with the notoriety of exception, algeri, Tunisia, Montenegro and Serbia (these had special international status and were consequently excluded) and of Mount Lebanon (where the Maronites and Druzes refused to vote, lest it affect their special status). In theory, every 50,000 male Ottoman subjects were to elect one delegate. In practice, members of various administrative councils wrote in the delegates of their choice on the ballots, Muslims and non-Muslims alike (although the latter were subject to a quota). All ballots were checked according to a slightly different procedure.

The irida stipulated that the Chamber of Delegates comprise 190 Members. However, only 119 were elected and attended the first session; in the second, which commenced in December 1877, after new elections had been held—there were 113 delegates, including 55 who had attended the first session as well. All sessions convened in Istanbul, where the Chamber had no office (4 others were appointed subsequently) until 19 March 1877 until 13 February 1878, when the Sultan dissolved parliament. It appears that Abd al-Hamid II considered reconvening it, but then changed his mind; Parliament was not to convene again until 1908.

Senate meetings were closed to the public and little is known of them (other than that it debated several bills passed by the Chamber); sessions of the Chamber of Delegates were open, however. These dealt with foreign demands on Ottoman territory and subsequently with the Turco-Russian War—all with patriotic spirit. They discussed bills presented by
Ministers, passing a number of them with certain changes. Most significant were the Provincial Administration Law, the Municipalities Law, and the Electoral Law for the Chamber. They debated finances (e.g. they sharply criticised the Baghdad Railway concession) and made some pertinent observations thereupon to the Ministers. Their most noteworthy contribution, however, was most likely the constant stream of criticism of the Government’s handling of the war, bureaucratic mismanagement and administrative corruption. These manifestations of an independent stand received coverage in the local press, which commented approvingly on their lively character.

Many Members of the Chamber of Delegates were former government officials, including several members of the administrative councils supervising the elections. Socially, most seem to have been from the middle and upper middle classes, hence their interest in administrative reform and their conservative approach to most socio-economic issues. On the religious and ethnic levels, they were much more of a mixed gathering. In the first session there were 71 Muslims, 43 Christians and 4 Jews; in the second 54 Muslims, 43 Christians and 6 Jews. They belonged to various ethnic groups throughout the Empire: Turks, Arabs, Kurds, Greeks, Armenians, Bulgars, Albanians, Bosnians, Vlachs and Jews. There was an even greater diversity of languages, though Turkish was the official language of proceedings. Rich and poor, educated and uneducated, they were not unrepresentative of the Empire’s overall population. Despite their disparate character, they succeeded in cooperating and in publicising personal, local and national grievances to such an extent that the Sultan was prompted to send them home.

Parliaments in the Second Constitutional Period. The 1876 Constitution was reinstated (it had never been officially abrogated) in August 1908, after the Young Turk Revolution; parliament was thus revived. The Committee of Union and Progress (CUP) and other groups sought to assert themselves—and despise the Sultan’s powers—via the Chamber. ʿAbd al-Hamid II re-inaugurated parliament in Constantinople on 17 December 1908; it functioned until April 1914, when the last Ottoman parliament was dissolved.

Elections were held according to an electoral law which modified the irede of 28 October 1875 but retained the limited franchise and voting through administrative councils. The CUP was in conflict with other groups in the Chamber, which opposed it on either ideological or ethnic grounds (Greek members, for example). Still, it generally held an uneasy majority, useful during the historical meeting of Chamber and Senate, sitting as a single National Assembly (22 April 1909) which decided to depose ʿAbd al-Hamid II after his counter-revolution had failed. This was one of the high points in the annals of parliaments of the Second Constitutional Period. A partial result of this decision was the debate and subsequent passage of various amendments to the 1876 Constitution, rendering the Chamber an important component of the state. Concurrently, the once unconditional sovereignty of the Sultans was restricted; their prerogative to appoint Ministers and nominate others to high office became the right of parliament or the cabinet. Even the cabinet itself was made responsible, and to some extent subservient, to parliament.

During its early years, the Chamber debated and passed numerous laws, chiefly of a financial, administrative, or judicial character (but summaries may be found in Sarrou—see Bibliography); during the First World War, several laws of military significance were considered. However, the CUP itself, in firm executive control, strove to curtail the powers of parliament, achieving only limited results. The CUP enjoyed more success in passing legislation in the Chamber from 1909 onwards. It was generally aimed at centralising the Empire’s administration and strengthening their own position at its head. Examples are the Laws of: Vagabondage and Suspected Persons; Public Meetings; the Press and Printing; Associations; and the Prevention of Brigaudage and Sedition. These were intended to curb individual as well as public opposition and to limit the freedom of the press. Such measures did not pass without determined opposition; the Chamber included a group which resisted these restrictions, along with the limitation of the Chamber’s powers in favour of the Sultan, whom the CUP manipulated. In April 1912, new elections were held with the CUP obtaining strong support, reportedly by pressure and bribery. Yet another Chamber was inaugurated in May 1914, which prolonged its tenure in April 1918 (by amending the Constitution), after its four-year term had ended. However, in December 1918, Mohammad VI dissolved parliament. Elections were held a year later; the new Chamber convened on 12 January 1920, adjourned itself in March and was dissolved on 17 April 2020. It convened briefly, again, in March 1921; however, for all practical purposes, the sessions of parliament in Istanbul had come to an end.

The composition of parliament during the Second Constitutional Period was no less heterogeneous than in 1877-8. The nationalism of the Young Turk leaders had a market ethnic component, bolstered to a degree by their Islamic policy. Consequently, increasing preference was shown to Turks and Arabs in the elections, although the Turks, a minority in the Empire, constantly maintained an absolute majority in the Majlis. The CUP was suspicious of Arab and Armenian nationalism, on the one hand, and impatient with Greek and Albanian criticism within the Chamber, on the other. The following table (from Feroz Ahmad—see Bibliography) demonstrates this trend.

**Ethnic Representation in the Ottoman Chambers during the Second Constitutional Period**

_Bibliography: For the reconstructed records_
of the 1877 Chamber's proceedings, see Hakki Tarık Us, ed., Meclis-i Mebûsan 1293-1297 (Istanbul, 1939-44), I. The verbatim records of the Young Turk parliaments were printed in Ta'kufviyye Vakifât 7 and distributed by the Meclis-i Mebûsan. A register of all the meetings of the Young Turk parliaments, the laws discussed and their contents, and their approval or rejection, with dates, was published regularly as Meclis-i Mebûsan\'i \ldots \ldots Ýstiklalinden ikinci \ldots \ldots mecbûrâtı ve tezkûrâtı mecbûrâtı defteridir (Istanbul). A parallel publication summed up the Senate debates. The laws passed are available in Meclis-i Mebûsan\'i \ldots Ýstiklalinden ikinci tezkûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Istanbul), 1907, 180 ff.; \ldots Ýstiklalinden ikinci mecbûrâtı defteridir (Ist
the GNA remained fluid, adjustable to population fluctuations. Until 1945, the GNA housed (with brief exceptions) a single party, the People's Party (later renamed the Republican People's Party [see MİYEVİ VE LEZERİ ASKAR]; several experiments with including additional parties were short-lived. During the 1923-46 period, several parties have voted for power in the GNA.

The 1961 Constitution (passed by a Constituent Assembly convened after the military intervention of 27 May 1960 and subsequently approved by a popular referendum on 9 July 1961) greatly resembled that of 1924, with certain modifications concerning the GNA. It became a bicameral body comprising a National Assembly (Millet Meclisi) of 450 members, elected for a maximum term of four years and a Senate (Senato) of 150 members elected for six years (with one-third renewed every two years). This Senate included 22 of the ex-officers who had engineered the 1960 intervention (and became Senators for life), another 15 appointed by the State President, as well as all surviving former State Presidents.

The National Assembly was the more important body of the two, as Cabinets had to obtain its vote of confidence; in addition, it had the right to initiate and support legislation in the event of a dispute with the Senate. The powers of parliament and the cabinet were considerable; however, a Constitutional Court, established at that time, was able to rule on the constitutionality of parliamentary laws and decisions (among its other powers).

There have been several changes in the laws governing parliamentary elections. Up to 1945, elections were indirect and thus liable to manipulation. Women were enfranchised in 1934. Between 1945 and 1950, with the transition to a multi-party system, the electoral laws were modified. In 1946, direct elections replaced indirect ones (first applied in 1950) and a secret ballot and public vote-counting were guaranteed. In 1950, supervision of elections passed from the executive to the judiciary. The simple plurality system continued until the 1950 military intervention, when a modified system of proportional representation was instituted for elections to the National Assembly. According to the new electoral laws passed by the Constituent Assembly in April-May 1961, each of Turkey's 67 constituencies (identical to its administrative districts) was assigned its share of the 450 seats, proportional to its population. Each party received a number of seats relative to its vote in each constituency. In the Senate elections of 1961, the party winning the majority in a constituency carried all its seats (Istanbul and Ankara excepted). Since 1964, the Senate election system was adapted to resemble that of the National Assembly. Since 1961, all Turkish citizens aged twenty-six or over (baring convicted criminals) could vote: candidates for the National Assembly had to be literate and aged 30 or over; candidates for the Senate—university graduates aged 40 or over. Membership in the GNA was considered incompatible with service in the state bureaucracy, the armed forces or the judiciary. Democratization of the electoral process was bolstered by the requirement that parties hold primary elections six weeks before voting-day and that party representatives participate in the supervision of the balloting.

Parliamentary history in the Republic of Turkey appears to be divided into three major periods: 1923-46, 1946-60, 1961 to date (1975). During the first period, the single-party era, general elections to the GNA were held in 1923, 1927, 1931, 1935, 1939 and 1943. The GNA was not only identified with the cadres of the People's Party but was, to a certain extent, an extension of the party itself, co-operating with it in a single-minded effort towards rapid modernization. The second period ranges from the beginning of the multi-party era until the first military intervention. General elections to the GNA were held in 1945, 1950, 1954 and 1957. This period witnessed the orderly transfer of power from the ruling party to the Democrat Party [see DİYER PARTI], which obtained and kept a comfortable majority in the GNA for ten years (1950-60). While opposition within the GNA had been negligible during the first period, it was active indeed during the second. Although several smaller parties had a minor share in electoral competition and parliamentary contests, most of the campaigning was undertaken by the two mass parties, the Republican People's Party and the Democrat Party; their rivalry for power engendered a constant see-saw in parliamentary debates on legislation and general policy. The third period commenced with the establishment of a bicameral system under the new constitution. General elections to the National Assembly were held in 1961, 1965, 1969, 1973 and 1977, general elections to the Senate in 1961 and partial elections in 1964, 1966, 1968, 1973, 1975, 1977 and 1979. The see-saw continued, this time between the Republican People's Party and the Justice Party (and then the Democrat Party in many respects), although with three principal differences:

(a) The relative liberalisation of political party activities, initiated in 1961, enabled several radical groups to form legal parties, stand for election and enter parliament. Examples were: the socialist Workers' Party of Turkey, active since 1961, in parliament since 1965; the Republican Peasant's Nation Party (renamed Nationalist Action Party), active in its present form since 1961, and the Democrat Party [see MİYELI PATTI]. There have been several changes in the laws governing parliamentary elections. Up to 1945, elections were indirect and thus liable to manipulation. Women were enfranchised in 1934. Between 1945 and 1950, with the transition to a multi-party system, the electoral laws were modified. In 1946, direct elections replaced indirect ones (first applied in 1950) and a secret ballot and public vote-counting were guaranteed. In 1950, supervision of elections passed from the executive to the judiciary. The simple plurality system continued until the 1950 military intervention, when a modified system of proportional representation was instituted for elections to the National Assembly. According to the new electoral laws passed by the Constituent Assembly in April-May 1961, each of Turkey's 67 constituencies (identical to its administrative districts) was assigned its share of the 450 seats, proportional to its population. Each party received a number of seats relative to its vote in each constituency. In the Senate elections of 1961, the party winning the majority in a constituency carried all its seats (Istanbul and Ankara excepted). Since 1964, the Senate election system was adapted to resemble that of the National Assembly. Since 1961, all Turkish citizens aged twenty-six or over (baring convicted criminals) could vote: candidates for the National Assembly had to be literate and aged 30 or over; candidates for the Senate—university graduates aged 40 or over. Membership in the GNA was considered incompatible with service in the state bureaucracy, the armed forces or the judiciary. Democratization of the electoral process was bolstered by the requirement that parties hold primary elections six weeks before voting-day and that party representatives participate in the supervision of the balloting.

(b) For the first time in Turkey's parliamentary history, coalition cabinets were required in order to hold power in the GNA. To obtain a comfortable majority in the GNA, parties had to cooperate with one another (see tabic of Election Results below) and rather unstable coalition cabinets had to be formed. This hindered meaningful legislation in both Houses and encumbered policy-making in the Cabinet (although the parliament and cabinet still could—and did—move decisively in times of national crisis, as in Cyprus, in 1963).

(c) Frequent elections were held; scarcely a year went by without an election for the National Assembly, the Senate or local authorities. Thus public excitement never abated; on the contrary, it increased, often to the point of physical violence. Indeed, violence appealed to several extra-parliamentary groups, small but vocal and active, supported by those who had despaired of obtaining speedy socio-economic and other reforms by parliamentary means, especially during the years of coalition government stalemate. Consequently, political processes in contemporary Turkey appear to continue...
on two different levels, only one of which is centred in the GNA and follows the parliamentary rules of the game; the other level is extra-parliamentary, radicalised and dominated by violence.

The GNA has attracted many well-educated persons, approximately 70%–80% of its members, in all sessions combined, had studied at the university. However, the socio-economic and occupational composition of parliament in Turkey reflects more accurately the transition to a multi-party regime and the changes brought about by modernisation. The key-date for this process is 1950, as it was then that a counter-elite was largely substituted for the Kemalist. Analyses conducted separately by Frey and by Tschau (see Bibliography) have established that prior to 1950, the GNA comprised—a descending order—former government officials, retired officers, lawyers, merchants and businessmen, and educators. After 1950, the main groups—again, in descending order—were lawyers, merchants and businessmen (i.e., the groups with more experience in a competitive system) followed by former government officials and retired officers. Before 1950, a much larger proportion of the GNA came from the more developed areas in Western Turkey; since then, there has been a much more equitable distribution. In the sessions between 1927 and 1943, 63% of more of the membership had already served in parliament; since then, the proportion has dropped to below 50%, with new members entering not only for natural reasons but also thanks to new ideologies enjoying some popular support. The above indicates a broadening of the Turkish political elite, as expressed in the GNA, as well as a freer elite circulation and greater competition between rival élites, reflecting the growth of pluralism in Turkish society and the increase in its upward mobility during the multi-party era. Electoral participation has been quite a crucial factor, as it has generally been rather large, between 60.5% and 69.3% (56.2%–81.0% for the Senate). Voting has usually been heavier in the rural, less-developed areas in Central and Eastern Anatolia, perhaps because of the influence of local landlords. This status-quo factor has been offset, however, by the considerable internal migration from villages to town and city, on the one hand, and to a lesser extent, by the impact of Turkish workers returning from Europe, on the other. In recent years, the Justice Party and the National Salvation Party have been particularly strong in rural, less-developed areas in Central and Eastern Anatolia, though remaining relatively weak in the cities. It is not easy to predict how all this will be affected by the military intervention of 12 September 1960, one of whose first measures was to dissolve both Houses of Parliament in Turkey.

Notes: The Democrat Party was forbidden to participate in politics after the 1960 military intervention. The Democrat Party is a new group which seceded from the Justice Party. The Democrat Party and the Republican Nation Party were run by the same leadership-core, essentially. The Nationalist Action Party was the new name of the Republican Peasants Nation Party since 1969. The Workers' Party of Turkey, closed down in 1971, re-entered electoral contests in 1977.

Notes: In 1967, elections were held for all 150 Senate seats that were earmarked for election (other Senators were appointed). Since 1964, elections were held in about a third of the constituencies, for a third of those seats and for those that had become vacant. The Nationalist Action Party was the new name of the Republican Peasants Nation Party since 1969.
(iii) Iran

No significant representative institutions existed in Iran until the 1906 Revolution, when the Iranian Parliament was established, reflecting the basic intention of the Fundamental Law of 30 December 1906 and the Supplementary Fundamental Law of 8 October 1907 (both principal components of Iran's first Constitution) to curb the absolute monarchy of the Qajars. These laws, largely patterned after the Belgian Constitution of 1831, provided for a National Consultative Assembly (Majlis-i shura-yi milli) (i) and a Senate in 30 constituencies, amounting to nearly 51% participation; and 5,834,666 votes for the Assembly, about five and up could vote in the Assembly as well. There were 6,805,647 votes cast for the Assembly, about 53% participation; and 5,834,666 votes for the Senate in 30 constituencies, amounting to nearly 50% of eligible voters. Twenty women entered the Assembly and one the Senate.

The 24 Iranian Assemblies from 1906 to 1978 have had an uneasy and sometimes tumultuous history of in-fighting and of struggling with the Shah for power. The First Assembly began as a nationalist and reformist parliament, which improved fiscal controls and dealt with the administration of justice (including anti-bribery measures) and the organisation of municipalities and provincial councils. Muhammad Musad-dik, however, enjoyed less certain support in the Assembly than he did amongst Tehran's population. His dissolving of the Assembly was countered by a pro-government coup, supported by pro-Shah forces. Musad-dik was arrested and political parties were banned.

More than half the membership of the Eighteenth Assembly, elected in 1954, was new. The Shah consolidated his power and Assembly Members were invited to join one of two court-sponsored parties. In 1961, the Shah dissolved parliament indefinitely and began to rule by decree (promulgating more than 500 laws in two-and-a-half years). A popular referendum approved the Shah's impressive new plans for a “White Revolution”, calling for the re-distribution of land, improvement of agriculture and industry, and increasing literacy. When a new Assembly was elected in September 1963, the Pahlavi Party predominated. This party comprised technocrats and former civil servants; it supported the Court (probably having been initiated by it), identifying with the policies of the Shah and his Ministers. Later on, the Rastakhiz Party followed suit. This co-operation, which characterised the subsequent assemblies, was justified by continuous economic growth and an increase in military power.

In Assembly-Shah relations, the Assembly was in ascendance in 1960-63, when it was a partner in the removal of the Qajars, and again in 1941-53, when a nucleus of its leaders even succeeded in temporarily exiling the Shah. The Shah subdued the Assembly in 1926-41 and again since 1954, mostly because of his prestige and central position, his executive control over legislative recruitment and executive divisiveness within the Assembly. Even then, Muhammad Reza Shah has consistently praised the positive role and great importance of parliamen
dary democracy in Iran. In actual practice, the Assembly had a long (although mixed) record in legislation, as well as in criticism of the Cabinet and administration (although not of the Shah and armed forces).

The character of the Majlis was determined by the electoral laws, by the bargaining which ensued, and sometimes by official manipulation, but even more by Iran's socio-economic and political
realities. Indeed, at least until the early 1960s, most political parties in the Majlis were recognisable by their affinity to the person of a leader, rather than their being held together by a cogent ideology. Socio-economic ties were, characteristically, more relevant. Originally, the electoral law institutionalised the situation, by stipulating that the Members of the Majlis were to be elected under a system of indirect balloting, which curtailed popular voting, placing it under the supervision of electoral committees representing six social groups (or classes, jakabati: nobles, landlords, men of religion, businessmen, traders, and farmers. The 1965 Electoral Law substituted workers and peasants for the first two groups; nevertheless, several members of aristocratic families continued to be elected to the Majlis. Other characteristics were, however, no less evident among Majlis Members: in general, Members of the Majlis had to be well-to-do; in 1960, they were required to be property owners and pay a minimum annual tax. Later on, it was still necessary to be a person of means, in order to assume campaign costs. In addition, they had to be somehow identified with the "Establishment!" headed by the Shah and his Court—with the exception of the first few Assemblies, which were essentially revolutionary, and of groups in the Assemblies immediately following the Second World War, which included outspoken members identifying with leftist, ultra-nationalist and extreme religious factions.

The average educational level of Majlis Members has risen steadily: university degree holders made up 60% of the total in the 21st Assembly (1963-67). Landerd representation, although still strong, is declining against an increase in the members of the middle classes; between 1945-56, the representation of the first group remained more or less constant, whereas that of the middle group, which was much smaller in the Assembly immediately following the Second World War, has risen steadily: university degree holders made up 62% of the total in the 21st Assembly (1963-67). In addition to the minutes and the personal interviews, a system of indirect balloting, which curtailed popular voting, placing it under the supervision of electoral committees representing six social groups (or classes, jakabati: nobles, landlords, men of religion, businessmen, traders, and farmers. The 1965 Electoral Law substituted workers and peasants for the first two groups; nevertheless, several members of aristocratic families continued to be elected to the Majlis. The parliamentary history of 'Irak commenced virtually simultaneously with the inception of the British Mandate. Following the signing of the Anglo-'Irak Treaty of 10 October 1922, King Faysal I, in a Royal Decree dated 21 October, called for elections to a Constituent Assembly. These elections were held in two stages during 1923 and the first Constituent Assembly, numbering 100 members, was inaugurated by Faysal on 27 March 1924. The Assembly's main task was to ratify the 1922 Treaty, to draft an Organic Law approved by Faysal on 21 March 1925—and to adopt an Electoral Law. When this was accomplished, the King dissolved the Assembly.

The Organic Law and the 1924 Electoral Law regulated between them the elections to the Chamber (Majlis al-nuwurib) and the functions of parliament. Elections were to be held by administrative departments, in two stages, with every 20,000 male citizens, aged 25 or over, having a vote. This was achieved only by a 1952 decree, later in July 1923, Faisal nominated the first Senate (Majlis al-umma) for a three-year period. The Senate continued even after 'Irak had formally obtained its independence in 1932. While parliament was to debate the subject. In 1946, a new electoral law for the Chamber was enacted, especially in electoral reform. The two-degree system often helped the same families and groups to obtain perennial representation. With the advent of political parties, chiefly after the Second World War, the power of the established, conservative circles within the Chamber was challenged. Heated arguments were carried on concerning the internal socio-economic situation and 'Irak's foreign policies towards Arab states and international alignments. Most effective decision-making in 'Irak took place outside parliament— to a greater extent, perhaps, than in certain other Middle Eastern states. This continued even after 'Irak had formally obtained its independence in 1932. While parliament was characterised by haranguing, the King and the Cabinet of Ministers continued to be the true foci of power, with the British still very influential; since the mid-1930s the military became increasingly involved in politics as well. While the parliament's lower house owed more to the then-prevailing political culture in 'Irak than to anything else, certain corrective steps, particularly of a formal nature, were attempted, especially in electoral reform.

During the early 1940s, electoral reform had been increasingly suggested as a palliative; the Chambers elected since 1933 appointed committees to debate the subject. In 1946, a new electoral law for the Chamber was promulgated. Essentially, it was based on the 1924 Electoral Law, although it modified constituency zoning, increased the representation of ethnic minorities (six Christians and six Jews) and imposed legal restrictions on the arbitrariness of local officials supervising the elections. It did not, however, transform the two-degree system into a one-degree system as was vociferously demanded by those desiring democratisation of the popular vote, this was achieved only by a 1952 decree, later...
incorporated into the Electoral Law of 1956. The 1952 decree set membership in the Chamber at 155, including eight Christians (but no Jews), re-dividing Iraq into 92 constituencies. The decree also insisted upon secret ballots and regulated the ways and means of electoral propaganda.

Considering the electoral reforms of 1946, 1952 and 1956 as a whole, one tends to attribute them, at least in part, to the increasing pressure of Iraqi political parties on public life. Of moderate consequence before the Second World War and banned during the War itself, parties were permitted to function once again in 1946, old and new ones alike increased their activities both in and out of parliament. Consequently, the Government and its supporters, obviously considering these parties as rivals, took steps to limit their chances of success in the elections and their power within the Chamber. Various parties boycotted the elections of 1947, 1948 and 1952. The January 1953 elections were particularly unsuitable for free voting; several parties were banned, the press severely censored and martial law imposed in Bagdad. The mood was such that only 57 seats were contested; the others were filled without opposition. The Government did not consider this situation unsatisfactory and dissolved the Chamber after less than two months, holding new elections on 7 June 1954. These were the first direct elections to be held with Iraq not under martial law, thus allowing free electioneering by all major political parties. Although the balloting was not secret, the Constitutional Union Party, still the largest parliamentary group, obtained only 50 seats, losing its majority; but all conservative groups together still managed to obtain a majority (counting many independents); however, the Government did not consider this situation unsatisfactory and dissolved the Chamber after less than two months, holding new elections on 12 September of the same year. With most parties split over the issue of boycotting the elections, only 23 out of 125 seats were contested. Consequently, the Opposition was heavily defeated; only 7 out of the 32 Opposition Members of the Chamber elected in June were returned again in September. Many, perhaps most of the independents elected in September were partial to Nuri al-Sa'id's policies. The Chamber, however, changed its mind by issuing, on 22 September 1954, an Association Ordinance. This effectively banned some political parties and restricted the activity of others.

Holding three general elections within twenty months and eliminating much of the opposition from the Chamber of Deputies, the Government succeeded in making opposition extra-parliamentary. The above Association Ordinance drove many civilians and soldiers underground. The 1954 Chamber was even less representative than several of the preceding ones, so that in the following general elections, on 5 May, 1956, only 27 seats of the then-expanded Chamber of Deputies were actually reported, the press hardly reported the voting, which was very sparse, in any case, even though women were enfranchised for the first time. Consequently it is hardly surprising that when the military revolution occurred soon afterwards, on 24 July 1958, none came to the Government's assistance.

With the end of the monarchy, the Iraqi parliament passed into history as well. One of its last acts had been to approve the Arab Union of Iraq with the Hashemite Kingdom of Jordan, on 23 May 1958 (the Union's constitution provided for a joint parliament with 20 delegates from each component). The Arab Union, too, disappeared with the 24 July revolution. During the following years, succeeding governments and their spokesmen repeatedly mentioned the establishment of some sort of parliament, but no practical steps towards this end have been taken. A National Council of the Revolutionary Command, formed soon after the revolution, has, however, represented one of the legislative institutions created during the Revolutionary Government's assistance. With the end of martial law, the press was no longer a target of the Government, the press severely censored and martial law imposed in Bagdad. The mood was such that only 57 seats were contested; the others were filled without opposition. The Government did not consider this situation unsatisfactory and dissolved the Chamber after less than two months, holding new elections on 7 June 1954. to be mainly a deliberative body, with the final decisions remaining with the Revolutionary Command Council staffed by the Ba'ath.

(v) Syria.

The history of parliament in Syria is a turbulent one, not uncharacteristic of this country's political culture in recent years. Indeed, the Syrian parliament has been both an agent of and a contributor to the political culture at large. At the time of the French Mandate it was dependent upon relations with the authorities of the French Mandate; then, after complete independence was achieved at the end of the Second World War, it became subject to political vicissitudes: constitutions have been proclaimed and abolished and parliaments convened and dissolved.

When Faisal entered Damascus in October 1918, with the declared intention of setting up an Arab government, a Syrian Congress was convened, holding three sessions between 3 June 1919 and 19 July 1920. This first experiment at parliamentary government even constituted the draft of a constitution (although it did not have the opportunity to approve it) providing for a bicameral legislature (among other stip-
The parliamentary history of Syria under the French Mandate centres around the struggle between Syrian nationalists, who desired a constitutionally-guaranteed parliament endowed with independent powers, and the French authorities, who sought to limit them. At first, the French authorities experimented with Representative Councils in the various "states" of Syria. Elected in two degrees, these Councils were regarded by Syrian nationalists as partial and even subservient to the French. The 1925-7 revolt convinced the French of the need to reach some accommodation with the Syrians. In February 1928, the French High Commissioner Ponsot charged a moderate provisional government with holding general elections for a Constituent Assembly. These were held in April and the Assembly first met on 9 June. It elected a leading nationalist, Háshim al-Átassi, as its Speaker and a draft commission of 27 to prepare a constitution. The nationalists, although not clearly in the majority, were the only group well-organised in a National Bloc (al-Kulla al-majyya). They inscribed their own views into the Constitution, which was approved by the Constituent Assembly in August 1928. The French objected to several paragraphs, but the Assembly stood firm. The High Commissioner therefore adjourned the Assembly, in February 1929, sine die and dissolved it in May 1930. He then proceeded on his own to proclaim the same Constitution, with a few minor changes.

Among its other provisions, the 1930 Syrian Constitution established a 60-member unicameral Chamber (Madjlis), elected every four years and meeting in two sessions of two-and-a-half months annually, from mid-March and from mid-October. Voting was in two stages, each adapted to Syria's administrative divisions, resulting in quite an accurate representation of local, religious and socio-economic interest; it also assisted a well-established oligarchy in obtaining and maintaining control of parliament. Every Syrian male aged 20 years or over was able to vote and every literate Syrian male aged 18 years or over could be a candidate. The number of seats in the Chamber increased over the years according to Syria's population growth. The Chamber's duties were to: legislate, elect the President of the State (for a five-year term), approve the budget and vote confidence in the Government.

The first Chamber, elected in March 1932, met on 7 July of that year. The main subject of dispute between nationalists and moderates concerned relations with France on the nature of Syrian statehood. The National Bloc (al-Kulla al-majyya) was adjourned in November 1933 and dissolved in 1934. Only in November 1936 were general elections held. The Chamber was to consist of 86 members, of whom 16 were to represent minority religious denominations and another represented Bedouin tribes. The National Bloc had an overwhelming majority in the Chamber, which convened in December. They elected Háshim al-Átassi as State President. The Chamber's most important achievement was to approve a treaty with France, signed by both the Syrian Cabinet and the French High Commissioner but never ratified in Paris. Hopes for Syrian independence were dashed once again—and nationalists both within and without the Chamber reacted accordingly. In July 1939, the High Commissioner suspended the Chamber again, as well as the Constitution, in view of the tense international situation.

The Second World War, in particular the fall of France, strengthened the hand of those Syrians striving for independence. After the Free French and British forces had occupied Syria and Lebanon in 1941, General Catroux, representing de Gaulle, proclaimed Syria's independence on 28 September. Early in 1943, the French, surrendering to nationalist demands, restored the Syrian Constitution of 1930 and ordered general elections. These were held in July and resulted in an overwhelming victory for the National Bloc, now led by Šukr Al-Kuwwaiti. The new 124-seat Chamber met on 27 August, electing al-Kuwwaiti State President. One of the main tasks of this Chamber was to bring about a full French retreat spelling total independence.

The vicissitudes of Mandatory Syrian parliaments continued in independent Syria as well. The first Chamber of independent Syria was elected in May 1947 and sat until dismissed by Colonel Husn Al-Zam, who seized power at the end of March 1949. The 1947 Chamber, increased in membership to 140, was elected according to the new Electoral Law of 29 April 1947, which provided for 60,000 voters and a franchise thereof exceeding 3,000 (in reality, only 135 members took office). A local journalist, Hábib Kahlifa, reported later (in his Distrayt al-halby) that this very mixed parliament was merely "a bundle of contradictions" in social composition, organisation, literacy and dress. This certainty could have applied to its ethnic make-up as well, for representation took into account the mosaic of minorities. Representation of the National Bloc, which had had a majority in the 1947 Chamber, dwindled to mere 24 out of 135 seats, while the opposition commanded 53 and the independents 58 seats. Distribution of representation by district and religious denomination was as follows (based on George Haddad—see Bibliography):
The Chamber elected the State President for a five-year term and legislate. Proposed of 25% of its total membership, would deliberate. Under his guidelines, on 29 November 1951, sensing correctly that it could hamper his dictatorship. Under his guidelines, the Constituent Chamber became the Chamber of Deputies. The 1950 Constitution did not differ essentially from that of 1930, insular as the legislature was considered. The unicameral Chamber of Deputies was to be elected every four years at the expense of the Legislature. The three principal limitations on the attributes of the Chamber were: (a) The Chamber no longer elected the State President; (b) The Constitution abolished the post of Prime Minister and gave it to the Cabinet responsible to the State President alone; and (c) The Chamber was to convene from October to February only; during the remainder of the year, a token Chamber, composed of 25% of its total membership, would deliberate and legislate.

Under the provisions of this constitution, elections to a new Chamber are held on 9 October 1953. Suffrage was universal: any Syrian citizen aged 18 and over could vote and any Syrian citizen aged 25 and over could stand for election. One member would be elected for every 30,020 inhabitants. Not unexpectedly, Shishakli's own party, the Arab Liberation Movement, obtained 72 out of a total of 82 seats; one of the remaining seats went to the Syrian Social National Party and another nine to independents. However, the 1953 Constitution and the 1923 Chamber remained only brief episodes in Syria's parliamentary history. After Shishakli's downfall on 25 February 1954, the Chamber of 1949, dissolved in 1951, re-convened. One of its first acts was to re-establish the 1950 Constitution and restore the parliamentary regime in Syria. General elections were held again, on 24-5 September (with a new round, for undecided seats, on 4-5 October) 1954, for a new Chamber of 142 members: 126 Muslims—including 9 Bedouins—and 16 Christians. This time, however, no special seats were earmarked for any religious or other group. Apart from dealing with internal issues, this electoral campaign was largely concerned with Syria's joining a Western-inspired defence treaty. The elections themselves were characterised by their free atmosphere; secrecy was enforced for the first time. The results were as follows: People's Party—39, the Ba'ath—22, National Party—19, Popular Syrian Party—4, Cooperative Socialist Party—2, Arab Liberation Movement—2, Communists—1, and Independents 64 (for 43% of total membership). The Chamber met in November 1954 and functioned until Syria's union with Egypt in February 1958; it came closer than any preceding Chamber to completing its four-year term and legislated energetically. It ceased to exist with the establishment of the United Arab Republic, when Syria's separate parliamentary life was so soon restored. General elections were held on 1-2 December, with a simultaneous referendum on a new provisional constitution (approved by a 97.6% majority). Voting for the Chamber was secret and free; despite Egyptian appeals to boycott the elections, participation reached 65%—the highest in Syrian parliamentary elections. The outcome was again a sharply-divided Chamber, lacking a comfortable working majority: the People's Party received about 22% of the vote, with 14% for the National Party (heir to the National Bloc), besides 32% independents and several smaller groups. The Cabinet, based on broad right-of-centre support in the Chamber, aimed to rescind the nationalisation decrees and the agrarian reform of the UAR era. Displeased military groups repeatedly intervened in politics, leading to the dissolution of the Chamber, at the end of March 1961 and then to the seizure of power by the Ba'th Movement, in March 1963.

The Ba'th, in power since then (despite factional strife and personal changes), has altered perceptibly the structure and functions of parliament, recasting it subservient to the Executive. At the beginning of the Ba'th regime, a National Council of the Revolutionary Command (al-Majlis al-watanii li-hiyatat al-ha'reem) was established, comprising military officers. Under a provisional constitution, this council—both executive and legislative—exercised the real power. In 1964, it was renamed The National Revolutionary Council (NRC) and was expanded to 95 members, mostly civilians: 10 ranking Ba'th officials, 20 members of the former National Council of the Revolutionary Command, five representatives of the military, 14 trade unionists, 13 peasants, seven women representatives, seven representatives of the teachers' union, five selected from the free professions, two university professors and 17 "progressive citizens". NRC, Syria's parliament, could enact laws (its main function), pass the Budget, amend the constitution, supervise referenda and elect a five-man President—Council—the principal executive body. In February 1966, NRC was expanded from 95 to 134 members, outing
ratifying agreements and treaties, electing the State constitution, approving laws, debating the budget, on 1 May 1969, a new constitution was promulgated
power. Two weeks later, a military coup by Hafiz al-Asad, brought the 173, then 186 and

Madjlis al-sha'b), to be elected for a four-year
by the Regional Command of the Ba'th. This stipulated the establishment of a People's Assembly (Madjlis al-sha'b), comprising 173, then 186 and
1973 and 1977 elections for the People's Assembly,
only a small part of the eligible voters participated. The People's Assembly nominated by Syria's President, Hafiz al-Asad, in February 1971, consisted of 87 Ba'aths, or just over half of the total 173; another 36 represented the General Union of Peasants. In the Assembly elected on 25 May 1973, the Ba'aths numbered at least 125 out of a total 186, while another 46 labelled themselves independents; 97 of the total number of seats had been earmarked for peasants and workers. In the Assembly elected on 1-2 August 1977, Ba'aths numbered 125 out

(Source: Winder, in MEJ, xvii (1963), 59)
of a total 195; another 36 labelled themselves independents, and 99 of the total number of seats had been earmarked for peasants and workers.

The history of Syrian parliaments is not easily divided into distinct periods. Nevertheless, it may be divided into three main eras: (a) The Mandate period, during which the Chamber was in a state of flux; (b) Independence, when Chambers were marked by even deeper internal strife with determined efforts by the Cabinet and the party (or parties) to gain power, at the Chamber's expense, against equally determined opposition; and (c) Dependence, first on Egypt, during the UAR years, then on the guidelines set for it by the Ba’ath-military coalition which governed Syria after the UAR broke apart. One may conclude with some justification that the role of parliament in Syria has diminished, from one era to the other, at least regarding its impact on public decision-making.

Syrian parliamentarians were characterised by factors besides distinct and religious denomination (which were relevant during the first two eras of the Chamber). An investigation of these periods based on Winter's bibliography concludes as follows: (a) Parliamentarians were youthful—the median age (at time of entering each Chamber) was between 39 and 46; this was perhaps chiefly due to a fairly large turnover; (b) The proportion of Members with university education rose consistently, reaching 43% of the Chamber in 1954; another 36 labelled themselves landlords. On the other hand, very few Members were professional or military officers.

The Lebanese parliament was first initiated by the French Mandatory authorities in 1922. It was intended to support the Mandate, but gradually became more independent and attracted various leaders of public opinion, thus enabling it to work for independence during the Second World War. Its weakness, however, became increasingly more apparent since the achievement of Lebanese statehood in 1943 and of complete independence in 1945—when the French departed and political responsibilities of government passed into Lebanese hands.

Although the Lebanese parliament contributed only modestly to policy-making and was insufficient as a check on both the executive and the bureaucracy, it has been an integral part of the political system nonetheless. Its powers have been hampered constantly by the lack of public consensus on central issues, the personal character of politics, the important role of religious communities and the peculiar nature of the political system (which, as amended, has essentially institutionalised in the legislature; it was soon to become the main organisational feature of the entire society). The constraints have hindered the Lebanese parliament from fulfilling the role of conflict-resolution; rather, it has assumed a role of conflict-accommodation which, in practice, frequently meant conflict-postponement.

Lebanon's Constitution, unwritten guidelines (usually called the "National Pact" of 1943), government structure, parliamentary system and elections, as well as many of the laws, are peculiarly suited to an involved complex of rivalries and based on the desire to maintain an equilibrium between them—whether within or without parliament. Therefore, the constraints have hindered the Lebanese parliament from fulfilling the role of conflict-resolution; rather, it has assumed a role of conflict-accommodation which, in practice, frequently meant conflict-postponement.

The character of the Lebanese parliament was essentially determined early during the French Mandate period. In March 1922, the Mandatory authority instituted a consultative Representative Council of 30 members, to be elected in two degrees, for four years; its two annual sessions would be of two and two and one-half months duration, respectively. The formal powers of parliament were legislation (which could also be initiated by the executive); approving the budget and taxation; electing the State President, for three years (since 1929—for six years); supervising the

This ratio no longer reflects the demographic breakdown of Lebanon's population (the last census was taken before the Second World War). This has been only partly offset by frequent changes in the number of electoral constituencies and the resultant re-zoning. Since 1960, these have corresponded to the state's administrative districts; a serious attempt has thus been made to represent Lebanon's regions fairly and still keep the religious denominations reasonably happy. Each district now elects from two to eight Members of the Chamber (the only single-Member district is Saâda) according to a pre-determined breakdown by denomination (roughly reflecting the assumed ratio). For example, the district identical with the city of Tripoli elects four Sunnis and one Greek Orthodox. Similarly-composed slates of candidates (in the above example, of four Sunnis and one Greek Orthodox) run against each other. Single candidates may also compete, although they have consistently met with little success. Every eligible voter in the district, whatever his denomination, votes for the candidate or slate of his choice, provided he observes the denominational breakdown prescribed by law. An obvious advantage of the system is that, on the one hand, it compels candidates to ally themselves with others from different denominations and, on the other, to show moderation and refrain from antagonising any particular denomination in the district. A possible drawback is that many Members of the Chamber are rather tame individuals who have run as compromise candidates. Political parties competing in these elections are under the same constraint in forming slates of candidates by denominations, thus possibly limiting their activities.
served as an obstacle to structural political change—for better or worse, depending on one's viewpoint. It has also bred antagonism, hardly mitigated in the Chamber by the above electoral arrangements: loyalty to affiliation to a religious denomination is only one variable in parliamentary politics. When Members do not vote by religious denomination, they take sides according to the local interests of their constituencies. There are also ideological differences in the Chamber, of which the longest-standing has been support for Lebanon as a separate political entity versus a union or federation with one or more Arab states. Furthermore, there is competition among the political parties, which frequently, although not always, are identified with the respective denominations; in the 1960s, only one-quarter to one-third of the Members were officially affiliated to parties. Within the wide scope of denominations, one finds smaller, feudal-loyalty groups as well. Personal parties are also often identified with denominations (chiefly Christian) as are several ideological ones, such as the Phalangists or Progressive Socialist Party; the Ba'ath and several others, however, are not so, identified.

Under the aggregate pressure of denominational, local, ideological and party competition, as well as personal rivalry, the Lebanese Chamber has been fraticile and cautious—and consequently limited in policy-making. It expects that a good share of the decision-making and executive policies be carried out by a Cabinet, whose Ministers are drawn from the Chamber and which works closely with the State President. Even legislation has been a lengthy and sometimes inconclusive process, although its overall record is impressive; during the years 1953-72 the Chamber passed 4,506 bills (or an average of 105 annually). The Chamber has often skirted divisive issues, at least insofar as decision-making is concerned. On the whole, its role appears to have been chiefly deliberative; argumentation in the Chamber displays a high level of competitiveness, within the framework of political and cultural pluralism. However, this has afforded satisfaction only to the participants themselves rather than to those Lebanese who have no access to it and to disenfranchised groups, such as the Palestinian refugees, who have been largely instrumental in using extra-parliamentary, increasingly violent ways to make themselves heard. By 1975 they had succeeded in fracturing the delicate minimum consensus concerning Lebanese polarity and shattering the precarious status-quo of which the Chamber had been both an exponent and an advocate. It is symptomatic that two earlier serious national conflicts—in 1952 and 1958—were settled by the Chamber's agreeing on the election of a State President. During the civil war (since 1975), the Chamber has met several times, in order to elect a new State President (in June 1976); a new State President (in June 1976); it has accomplished little else, however, not really succeeding at resolution of the conflicts which keep violence alive. Its inability to agree on action in urgent issues has prevented the Chamber from taking a stand, also, on an important suggestion of President Farandijyya (in a speech on 24 February 1976). He then suggested altering the Muslim-Christian ratio in the Chamber from 5:6 to 1:1; the Chamber, however, has not even debated this.

The socio-economic composition of Lebanese Parliaments has had little to do with the rate of voter participation. While countrywide participation has usually been between 50 and 61 per cent (women were enfranchised in 1953), rural turnout has regularly been proportionately higher than the urban, possibly due to recruitment by landowners and local leaders. In addition, rural districts have had a slight relative edge in the seats allocated them in the Chamber. The reason seems to be that the Lebanese Chamber is an exclusive club, reserved in practice for those with better-than-average education who can afford the registration fee and campaign expenditures. Indeed, every slate of candidates includes at least one who finances the campaign; he is generally a prosperous businessman (or, for a smaller power (incidentally, this has provided an avenue for the nouveau riche to penetrate the power system, avoiding a cleavage between the political and economic elites). The outcome, however, has been that the well-to-do generally represent the poor. Even among the former, however, there are meaningful differences in socio-economic make-up, as the following table (based on Hudson and Harik, see bibliography) indicates:

The shift is most interesting: landlords comprised the largest single group between 1943 and 1953; lawyers predominated in 1957. The business and professional groups made up more than half the membership between them. Otherwise stated, the top political elite in the first decade of the Republic failed to hold its own in parliament; the typical Member of the Chamber nowadays is an educated person of upper or middle income, actively engaged in business, law or some other free profession.

**Bibliography:** The minutes of parliamentary proceedings have been published regularly, since the 1940s, in the official *Magjil al-muwādā—al-dawr al-taghib fi* (Beirut). The laws passed in parliament have appeared in the official *Magjilat al-haditha li'l-kata'irin al-Iubudniyya.* The periodical publication *Al-Bayyad al-wataniyya,* issued since 1944, comprises original material about parliamentary debates as well as research on the Lebanese parliament. Bloomington, a study in political development, feudality in Lebanese politics, in a confessional democracy, in Lebanon: the challenge of a fragmented political system, political parties, in Lebanon: improbable nation, in Lebanon: the modern history, in Lebanon; improbable nation, in Lebanon: the modern history, in Lebanon; improbable nation, in Lebanon: the modern history, in Lebanon: improbable nation, in Lebanon: the modern history, in Lebanon: improbable nation, in Lebanon: the modern history, in Lebanon: improbable nation, in Lebanon: improbable nation, in Lebanon: improbable nation.

The Emirate of Transjordan, carved out by Abd al-Aziz in 1921 and recognized by the British as such in May 1923, has displayed strong British influence in its parliamentary structure and procedure, both during the Emirate itself and in the subsequent independent Hashimite Kingdom of Jordan (further: Jordan). As early as July 1923, Abd al-Aziz formed by decree a Committee to prepare an electoral law for a representative assembly. The law was ready in June 1924, although the entire Assembly project was postponed, reportedly due to British discouragement of the idea. In October 1926, a group of notables was convened to prepare another electoral law, meeting with similar results. More tangible progress was achieved, however, after the Anglo-Jordanian Treaty was signed on 20 February 1928. In accordance with
Over the objections of nationalist circles that the Senate was considerably less oppositionist towards the Emir. On 9 February 1931, when it refused to approve the financing of the Desert Patrol, the lesson was not lost and the following four Councils appear to have been considerably less oppositionist towards the Emir.

Following the new Anglo-Jordanian Treaty of 22 March 1946, which recognised Jordan's independence with 'Abd Allah as its King, a new constitution and an appropriate electoral law were promulgated. The constitution provided for a bicameral National Assembly (Majlis al-ta'atwa). The Chamber of Deputies (Majlis al-nu'mah) was to consist of 20 Members (12 Muslims, 4 Christians, 2 tribal representatives and 2 for the Circassians and Shehans), elected by all male Jordanian citizens aged 18 or over. Candidates had to be at least 30 years of age; they were required to deposit a sum of money which would be forfeited in case of failure to be elected. The Senate (Majlis al-adl) was to number precisely half the membership of the Chamber and was to be appointed by the King, for eight years, from among more mature persons (at least 40 years of age), with half the Senators completing their terms every four years (as in ‘Irak).

General elections were held on 20 October 1947, over the objections of nationalist circles that the King retained too much power under the 1947 Constitution and the Cabinet was not responsible to the Chamber. The only party running, the government-sponsored al-Nahda ("Revival"), obtained 4 seats; other seats were won by independents, also identified with the Establishment. In general, this Chamber—dissolved on 1 January 1950—was no different in character and tone from the Legislative Councils it had superseded.

More substantive change occurred after Jordan's annexation of a part of the West Bank in 1950 and the granting of citizenship (including the franchise) to its inhabitants. Since then, the political history of Jordan has been largely the struggle between an embattled monarchy and its Palestinian subjects. One of the fronts of this struggle was the Chamber (a cautious nomination policy prevented clashes in the Senate), practically the sole forum for uninhibited criticism, and unhampered propaganda. General elections were held on 11 April 1950, with high voter participation, reportedly about 70%. With the increased number of eligible voters, the Chamber's membership was increased in 1950 to 40, equally divided between East Jordanians and West Bankers. The latter also obtained 7 seats in the Jordanian Senate, whose membership was expanded to 20. The system favoured East Jordan by minimising representation of the more populous West Bank. Nevertheless, the West Bankers—who were more politically-conscious and less attached to the Royal House than the East Jordanians—ultimately altered much of the Chamber's character. Most of the Chamber's West Bankers introduced an ideological dimension both into electioneering and the Chamber's deliberations through their relations with political parties. This was so even when those parties were not legally permitted to run, which was virtually the general practice (since 1957, all parties have been banned). The following table illustrates the party affiliations of Members of the Chamber during the first twelve years after the enfranchisement of the West Bankers (based on Abu Jaber, see Bibliography).

The first Chamber to comprise West Bankers (Jordan's second since independence) had a nucleus of six or seven oppositionists, all West Bankers who, although a minority in the Chamber, often took the lead in the debates. Briefly stated, this Chamber behaved much as did the first Legislative Council in 1931. It refused the budget and consequently was dissolved by the King in May 1951, with new elections called for 29 August. Although 'Abd Allah was assassinated on 20 July 1951, the August 1951 elections were held on time (with a voter participation of about 50%). In the new Chamber, the Opposition was even stronger and numbering about 14 of the 20 West Bankers. It was also more vociferous and passed a new constitution on 8 January 1952, which made the Cabinet (singly and jointly) responsible to parliament; a two-thirds majority no-confidence vote in the Chamber was to result in the dismissal of the Cabinet. Furthermore, the 1952 Constitution provided for legislation in both Houses and a joint session in case of disagreement; the King's veto could be overruled if each House re-adopted the law by a two-thirds majority. Foreign treaties and financial agreements were to be ratified in parliament. Immunity was reaffirmed and interpellation of Ministers introduced.

This Treaty, an Organic Law was promulgated on 16 April setting up a Legislative Council (Majlis al-ta'atwa), to be elected for three years by two-degree male suffrage. It was to consist of 15 Members, with guaranteed representation for the Christians (3), Circassians (2) and Bedouins (2). There was no Cabinet responsibility towards the Council. Laws passed by the latter required the approval of both the Emir and the British Resident, while the Council could not override the Emir's veto.

Despite repeated protests by nationalists that the Council was in effect merely consultative and unrepresentative of the people, it remained the basic instrument of parliamentary activity until 1946. In actual practice, it demonstrated greater independence than had been anticipated. The first Council demanded and obtained immunity and freedom of debate for its Members and was dissolved by the Emir on 9 February 1931, when it refused to approve the
The increase in the legislature's powers and concomitant curtailment of those of the Executive were noteworthy, even though in practice King Husayn and the Cabinet frequently succeeded in circumventing these constitutional provisions during the turbulent years which followed. Nevertheless, these provisions remained a frame of reference for the Opposition, which soon demanded and passed a constitutional amendment that established a simple majority (instead of two-thirds) as sufficient for a vote of no-confidence. Alarmed, the Palace dissolved the Chamber in January 1954, and reportedly rigged the general elections of 16 October 1954 (in which participation was about 57%). This election brought in a more compliant Chamber: half of the Members of the previous Chamber were defeated and only 3 out of 28 Opposition Members were re-elected. Consequently, about 35 of the 40 Members were loyal to the Government; much of the opposition became extra-parliamentary, with foreign elements allegedly inciting mob violence.

The general elections of 21 October 1956 almost entirely concerned foreign issues, and brought in the long-serving Prime Minister Al-'Amarneh. Most matters involved a traditional, pro-Western orientation versus a Pan-Arab (i.e., pro-Egyptian) policy. The King, favouring the former trend, won this contest of ideologies and succeeded in replacing some of the more radical Members of the Chamber. Meanwhile, the Chamber's membership had been raised to 50 and that of the Senate to 25. Elections to all subsequent Chambers were reportedly influenced by the Government and the Chambers were considerably more conservative politically. Although it always doctored (several had to be dissolved), Chambers generally did find a modus operandi with King and Cabinet.

In the general elections for the Sixth Chamber, held on 22 October 1961, only about a tenth of the electorate participated. Under the new Electoral Law of 25 May 1960, the Chamber's seats had been increased to 60 (with 10 earmarked for Christians and 2 for Circassians) and the Senate's to 30 (in both cases, half of the seats were earmarked for West Bankers). However, only 20 seats were contested in the 1961 elections. The Chamber was dissolved on 1 October 1962; general elections for the Seventh Chamber were held on 24 November. These elections were freer in nature and about 20% of the electorate participated. The Chamber was still politically moderate, perhaps due to the official ban on political parties. Still, it was bold enough to bring down the Cabinet in April 1963 and was consequently dissolved. During this period, the Ba'th had taken over in both 'Irak and Syria, firing the imagination of Pan-Arab nationalists in Jordan as well. Elections for the King and for the National Consultative Council ('Al-tistigârî) were held on July 3, 1963 and for the Ninth on 15 April 1967. Both elections yielded fairly conservative Chambers, probably due to the result of manipulation, with 21 and 7 candidates, respectively, returned unopposed.

Since the Six-Day War of June 1967, there have been no parliamentary elections in the Israeli-held West Bank, although some West Bankers visited 'Ammân and assumed their seats in both Chamber and Senate several times. Since 1967, the ratio between East Jordanians and West Bankers has been maintained through the tactic of having Members decide how to fill vacant seats. Husayn has also continued to appoint Palestinians to the Cabinet, although the key Ministries have gone to East Jordanians. Lately, seeking to broaden its popular East Bank representation, the Jordanian Cabinet—acting on instruction from King Husayn—decided (1 April 1978) to amend the state's electoral law in order to grant women both passive and active voting rights for the Chamber. Keeping Jordan's options open concerning its future relations with the West Bank, the Chamber—on the King's initiative—passed a constitutional amendment which empowered the King to dissolve the Senate as well and to postpone general elections for a period of up to one year. On 5 February 1976, the two Houses were called upon to approve another amendment, empowering the King to postpone the elections sine die forever, meanwhile, to reconvene parliament as required.

However, the semblance of a king governing in consultation with his people had to be maintained. On 13 April 1978, Husayn requested his government to enact a temporary law, providing for a National Consultative Council to assist the Executive. The new Council, nominated Governorate by Governorate, sought to comprise legal and competent persons, representing various public sectors. On 17 April, a royal decree promulgated the law instituting the National Consultative Council (al-Majlis al-'aṭlam al-tistigâri). It stipulated that the Council would be composed of 60 nominated Members, men and women. Jordanians, aged 30 or over, not simultaneously employed elsewhere, nor Senators. Its duties were to study and discuss all draft laws and advise the Cabinet before it approved them. The Members of the Council had full authority to demand explanations from the Ministers, on any subject, and to speak freely. The Council would be formed every two years. The King had the right to dissolve it at any time, or relieve a Member of his position. The Council was to be dissolved automatically when the suspended parliament was revived, after new elections.

There appear to be three main periods in Jordan's parliamentary history. During the first, when the country was still called Transjordan, the Emirate's Legislative Council was generally compliant with 'Abd Allah's wishes. During the second, commencing with independence and the annexation of the West Bank, the Chamber of Deputies (although not the Senate) witnessed the growth of a real Opposition. The Opposition, comprising part of the West Bankers' contingent, was concerned less with socio-economic affairs than with essentially political ones, chiefly relating to foreign policy, such as the non-recognition of Israel, a tougher border policy and the strengthening of Jordan's relations with one or more of the Arab states. The third era begins in 1997, when Jordan rules the West Bank no more and West Bank connections with the parliament in 'Ammân, although still extant, become weaker and less frequent.

The character of the Jordanian legislature has been marked by conservative, particularly during the first period, although later on as well, due to the regulation that gave the right-of-vote to tax-payers only. The Legislative Councils elected between 1931 and 1946 always comprised the same people (or their relatives)—all belonging to thirty-six leading families. In the Chambers of Deputies elected between 1947 and 1967, despite the addition of the West Bankers and the increase in the number of Members, only 230 individuals, representing 135 prominent families, occupied the available 437 seats (details correct only for candidates originally elected, not for replacements).

This explains why the socio-economic character of the Chambers in the second period varied but

Bibliography: The proceedings of the Legislative Council have appeared as Majdharat al-majilis al-islami fi l-Urdun, Amman 1954-1964. Since 1947, they have appeared in Amman, as Majdharat majilis al-ammal and Majdharat majilis al-amm. The laws passed by the Jordanian parliament are published in the official gazette, al-Qardat al-rasmiyya or its Madhak supplement).

(viii) Saudi Arabia.

Saudi Arabia has not yet established anything resembling a parliament, although the matter has been occasionally mentioned among the ruling circles as something to be dealt with in the future. The King has delegated authority to various councils and committees, although no representative institution has been set up to date (1978). The King retains most powers and is a Majlis unto himself (as vividly described in Time, 29 May 1973, p. 23). The Ministers, headed by the King, fulfill the function of a legislative as well as executive body. A Ministry of Justice co-ordinates laws and regulations with the injunctions of the Shari'a.

Kuwait.

Independent since June 1961, Kuwait soon began to introduce some changes in the paternalist, absolute rule of its Amir. In 1938, a Consultative Assembly had been established. Although headed by the Crown Prince and mostly nominated, it voiced criticism of foreign concessions in Kuwait. It was dissolved soon afterwards because of anti-British sentiment expressed by its nationalists. Following a decree of the Amir on 26 August 1961, an electoral law, decreeing a Constituent Assembly, was issued on 7 October 1961, granting the franchise to all literate male citizens aged 21 or over; candidates were to be literate male citizens, aged 30 or over. Elections were held that December for 20 seats in the Constituent Assembly; Ministers constituted the other members. The Assembly first met on 20 January 1962 and drafted a constitution, promulgated on 11 November.

The constitution provides for a National Assembly (Majlis al-watani), elected every four years, comprising 50 members. The right to vote is granted to literate male citizens aged 21 or over, with ten constituencies each electing five members. Candidates stand as individuals (as no political parties are allowed); they must be male citizens aged 30 or over. The Assembly is in session eight months per year.

The main powers of the National Assembly are legislative (although the Amir has the right of veto), discussing general policy and ratifying foreign agreements. Members enjoy parliamentary immunity. Ministers are responsible singly before the Assembly and collectively before the Amir alone; this means that the Assembly cannot topple the Cabinet by a no-confidence vote. Both this and the right-of-veto reflect the paternalistic attitude of the Amir towards the National Assembly.

The first elections were held on 23 January 1963, then in January of 1967, 1971 and 1975. The electoral base was very narrow, only about 50,000 Kuwaiti citizens having the right to vote. In every Assembly, several members formed an opposition, noted for its leftist views, to the Amir and his government; although a minority, they were usually educated, articulate and active, often demanding more powers for the National Assembly. In April 1963, they requested abrogation of the defence arrangements with Great Britain and rapprochement with Egypt or Syria. In December 1965, seven opposition members resigned from the National Assembly, protesting limitations on individual liberties and on the Kuwayti model, as did the subsequent constitution. Statements by the Amir concerning the advantages of democracy. This mode probably helped bring about the very large voter participation of 88.5%. Efforts by leftist groups to influence the electorate failed, while moderate, conservative candidates generally succeeded in these elections. The Shi'a minority cast bloc-votes for candidates of their own denomination. Consequently, elected members were mostly Shi'a (14 out of 22), young (12 of the 22 were under 39 years of age) and well-educated (8 of the 22 were university graduates and another 2 had studied at universities for two years or more). The Amir and his Cabinet, always cautious to maintain the Sunni-Shi'a balance, corrected the above ratio by their own nominations (so that the Assembly comprised 21 Sunnis and 2 Shi'a).

The Constituent Assembly, which was first convened on 16 December 1972, approved a constitution in June 1972—essentially the draft submitted by the Cabinet, although several additional safeguards for constitution and Assembly were worked in. This constitution provided for a National Assembly (Majlis al-watani) of 30 elected members (the second legislature was to have 40) and no more than 12 Ministers, to be elected every four years. The Assembly's powers were mainly legislative, although one of its attributes was the authority to grant concess-
The United Arab Emirates, a federation of seven former Trucial Coast principalities [see Al-IMARAT AL-'ARABYYA AL-MUTTASHRA in Suppl.], was established, after protracted negotiations and some initial difficulties, on 2 September 1971. A provisional constitution was agreed upon on 18 July 1976 and extended for another five years in November 1976. This

The mode of selection was left to each member state (in practice, they are nominated by the respective Amirs). The Assembly's term is two years; sessions commence each November and last for six months. Its main functions are to debate the federal budget and drafts of laws presented to it by the federal Cabinet. The Cabinet must inform the Assembly about international agreements. Voting is by simple majority and Assembly Members enjoy immunity. The President of the United Arab Emirates—who has consistently been the Amir of Abu Dhabi—may dissolve the Assembly.

In actual practice, the Federal National Assembly is merely a consultative body, debating mostly matters of internal interest to the federation. Its character is largely determined by the fact that all members are appointed by the Amirs, who select them from their own families or from among the community of wealthy merchants and businessmen, interested in preservation of the status quo. In addition, the powers of the Federal National Assembly are limited, in practice, by the fact that each state legislates individually according to the qar'a. Abu Dhabi even has an Advisory National Council (al-Majlis al-islahi al-'udayn) of its own, comprising 50 nominated members, although with no meaningful power.

(xv) South Yemen.
The People's Democratic Republic of Yemen (sometimes called South Yemen) was established on 30 November 1967, upon the departure of the last British troops from Aden. This withdrawal followed the failure of the British to bring about a Federation of South Arabia between the Colony of Aden and the former Protectorates bordering it. The issue had been
briefly debated in the Legislative Council, the only
apparent representative institution in the Colony
of Aden. Inaugurated in 1947 as an entirely nomi-
national Assemblé, a new, provisional constitution was prom-
ulgated, granting the Military Command Council
both executive and legislative powers. Nevertheless,
the Consultative Assembly was re-convened in
November 1974, under the pressure of tribal chieftains,
then suspended again in September 1975, without much achievement. Its critics felt that it had been a forum for self-interested cliques, with no real understanding of national development. Brief and unstable in its history, parliamentarism in
Yemen appears to lack a firm foundation to this very day.

MADJLIS

al'ld) of 107 members, elected for three years. Of these, 86 were to be elected by all those aged 18 or over, through local councils, under the supervision of the General Command of the National Front, and another 15 by the Trade Union Federation. A quota was reserved for women among the 86 (though they could run independently as well).

The formal powers of the Supreme People's Assembly were fairly wide-ranging: election of the state President and Cabinet; debating and passing of laws, including the budget and development plans; ratification of international agreements and the announcing of a state of emergency. Members enjoyed parliamentary immunity.

As the local councils required for the elections were not in existence in 1970, a provisional Supreme People's Assembly was nominated by the National Front. It first met between 31 July and 4 August 1971, in order to elect certain state officials, as directed by the National Front. Insofar as can be ascertained, this nominated Supreme People's Assembly has continued to meet regularly, passing laws presented to it by the Cabinet and debating and approving economic plans. However, the Assembly's constant subservience to the National Front has minimised its effectiveness considerably. The first elections in South Yemen to the Supreme People's Assembly were held on 18 December 1978; it is not known whether its powers versus the National Front have changed since.

The first was to consist of 39 members of whom 14, including the President, were to be appointed by the Khedive and his Ministers; the other 25 were to be elected for 6 years by indirect balloting. It would debate (but not initiate) legislation and discuss the budget. The second was to consist of eighty-two members, including the Ministers, the Legislative Council and another 46 members elected for 6 years from among candidates over 30 years old, literate and who paid at least £ 6 per annum in direct taxes. The first body met 5 times per year and the second—at least once every two years to debate more important matters, including new taxes. While these partly-appointed bodies were less representative than a National Assembly of Delegates, they had a greater share in approving government expenses. These bodies were superseded by a unicameral Legislative Assembly (al-Djam'a'iyya al-takriyya), according to a Fundamental Law, issued on 1 July 1933, initiated by Lord Kitchener, then Great Britain's Consul-General in Egypt. In addition to the Ministers and 66 elected members, this Assembly was to include another 27, nominated in order to guarantee minimal representation for the Copts, Bedouins, merchants, physicians, engineers and teachers. Elections were to be indirect, with candidates aged at least 32, literate and paying a minimum amount of taxes. The mandate of the members was to be for six years, with one-third of the membership renewed every two years. Most important amongst the prerogatives ascribed to the Legislative Assembly were that, no new law could be passed before it had been debated and no new tax imposed before it had been duly approved. The Assembly met several times during 1914, although its convention was postponed again and again following the outbreak of World War I and it never reconvened subsequently.

Egypt was the first part of the Ottoman Empire to experiment with parliamentary bodies (in 1865).

Earlier, in 1829, Muhammad 'Ali had instituted a Consultative Council (Madjlis al-ma'qalíq), although it was merely an advisory board, meeting only once a year. Isma'il was the first to endow Egypt with a representative assembly modelled on Western European parliaments, even though he undoubtedly intended it to remain solely advisory. This body, the "Assembly of Delegates" (Madjlis al-shuyu'í al-mu'asir), was constituted in November 1855 by Khedival decree (for the text of this decree, see Bibliography—Hudud wa-misára'íí madjlíís al-shuyu'í al-mu'asirííyya). The 75 members, Egyptians aged at least 25, were to be elected for three years, indirectly, as befitted a partially-illiterate population; in addition, it enabled the Khedive to exercise better control over the results. This intention was also manifested in the paragraphs prohibiting Delegates from receiving petitions, limiting them to debate purely internal affairs and to proffering advice on projects submitted to them by the Khedive's Council of Ministers (Madjlis al-susara'). In any event, all decisions had to be ratified by the Khedive, who nominated the Assembly's President and Vice-President and had the exclusive right to convene, adjourn and dissolve it. The Assembly's name was changed to Madjlis al-mu'asiríí at the end of Isma'il's rule, although its functions underwent no essential changes. These Assemblies were convened for several weeks per year, most likely in order to impress Egypt's creditors—especially the European Powers—with the supposed liberal-constitutional views of its ruler. However, the general ferment in Egypt in the late 1870s and 1880s led to the Assemblies demanding a greater share in decision-making, which they did obtain in February-March 1882. Soon afterwards, however, the Assemblies were adjourned, during the events leading to the British occupation of 1882; in any event, they were never convened subsequently.

Soon after the British Occupation, Lord Dufferin issued a special report suggesting the institution of a Legislative Council (Madjlis al-shuyu'í al-sawáman) and a General Assembly (al-Djam'a'iyya al-shuyu'íyya), both of which functioned from 1883 to 1912. The first was to consist of 39 members of whom 14, including the President, were to be appointed by the Khedive and his Ministers; the other 25 were to be elected for 6 years by indirect balloting. It would debate (but not initiate) legislation and discuss the budget. The second was to consist of eighty-two members, including the Ministers, the Legislative Council and another 46 members elected for 6 years from among candidates over 30 years old, literate and who paid at least £ 6 per annum in direct taxes. The first body met 5 times per year and the second—at least once every two years to debate more important matters, including new taxes. While these partly-appointed bodies were less representative than a National Assembly of Delegates, they had a greater share in approving government expenses. These bodies were superseded by a unicameral Legislative Assembly (al-Djam'a'iyya al-takriyya), according to a Fundamental Law, issued on 1 July 1933, initiated by Lord Kitchener, then Great Britain's Consul-General in Egypt. In addition to the Ministers and 66 elected members, this Assembly was to include another 27, nominated in order to guarantee minimal representation for the Copts, Bedouins, merchants, physicians, engineers and teachers. Elections were to be indirect, with candidates aged at least 32, literate and paying a minimum amount of taxes. The mandate of the members was to be for six years, with one-third of the membership renewed every two years. Most important amongst the prerogatives ascribed to the Legislative Assembly were that, no new law could be passed before it had been debated and no new tax imposed before it had been duly approved. The Assembly met several times during 1914, although its convention was postponed again and again following the outbreak of World War I and it never reconvened subsequently.
The Constitution of 19 April 1923, suspended by a less liberal one on 22 October 1935, was reinstated on 12 December 1952. Essentially modelled on the 1920 Belgian Constitution, it provided for a monarchy largely in control of parliament. The latter was to be bicameral, comprising an Assembly of Representatives (Majlis al-anwa‘), and a Senate (Majlis al-thawra). The former was to be elected for five years by indirect balloting; candidates were to be at least 30 years old and literate. Two-fifths of the latter were appointed and three-fifths elected by indirect balloting. The term of office was ten years, with half of the Senators, appointed and elected alternately, leaving every five years. Senators had to be at least 40 years old and enjoy a certain social and economic status. The King and either House had the right to initiate legislation. Every law had to be passed by both Houses; the King had the right of veto, although it could be over-ridden by a two-thirds majority. The Assembly had a slight advantage over the Senate in discussing the budget and voting confidence in the government; however, unlike the Assembly, the Senate could not be dissolved, but merely ignored.

Attempts by King Fu‘ad [see Fu’ad al-Awzayl] to increase his prerogatives at the expense of Parliament—despite opposition by the Wafid Party—culminated in his promulgating a new constitution, by Royal Decree, on 22 October 1930. The new constitution raised obstacles to parliamentary censure, increased the proportion of appointed Senators from two to three-fifths (60 out of 100) and empowered the Executive to legislate during the parliamentary recess. In addition, the Assembly of Representatives could not initiate financial laws, while the King could do so. Modifications in the electoral law facilitated the continuation of the former House, although they may be deprived of their seats by a motion of twenty members and a subsequent vote of both chambers (two members in each). Candidates must be approved by the Arab Socialist Union; at least half of those elected must be peasants (owning no more than 25 acres of land) and workers. Another 10 members are nominated by the State President.

The former House was to be elected for five years by indirect balloting in 175 constituencies (two members in each). After the remaining 8 seats were decided, women could be elected by a two-thirds majority. The Assembly had a slight advantage over the Senate in discussing the budget and voting confidence in the government; however, unlike the Assembly, the Senate could not be dissolved, but merely ignored.

The 1923 Constitution was reinstated, on 12 December 1935, with all its former parliamentary attributes; it remained in effect until the Revolution of 23 July 1952. The constitution was formally abolished on 10 December 1952 and political parties disbanded on 13 January 1953. Since April 1954, the new regime had declared repeatedly its intention to return to some form of parliamentary rule. The new constitution of the Republic of Egypt was promulgated on 23 July 1952 and approved by a popular referendum. It provided for a 350-member unicameral National Assembly (Majlis al-anwa‘), to be elected every five years by general, secret and direct balloting, controlled by the National Union (established in May 1952 and the only political grouping permitted). For the first time, women were granted the passive and active franchise, although voting was compulsory for males only. Voters had to be aged 18 or over, with no criminal record; candidates had to be at least half of those elected must be peasants (owning no more than 25 acres of land) and workers. Another 10 members are nominated by the State President.

In 1976, these were the Arab Socialist Party of Egypt (centrist) the Socialist Liberals (right-of-centre), and the Patriotic Progressive Unionsist Alignment (left-of-centre). In the first round, the first won 161 seats, the second 120, the third 2, and independents 48. After the remaining 8 seats were decided, in the second round, the State President appointed another 10 Members (all of the Arab Socialist Party of Egypt), and several independents and others crossed the lines; the final allocation was: 132 Arab Socialist Party of Egypt 11 Socialist Liberals 34 Patriotic Progressive Unionsist Alignment Total 360

On 29 June 1977, the People’s Assembly adopted the new Party Law, liberalising the situation within limits and legitimising certain groups, which had previously been forced to act clandestinely. The debate within the Assembly became livelier, regarding both legislation and policy-making, and frank criticism was expressed more frequently. The government, however, remained secure in the Assembly’s support. On 22 July 1978, President Anwar al-Sadat
announced the formation of his own party, the National Democratic Party, which 366 of the Arab Socialist Party Members in the People's Assembly joined on 24 September 1976. Following this merger, the National Democratic Party became the ruling party in the state and in the People's Assembly (subsequently winning a handsome majority in the 7 June 1979 general elections to this body).

The history of parliamentary institutions in Egypt may be divided into three principal periods. The first, from 1866 to 1914, is the stage of experimentation with Western parliamentary models, advising the ruler and largely dependent on him (or on the British Occupation, after 1882), with no political parties playing any significant role. The second, from 1924 to 1952, represents the closest approach to an elected parliament during this period, because the Wafd Party, which won the Assembly in the first elections of 1924 with 150 out of 211 members, frequently (although not always) repeated its victories, thus compelling the King to dissolve parliament. The third period, from 1957 to date, represents a move towards renewal of multi-party activity. Consequently, opposition to the State President is being voiced more freely than ever before.

Since 1957, the House of Representatives, which 350 elected members, about 114 had registered as fuláhÍn and another 75 as workers. Other groups—academics, journalists, lawyers, physicians and Bedouins—numbered considerably fewer. The Christian elected members were under-represented (one Copt and one Greek); this was partially corrected by allotting 6 out of the 10 appointed seats to Christians.

Among functionaries, indirect balloting during the multi-party era. Nevertheless, the socio-economic make-up of Egypt's Assemblies may serve as an indication of the shift in the balance of power. To some extent, this has been determined by the electoral system—indirect balloting in the first period, which facilitated the decision of public functionaries. Indirect balloting during the multi-party period, subverted by the power structure and the wealthy (as Egyptians were the first to admit), enabled constant re-election of the politicians and the rich. The single-party controlled election system under the Republic enabled those trusted by the new régime to enter parliament. While no definite studies of the socio-economic composition of the membership are available, some incomplete data confirm the trends influenced by the electoral system. In the first Assembly, elected in 1866, there were 58 wÚmdas out of a total membership of 75; the proportion of wÚmdas decreased from one Assembly to the other. Since 1924, parliament has become more broadly representative, although landowners, businessmen and professionals (chiefly lawyers) played an important and possibly decisive role. In the Republic, the Assemblies of the late 1950s and early 1960s comprised a relatively large proportion of lawyers, businessmen, bureaucrats, officers and landowners, but very few workers and peasants. For example, according to the calculations of H. Hopkins, 332 fl. (see Bibliography), the Assembly of 1957-8 comprised one-third lawyers and businessmen, nearly one-third senior civil servants, ex-Ministers, former officers and landowners, and about one-third village uÚmdas and shayláds—but very few peasants and even fewer workers. This situation was reversed in legislation in the Assembly elected in 1964, where only 76 members—out of a total of 336—had served in previous Assemblies. Out of the 330 elected members, about 114 had registered as fuláhÍn and another 75 as workers. Other groups—academics, journalists, lawyers, physicians and Bedouins—numbered considerably fewer. The Christians elected members were under-represented (one Copt and one Greek); this was partially corrected by allotting 6 out of the 10 appointed seats to Christians.

The internal rules of procedure of these parliaments were printed several times as al-lÁdâjih al-níshâríyya, Cairo, while the laws passed appeared as the Journal Officûl du Gouvernement Égyptien, Cairo, and the debates themselves were issued as supplements to the above Journal. In the Republican period, the Egyptian parliament has published the projects of law, the debates of its Legislative Committee and the final text of the laws, as approved, in the plenary sessions—e.g. Dùmmíhiryyat Mísir al-'Arabíyuna. Since 1964, more than half (actually, 50% to 60%) of the membership has comprised workers and peasants, although few indeed hold important positions (such as Ministers or chairmen of parliamentary committees).

British attempt to come to terms with Sudanese nationalism.

After the end of the Second World War, Sudanisation proceeded swiftly and comprised representative bodies as well. A joint British-Sudanese administrative conference met for several months during 1946 and 1947, suggesting the formation of a Legislative Assembly and Executive Council, based largely on the British model. As the Egyptian government was reluctant to commit itself to a project which endangered its future ties with Sudan, the British went ahead alone and on 14 June 1948 authorised the governor-general to promulgate an ordinance establishing the above institutions. According to this ordinance, the Legislative Assembly (Djamiyya lidjJaṣr), elected for three years, was to represent all of Sudan; the inclusion of the south in the Assembly was a significant step in Sudanese integration. It provided for 52 elected members to represent the north and another 13 to represent the south. The governor-general could nominate up to 10 members; several were to present the executive. Of the 65 elected members, 10 would be elected directly in towns and the others by indirect elections in the rest of the Sudan. Voters must be Sudanese, male and aged 25 or over; candidates must be Sudanese, male and aged 30 or over. An Executive Council (Majlis tal-Qayyir), comprising between 12 and 18 members (at least half of them Sudanese), headed by the leader of the Legislative Assembly, was to supersede the governor-general's Council. The governor-general still retained important powers: vetoing decisions of the Executive Council, the right to legislative by ordinance, and excluding certain matters from the Legislative Assembly's competence. Nevertheless, Sudan's parliament had come into its own. The elections held in November 1948 were boycotted by political parties favouring union with Egypt. The first Legislative Assembly met on 15 December 1948, with the Umma party—favouring self-determination for the Sudan and amicable relations with the British—in the majority. Another influential group was that of the north Sudan tribal chieftains—self-styled Socialist Republicans.

The first Legislative Assembly, using both Arabic and English, debated economic matters, such as the Budget, local affairs, labour legislation and the education of southern Sudan. It's immediate concern, however, was relations with Britain and Egypt in the context of Sudan's own political future. A "Self-Government Statute" was enacted by the Legislative Assembly on 23 April 1953, providing for an entirely Sudanese Cabinet responsible to a bicameral parliament—a Chamber of Deputies (Majlis al-nuwaab) and a Senate (Majlis al-khayri); the governor-general would retain some authority on internal affairs—particularly in public services and in southern Sudanese matters—and exclusive powers over defence and foreign affairs. After initial strong opposition, Egypt eventually accepted the Statute. In the Anglo-Egyptian Agreement of 1953, however, Egypt made a bid for popularity in the Sudan against the British and suggested several modifications in the Statute, which the British could not reject. An elaborate plan was worked out for a maximum three-year transition period from self-government to self-determination. This provided, among other arrangements, for a specially-elected Constituent Assembly to decide between complete independence for the Sudan and links with Egypt.

An internal commission supervised the elections to this Assembly, in November-December 1953. Voting was by constituencies; voters had to be 21 or over and resident in their respective constituencies for a period of not less than six months. The National Unionist Party on a decisive victory in both Houses (51 out of 97 seats in the Chamber of Deputies and 22 out of 50 elected seats in the Senate).

The new Sudanese parliament, meeting as a Constituent Assembly (Majlis ta'asīs), was convened on 1 January 1954. The majority National Unionist Party, formerly assumed to favour union with Egypt, correctly interpreted the mood of the country and gradually changed direction. On 19 December 1955, the Chamber of Deputies declared Sudan's independence; the Senate declared its support three days later. A transitional constitution, largely based on the 1952 Self-Government Statute, was adopted and the Republic of Sudan was proclaimed on 1 January 1956. The struggle for independence gave way to translating sovereignty into practical terms, which meant parliamentary debates and decisions on numerous issues, including relations between North and South Sudan. Sudan's parliament was rather hampered by a spirit of factionalism, expressing itself through groups leaving the political parties and forming strong new rapprochements.

Parliament was dissolved on 30 June 1957. General elections were held between 27 February and 9 March 1958, with the number of Members of the Chamber of Deputies raised from 97 to 173, to be elected by constituencies of 50,000-70,000 inhabitants each. The Senate remained the same: 50 members of whom 30 were elected. The new parliament met on 20 March 1958 with the Umma party holding 63 seats; it formed a Coalition Cabinet with the People's Democratic Party, a group which had broken away from the National Unionist Party. The disparity between these two partners, the constant bickering between the other factions and rumours of corruption in high circles discredited both parliament and government. The military, led by Ibrahim Abbād, took control on 17 November 1958. Among its first acts were to suspend the transitional constitution, ban political parties and dissolve parliament. The work of the Legislative Assembly ceased; moderate legislative powers were granted to a Central Council, two-thirds of whose members were nominated by provincial councils and one-third nominated by the President of the Republic. The Central Council's term of office was two years; the first Council, which convened on 15 November 1963, served a shorter term, as less than one year later, in October 1964, civilian rule was restored following a popular revolt.

The new elections held in northern Sudan during April-May 1965 were based on the 1958 Electoral Law, with a few modifications, most important of which were: institution of a unicameral legislature (the Senate was done away with); reduction of the voting age from 21 to 18; and enfranchisement of women. Fighting in the south led to postponement of elections to March-April 1967. Now that independence had been achieved, the main issues were the state of the economy, the character of Sudanese society and the question of the south. In 1965, the Umma Party achieved the largest plurality (62 seats) in the north, while the National Unionist Party was second with 53. The other parliamentary groups were much smaller and the Legislative Assembly (meeting again as a Constituent Assembly) included 18 independents as well. A coalition cabinet of the
two largest parties, supported by the People's Democratic Party and the Muslim Brotherhood—all four forming a so-called United Front—was characterized by friction among the partners and among the various party components. Disagreements were so frequent and serious and parliamentary work was so hampered that the Cabinet decided to dissolve the legislature and appoint a new government. Two cabinet ministers resigned in protest. The government was reorganized with the resignation of the Minister of Defence and the Minister of Agriculture. This brought the resignation of the Minister of Education. The government was again reorganized with the resignation of the Minister of Finance and the Minister of Industry. The government was again reorganized with the resignation of the Minister of Trade and Commerce.

General elections were held in April-May, 1968 for an enlarged Assembly, seating 213. The National Unionist Party and the People's Democratic Party had merged into a Democratic Unionist Party and obtained 101 seats; the Umma Party obtained 73. Other seats went to smaller groups, including 40 independents. Again, the two largest parties formed a coalition cabinet suffering from essentially the same discord as the preceding one. Efforts at approving a permanent constitution failed and bickering prevailed. It was against this background of disillusionment with parliamentary democracy that the "Free Officers", led by Colonel Daief al-Numayri, seized power by a bloodless coup on 25 May 1969. The constitution was suspended, the Legislative Assembly dissolved and all parties banned. The government which had seized power soon vested all executive and legislative powers in a ten-man Revolutionary Command Council, nine of whom were military officers. It took some time until the new military régime of the Democratic Republic of Sudan felt secure enough to experiment with parliamentary institutions. On 12 August 1972, al-Numayri announced that a People's Assembly (Majlis al-umum) of 275 members would draft a new constitution, after which it would disband and new elections would be held, based on the constitution. In September-October 1972, 175 members were elected and another 32 nominated by al-Numayri including 13 women. On 12 April 1973, the first permanent constitution was approved by the People's Assembly; it became effective on 8 May 1973, superseding the 1954 provisional constitution. The first People's Assembly, acting as a legislature, was elected—according to the 1973 Constitution—under the supervision of the Sudanese Socialist Union, the only legal party. Candidates for the Assembly were nominated by the Sudanese Socialist Union; they had to be members of the party, Sudanese citizens aged 21 or over, literate and not deprived of their political rights. The Assembly itself is elected for a four-year term and sits for at least six months annually. Constitutionally, it has vast legislative powers, it may approve the budget, confirm the government's action and vote no-confidence (by a two-thirds majority). The Assembly elected in 1974 comprised 250 Members: 125 were directly elected from geographical constituencies, 70 elected by occupational organizations (workers, businessmen) and popular associations (women's unions), 30 by provincial People's Councils, and another 25 (no more than 25% of the total) nominated by the State President. The Sudanese Socialist Union has been very active in the Assembly elected in 1974 and is responsible for legislation and general policy. The cease-fire agreement of April 1972, ending a 17-year civil war between North and South, granted Southern Sudan its own, separate Assembly. First meeting in April 1974, it enjoys wide autonomous powers; the head of its Executive Council is the Vice-President of the Republic. Southern provinces also send delegates to the People's Assembly in Khartum.

Sudanese parliamentarism has been too brief for any detailed evaluation. Commencing with a stage of preparation and guidance by the British, the bicameral legislature got off to a fair start, although it was rather hampered both by the north-south dichotomy and by factional bickering. Its development has been twice interrupted—first between 1958 and 1964, then since 1969. Both interruptions—the result of military interventions—led to the establishment of unicameral legislatures, subservient to the respective heads of the military régime, although still indicating perhaps that parliamentarism had struck sufficient roots in the Sudan so as not to be wholly eradicated. This is also confirmed by the fact that all parliamentary elections held under civilian rule were generally carried out smoothly and fairly.

of the Sanusiyya [xxv] and of its then leader, Libya's Idris I.

The constitution provided for legislative assemblies in each of the three provinces and for a federal National Assembly (Majlis al-a'mama). The latter was bicameral and consisted of: (a) The Chamber of Deputies (Majlis al-nu'malli), directly elected on the basis of one member per 20,000 male inhabitants aged 21 or over (candidates had to be 30 years or over and literate). The first Chamber comprised 55 members: 15 from Tripoli and Cyrenaica and 5 from Fezzan. (b) The Senate (Majdīsi al-a'ghyūb), comprising 24 members aged 40 or over, equally divided among the three provinces: four Senators were nominated by the legislative assembly of each province and the remaining 12 by the King. The main task of the National Assembly was to enact legislation on issues of national significance, such as foreign affairs (local matters were essentially left to the respective legislatures of the three provinces). The King, or either House, could initiate legislation, although the privilege of initiating financial laws remained with the Chamber alone. The King could vote legislation and dissolve the Chamber at his own discretion. The Chamber's usual term was four years and the Senate's eight, with half the latter leaving every four years. Ministerial responsibility was to the Chamber only, where a two-thirds majority was required for a no-confidence vote.

On 7 April 1962 and 25 April 1963, legislation was passed in both Houses of the National Assembly to alter the 1951 Constitution and change Libya from a federal to a unitary state, based on its ten administrative districts instead of on its three provinces (which thus lost their special privileges). All of the Senate, rather than half of it, was to be nominated by the King. The Chamber was to be elected as formerly, although women were enfranchised and the number of seats was raised from 55 to 103. Some of these changes were a response to nationalist pressures for a unitary rather than federal state and an expression of the government's desire to decrease local and provincial rivalries and conflict between the National Assembly and the King and Cabinet.

The first elections to the Chamber were held on 19 February 1952 (based on the Electoral Law of 6 November 1951). The principal issues were relations with the Arab States and the Western Powers. Candidates opposing the King and the new regime grouped as a National Congress Party, based on Tripoli and supported by Egypt; its platform was strongly nationalist and opposed foreign bases in Libya. Elections were held on time in all constituencies, despite riots. The National Congress Party won in and around the city of Tripoli, but lost elsewhere. Forty-six out of the 55 Members of the Chamber supported the King and government; the National Congress Party obtained only 7 seats. The first duly elected National Assembly convened in Benghazi on 25 March 1952. Subsequently, it met irregularly and was concerned with debating and passing legislation. Although Assemblies were generally compliant, not infrequent criticism of government internal and external policies was voiced, particularly in the Chamber—frequently expressed by interpellations.

The successive general elections of January 1956, January 1960 (with secret balloting imposed on the whole state), October 1964 (with women voting for the first time and the number of constituencies increased to 103) and May 1965 (after King Idris had dissolved the Chamber on 13 February 1965) were

The Kingdom of Libya was established on 24 December 1951, largely as a result of the inability of the Great Powers to agree on the future of this area, which had been vacated by a defeated Italy. Prompted by the United Nations, an Interim National Constituent Assembly (referred to as Dārussiya waqanissiya or Majlis ta'ṣīli) of Libya met, beginning 25 November 1950 and resolved, on 3 December, that Libya should be a federal kingdom under the Amir Muhammad Idris, henceforth called King Idris I. By October 1951, it had also adopted a constitution, considering that the new state was made up of three rather disparate components—Tripolitania, Cyrenaica and Fezzan. Strong rivalry existed between the first two; Tripolitanis was the most populous, Cyrenaica the bese

Tripolitania, Cyrenaica and Fezzan. Strong rivalry existed between the first two; Tripolitanis was the most populous, Cyrenaica the bese
held on a personal (or family) competition basis (as political parties were not permitted to function legally). In the 1965 elections the number of constituencies was decreased to 91; all successful candidates were apparently pro-government—16 ran unopposed.

One of Libya’s main problems during the first two decades of statehood was a lack of personnel trained in the skills required for running the state. Nevertheless, the many skilled Libyans serving in the National Assembly or its administration sufficed to cause Muammar al-Kadhābi to annul the constitution and dissolve the Assembly after his coup of 1 September 1969 (the Assembly was, obviously, also one of the bases of power of the King he had deposed).

Under French rule, Tunisia had experimented with several French-imposed semi-representative
The Consultative Conference (Conseil Consultatif, Haya‘ı sâbâhîyya), established in 1897 (with defined powers since 1898), comprised only Frenchmen, elected by universal direct suffrage since 1903; from 1907 on, they were joined by 16 Tunisians, nominated by the French Governor General (Resident général). At first, the French and Tunisians met together, and later (since 1910) separately. The main task of the Consultative Conference was to advise concerning the budget.

In 1922, the French replaced the Consultative Conference with the Grand Council (Le Grand Conseil de Tunisie, al-Madżlis al-Kabïr li-l‘Itthâl al-Tunisîyya). Elected for six years, it comprised two sections possessing equal rights: one of 30 French members, elected by the French in Tunisia and the other of 41 Tunisians, elected by other Tunisians. The task of the Grand Council was to discuss the budget; in case the two sections differed, the decision rested with an Upper Council (Conseil Supérieur), comprising the Governor General, several Ministers and ranking secretaries, as well as seven members from each of the Grand Council’s two sections. The Grand Council could also raise and discuss any economic or financial matters, but not political or constitutional ones. Although the powers of the Council were limited and minimal, the Vichy Government was still wary and abolished it on 21 November 1940, transferring it to a Consultative Committee (Conseil Consultatif) of 5 Frenchmen and 5 Tunisians.

After the end of the Second World War, the Grand Council was re-established; its make-up and powers were altered on 15 September 1945. After then, it comprised two sections, French and Tunisian, each numbering 53 Members elected for six years. The franchise for the French section was extended to include all Frenchmen and Frenchwomen in Tunisia, aged at least 21 (candidates—at least 25), with direct voting and proportional representation. The franchise was also somewhat extended for the Tunisian section as well, including all Tunisian males aged at least 25 (candidates—at least 30), who either paid direct taxes, were war veterans, or had completed secondary school. Voting was in two stages. Although the Grand Council essentially remained concerned with economy and finance, its powers were increased to cover advising the government on all legislation—although the government could still bypass it in urgent cases. However, the Grand Council was not convened from the end of 1951 until 1954, when its powers were slightly extended.

Tunisian nationalists were obviously not happy with the limited powers of the above-mentioned Conference, Council and Committee, nor with their selective representation, which disenfranchised many Tunisians and afforded preferential voting to the French minority. As early as 1921, the Destûr Party demanded the creation of a representative assembly, to which Ministers would be responsible. When the Neo-Destûr was set up in 1934, it demanded the establishment of such an assembly as an instrument of national sovereignty and for limiting the arbitrary government of the Bey or of France. Consequently, the Neo-Destûr rejected the reforms suggested by the French in March 1934. These reforms provided for a legislative assembly, including French representatives, with full powers in social and economic matters, to be elected by universal suffrage. Under the pressure of the Neo-Destûr and more radical nationalists led by Sâhîb ben Yûsûf, the Bey signed a decree, establishing a Constituent Assembly, on 29 December 1935.

The Neo-Destûr, a "dominating party" (in Verger’s sense) has continued since to consider itself as the instrument of "national will". Hence in order to dominate the 98-seat Constituent Assembly (al-Madżlis al-Ta‘sisl), it insisted on an electoral law (promulgated on 6 January 1936) which would favour it over smaller parties and groups. All Tunisians, directly into 8 constituencies and the slate of candidates obtaining a relative majority of the vote in each was considered as "winner take-all".

Complete independence was the main issue in the 25 March 1956 elections to the Constituent Assembly. The National Front, led by the Neo-Destûr Party, won an impressive victory (597,813, out of a total of 610,989 votes, or 97.8%). Consequently, it induced the Assembly to pass regulations granting considerable parliamentary powers to the Assembly, its Bureau and six committees. Adoption of those regulations enabled the political bureau of the Neo-Destûr to control the proceedings of the Assembly efficiently and to delay the formation of any meaningful opposition within it. The wide and often unanimous support of the Assembly was skillfully exploited by the Neo-Destûr, especially by its leader, Habîb Bûrgiba, who was also the Assembly’s first Speaker; in April 1956, he left this post to become Prime Minister. The party utilised Constituent Assembly support to extend the powers of the Assembly beyond those of the Bey, his government and the French, on the one hand, and to achieve full independence for Tunisia, on the other. The Constituent Assembly increasingly considered itself sovereign; one of its most significant steps was to proclaim the republic on 25 July 1957. No less significantly, it established the norms for future Assemblies, both by its own practice and by adopting the June 1959 Constitution.

This constitution grants the National Assembly (Madjlis al-Minima) wide powers, limited, however, by the very essence of Tunisia’s presidential regime: the State President is elected by universal suffrage and neither he nor the various Ministers are responsible to the National Assembly. The National Assembly is elected in constituency voting for five-year terms by all Tunisian citizens aged 20 or over (candidates must be 30 years or over). In theory, it is the only legislative body and its members enjoy parliamentary immunity. However, the State President also has the right to initiate legislation—taking priority over the Assembly; he may also enact decrees while the Assembly is in recess (subject to the Assembly’s subsequent confirmation). Thus, further restrictions are imposed upon the Assembly’s legislative prerogatives.

The National Assembly elections of 8 November were, in many respects, similar to the 1956 Constituent Assembly elections. Once again, a National Front led by the Destûr Party won without serious competition. However, Tunisia was independent in 1959 and women were enfranchised for the first time. Separate polls determined the composition of the Assembly and elected the President of the Republic. The National Front won in the Assembly and Bûrgiba was elected President. All 90 Members of the National Assembly belonged to the Neo-Destûr Party or were independents sponsored and supported by it. As a result, main policy decisions were initiated and controlled by Bûrgiba and the party in the 1959-64 Assembly; in this respect, the National Assembly in Tunisia can be considered as an extension of the Neo-Destûr Party, renamed the Socialist Destûr.
Party in October 1964. However, as Tunisia achieved full independence and secured its place in international relations, internal affairs increasingly took precedence, and wide divergences of opinion became apparent in the Assembly, both because of the various interests represented in the single party and because the Assembly was no longer able to be influenced by the extra-parliamentary demands and reactions of those socio-economic and political groups excluded from the official political game.

Much of the above holds true for subsequent National Assemblies as well. In the Assembly elected on 8 November 1964, the Socialist Destür Party again held all 90 seats (a majority of the outgoing Members of the Assembly including its only woman, were re-elected). The 2 November 1965 National Assembly elections (increased to 107 seats) were essentially a repetition of earlier ones, with heavy voter participation and the election of the party's own candidates, even though the issues debated at this time chiefly concerned the government's economic policies, which had led to considerable controversy. Consequently, economic problems occupied much of the attention of the National Assembly elected in 1965. The results of the elections of 3 November 1971 to the Assembly (increased to 112 seats) were no different from previous ones: the party obtained all seats, although 77 of its Members were elected for the first time, including many representatives of the younger generation. Concurrently, several Members who had opted for a more liberal political and economic regime, thus opposing the line of Bourguiba, had been dropped from the candidates' list.

Although there is no detailed statistical breakdown of the Members of all National Assemblies in Tunisia, available material indicates several characteristics. As mentioned above, all Assembly Members were selected from within the single party; the top party leadership—identical with Tunisia's political leadership—had occupied the Assembly. The first National Assembly, elected in 1959, comprised 12 members of the party's political bureau, 9 Ministers, the director of Bourguiba's Cabinet, 8 former Ministers, 4 former governors, the secretary-general of the Neo-Destür youth and 7 fermer and then current party political commissioners. Members of that Assembly were markedly well educated: 37 had graduated from French universities, and another 23 from modern secondary schools; thus 56 out of the 90 had had a good French education. Most of the others had had traditional education; only one was illiterate. Professionally, the Assembly comprised 13 lawyers, 13 businessmen, 14 manual or clerical workers, 12 professors, 12 farmers, 7 physicians, 6 school teachers, 5 senior civil servants and 4 others. While later elections obviously introduced new members, the essential characteristics of the Assembly elected remained substantially the same. Thus the Assembly remained highly educated, and its Members were mostly well educated.

The parliamentary history of Tunisia since the 1950s indicates that the Constituent and then the National Assemblies have generally been of secondary importance to the single party. The latter has been the real focus of most important decisions, even in legislative matters. The Assembly's work is scheduled by its Bureau, usually after due consultation with the party. Assembly control is minimal, as nearly all its work is done in committees; on the average, only fifteen plenary meetings take place each year, mostly to approve legislation submitted by Bourguiba. On the whole, the Assembly has displayed docile subervience, rarely demonstrating a will of its own or even reflecting differences of opinion within the party itself.

xx) Algeria

The French, who ruled Algeria from 1830, introduced several moderately-representative institutions on 23 August 1898. The decrees established the Financial Delegations (Les Délégations financières) —intended to represent economic interests—which existed until 1945. The franchise changed several times, while candidates consistently had to be French citizens aged 25 or over, residing in Algeria at least three years. All were elected for six-year terms, half of them leaving every three years. Two of the three Delegations comprised 24 European Members each; a third, with 21 (later 24) non-European Members, included six who were nominated. Each Delegation was concerned solely with its own economic interests. Delegations served in an advisory capacity only, concentrating on the budget. United into one body by a decree in 1918, their powers remained unaltered. During 1945-1947 they were transformed into a Financial Assembly (L'Assemblée financière) of 37 elected members with broader representation but the same essential capacities.

The Financial Assembly was obviously unsatisfactory to proponents of Algerian nationalism, particularly during the period following the Second World War. All legislation was still passed by the National Assembly in Paris or by the French Governor-General in Algeria. Pressured by Algerian nationalists and by its own Algerian and French Members, the National Assembly in Paris approved a new Statute for Algeria (Statut Organique de l'Algérie, or al-Annabiyā) on 4 April 1945, setting up an Algerian Assembly on 20 September 1947.

This Statute provided for an Algerian Assembly (al-Madjlis al-Djawārī) of 120 Members, elected for six years—with half renewed every three years—in two separate “colleges” of 60 members each. The franchise was granted to all French citizens of legal age (although participation of Muslim women was deferred) in two-stage constituency voting. Candidates were subject to the same criteria but had to be at least 23 years old. Members of the Assembly were to convene in Algiers, for three sessions per year, each lasting not longer than six weeks (probably to prevent it from becoming too powerful). Much of its work was to be done in six committees. As legislation for Algeria remained the prerogative of the National Assembly in Paris, the Algerian Assembly’s function was chiefly to apply—with some modification—French laws and regulations to Algeria. The Algerian Assembly could also transmit its proposals to the National Assembly in Paris.

The first elections to the new Assembly under the Statute were held in April 1948, with partial elections in February 1951 and January 1954. It soon became evident that the Statute satisfied no one; it was too much for the local French and too little for the Muslims. Nationalism, expressed in moderate to extreme anti-French terms, was the main issue in the elections. Nevertheless, the Nationalists obtained only 16 seats in the 1948 Assembly and even fewer in subsequent elections—perhaps because the two-stage voting, the constituency-system and the disfranchisement of French citizens only favoured upholders of the status quo, supported by the French Administration.

The three Assemblies devoted much time to economic and financial matters—particularly Algeria’s annual budget; they were also responsible for instituting social security throughout the country. However, debate moved increasingly towards politics, largely as a result of the rise in nationalism, anti-French campaigns, now impelled into extra-parliamentary activity after the total failure of the nationalists in the 1954 elections. This appears to be the main reason for the Assembly’s dissolution on 12 April 1956. Algeria’s sole parliamentary representation remained in the National Assembly in Paris alone, which (in 1937-8) was concerned with drawing up a new constitution for Algeria, providing for a Federal National Assembly. However, this concept was never put into practice, because of growing unrest and violence in Algeria.

Parliamentary life revived only after the end of the war in Algeria; the Evian Agreements spelled out the necessity for electing a representative assembly. A Constituent National Assembly was elected accordingly on 20 September 1962, first meeting on 25 September. Its powers included legislation, promulgation of a constitution and selection of a provisional government. It comprised 195 Members, about one-third of whom had been guerrilla leaders and another 16 European Algerians. The 60-Member Front for National Liberation (known by its French acronym—FLN) dominated the Constituent Assembly, which had elected Ahmad Ben Bella Prime Minister, and dedicated only part of its time to legislating, as Ben Bella and the government were busy decreeing laws. However, the Constituent Assembly did initiate a fruitful exchange of opinions, with free criticism, meeting increasing disapproval from Ben Bella and his close advisers. Thus there was a marked difference between the level of tolerance for the opposition during the first year of the Assembly, presided over by liberal-mindedFarhat Abbas and during the second, when others presided. In the second year, political debates became increasingly infrequent and most attention was focused on economic matters, in which there were fewer differences of opinion.

Elections to the National Assembly took place in September 1964, in accordance with the August 1963 Constitution, approved by popular referendum on 8 September. This aimed at legitimising personal rule in Algeria, as well as the predominance of the FLN over the National Assembly. The constitution declared FLN as the only legal party and consequently empowered it to control the National Assembly. It provided for a unicameral National Assembly (al-Madjlis al-nuwtanī), seating candidates endorsed by FLN and duly elected by a general, direct vote for five-year terms. The Assembly and the State President were to initiate legislation; the latter exercised direct legislation under certain circumstances. The Assembly was also supposed to control the government’s rule-making. Ministers were responsible to the Assembly’s committees, whose members could interpellate them. Members of the Assembly enjoyed parliamentary immunity. According to a new electoral law, adopted in the Assembly on 25 August 1964, the number of seats was reduced from 104 to 138, which proved useful to the FLN government in eliminating members who were considered oppositionists. Nevertheless, about 43% of the Members were indeed re-elected. This Assembly, however, was short-lived and its achievements unspectacular, as more and more laws were promulgated by Presidential decree. Boudouyn’s coup of 19 June
1965 resulted in the suspension of both the 1963 Constitution and the National Assembly.

In June 1973, Boucheney announced his intention to hold elections for a new representative assembly, Algeria's new constitution, approved by a popular referendum on 19 November 1976, provides for a National People's Assembly, to be elected for a five-year term by direct secret and universal suffrage at the proposal of the single Party's leadership. A number of seats is to be reserved for representatives of peasants and workers. Legislation is to be the prerogative of both the Assembly and the State President, although only the latter may introduce bills on national defence. The Assembly is to hold two annual sessions of not more than three months each, while its sub-committees meet regularly.

Members are to enjoy parliamentary immunity. A National People's Assembly has not yet been elected to date (1976) and the Council of the Revolution, headed by Boucheney, is the state's supreme executive and legislative organ.

There is only meagre data available on members of the various parliamentary bodies in Algeria. During the pre-independence era, most were middle-class and were frequently identified with circles cooperating with the French and interested in preservation of the status quo. More specific data are available for the post-independence Constituent National Assembly, which sat for two years, between 1962 and 1964. Among its 194 members, 15 were of European origin; 10 were women. The average age was 39—fairly young as parliamentary bodies go. Its occupational breakdown was as follows:

**Occupational breakdown of 183 of the 194 Members of the Algerian Constituent Assembly, 1962-1964 (%)**

(Source: Anisse Salah-Bey—see Bibliography).

The "military" component was a direct result of the Algerian war; some had probably had a different background initially. The proportion of merchants and clerks seems high for a revolutionary Assembly. Those representing the free professions, on the other hand, comprised a relatively small group; apparently, however, some of the military had formerly been professionals. In any event, it was a well-educated body: some 25% of the Members had had university education and many others secondary school training. More than 75% spoke French, which was consequently the language used in the Assembly.

Algeria's parliamentary history falls into two main periods: the colonial era, until 1956, when the nature of the Assemblies, determined by the French, remained largely consultative, although some autonomy was acquired gradually; and the brief experience in independent Algeria, with the Assembly controlled by and largely subservient to the FLN.

**Bibliography:** The parliamentary debates (generally held in French) have been published in the *Délégations financières Algériennes, Debats et, later, in Conseil du Gouvernement, Débats*. These were superseded, during 1948-1962, by *Assemblee, Journal Officiel*, published in *Compte rendu in extenso des séances*. During 1962-1965, this appeared weekly as *Assemblée Nationale, Journal Officiel*...
Socio-economic groups. The King inaugurated the Assembly on 12 November 1956. When independence was achieved, King Muhammad V considered the issue of parliamentary bodies. Although the 1962 Constitution was criticized by both traditionalists and modernists in Morocco as being too modern or too traditional, respectively, it remained in force for several years; the first two Chambers were elected following its provisions and those of a subsequent Electoral Law, which was mainly a declaration of principles. This was enhanced by Morocco's first constitution, prepared by a commission and submitted by Hasan II to a popular referendum on 7 December 1962. Some 80% of those eligible voted, with a heavy majority in favour (3,706,732 versus 113,879).

The 1962 Constitution provided for a bi-cameral legislature—a Chamber of Representatives (Chambre des Représentants, Madjlis al-nuwtāb) and a Chamber of Councils (Assemblée des Conseillers, Madjlis al-nuṣūḥātijāhārīn). The former was to be elected for four years by direct universal suffrage and the latter for six years (with half the membership changing every three years)—by and from colleges consisting of local assemblies (two-thirds of this body) and chambers of agriculture, commerce and industry, artisans and trade-unionists (one-third). Both Chambers debate policy and legislate, although the Chamber of Representatives has greater authority. For example, the latter may bring about the resignation of the Cabinet by a vote of censure (Ministers are nominated by the King, who has also the right to dismiss them). While the Representatives have greater authority, legislation in both Chambers is hampered, in practical terms, by their meeting for only two annual two-months sessions. Furthermore, the King may withhold approval of laws indefinitely and may submit laws for popular referendum without prior consultation with the two Chambers. Members of both Chambers enjoy parliamentary immunity.

Although the 1962 Constitution was criticized by both traditionalists and modernists in Morocco as being too modern or too traditional, respectively, it remained in force for several years; the first two Chambers were elected following its provisions and those of a subsequent Electoral Law. Elections to the 144-seat first Chamber of Representatives were held on 17 May 1963, following a simple majority system with single-member constituencies, of which 117 were rural. There were 64 candidates running, each was required to deposit 200 dinars (then about £ 70), to be forfeited if the candidate his vote was cast in the constituency. About 73% of the 4,650,000 eligible voted. The Front for the Defence of Constitutional Institutions, a pro-King and pro-Government group, won 65 seats, four short of an absolute majority. Next came two nationalist groupings, the Istiqlāl with 42 seats and the National Union of Popular Forces with 28, together equaling the number of seats obtained by the Front, with Independents holding the remaining 6 seats. Elections to the 120-seat Chamber of Counsellors were held on 23 October 1963; the Front for the Defence of Constitutional Institutions won decisively with 107 seats, the Istiqlāl received 12 seats, and independents another 2. Hasan II opened the first Moroccan parliament on 18 November, re-

Under the French Protectorate, Morocco was an absolute monarchy, in which the Sultan and the French (particularly the latter) ruled without any parliamentary institutions. The King nominated a 76-member Consultative National Assembly (Assemblée Nationale Consultative, al-isti'mār al-nuwtāb) on 3 August 1956, striving to make it as representative as possible of the three major political parties, of the different regions of Morocco and of various socio-economic groups. The King inaugurated the Assembly on 12 November 1956. The powers of the Consultative National Assembly, amplified by a royal decree on 27 November 1956, were renewed every two years. The Assembly convened each year in spring and autumn. Most of its work is carried out in four (since 1958) committees comprising between 12 and 24 members each (every member may belong to one committee only). The Assembly's regular term is two years, although the King may prolong it (in 1958 it was prolonged by six months) and Members enjoy immunity. Since the Moroccan Cabinet preceded the convocation of the first Assembly, the Ministers were neither part of the Assembly, nor responsible to it, although the Members of the Assembly could interrogate them. Ministers were responsible to the King alone, who succeeded in imposing his will on the Assembly thanks to both the definition of its powers and to his own standing and prestige. Hence there were large pro-Government majorities in practically every vote on all important matters during the Assembly's first two years. Only during its third year were there signs of growing independence—and even increasing criticisms and opposition, probably reflecting the overall political climate outside the Assembly. This seems to have led Muhammad V to allow the Assembly to die a natural death in May 1959; its term was not renewed, nor did the King convene another Assembly during his reign.

Muhammad V's son and heir, Hasan II (mounted the throne in 1961), contributed to the course of parliamentarism in Morocco. On 5 June 1961, the new King promulgated a new Political Law, which was mainly a declaration of principles. This was enhanced by Morocco's first constitution, prepared by a commission and submitted by Hasan II to a popular referendum on 7 December 1962. Some 80% of those eligible voted, with a heavy majority in favour (3,706,732 versus 113,879).

The 1962 Constitution provided for a bi-cameral legislature—a Chamber of Representatives (Chambre des Représentants, Madjlis al-nuwtāb) and a Chamber of Councils (Assemblée des Conseillers, Madjlis al-nuṣūḥātijāhārīn). The former was to be elected for four years by direct universal suffrage and the latter for six years (with half the membership changing every three years)—by and from colleges consisting of local assemblies (two-thirds of this body) and chambers of agriculture, commerce and industry, artisans and trade-unionists (one-third). Both Chambers debate policy and legislate, although the Chamber of Representatives has greater authority. For example, the latter may bring about the resignation of the Cabinet by a vote of censure (Ministers are nominated by the King, who has also the right to dismiss them). While the Representatives have greater authority, legislation in both Chambers is hampered, in practical terms, by their meeting for only two annual two-months sessions. Furthermore, the King may withhold approval of laws indefinitely and may submit laws for popular referendum without prior consultation with the two Chambers. Members of both Chambers enjoy parliamentary immunity.

Although the 1962 Constitution was criticized by both traditionalists and modernists in Morocco as being too modern or too traditional, respectively, it remained in force for several years; the first two Chambers were elected following its provisions and those of a subsequent Electoral Law.
inquiring the post of Prime Minister which he had filled until then.

The achievements of the 1965 parliament were not particularly remarkable and ended abruptly in June 1965, with the declaration of a state of emergency by Hassan II (all within the framework of the constitution). There followed a pause in parliamentary activity, restored by the 1970 constitution published by the King on 8 July. It was reportedly approved by a 98.7% majority in a popular referendum held on 24 July. These official figures are questionable, however, as many have indicated the strong opposition of most parties and many organisations to the new constitution, largely caused by its differing from that of 1962 in that it further strengthened the powers of the King at the expense of the Prime Minister and parliament. According to the 1970 Constitution, the King was empowered to amend the constitution at will, promulgate decrees in almost any matter (even to declare war) and reject parliamentary bills and requests. Conversely, the nature of parliament was altered; it was now to be a unicameral Chamber of Representatives of 240 seats: 90 elected directly, 90 by members of local councils and 60 elected in two-stage voting by chambers of commerce and industry (including professional and workers' groups), all elected for six-year terms.

As most parties boycotted the 21 and 28 August 1970 elections to the Chamber of Representatives, the majority of candidates were independently supported by the government. Many candidates were returned unopposed and the government claimed huge participation despite the boycott. The Chamber comprised 158 independents (nearly all pro-government), 60 members of the pro-government Mouvement Populaire and 22 belonging to other parties and groups. The Chamber achieved little during its two-year lifespan and was sharply criticised from many quarters, prompting Hassan II to promulgate yet another constitution.

Morocco's third constitution was promulgated on 16 March 1972, following a popular referendum which approved it on 3 March. It was slightly more liberal regarding parliamentary powers; two-thirds of the unicameral Chamber of Representatives (of 264 seats) were to be elected by direct, universal suffrage and only one-third by two-stage voting of local councils as well as professional and employees' organisations. The Cabinet was made responsible to both the King and the Chamber. Nevertheless, the King's position remained pre-eminent, particularly as he had postponed the holding of new elections several times, ruling by decrees in the interim.

Under the 1972 Constitution, elections to the Chamber of Representatives were held on 3 June 1977. For the benefit of illiterate voters, each party was allotted a specific colour for its ballot. Some 82.9% of those eligible voted. Independents, mostly pro-Government, held 141 seats and Istiqlal candidates, 49; the pro-Government Mouvement Populaire held 44 seats and other groups 30. The King enjoyed a comfortable majority of his supporters in this Chamber, which he inaugurated on 14 October 1977.

The characteristics of Moroccan parliamentarians have not yet been studied in detail. Both the will of the Sovereign and subsequent electoral laws ensured that all Morocco's regions were represented, with rural areas favoured somewhat. Many of the Members were young; according to official figures, about 46% of the Members of 1963 parliament and 60% of those of the 1970 Chamber, were between 25 and 40 years of age. When nominating the Members, the King and his officials strove to strike some balance among political parties, non-political leaders, economic and social groups and diverse occupations. In November 1956, the occupational distribution was as follows: free professions - 10, agriculture - 19, commerce and industry - 17, workers - 16 and religious personalities - 5. In later Chambers, this distribution appears to have been more diversified.

Independent Morocco's bitter-and-thither experience with parliamentarism at first continued the tradition of the French Protectorate in nominating the whole institution, then moved towards elections, although the King did preserve his special powers in both the written constitutions and in the practice of imposing a two-stage electoral system (for at least a part of the membership) on parliament, ensuring the election of a largely-compliant body. Legislating by decree, without the benefit of parliamentary participation, completed the circle of the King's powers vis-à-vis the elected Chamber. This is all the more remarkable in light of Morocco's multi-party system.

region. Representation was then provided on three levels: (a) Territorial: a General Council elected by the Assembly could formulate its own policies in such local affairs as agriculture, forestry, trade, health and education. In Mauritania's case, these included the primary and secondary education. In Mauritania's autonomous membership in the new Community of the Sahara (Comunauté Frangaise), the Mauritanian Progressive Union (Union progressive Mauritanie) won 35 out of the Assembly's 54 seats, obtaining 252,868 out of the 272,474 votes cast. This party represented both the administrative and political elite—a study in segmented politics, as well as trade unions and co-operatives, government officials, wage earners, owners of registered property and war veterans. Consequently, few were eligible to vote in the 1946 Mauritanian elections. In 1947, the literate male population was added and in 1951, heads of households and mothers of two or more children. The following table indicates the sizable increase in the number of eligible voters. By 1956, the franchise was universal, so that the population was not unprepared for the new Loin cadre. The Loin cadre of 1956 bestowed a larger measure of autonomy on France's overseas territories, vested in respective elected Territorial Assemblies and in Councils of Government (Conseils de Gouvernement), comprising senior French officials and Ministers elected by the Assembly. Each Territorial Assembly could formulate its own policies in such local affairs as agriculture, forestry, trade, health and primary and secondary education. In Mauritania's first elections to the Territorial Assembly, held on 31 March 1957 (the first held under universal suffrage), the Mauritanian Progressive Union (Union Progressive Mauritanienne) won 35 out of the Assembly's 54 seats, obtaining 252,868 out of the 272,474 votes cast. This party represented both the administrative and traditional attitudes as well as tribal chieftains who had already participated in the 1952 election to the General Council (Territorial Assembly), winning 22 out of 24 seats. It was led by Mouhîd Nasr Mâddà, a lawyer-turned-politician who was to lead Mauritania to independence and serve as its first president. Mauritania's heavy "yes" vote in the De Gaulle referendum of 28 September 1958 signified its approval of the Constitution of the Fifth Republic and its autonomous membership in the new Community Francaise. Mauritania's Territorial Assembly was converted into a Constituent Assembly (Dînîyya ta'asrîyya), on 28 November 1958, with the task of drafting a constitution. Prepared by former administrators, the Assembly approved and promulgated a constitution on 22 March 1959, providing for a 40-seat Legislative Assembly (Assemblee législatif, Dînîyya tasrîyya), to be elected for five years by direct, universal and secret voting. The Assembly was to meet for two sessions annually, not exceeding two months each. Its powers were mainly legislative, although it also elected the Prime Minister, who in turn appointed the rest of the
Cabinet. Ministers were responsible to the Assembly, which could bring the Cabinet down by a no-confidence vote. Members enjoyed parliamentary immunity. The first elections to the Legislative Assembly were held on 27 May 1959, with some 326,000 out of about 373,000 participating. This time, the Mauritanian Progressive Union, renamed Parti du Regroupement Mauritanien (since 1958), captured all 40 seats.

After negotiations with France, the independence of the Islamic Republic of Mauritania was proclaimed on 28 November 1960. A new constitution, required for a sovereign state, was adopted by the Assembly on 20 May 1961 by a vote of 31 to 2, with one abstention. The 1961 Constitution—amended in 1972—was basically a modification of the former one, adopted for a presidential regime. It established the office of a state president, absorbing that of the prime minister, strengthening it at the expense of the Assembly. The 1961 Constitution provided for a 40-seat National Assembly (Assemblée Nationale) (30-seat since 1971 and 20-seat since 1975), elected for five years, legislating only in a limited number of areas, including the budget. The Assembly convened for one four-month session per year. It cannot pass a vote of no-confidence in the President or the Ministers (although it may impeach them). Ministers are responsible to the President but not to the Assembly. The President has priority in legislation and right of veto, but cannot dissolve the Assembly.

In the early 1960s, the Assembly produced much-needed legislation, such as the establishment of an adequate judicial system for Mauritania (1963). It also discussed policy, sometimes displaying an independence of spirit which caused considerable friction between the National Assembly and President Ould Dadda. The latter succeeded in strengthening his position, however, particularly since a constitutional amendment was passed, institutionalizing the Mauritanian Progressive Union as the only legal party. Since this action of his, it is the single party (led by Ould Dadda), rather than the National Assembly, which has served as the main locus of power in Mauritania and dominated its politics. This has been at least partly motivated by Ould Dadda's intention to use the party as Mauritania's main vehicle for modernisation, as traditionalists still have a strong hold in the National Assembly.

Consequently, in the general elections for the National Assembly held on 9 May 1966, the party, whose name had been changed to Mauritanian People's Party (Parti du Peuple Mauritanien, Hizb al-sha'b), won all 40 seats; it obtained 445,644 votes or 92.1% of the 447,660 valid votes cast (out of a total of 482,955 eligible to vote). Such results were repeated in the general elections for the National Assembly, held on 8 August 1971, when the party won all 50 seats, obtaining 502,547, out of 502,945, valid votes cast (nearly 100%). Again, in the general elections held on 26 October 1975, the party won all 70 seats obtaining 99.9% of all valid votes cast.

In February 1979, Mauritania participated with fourteen other African states, in Agadir, in the establishment of a Union of African Parliaments (Union des parlements africains), whose avowed aim was "to strengthen parliamentary institutions by improving the functions of representative democracy". Mauritania was represented in this new body by one of the Union's Vice-Presidents, 'Abd al-‘Aziz Sali, President of Mauritania's National Assembly and by Muhammad Fall, who entered the Union's Executive Committee. Mauritania's own parliament, however, was suspended following the July 1976 military coup.

Not much is known about the socio-economic composition of the National Assembly, although the 1965 Assembly reflected the administrative character of the single party; 39 out of the 40 members were civil servants. There is every reason to believe that this group has continued to predominate.

The parliamentary history of Mauritania falls into two periods: until independence, the Assembly was virtually led by the French, who even had a special college within it to protect the interests of France and French settlers. Since independence, it has been dominated by President Ould Dadda and his single party, generally (although not invariably) serving in a rather docile manner.

(xxiii) Israel.

Israel is one of the few Middle Eastern states with a sizable Muslim minority sharing in its parliamentary life. Upon the establishment of the State, on 14 May 1948, Israel had a population of about 1,362,000 Arabs, out of some 770,000 people; on 7 October 1978 there were approximately 590,000 (including those in East Jerusalem) out of a total population of 3,708,300. With some variation, the Arab vote has been relatively greater than that of Jews, due to the success of the nationalist Arab image and the fact that representation, so that every vote counts. Israel's electoral laws pass there are printed, in Hebrew, in Dever ha-Kneset, in Arab, in 'Itab al-Kawâdin; and, in English, in the Laws of the State of Israel. The immediate results of parliamentary elections are published in the Central Bureau of Statistics, Jerusalem, in Riqâghat -Yahâri ha-Firsâmin and, later, in detail, in special volumes entitled Results of election to the Knesset (Hebrew and English). See also M. Wight, British colonial constitutions, 1647, Oxford 1952, 99 ff.; Davies, 229-35; Godchot, 253-9; Atallah Mansour, Israel's Arabs go to the polls, in New Outlook (Tel-Aviv), iiii (Jan. 1960), 25-6; D. Most (although not all) of the Arab Knesset Members connected with the Establishment have been farmers; one was a Bedouin sheikh. Those voted in as Communists, however, have generally been townspeople. All have been—or have become—professional politicians. The education level of Arab Knesset Members, like that of Jewish ones, has risen from one legislature to the next; the Arab contingent has increasingly comprised journalists and writers.

29%; 1973-33% (about 48,000 votes); 1977 48% (about 70,000 votes). This party, formerly strongly principally among Christians, has made considerable inroads among Muslims and Druzes in recent years. As a result, its representatives in the Knesset have increasingly claimed to speak for all Israel's Arabs and have frequently insisted upon using the Arabic language there (Israel has two official languages—Hebrew and Arabic).

During the past twenty years, Arab electoral support for the Communist Party has increased, probably due to the success of the nationalist Arab image created by this party. The following are the percentages of Arab votes for the Communist Party, out of the total Arab vote, in recent Knesset elections: 1955-20%; 1961-22%; 1965-23%; 1969-

(xxiv) Cyprus

Cyprus is another Middle Eastern state with a large Muslim minority; although estimates vary, the Turkish community there numbers close to 20% of the island's inhabitants—the second largest after the Greek community.

The island was a part of the Ottoman Empire from 1571 to 1878. One of the first measures of the British, after they had taken over Cyprus in 1878, was to institute some form of representation for its inhabitants. Their first experiment, in August 1878, was a nominative Council of 4 to 8 members, with the Greek community having a proportionate representation. Soon, however, in the March 1882 Constitution, promulgated by an Order in Council, a more representative Legislative Council was appointed. This could initiate discussion in certain matters, although some financial matters were not within its competence.

The Legislative Council comprised 12 elected members (9 Greeks and 3 Turks) and 6 appointed members, generally officials, with the British High Commissioner or another senior official presiding and having a casting vote in case of a tie. The members were elected within their respective communities.

On 6 February, 1925, the membership was increased to: 24: 22 Greeks, 3 Turks, and 9 officials. The British intention appears to have been to be able to offset a collective vote of the Greek majority against the Turkish community. In practice, however, the British officials voted almost regularly together with the Turkish members. This led to no little frustration on the Greek side and to its increasingly introducing extremist measures into the Constitution. The moderating British presence, however, legislation slowed down frequently and policy debates turned to stant friction continued in the House and other levels of government, at a ratio of 70% for the Greek, and 30% for the Turkish community. The Cabinet has 7 Greek, and 3 Turkish, Cypriots—who may be Members of the House. Legislative authority is vested in a House of Representatives, elected for five years; it is made up of 35 Greek Cypriots and 13 Turkish Cypriots, elected within their communities. The Speaker of the House is a Greek Cypriot, the Deputy Speaker a Turkish Cypriot. While the President of the Republic (a Greek) or the Vice-President (a Turk) alone may initiate financial bills, the House discusses them. The House's powers are limited further by the absolute right of veto of the President and Vice-President in foreign affairs, defence and security, as well as by the establishment of separate communal Chambers of the Greek Cypriots and the Turkish Cypriots, which have competence in all religious, cultural and educational matters, and by the decisions of the communal courts in matters of personal status. Both Greek and Turkish are official languages.

The first House of Representatives was elected, according to the pre-independence Electoral Law of 31 December 1939, in 6 multi-member constituencies; each community voted only for its own candidates. The first elections to the House of Representatives were held on 31 July 1960. Those to the Communal Chambers were held on 7 August; the Turkish Cypriots elected, to all the 25 seats of their Chamber, the National Front of Faiz Kâğızık. From the start, Turkish Cypriots stood fast for protecting their constitutional rights, while the Greek Cypriots argued that their rivals were taking an unfair advantage of the constitution. Constant friction continued in the House and other levels of government, sometimes reaching crisis dimensions. As with the establishment of separate communal Chambers of the Greek Cypriots and the Turkish Cypriots, the House of Representatives served to emphasise discord rather than accommodate conflict. Without the moderating British presence, however, legislation slowed down frequently and policy debates turned to hickering. Deadlock sometimes ensued, and in November 1963 Makarios, the State President, proposed various constitutional amendments; the main ones were to do away with the separate voting of Greeks and Turks in passing certain laws, and to abolish the right of either of the State President and Vice-President, separately, of vetoing legislation. The amendments were energetically rejected by the Turkish Cypriots, who argued that the amendments would undermine the regime. When disturbances, late in 1963 and early in 1964, prevented the Turkish Cypriots from attending the House, the Greek Cypriots passed the above amendment, anyway, on 23 July 1965, modifying also the 1959 Electoral Law to make voting general, instead of by communities. The Turkish Cypriots rejected all the above—and the joint House of Representatives ceased to exist, becoming a Greek Cypriot body. The Turkish Cypriots reacted by boycotting the House and instituting their own "Turkish Cypriot Transitional Administration" (December 1967).
General elections for the House of Representatives were held on 5 July 1976 (the former House, elected in 1960 for five years, had had its term prolonged, annually, by Presidential decree). The Turkish Cypriots, on the same day, elected their own 25 Representatives to the House, These, however, continued to boycott the House and, together with the 15 Members of the Turkish Cypriot Communal Chamber, formed a joint 50-Member Chamber, part of the Turkish Cypriot Transitional Administration. After Turkey's military intervention in July 1974 an Autonomous Turkish Cypriot Administration was established, with an Executive Council and a Legislative Assembly. Following the decision, on 23 February 1975, to create a Turkish Cypriot Federated State in the whole area under Turkish control, a 50-Member Constituent Assembly (Kurucu Meclis) was elected in the same month, comprising 25 Members of the joint Chamber and another 25 Members selected by various organisations. This body prepared a new, separate constitution for the Turkish Cypriot Federated State, which was approved with a large majority, by a popular referendum, on 20 June 1976. The National (Yasama Meclis) was elected in the same month, comprising 25 Members of the joint Chamber and another 25 Members of the Turkish Cypriot Communist Party and the Republican Turkish Party each.

The Territory of Cyprus, in its history, has been divided into three main parts. Under British rule, the Turkish Cypriots sat—first from 1883 to 1913—as a minority group together with the Greek Cypriots and the British, usually voting with the British for what they saw as their special interests. In the independent Republic of Cyprus, from 1960 to 1963, they sat with the Greek Cypriots in a House of Representatives, as a minority group, but with special safeguards for their community. Since 1963, first in their own area in the Republic, later in what they consider the Turkish Cypriot Federated State, they have maintained their own, all-Turk, representative institutions.

Afghanistan has known two distinct types of representative assembly, the *djirga* and the *madjlis*. Their origins, development and functions are quite different and they are best discussed separately.

The *djirga* is a tribal council operating at all levels from the family upwards and reflecting the collective authority of the group over the individual. At the lowest levels its membership comprises all adult males; at higher levels various units are represented by men chosen primarily on the basis of seniority, but also for skill in negotiation or family reputation. Djirga decisions represent a consensus, weighted according to age and reputation. The functions of the *djirga* embrace all matters, but especially the resolution of disputes within the group and the relations of the group with outside organisations. The authority of the *djirga* depends upon the distribution of power within the group concerned. In state affairs, two varieties of council are employed: one was the permanent council of chiefs, members of the royal family and other notables, which was consulted frequently on all matters of state business and which offered detailed advice. References to such an institution under various names are common from the time of Ahmad Shah Durraní (*i.e.* Abd Allah onwards. The second, usually known as the Loya Djirga, dealt with the most important matters. It was a much larger body, including all men of influence in the region or country, and it was usually summoned to deal with one issue alone and subsequently dismissed. It was called in cases of succession where the legitimacy of the claims of a candidate to the throne were in doubt and where some broad expression of national endorsement was required. In 1747 Ahmad Shah Durraní elected a ruler by a *djirga* of Abd Allah and Ghaznavi tribal chiefs and religious figures; in August 1880 'Abd al-Rahman (see *Abd al-Rahman Khan*) was chosen by an assembly of tribal chiefs; and in February 1919 Aman Allah (*i.e.* in Suppl.) was proclaimed sardar by a gathering of tribal chiefs and notables at Kábul. Ba££a-yi Sak&w legitimised his claim to the throne through the *n/ami* and in March 1929 his decision, not to discuss it. In 1921 Amín Allah was chosen of Abd Allah's plans for reform. In 1941 a Loya Djirga was called to endorse Afghanistan's foreign policy in the Second World War following the Allied demand for the expulsion of German citizens; and in 1949 and 1953 Loya Djirgas (possibly representing only certain tribes) were called in connection with the Pakhtunistan dispute. The constitutions of 1969 and 1977 were also submitted to Loya Djirgas for approval. In keeping with its inclination towards parliamentary democracy, the 1964 constitution considerably reduced the role and importance of the Loya Djirga. The Loya Djirga of January-February 1977, which considered the new constitution and elected Muhammad Da'ud as President of the Republic, in particular, provided good evidence of the development of the Loya Djirga and its continuing importance as a major source of legitimisation. In the Presidential proclamation of 28 December 1976, which announced the summoning of the Djirga, it was stated that "in accordance with the conventions of our society Loya Djirgas in the course of the history of Afghanistan have been convened on sensitive and important occasions and have deliberated vital national issues". The Loya Djirga was described as a *supra-parliamentary body*. Article 65 of the 1977 constitution defined the composition of the Loya Djirga, which was represented as "the supreme manifestation of the power and will of its [Afghanistan's] people". The 1977 Loya Djirga consisted of elected representatives, members of the government, members of the central committee of the only political party, the high judicial council, the constitutional drafting committee, military officers, and other persons appointed by Presidential decree. The Djirga sat for twenty-six sessions and made several amendments to the constitution before finally approving it (see further *Afghanistan in Suppl.*). In particular, it legitimised the institution on the Indian side of the Frontier.

The constitution of the *madjlis* proper has a much shorter history. Until 1923 Afghanistan knew only consultative councils appointed by the ruler from among the notables. The 1923 constitution provided for three national bodies: a council of ministers, the Darbār-i 'Aîl; and an advisory state council, half nominated and half elected. The state council was the first Afghan institution which possessed some likeness to a Western parliament, but its role was reduced and it seems to have played an insignificant role in Afghan public life. The 1923 constitution also provided for regional advisory councils, an innovation continued under Nádir Shah. By 1924 the Afghan parliament bore a strong resemblance to the European institutions upon which it was, no doubt, modelled, although in his defence of the constitution Nádir Shah argued (in the manner of
Under British rule in India, Muslims were involved in two forms of assembly. There were the sessions of the various Muslim organisations, the most important of which were those of the All-India Muslim League, founded in 1906, in which major matters concerning Indian Muslims were discussed and resolutions passed. But for most of its existence the League was not a particularly representative organisation; support was limited to the upper classes and professional men from provinces where Muslims were in a minority, "ulama" refused to join, some Muslims preferred to support the Indian National Congress, others supported regional organisations of Hindus and Muslims like the Unionist party in the Punjab or the Krishak Samiti in Bengal. The League's fundamentally limited appeal was emphasised in the general elections to the legislative councils in 1937, when it won a mere 104 out of 489 seats reserved for Muslims. Only in the years 1927-47, as the meaning of Congress government was revealed and as the League began to campaign for a Muslim homeland of Pakistan, did the organisation come to win the support of most Muslims and its sessions to embrace their views. The extent of this support was demonstrated in the general elections to the legislative councils in 1945-6, when the League won 439 out of 494 seats reserved for Muslims.

The second form of assembly in which Muslims participated was a system of provincial councils which the British began to introduce in the second half of the 19th century. These operated at two levels, there being a legislative council for the whole of India and a legislative council in each province. When, from the beginning of the 20th century, the British began to make elections the main way of choosing council members, Muslims demanded special measures to protect them against Hindu majorities, which they feared. Each time the franchise was extended and council powers were increased, that is in 1909, 1919, 1929, 1935, Muslims were given separate electorates and, where appropriate, extra seats to take account of their "political importance". Each time the result was to raise the Muslim proportion of seats above their proportion of the population where they were in a minority, to reduce their number of seats where they formed a large majority of the population, and to destroy the possibility of a majority of seats where they formed a small majority of the population, notably in the key provinces of Punjab and Bengal. Up to 1937, although quick to defend Muslim interests when they saw them
threatened, whether it was the matter of money-lending in the Fandjb or local schools in the United Provinces, Muslims did not in general operate in council politics from a specifically Muslim platform, tending to belong to supra-communal groupings of landlords, local interests or nationalists. But all changed after the Indian National Congress formed governments in seven out of eleven provinces following the 1937 elections and the prospect of independence began to loom during World War II. Now Muslims realised that they must either support the Indian nationalist cause or follow the Muslim League. Most chose the latter course. Between September 1942 and March 1947, helped both by the mistakes of the nationalist leadership and the skill of its rivals from the League, it was possible to form governments in the provinces of Sind, the North-West Frontier Province, Assam, Bengal and the Fandjb.

After the partition of the subcontinent, 40 million Muslims remained scattered in minorities throughout the provinces (now known as states) of independent India, except in Kashmir where they formed a large majority. The new Indian constitution, promulgated in 1950, abolished the old Muslim safeguards of separate electorates and reserved seats; the law forbade any political appeals on the basis of religion. Nevertheless, distinctively Muslim political parties persisted; the relics of the pre-independence Muslim League survived in Kerala and spread to the northern states in the 1960s; in 1957 the Majlis Ittihad al-Muslimin revived in Hyderabad and a decade later was petitioning the Government of India for the foundation of a purely Muslim state on India's eastern coast; in 1964 the Majlis-i-Mushawarat was formed to press for specifically Muslim concerns through the political system. But, beyond winning a few seats and striking the occasional bargain with other parties at state level, these communal parties had little success in promoting Muslim interests or in winning large-scale Muslim support. Most Muslims have entered both state assemblies and national Parliament as members of the Congress Party, which has come to be seen, among the unsatisfactory alternatives available, as the best protector of Muslim interests. Indeed, so firm has been Muslim support that it has been recognised as one of the main sustainers of Congress dominance in Indian politics since 1947. The weakening of their support is marked down as a major cause of the Congress's defeat in the general elections of 1977; the return of their support as a cause of its victory in the general elections of 1980.

In the Muslim state of Pakistan, we are concerned less with Muslim representation in assemblies than with the fortunes of assemblies themselves. At independence there were the old provincial legislatures inherited from the British period, and these elected a Constituent Assembly whose task was to frame a constitution for the new country. But at the same time to act as a national legislature. Framing a constitution proved immensely difficult. Amongst the many problems were those of balancing the claims of East Pakistan, where a majority of the people lived, against those of West Pakistan, and finding an appropriate place for Islam in the country's constitution. The Assembly worked with much rancour and increasing slowness. When in 1954 it moved to curb the powers of the Governor-General, he replied on 24 October of that year by dismissing the Assembly and declaring a state of emergency. In June 1955 the provincial legislatures elected a second Constituent Assembly and on 29 February 1956, nearly nine years after independence, the Assembly adopted Pakistan's first constitution which provided for a federal and parliamentary system of government with a strong centre, adult franchise and direct elections. There was to be one house of Parliament and its members were to be divided equally between East and West Pakistan (see Table on p.107). General elections were proposed for 1958, but they were not held. Politicians squabbled. Faction, violence and corruption were rife. The public lost all respect for political institutions. On 7 October 1958 President Iskandar Mirza, under pressure from General Ayyub Khan, declared martial law, abrogated the constitution and dissolved all legislatures. Thus democracy lost its first struggle with authoritarianism in Pakistani life. In the first eleven years of its existence, the National Assembly met for a mere 385 days and passed only 163 acts. For the rest of the time, the executive had unrestricted power and issued 376 major ordinances.

On 1 March 1962 President Ayyub Khan promulgated a new constitution, which provided for two provincial assemblies, one for East and one for West Pakistan, and a National Assembly of 256 members whose seats were equally divided between the two wings of the country. Members were to be elected by a college of 80,000 "Basic Democrats" who had been elected directly by the people. The first meeting of the National Assembly was convened on 8 June 1962, but from the beginning it met with powerful opposition in the country. As political parties were forbidden, and as all executive and much legislative power was in the hands of the President, the Assembly seemed less a forum for democracy than a weapon of dictatorship. Eventually, opposition grew so great that Ayyub Khan was forced to declare martial law in March 1969 and to dissolve the Assembly. Agitation continued. On 25 March 1969 the Commander-in-Chief, V. B. Khan, dismissed Ayyub Khan and abrogated the 1962 constitution. On 28 November 1969 he reaffirmed a pledge to restore parliamentary government and announced that general elections would be held on the basis of one man, one vote, in autumn 1970 to elect a National Assembly to draft a constitution. Parity between the East and West wings of the country was now abandoned; on the basis of its population East Pakistan could now control 56% of the seats. On 7 December 1970 Pakistan held its first general elections. The Awami League won 160 out of 162 seats in East Pakistan and therefore had a potential majority in the National Assembly. On 1 March 1972 Vahiy Khan, under pressure from the West Pakistani leader, Zulfikar Ali Bhutto, decided to postpone the National Assembly, and events were set moving which led to the transformation of East Pakistan into the new state of Bangladesh in December 1971.

In 1972 the National Assembly of the now truncated Pakistan began to meet and agreed that the country should have a federal and parliamentary system of government. There were to be four provincial assemblies and two houses of Parliament, a National Assembly and a Senate. This, the first constitution framed by a directly elected assembly, was adopted on 10 April 1973 and came into force on 14 August. The National Assembly was dominated by the Pakistan People's Party whose leader, Zulfikar Ali Bhutto, resigned the presidency of Pakistan to become Prime Minister. In 1977 Mr Bhutto called Pakistan's second general elections for March. His party won 135 of the National Assembly's 200 seats. Soon it became evident that the elections had been
rigged on a huge scale. The nine opposition parties which had coalesced to form the Pakistan National Alliance refused to accept the results, launched a mass movement to press for Mr Bhutto's removal and for fresh elections supervised either by the Judiciary or by the Army. On 5 July the Army took the leaders of both sides into "protective custody", declared martial law and disbanded the national and provincial assemblies. The Chief Martial Law Administrator, General Zia-ul-Haq (Diyu' al-Hak) promised elections for 18 October. They were postponed. He promised elections again for 17 October 1979. They did not take place. Now, General Zia-ul-Haq has promised to establish a government of people's representatives who are to be chosen through the "Islamic mode".

In Bangladesh, a Constituent Assembly met on 1 March 1972 which comprised those members who had been elected from Bangladesh to the Pakistan National Assembly and the East Pakistan Provincial Assembly in the general elections of 1970. On 4 November 1972 the Assembly adopted a constitution which provided for a Parliament (Jatiya Sangsad) of one house. Three hundred members were to be directly elected by universal adult suffrage, and a further fifteen seats were reserved for women who were to be elected by the members of Parliament. General elections were held on 7 March 1973 in which Shykh Mujeeb-ur-Rahman (Diyu' al-Rahman) of the Bangladesh National Party won 31 seats. But then, by means of a series of amendments passed between 1972 and 1975, Mujeeb-ur-Rahman changed the constitution, creating a presidential and one-party system in which all the powers of government were concentrated in the President, and the power of the legislature to control the executive was virtually destroyed. On 15 August 1975 an army faction killed Shykh Mujeeb. Martial law was declared. Parliament was dissolved. Shykh Mujeeb's submerged constitutional amendments were repealed and elections promised for 28 February 1977. These elections were eventually held on 18 February 1979 and produced a majority in Parliament for the Bangladesh National Party, the party of General Zia-ul-Rahman (Diyu' al-Rahman), Chief Martial Law Administrator and President.

MADJLIS - MADJLIS AL-SHURĀ

The name given to extraordinary, ad hoc consultative assemblies in the last century-and-a-half or so of the Ottoman Empire in order to deal with special matters. While it had existed in the Ottoman Empire, and in earlier Islamic states, to hold special consultations about urgent matters (see MASHHARA), such meetings appear to have become especially frequent among the Ottomans between the Russo-Ottoman War of 1787-88/1796-97 and, roughly, the abolition of the Janissaries in 1826. Referred to by a variety of synonymously terms, such as mawṣil-i šurā, dar al-ṣurā, madjalis-i meṣkhat (or mawṣil-i meṣkhat), or endjumen-i meṣkhat, these assemblies were convened ad hoc and included a variable list of high-level officials: the grand vezir, the gayḥūk al-ʾĪslām, the senior military commanders, top scribal officials, and perhaps others. The place of meeting was also variable: the palace, the Sublime Porte (Baḥr-i ṣāl [q.v.]), the headquarters of the gayḥūk al-ʾĪslām (baḥr-i meṣkhat [q.v.]), military headquarters in the field, or even provincial administrative centres. The increased frequency of such consultations clearly reflected the gravity of the crises of the time; it may have been related, too, to the decline of the old system of diwan [q.v.]-meaning, in Ottoman usage, conciliar bodies, rather than government
bureaux. The pattern of convening consultative *medjizes* continued to some degree until the end of the empire (Devereux, 37-8, 45-6, 96-7, 243-4; Davison, Reform, 34-9, 354, 356, 353, 368, 393-4; Patalin, OTD, iii, 361; Findley, 245).

Ottoman histories of the late 18th and early 19th centuries provide many accounts of consultative *medjizes* (e.g. Cevdet, i, 99-102, 175-7, 316-9; ii, 79-80, 126-9, 136; iii, 276-9; iv, 360; vii, 28-9; ix, 302). Such comments against him after the meeting (Cevdet i, 3x6-7; Otub, x, 199-201; ii, 195-8; iv, 2-5, 37-5, 155-8, 201-4; Cevdet, ii, 242-3, 276-8; iii, 33-47, 53-5, 74-5; iv, 154-60, 187-95, 289-91; v, 52, 53; vii, 28-9; ix, 160-1, 300-2; x, 17-20, xi, 95, 186-7, 272-5; xii, 147-51, 158-9; Mehmed Es'ad, 14-15; Lütül, i, 291-2; i, 172; cf. d'Ohsson, vii, 228-3; Shaw, Old and new, 73-9). These accounts contain some of the most vivid documentation available for any facet of Ottoman history. Often, they testify to the importance of these bodies, the need to extend quotations from the participants. The remarks may be quite heated, and are sometimes expressed in plain language sharply in contrast with the normal style of the author who quoted them. It is not impossible to find different accounts of the same assembly, in which a given remark will be rendered in "plain Turkish" according to one author, and in highbrow Ottoman according to another. In recounting an assembly of 1808, for example, Cevdet Paşa commented on the "reckless" (karbakhsh) way in which Sıçalzade Mustafa Paşa then grand vezir, expressed himself. Cevdet went on to quote the Alemdar as using the plainest of language to say that his earlier action had been mistaken (padiyem yolsun ve bağımsız parlyakh: Cevdet, i, 95). Şanlızade's earlier history recounts the same assembly, but there the same remark is "translated" into Ottoman (sülüknamâ cavv-ni hahk-i feth-i 'ıdâh-ı khlrka-yi sherif-xcel ra'iiyytl). As for Şanlızade, his point in making this comparison was to argue—either forcibly or by later writers often returned [see 296). As for Şanlızade, his point in making the comparison was to argue—with appropriate reference to the authority of the sultan and the source of the Prophet—that Ottoman assemblies ought not to be as large as those of the states he was describing. He argued that some of those invited to participate in the larger of the Ottoman assemblies had nothing to add to the discussion. In fact, the issue was not so simple. Particularly as the problems at hand grew more threatening, the Ottomans discovered a variety of needs, of which some reinforced, but others conflicted with, the tradition of a narrow scope of consultation.

One of the first concerns to emerge out of the consultative assemblies of the late 18th century was for greater care in maintaining the confidence of proceedings. At first, it appears that there had been little care to have the councils meet in closed session (Cevdet, ii, 243) or otherwise maintain secrecy. By the 1790s, however, great concern had developed over this point. Participants were sometimes made to swear secrecy. Threats were invoked upon those who divulged what they had heard or later criticised decisions they had supported in council (Cevdet, iii, 35, 45, 332; iv, 188, 360; vi, 133; x, 18). Ma'mûn I carried out such a threat on at least one occasion, by exiting Rızaşhâh Fevzi Molla, father of the future grand vezir Fuâd Paşa, for criticising a measure that he had not opposed in assembly [see VIZET MOLLA].

Perhaps the most striking procedural trait of the consultative *medjizes* of this period was the terms and war with almost certain prospect of defeat. At such moments, the proceedings could become highly dramatic. The shaikh al-İslâm might become so agitated that he would threaten to take a gun in hand and set out on the dhîhdâh himself (Şanlızade, iv, 201; cf. Cevdet, iii, 40). The senior military men would answer such effusions with sober talk of what war really meant for a state in the position of the Ottoman Empire (Davison, Reform, ii, iii, 36, 42). Consultative meetings of the tens of consultative assemblies occurred at Topkapı Palace in 1847/1860, just prior to the decisive strike against the Janissaries. With the sultan himself hesitating due to uncertainty over the outcome, it was an impassioned speech by one of the participants that incited him to rush into the chamber where the mantle of the Prophet (hârbiyi-ya sirâf (f.t.), and other relics were kept, bring out the banner of the Prophet, turn it over to the grand vezir and thus symbolically launch the attack (ibid., xii, 158).

In general, the accounts of the *medjizes* of the late 18th and early 19th centuries convey a number of interesting points about what such assemblies were supposed to be and do. On a comparative note, first, it is worth comment that Şanlızade 'Aṭâ' Allah (d. 1822/1860) already knew enough about parliametary institutions to compare the Ottoman consultative assemblies with what sound like bicameral parliaments (Şanlızade, iv, 5). Probably by design, Şanlızade evoked Cevdet Paşa and the Madjîlis as the "well-ordered states" (sâde-i vaqfatmanâ), but he did give a recognisable account of such features as popular election of members, majority rule (hukm-i aşghâb), and membership in two "classes", described as government servants and agents or representatives of the subjects (hades-i-ziyâdet ve wâlîhâ-i ra'iiyytl). This comparison of Ottoman assemblies with those of the West is of particular interest as an early illustration of a theme to which later writers often returned [see 306]. As for Şanlızade, his point in making the comparison was to argue—either forcibly or by later writers often returned [see 306]. As for Şanlızade, his point in making the comparison was to argue—either forcibly or by later writers often returned [see 306]. demand that the participants arrive at their decisions in "unanimity of opinion" (ittifâd-i ârâd or equivalent expressions; Wâlîf, i, 177, 317; ii, 14, 233; Şâhîzâde, i, 62, 64; Djeuwdet, iii, 38, 43, 333: ix, 350; vi, 276; vi, 6, 19; ix, 3; x, 16; xi, 201. "Consensus" would perhaps be a more exact rendering of what was really desired. Still, the idea of "unanimity" is a striking sign of desire to maintain unity of decision even while broadening participation in decision-making. This desire, like the need for secrecy, would have suggested keeping the consultative assemblies small in size.

By the time of Mâmûd II, however, there were clearly situations where it seemed necessary to enlarge the councils, or even usethem as means for mobilisation of mass opinion. One example of this occurred in 1823/1832, when the grand vezîr, Alemâr Mûsâî Fâha, himself one of the provincial ağâyın, held a great assembly in Istanbul, to which he invited not only high officials of the central government, but also other provincial notables, to conclude an agreement between the ağâyın and the sultan (Şâhîzâde, i, 62; Djeuwdet, ix, 3; Lewis, 75-6; Shaw and Shaw, 1-3). In the 1820s, with the outbreak of the Greek Revolution, there were medjîles to which an unusually large range of military officers and even such non-officials as the agents (beşkâfitlî) of various guilds were summoned (Şâhîzâde, iv, 2, 3, 201): these were assemblies that Şâhîzâde criticised as being too large. By this time, however, the concerns of the government had clearly extended beyond secret consultation into mass mobilisation of Muslim opinion. The "crowded" (djezînî yettîlî) assemblies contributed to this purpose by making, or legitimating, decisions that were communicated to the populace through the non-official participants, or by such other means as dispatching circular orders to local officials or sending out public criers (mârinî; Şâhîzâde, iii, 203-6; iv, 201-4; Djewdet, xi, 272-5; xii, 159; al-Sâzî, Tal'îsî, i, 100-2).

Appeals to Muslim solidarity are a speciality illustration, finally, of perhaps the most important feature of the medjîles: the emphasis on Islamic ideals and values. Such appeals were a general theme of traditional Ottoman culture; even so, they appear particularly prominent where the consultative assemblies are concerned. It is surely no coincidence that these important assemblies were designated by the term giûrî (gûrî) or its derivatives, or that Ottomans were quick to cite giûrî in support of the procedures. It is significant in this regard that Djewdet Pagha, who was trained as an Âlim prior to his transfer into the civil bureaucracy and who was politically quite conservative, was consistently critical of the capacity of the giûrî to contribute to the medjîles that we have been discussing. If Djeuwdet's opinion is debatable for the period before the 1820s, it points to a problem in relations among governmental elites, and to a feature of policy, that was unmistakable thereafter (Djeuwdet, iii, 38; iv, 195, 261-2; v, 27-35, 231; xii, 82-3; Heyd, 63-96; Findley, 61-3).

As for the apparent decline of the medjîles, on the other hand, there are signs that this signifies, not a loss of interest in consultation, but rather an adaptation and institutionalisation of the deliberative medjîles in a variety of setttings. The fact that the term medîjes from this time on virtually supplanted the term hâliîn as a designation for conciliar bodies suggests that the frequent medjîles of preceding decades indeed formed the major link through which the Ottoman divân tradition evolved into the 19th century. As early as 1832, then, we find a military council (hâliîn-i 'içeri; Levy, 479-80). A key moment in the proliferation of councils occurred in 1836, when, as part of an effort to abolish the grand vezîriate and redistribute its powers, Mâmûd II set up two councils, the Consultative Assembly of the Sublime Porte (dâr-i giûrîl-î divân-i divân) and the Supreme Council of Judicial Ordinances (medjîles-veyîl-i ahkâm-i 'adîlye). The latter was supposed, like the imperial divân of earlier times, to meet at the palace (Lutfî, v, 106-3, 176-9; vi, 926; Kaynar, 198 ff.; Shaw, Legislative councils, 57-77; Findley, 141). Following Mâmûd's death in 1839-1839, the grand vezîriate was quickly restored; and the various councils and ministers who had begun to appoint on European example in the mid-1830s, were grouped into a "council of ministers" (medjîles-i wâlia-i ahkâm-i 'adîlye) or "privy council" (medîjes-i kârîyân). The pâyâh al-'îslâm also served as a member of the cabinet. Of the two councils created in 1839, only the medjîles-i wâlia-i ahkâm-i 'adîlye survived. It assumed the function of drafting the new legislation called for under the Gûlkhânî decree. It also served as the highest court for trying cases under the new legislation. Thus the medîjes-i wâlia embarked on a long evolution, in course of which it turned, in political terms, into a new constellation of offices in 1865, into the Council of State (dâr-i giûrîl-î divân [g.]), later the Dönûsbey of the Turkish Republic. In the late Ottoman period, the council of state was the most important civil administrative body after the council of ministers; it also normally retained top- level responsibility for administrative justice (Shaw, Legislative councils, 57-84; Findley, 172, 174-6, 247-50, 307-9).

The early history of the medjîles-i wâlia, as well as that of the military council created in 1832, also included important steps in the development of Ottoman ideas of conciliar procedure. Procedural
regulations for the mediâlis-i ülâ, dating from ca. 1255/1839, began by citing problems experienced in earlier deliberative assemblies. The document went on to require changes such as circulating documents on important issues prior to meetings, requiring those who wished to speak to sign up in advance and speak in order of signing (thus without regard to rank), and—most important—taking decisions by majority approval (êkûber-i yelid-i 2ârât), rather than by unanimity. At this point, Western ideas of parliamentary procedure, known in some measure at least since Şânîzâde, began to be incorporated into Ottoman practice. The fact that a French translation of the new regulations for the mediâlis-i ülâ reached the British embassy almost immediately may be a sign of direct European influence on their formulation (Kaynar, 268–8; Levy, 480–1; Findley, 158–9, 385 n. 356).

As the council of state took shape, the Tanzimât also witnessed an unprecedented proliferation of smaller, specialised medâjlîses, many of which subsequently disappeared. In part, this is because they served as committees to perform new tasks for which, up to that point, there were no permanent administrative agencies to assume responsibility. Some of the specialised medâjlîses evolved into such agencies. This is clearly how the Ministry of Trade and Agriculture emerged; traits of the pattern also appear in the formation of the Ministry of Justice. In other cases, medâjlîses continued to supplement the regular bureaucratic apparatus where it remained thinly developed (Findley, 176–7, 179, 181, 245, 253). The clearest example of this is the local administrative councils, first created in 1840 and ultimately known as medâjlîs-i idrâr. These administrative councils were originally intended to supplement the functions of the jûdâs of the bâbâs, at least in the roles that these had acquired in local administration, as well as the divûses of the provincial governors. Emulation of conciliar institutions created under Muhammad 'Ali in Egypt and Syria may also have stimulated the development of the Ottoman local councils (Heidborn, i, 156–6; Ma‘ûs, 87–107; Russell, i, 139, 322–3, 225–8; Guys, 143–9; Barber, i, 144–8, 316–7; Davison, Aden, 98 ff.; Innis, Tanzimât-î Uglulanmas, 623 ff.; idem, Application of the Tanzimât, 300–1, 107–9; Kornrumpf, 44–57; Ortayli, 13 ff., 42 ff.). As organised in 1840, the councils included not only the local officials and religious leaders, but also indirectly-elected representatives of the notables. These councils were thus the first Ottoman governmental institutions to include representatives of the people as a matter of system. In 1261/1845, there was even an experiment—clearly following an Egyptian model—with the convening of a consultative assembly in Istanbul, to which each province of the empire was to send two delegates. The Istanbul assembly served as a model for the years immediately following, but the local administrative councils became permanent fixtures. Since they exercised not only administrative functions, but also local responsibility for cases tried under the new legislation of the Tanzimât, they also represented the starting-point of an important organisational development of a different kind: the emergence of what eventually became the distinct system of nâmâyye courts [see Nâmakâmâ, 2. The Ottoman Empire excluding Egypt, ii. The Reform era]. Even as the nâmâyye courts became separate from the local administrative councils, they retained marks of their origins in being known, until the 1860s, as mediâlis or divûses, rather than medâjlîses (Duârât, i, 10–12, 65–18; Heidborn, i, 226 n. 57), and in continuing until the end to be collegial bodies.

In terms of elaboration of the underlying organisational form, the most important of the organisational progeny of the Ottoman mediâlis-i shâhâ was the Ottoman parliament. The link to the earlier councils appears both in the Ottoman name for the parliament, mediâlis-i şurâtî [see Medâjlîs, 4 A. In the Middle East and North Africa, section 1] and in the adoption, which Şânîzâde had anticipated, of the concepts of shâhâ and mehdürel to refer to parliamentary government. The parliament also represented the ultimate extension among the Ottomans of the representative principle first introduced in the local administrative councils. In this sense, whatever the shortcomings of the Ottoman parliaments, their emergence indicates the extent to which the scope of political participation, or at least the demand for it, had continued to broaden since the convocation of the consultative assemblies of the 18th century.

Organisations like the Ottoman mediâlis-i shâhâ and its derivatives appeared in other Islamic political centres as well. In Egypt, Muhammad ‘Ali Pâşi was as attached to conciliar deliberation as he was to the centralisation of ultimate decision-making. Under him, the development of conciliar institutions advanced to the point that the dihdâr—a term referring in Egypt to administrative bureaux—were sometimes displaced by councils with corresponding functions (Deny, 33–4, 108). This happened with his civil and military councils (mediâlis-i ściïh-i mulkîyye, mediâlis-i dihdâleyye). The former of these was also known by designations including the terms mediâlis-i shâhâ or mediâlis-i mehdürel and in existence from 1240/1824–25 to ca. 1254/1838. As with some of the Ottoman councils, the responsibility of this council included matters of administrative justice (ibid., 108–9; Lane, i, 142–4). Muhammad ‘Ali also had a "cabinet" referred to as the shâhâ-yi êkhâṣâ (Deny, 109, 125). Beginning in 1243/1829, there was an annual "general assembly", including leading officials, together with provincial notables and the leading ulema. This assembly was known by a variety of names, such as mediâlis-i şurâtî, demêlîyye-i demêlîyye, mediâlis-i mehdürel (or shâhâ) and mediâlis-i nâmâyye (ibid., 10–11). There was also a "general assembly and regular system of local councils", at least in Syria and Palestine, while they were under Egyptian control in the 1830s (Ma‘ûs, 100; al-Shâbidî, tâ’likh, ii, 72; idem, Lubbûs, iii, 305; Rustum, ii, 356, n. 3204). The local councils of Egyptian-ruled Syria may have provided a model for the Ottoman local administrative councils. Subsequently, under the Khedive Ismâ‘îl (1863–79), when Egypt acquired a "parliament", it was known as the mediâlis shâhâ al-amâ‘al. It was in fact an assembly of delegates, some of whom were local notables. This assembly did not attempt to assume any more active role before 1279/1863 (Khalîlî, 427–8; Shûkî, 27–30, 27–88, 93–4, 123–25, 268–69, 250–7, 243; see also Medâjlîs, 4 A. In the Middle East and North Africa, section v, Syria, xvi, Egypt).

Kâdir Iran also eventually acquired consultative assemblies resembling, and to some degree inspired by, those of the Ottoman Empire. Like Mahmûd II before him, Nâsr al-Dîn Şâbî decided in 1858 to rule without a prime minister (sâdîr-i dâ‘âm). Instead, he appointed a six-man council of ministers, as well as—a year later—two advisory councils, a mediâlis-i şâhâ-yi dâ‘âmî and a larger mehdürel-

MADJLIS AL-SHÎRÂ — MADJLISI

Bibliography:

MADJLISI, MULLA MUHAMMAD BAKIR, known also as 'Allama Madjliši and Madjliši-y Thâni (1837-1870/1827-98), an authoritative jurist, a most prolific hadîth collector, an unprecedentedly influential author in the world of the Twelver Shi'a. He was also a distinguished expert in bibliog-
riage, a well-read man in Islamic philosophy and mysticism, and an active authority in politics, social and judicial matters during the late Safavid period. He belonged to a distinguished clerical family; his father, Muhammad Teki, mostly referred to as Ma'djilisi-yi Awwal [q.v.], his ancestors as well as his descendants, have been mentioned among men of knowledge.

Ma'djilisi, in line with his family tradition, became "eager for learning various Islamic sciences and noble branches of arts right from ... early youth" (Muhammad Bakiir Ma'djilisi, Bihdr al-anwar, i, Tehran 1887, 3). He successfully studied Islamic subjects such as fiqh (jurisprudence), usul al-fiqh (fundamentals of jurisprudence), commentary of the Kur'an, hadith (theology), philosophy, mysticism, etc., under his father and many other professors such as Sayyid Amir Sharaf al-Din al-Husayyi al-Shafii' osób (d. 1660/1659) and Hasan All al-Tustari (d. 1075/1664); the names of eighteen of his teachers and other authorities who granted him certain certificates are given in Husayn Nuri, al-Fayd al-bulub fi tafjam al-Alisha al-Majdilisi, Tehran 1887, 12-23 (attached to the first volume of the old edition of the Bihdr). At a certain point in time, however, Ma'djilisi decided to abandon those fields of knowledge which had then become popular, and to concentrate only on the study of prophetic traditions which were, in his belief, beneficial for him in the hereafter, though they had then a depressed market (kisiih (Bihdr, i, 4).

Henceforth, Ma'djilisi devoted the most part of his life not only to lecturing on the Shi'i subjects to the students, whose number at times exceeded one thousand (al-Fayd, 15; in this book, only forty-nine of them are introduced with some bibliographic information), but also to collecting the scattered and forgotten Shi'i hadiths and to compiling them into various Arabic and Persian books. His main work in this field is the immensely voluminous Arabic book Bihdr al-anwar whose outline he sketched out in 1070/1664 and completed its compilation ca. 1106/1694. He also wrote books in Persian, a number of these being translations of different sections of the Bihdr. His aim in writing in Persian, as he himself repeatedly mentioned, was to make the prophetic traditions easily accessible to "the masses of believers and common Shi'a" who had "no familiarity with the Arabic language", hoping that his works "may give life to the hearts and spirits of the dead-hearted people!" (Muhammad Bakiir Ma'djilisi, 'Ayn al-baydt, Tehran 1952, 4). In his efforts, in fact, Ma'djilisi was quite successful because his 'Ayn al-baydt alone reportedly converted 70,000 of the Syrian Sunnis to Shi'ism (Muhammad b. Salyman Tunakabunl, Kiigar al-isla, Tehran n.d., 205).

Ma'djilisi had very close relations with at least two of the Safavid monarchs, Shah Salyman (d. 1075/1664) and Sultan Husayn (d. 1078/1713). In compiling his book, he received effective financial and other types of support from them, and in return he praised those rulers and dedicated several of his books to them. In reference, for instance, to Shah Salyman, he used many phrases of a hyperbolic nature (Muhammad Bakiir Ma'djilisi, 'Ayn al-bulub, i, 1860; 3; the second volume of this book is translated into English by James L. Merrick under the title of The life and religion of Muhammad as contained in the Shi'ite tradition of the Hydi-al-isla, Boston 1856). He used also highly eulogistic expressions for Sultan Husayn (see, for instance, Muhammad Bakiir Ma'djilisi, 'Ayn al-masai', 2:3).

In 1085/1676, Ma'djilisi was appointed as the official Shaykh 'ulamal by Shah Salyman, but his title was changed to 'ulamal al-masai on Sultan Husayn's accession to the throne in 1106/1794. While holding these highest, institutionalised clerical offices, Ma'djilisi "personally undertook all proceedings of law and legal matters" (Husayn Nuri, Mustadrak al-asma' wa-musannafat al-masai, iii, Tehran 1903, 408). He used his power and influence to suppress anything which appeared to him as heresy and infidelity. He ordered the Indian idols of Isfahan to be demolished in 1095/1686 (al-Fayd, 3) and "suppressed the aggressors and transgressors" who were adherents of sectarianism and innovation, and were enemies [of the right religion], especially the heretic Sufis (Yafur Bahrami, Lujn al-bulub fi tafjam al-Alisha al-Majdilisi, n.d., 55). These "aggressors and transgressors" also included Zoroastrians and the Sunnis (L. Lockhart, The fall of the Safavid dynasty and the Afghan occupation of Persia, Cambridge 1958, chs. 3-4, 6).

During the last four years of his state position under Sultan Husayn, Ma'djilisi was practically the actual ruler of Iran. With his vast power and influence in the country, he undertook so strict a religious policy against the Sunnis that, in some authors' opinion, it expedited the Afghan invasion of Iran in 1135/1722 (cf. inter alia Hamid Algar, Shi'ism and Iran in the eighteenth century, in T. Naff and R. Owen (eds.), Studies in eighteenth century Islamic history, London and Amsterdam 1977, 288-502, 400-3). It is interesting to note that Ma'djilisi wrote his famous 'Ayn al-baydt when the execution of his anti-Sunni policy was about to reach its culmination. In this book, written one year before Ma'djilisi's death (1109/1697), he clearly declared the first three Sunni caliphs, i.e., Abu Bakr, 'Umar and 'Uthman, to be hypocrites and unbelievers who deserved God's curse (Tehran 1968, 154-278, 519, and passim).

There is no doubt that the culture and tradition of Twelver Shi'ism enjoyed an unprecedented blossoescence through Ma'djilisi's efforts, and the influence of his teachings and practices on later generations—common believers as well as clerical circles and leaders—is undeniable. One of Ma'djilisi's fundamental teachings is that the Shi'a should have full respect for the rulers, the emperors and transgressors who were that anyone "who despises the kings" will suffer exceedingly severe punishment; he says that "one who does not obey the kings, has not in fact obeyed God". He also reminds his audience that "the hearts of the kings and those of all mankind are in the hands of God; one must have regard for all tyrannical kings and other oppressors, and it is even compulsory to exercise dissimulation before them, to prevent oneself from their harms, and not to expose oneself to their wrath" ('Ayn al-baydt, 560-7).

Among the distinguished clerical leaders who, following Ma'djilisi's teachings, had regard for the tyrannical kings by not opposing their oppressive rule and never despising them was Shaykh Murta'da Ansari (d. 1281/1864) [q.v. in Suppl.], whose aloofness from state affairs seems to have been taken as a sign of his asceticism (Hasan Khan Shaykh Dinari Ansari, Tarikh-i Isfahan va Ray va hansa-yi isla, Tehran 1943). One may also mention Shaykh Muhammad Talu Isfa'ali, known as A'la Ma'djilisi (d. 1332/1913) [q.v. in Suppl.] as a good example of those Shi'i religious leaders who followed Ma'djilisi's pattern of strict religious policy by putting heavy
pressures upon religious minorities in Iran (cf. inter alia Abd al-Hadi Haji, art. Aqā Naftā, to appear in Encyclopedia Iranica). It is not, therefore, unexpected to see that the latter cleric made strenuous efforts to propagate in favour of Majdīlī's ideas by translating into Persian, summarising and publishing several volumes of Majdīlī’s books (Khanbābā Mūsār, Mu’alla‘īn-i kutub-i tāpī-yi farsi va al-saddat, i, Tehran 1961, nos. 198-203).

Majdīlī’s thoughts, teachings, and practices, however, perhaps also influenced, have not been secure from the criticism made by a number of Shi‘i religious thinkers since Majdīlī’s time. Mr. Lawī [9], for instance, accuses him of the distortion of the sense of some hadīths, and suggests its reason to have been either ignorance or worldly interests (Muhammad Mir Lawī, Kifayat al-nuṣūḥ fī ma‘rūfīs al-Mahdī, ms., no. 172, Faculty of Theology, Mashhad, 212). ‘Abd al-Hāy, another contemporary of Majdīlī, criticised him particularly over the Friday Prayer which Majdīlī and his father had revived (Muhammad Bākī Kāsānī, Ramādān al-nuṣūḥ fī khāṣṣat al-Safa‘fī wa ‘l-sudūd, Tehran 1947, 111) and which ‘Abd al-Hāy, indeed, believed that in the absence of the Twelfth Imam should not be performed. He also criticised Majdīlī because "he authorised every imbecile and wicked person to transmit hadīth on Majdīlī’s authority" (‘Abd al-Hāy Raḍawī Ḵānjī, Ḵānīqāt al-Safawī, Arabic ms., Majdīlī Library, no. 3770, p. 110). A Persian Sufi of the Kājam period believed that Majdīlī was inconsistent in his ideas (Muhammad Ṣadīq Ḵān Ṣafarī, Šīrāzī Ma‘ṣūm ‘All ‘Alī, Tehran 1960, 279 ff.). In reference to some of the hadīths, quoted from ‘Abd al-Hāy, which indicate the Shi‘ī Imams’ humiliation at the hands of contemporary caliphs, a Persian author of our time writes that if any person trusting Majdīlī happened to read Majdīlī’s thoughts, teachings, and practices, all of which are led by the clerical leaders. The ‘ulamā‘ active participation in the Persian Constitutional Revolution of 1906-11/1324-9 (Abd al-Hadi Haji, Šī‘īm and constitutionalism in Iran: a study of the role played by the Persian residents of Iraq in Iranian politics, Leiden 1977) and their unquestionable leadership in the Islamic Revolution of 1979 (Hamid Rōhkī, Bārsī va tabī‘ī al-nakhš va al-māhāl-i Imām Khvānīyāt dar Īrān, Kūn 1979) were certainly in sharp contradiction with Majdīlī’s teachings. Although the ‘ulamā‘ rose against the political establishments in these revolutions, they seem in reality, one may say, to have revolted against the legitimacy of many of the legacies of Majdīlī.

Bibliography: No comprehensive and critical study of Majdīlī’s life and work seems to have been yet undertaken. The most informative available biography of Majdīlī is al-Fayj, written in 1302/1884 and mainly based on Ahmad b. Muhammad ‘All Bihbahānī’s work still in manuscript entitled Mīrūt al-nuṣūḥ fī ḥadāths nam, Persian ms., Majdīlī Library, no. 5554; this valuable, original book, written between 1250/1796 and 1255/1810, is skillfully outlined in Abd al-Ḥasan Haen, Ṣafawī-i khitābāh-yi majdīlī-i šī‘ī, Tehran 1966, 19. Majdīlī’s own books may well be rated as the best sources of information concerning his thought as well as his links with the Safawī monarchs. Over 50 Persian books are ascribed to Majdīlī, and 13 Arabic books are also listed under his name, all in al-Fayj, 6-9. Majdīlī’s major work is the Bihār, which was first published in twenty-five large volumes in Tehran in 1305-13/1887-97, and a new edition of it has recently appeared in 110 volumes (Tehran 1956-72). This edition, however readable, finely printed, and handy in size, is not only devoid of any notably valuable editorial work, but since no pagination of the old edition is given in the new edition, the researcher has to face certain difficulties in collating the references to and quotations from the old edition with the new one. An extremely useful alphabetically-arranged guide to the Bihār is ‘Abd al-Ḥusayn Mīrūt’s Safawī al-bihār wa-madānīat al-khān wa ‘l-biḥār, i-i, 1943, but its abbreviation systems apply only to the old edition. Some of Majdīlī’s books have been translated into other Islamic languages, many of his books have also been published, but only forty-five of them are listed in Mu‘alīfīn, i, nos. 23-42.

(Abdul-Hadi Haji)
Diebal 'Amil (southern Lebanon) because, according to his son Muhammad Bākīr Madjlīṣī [2, 5], Darveš Muḥammad b. Ḥasan al-'Āmilī, a great mujtahid of Ẓahrābād (Ḵᵛārezm) and was his maternal grandfather (Muḥammad b. 'All Ardabīlī, Dījāmī al-rūwāt, ii, Tehran n.d., 553); the latter was also called Naṭanżūr from his stay in Naṭanżūr, north of Isfahān, for a certain period of time (Muḥsin al-Anān al-Husnaylī al-'Āmilī, Aṣ'ān al-Sīaṣa, xxx, Damascus 1949, 371-3). Muḥammad Bākīr Khvānsārī [5, e.] has held that Madjlīṣī-yi Āwāl's place of origin also on his father's side was Diebal 'Amil because ʿAbdíy b. Abl Ṭālil, a mujtahíd from the same region, was his paternal cousin. This view, however, logical and acceptable, seems difficult to combine with the fact that Madjlīṣī-yi Āwāl's son and great grandson claimed descent from Abū Nūrāyīn Ahmad b. 'Abd Allāh b. Isfahān (d. 430/1038) (Rawdāt al-dīnānī fī ahādīth al-nuṣūra, i-v, i, 1065, 3-130; see also Nāma-yi dāngīvāsan-i nāṣer dar gbâl-i hāl-i shāhīndān ixtan dar dawâmskañog-i nāmī, vii, Kūn n.d., 1-21). At any rate, he himself was born in Ardastān, north-east of Isfahān, and brought up and lived in Isfahān (Walsh, Kuft, and others had compiled) in that honourable [Imam]" (Abbas Kummī, Diwān-i naftān, ii, 363). Muḥammad Taṣī Madjlīṣī, Lawdmt-i sāḥabīn-i jihāndi, i, Tehran 1213, 363).

Having been born into such clerically distinguished family, he began his religious education very early in life. He himself writes that at the age of four he knew about God, prayers, paradise and hell, and used to preach to children according to the verses of the Kūrān and passages of the hadīth which his father had taught him (Madjlīṣī-yi Āwāl, Lawdmt-i, new edition, Tehran n.d., i, 903). He studied with remarkable steadiness under a number of teachers, including Bāhā' al-Dīn al-'Āmilī and 'Abd Allāh b. Husayn Ṣaḥḥāfī. He writes, at the age of sixty: "I spent over fifty years of my life in doing research on the traditions of the Prophet [Muḥammad] and on those of the infallible Imāms ... First of all, I read the ordinary books written on theology (kalām), fundamentals of Islamic jurisprudence (fiqh), and jurisprudence (fīqh); secondly, I studied whatever [works] our Twelver imām and others had compiled" (Muḥammad 'All Kakhānī, Nudjūm al-sāmāt fī tarājdīm al-tulāmā, Kūn 1974, 65). Madjlīṣī-yi Āwāl seems to have begun to be exceptionally prolific towards the end of that fifty-year period, because he wrote his voluminous work Rawdāt al-muladāt in approximately two years, i.e. from ca. 1065/1653 to 1066/1654 (Nudjūm, 3; cf. also Muḥammad Taṣī Madjlīṣī, Rawdāt al-muladāt, i, 120, 125, 128, 130, 136, 139, 141, 144, 147, 150, 154, 157, 160, 163, 166, 169, 172, 175, 178, 181, 184, 187, 190, 193, 196, 199, 202, 205, 208, 211, 214, 217, 220, 223, 226, 229, 232, 235, 238, 241, 244, 247, 250, 253, 256, 259, 262, 265, 268, 271, 274, 277, 280, 283, 286, 289, 292, 295, 298, 301, 304, 307, 310, 313, 316, 319, 322, 325, 328, 331, 334, 337, 340, 343, 346, 349, 352, 355, 358, 361, 364, 367, 370, 373, 376, 379, 382, 385, 388, 391, 394, 397, 400, 403, 406, 409, 412, 415, 418, 421, 424, 427, 430, 433, 436, 439, 442, 445, 448, 451, 454, 457, 460, 463, 466, 469, 472, 475, 478, 481, 484, 487, 490, 493, 496, 499, 502, 505, 508, 511, 514, 517, 520, 523, 526, 529, 532, 535, 538, 541, 544, 547, 550, 553, 556, 559, 562, 565, 568, 571, 574, 577, 580, 583, 586, 589, 592, 595, 598, 601, 604, 607, 610, 613, 616, 619, 622, 625, 628, 631, 634, 637, 640, 643, 646, 649, 652, 655, 658, 661, 664, 667, 670, 673, 676, 679, 682, 685, 688, 691, 694, 697, 700). Madjlīṣī-yi Āwāl has been described by many of his biographers as a Sōfī, and a number of his books also attest this fact (cf. i, 3-6). However, his famous son, Muḥammad Bākīr, and many other authors who considered Sūfism as heresy, have attempted to exonerate him from any truly mystical ideas or practices, and some of them have questioned the authenticity of Madjlīṣī-yi Āwāl's authorship of those mystical books which have been ascribed to him (Nudjūm, 59-61). Muḥammad Bākīr writes that his father had close associations with the Sūfis during the early part of his life and that he tactically pretended to be a Sūfī in order to lead them to the right path. Towards the end of his life, however, he found his efforts to have been useless and henceforth he openly turned against the Sūfis and even declared them unbelievers (Muḥammad Bākīr Nudjūm, 64). Muhammad Bākīr's statement, however important and thought-provoking, may well be questioned by the fact that his father's Lawdmt-i, written as late as 1065-6/1654-5, that is to say four years before his death, contains many favourable references to Sūfism (cf. i, 2-3, 38, 44, and passim in the new edition of vol. i; for an interesting discussion on this particular subject, consult Muḥammad Maḥṣūr Shāykh Maḥṣūr Allāh, Tahān, 1306/1987). Madjlīṣī-yi Āwāl's deep ties to Sūfism were also demonstrated by the spiritual stages he was known to have achieved and by his ascription, which became proverbial. He, despite his close friendship with a tyrannical ruler such as Shah 'Abbas II, claims to have established certain relations with the Shī'ī Imāms and the Prophet Muḥammad, who gave his sanction to the path Madjlīṣī-yi Āwāl was pursuing (Lawdmt-i, new edition, i, 1-2). With regard to his attitude towards Allāh b. Ṭalīb, Madjlīṣī-yi Āwāl points out that while paying a visit to the shrine of Allāh b. Ṭalīb in Najaf and "becoming occupied with an earnest spiritual striving (madākhādat), many things which weak intellects cannot bear were unveiled to me (wâdākāt) through the blessing of that honourable [Imam]" (Abbas Kummī, Encyclopaedia of Islam, V
of Turkish domination, and represented the

rediscovery of a common cultural heritage and a common language of discourse. In the nahda, there was a clear parallel between linguistic and political aspirations, which were directed first against the Turks and later against the British and French. Moreover, an opposition turned towards modern science and instruments of knowledge and their assimilation in Arab society. These aspirations, together with the religious aspects, gave to all discussions on science and language a particular acuteness.

Several private madjimā’i of language and scholarship arose as a consequence, though their existence was short-lived. In Beirut, al-madjamā’ al-mahāl al-sharqī was established in 1899 in co-operation of Fāris Nimr (1856–1956). In Egypt, the Institut d’Égypte founded by Napoleon in Alexandria in 1797 and transferred to Cairo in 1839 stood as the model for different madjimā’i in Cairo. Thus a madjamā’ existed there in 1892–3 due to the initiative of Shāykh al-Sayyid Tawfik al-Bikrī (1875–1933). An equally short existence was enjoyed by a Ḥijrīyya tarbiyya al-‘arabīyya founded by ldrīshī al-Ya‘ṣīrī (1847–1910), Īsādi Sayyid (1862–1914) and Shāykh Muḥammad Rāṣūl Rādī (1865–1939). Former students of the Dar al-Ulūm, like Hūfī Na‘īf (1859–1919) and Ṭāhir Barākāt Bey, founded the Ndūr Dār al-Ulūm in 1907 with the explicit purpose of “Arabising” foreign words. This circle disappeared, as well as a similar madjamā’ which was founded by Fathi Zaghlul (1863–1944) around the same time. The same fate overcame the Lāḏiyya al-mustasharkat al-‘ārabiyya founded by Ahmad Hījīmat Pasha when he was Minister of Education, and of which Ahmad Zāki Pasha (1860–1934) was a prominent member. A madjamā’ founded by Ṭutlī al-Sayyid (1872–1926) [42] in 1917 and transferred to Cairo in 1926 by Shāykh Sayf al-Biγālī (1892–1917) and then by Shāykh Abī l-Fadl al-Dīnāwī (1847–1927) existed from 1917 until 1925 with 28 members, among whom were a Persian, a Syrian Christian and a Jew. From 1921 to 1923 there existed a madjamā’ in Cairo which was presided over by Idrīs Rāghib Bēk. Māṣūr Fānlī (1889–1939) and Tāhā Husayn (1889–1976) were counted among its members. It had as its explicit purpose the composition of a modern Arabic dictionary, but this attempt was abandoned in 1925 because of the lack of official support.

The same fate overcame the Lāḏiyya al-mustasharkat al-‘ārabiyya founded by Ahmad Hījīmat Pasha when he was Minister of Education, and of which Ahmad Zāki Pasha (1860–1934) was a prominent member. A madjamā’ founded by Ṭutlī al-Sayyid (1872–1926) [42] in 1917 and transferred to Cairo in 1926 by Shāykh Sayf al-Biγālī (1892–1917) and then by Shāykh Abī l-Fadl al-Dīnāwī (1847–1927) existed from 1917 until 1925 with 28 members, among whom were a Persian, a Syrian Christian and a Jew. From 1921 to 1923 there existed a madjamā’ in Cairo which was presided over by Idrīs Rāghib Bēk. Māṣūr Fānlī (1889–1939) and Tāhā Husayn (1889–1976) were counted among its members. It had as its explicit purpose the composition of a modern Arabic dictionary, but this attempt was abandoned in 1925 because of the lack of official support.
subsequently been amended. Administratively, the Academy depends on the Ministry of Education, but it has financial autonomy. In 1960 a fusion took place with the Academy of Arabic Language in Cairo.

Besides the active members (tamaddun), whose number is fixed at present at fifteen, there are corresponding members (surusum) without a fixed number. All members and the president are elected and then appointed by the head of State. Well-known presidents were Muhammad Kurd All (1870-1953), Abd al-Kadhir al-Maghribi (1876-1956) and Mustafa al-Shirafi (1873-1968). The president, vice-chairman and permanent secretary have the direction of the Academy. The Academy has published the journal Madjalat al-tnada al-Hall al-arabiyya (al-which has as its coherences; article One of the constitution of 1928 describes the task of the Academy (Madjalla, xii [193-2], 765) as being to guard and perfect the Arabic language, and to research into the history of Syria and the Arabic language. The fuṣūl and its principles are to be a starting point and norm, since that is the noble language (lisba sharifa) of the Kur'an and of classical literature, and Arabic is the common patrimony of all Arabs. The aims of the Academy are more specifically:

i. To preserve the language (al-muhāfaza 'ala kalimah al-lugah), in particular from the dialectal language, foreign orthography, archaisms and incoherences;

ii. To protect the purity of the language (al-muhāfaza 'ala fasaha al-lugah) against foreign (dakhil) terms and style figures (a'yān); and

iii. To adapt the language to modern needs.

Bearing these aims in mind, the Academy can be of assistance to authors and translators as far as their use of language is concerned. Unlike the Academy in Cairo, the Academy in Damascus does not consider its decisions with regard to new general scholarly terms to be definite: they are preferences (tardījih) or propositions (tiwārif) which are submitted to others. The articles in the Madjalla are published under the responsibility of their authors, not of the Academy.

Most of the work of the Academy is done in committees (la'īf), of which three have been in existence since the beginning: the administrative committee, the linguistic and literary committee (lādiyin iqūh wa-'adabiyya), and the scientific and technical committee (lādiyin 'ilmīyya fa'mīyiyya) which has as its task the spreading of science and the arts in Syria. Later, more specialised committees were added: for general principles (al-salik al-'ilmī), for the dictionary (al-muṣāf), for the journal (al-madjalla), for the neologisms (wawī 'aṣrī', arabiyya ḫadidā), and for the dialects (al-lahāf). The committees work in closed sessions (jīlaṣ 'alá bāya), either according to a plan which is fixed at the annual meeting of the Academy, or in response to a particular problem. As an example of the latter, one could mention the project to enquire about words which are not found in the great Arabic dictionaries (al-balāmad gharb 'al-limāṣīyya). Representatives of particular professions and groups can be consulted by the committees. Once a year, there is an annual general meeting, with both closed (jīlaṣ 'alā ḫadidā) and plenary (jīlaṣ 'alā bāyā) sessions where all members meet together with notable figures (al-a'yān) and men of letters (al-udābi). In 1960 the name of the Madjalla became Madjalat al-maraj al-arabiyya-Madjalat al-adimā al-arabī sīlābīn.

As to the work which has already been done, Rachad Hamzaoui characterises the attitude of the Academy as trying to maintain the status quo, while introducing reforms where needed. Subjects which have been treated are the principles of orthography; (simplification of) grammar; and the diminishing of dialectal Arabic. Important work has been performed on modernising the Arabic vocabulary by means of istinbūl (resurgence of pure ancient Arabic words), sīltiḥ (derivation by means of ḥiyā and analogy conforming to given waṣāa and schemes), nāzī (composition of words) and ḥirī (borrowing from foreign languages), in this order of precedence. No definite solutions have been offered for the problems of orthography, grammar and dialectal Arabic. The fact that the Academy was tasked with a norm could not but restrict in advance the possibilities and means of the modernisation of language as it was striving after.

(b) Egypt. On the initiative of King Fu'ad I and the Senate (Madjīs al-shu'ūrī), the Minister of Education in 1928 requested that three reports be submitted by Latif al-Sayyid, Ahmad Ḥafis al-ʿAwāḍ and Abd al-ʿAzīz al-Bishrī concerning the creation of an official Academy, and this led to its foundation in 1932. This was accelerated by a previous suggestion made by King Fayṣal I of 'Irāq (1933-1933)—who had already established the Academy of Damascus in 1919—presented by Nūr al-Saʿīd to the Islamic Congress held in Jerusalem in December 1931, to establish an Islamic University in Jerusalem as well as an Academy of the Arabic Language in Cairo. The Madjīma al-ḥiṣn al-ʿarabīyya al-malāki was then founded independently by a royal Decree of 7 January 1932, presenting Independently by a royal Decree of 7 January 1932, when Muhammad ʿĪsā Pāša was Minister of Education in the cabinet of Ṣīrāfī Sīrāfī Pāša, which had been in power since the promulgation of the Constitution of 22 October 1932. The text of the constitution of the madjīma was first prepared by the Chairmen of the Scientific Committee and was modelled on the Académie Française, dating from 1660. Its specific tasks included guarding the integrity of the Arabic language and adapting it to the needs of present-day life. In order to achieve these aims, the Academy was to compose dictionaries and word lists, compile a historical dictionary of the Arabic language, carry out studies on Arabic semantics and study modern Arabic dialects in Egypt and other Arab countries. The Academy was also to treat all those subjects which the Minister of Education submitted to it with the aim of developing the Arabic language. There would be twenty active members on an international basis. The first active members would be nominated directly by the King. Subsequently new members would be elected and then nominated by royal decree, or by decree of the head of state. In addition to the active members, there would be corresponding members. The president of the Academy was to be selected by the Minister of Education from a list of three names chosen by a majority of the members, and then nominated by decree of the head of state.
A royal decree of 36 Dhimādād 11/6 October 1933 appointed the first twenty members: ten Egyptians, among them three Azharites, one Christian and one Jewish scholar, five European orientalists and five scholars from other Arab countries. Some opposition came from religious and conservative circles, and in particular, the presence of five orientalists on the list gave rise to fervent discussions. In the press, protests were made against both the methods and the results of the work of the mustagrīṣīn with regard to the Arab-Muslim world; they were also thought to be collaborating with Christian missionaries against whose activities in Egypt a press campaign was carried out. As a result, A. J. Wensinck (1882-1939) was replaced as a member by E. Littmann (1875-1938). Authors like Muhammad Parid Wajjel (Nūr al-ṣīrām, IV (1352 A.H.), 399-402) attacked Wensinck because of his articles on Ibrāhīm and the Ka'ba in Līmā (cf. Littmann, xiii (1931), 345-54). Besides orientalists, Egyptian scholars like Tāhā Husayn and 'All 'Abd al-Rāzīk, who had opposed traditional conceptions of language, culture and religion, were also attacked. Seen in a wider perspective, attacks on orientalists reflect a zeal for total arabisation; though their vast knowledge was recognised, they were not seen as being loyal to the cause of Arabic language and culture and Arab self-affirmation in general during the period concerned. Such attacks notwithstanding, within the Academy the European orientalists—A. Fischer (1865-1940), H. A. R. Gibb (1893-1931), E. Littmann (1875-1938), L. Massinon (1883-1962) and C. A. Nallino (1872-1938)—worked together successfully with the arabophone scholars, although from 1960 onwards non-Arabs could only be corresponding members of the Academy.

The first session of the Madīna took place on 14 Shawwād 1352/30 January 1934, after which the "house rules" were established and the chief officials were chosen. Presidents were successively Muḥammad Tawfīq Rūṣāf Pasha from 1934 until 1944, Ḥāfīz al-Sayyid from 1945 until 1963, and Tāhā Husayn as his successor until 1973. Permanent secretaries of the Academy were Maṣūr Maḥmūd al-Ṭayyib (1888-1959) from 1934 until 1959, and Ibrāhīm Maḍīr (b. 1902) from 1960 onwards. The administration is carried out by an administrative directorate (khizanat al-maṣ̱āfa al-ūlā) and by a Numerous committees were founded where needed, as well as technical committees. In their sessions, specialists in various fields can be invited as experts whenever the Academicians are not sufficiently competent. As the number of specialisations has grown, the number of committees has increased and sub-committees have been founded where needed, as well as technical committees. The committees submit annual reports to the President of the Academy; they should keep more records of their meetings (nāmadūd al-dīwān). The conclusions of the committees are provisional until they have been presented to and adopted by the general meeting of the Madīna. Members can publish their work outside the responsibility of the Academy; a special part of the Madīna is reserved for this purpose. The Minister of Education has always been very much alert as to the consequences of the decisions taken by the Madīna for schoolbooks.

Special mention should be made of the precious collection of cards (gunsīd) which have been prepared for the historical dictionary and for the dictionary of technical and scientific terms. Massinon used to lay great stress on this project and the need for a correct organisation of the cards, but it took some time before the system was introduced. August Fischer, whose project of a historical dictionary of the Arabic language was officially accepted by the Academy in 1938, made some 100,000 cards of his project, which were transported from Leipzig to Cairo, but were neglected after his death in 1949. The cards for the scientific dictionary and for the historical dictionary have been differently organised; they have been placed in rooms not accessible for the public, and apparently they have been filled out only partially. In 1946 an office of registration (nāmadūd al-taṣāfīl) was established with the task of classifying all terms accepted by the Academy.
The Academy has acted as patron for certain works and book publications, and it has given awards to certain manuscripts of quality which could be published as a consequence. The Academy has an international audience and is represented at international conferences dealing with the Arabic language. It has contributed to the organisation of the Union of Arab Academies and to that of the Arab Scientific Union.

In its efforts to adapt the Arabic language to the demands and needs of modern times, it has paid attention primarily to problems of vocabulary and, in particular, to the creation of neologisms. Studies of grammar and especially of morphology serve in part to facilitate this work and to contribute to the making of modern dictionaries. Compared with this, studies on orthography, phonetics, dialects, syntax and stylistics have been less prominent. Work has concentrated on semantics and the grammar of the _fusḥa_; the more conservative members have always tended to defend at all costs the integrity and purity of the language. Members try to avoid an accumulation of synonyms. The rule has been established to prefer whenever possible one term to two or more if a neologism has to be made, or otherwise—if it is not possible to find one Arabic term—to proceed by means of a literal translation of the foreign term. Another rule is to study anything which could simplify Arabic writing as well as the rules of syntax and morphology. In particular, the Ministry of Education stresses the need for simplification of grammar. The interest taken in dialectal studies derives from the desire to be able to know the _fusḥa_, so that a decision can be taken about the integration of the dialects of the Arab world into the standardised Arabic and to avoid the transliteration of foreign words written with geographical names. Throughout the discussions, the history of Arabic grammar, the place of the _Kūrān_ as a norm for the Arabic language, and the role of linguistic norms as such, have come up again and again. Although some attempts have been made to propose a simplification of orthography for the purpose of printing, problems of writing and orthography, like those of phonetics, have hardly been dealt with. Most important has been lexicography (al-muṣṭaḏfaʾiyyāt) and the technical procedure of composing dictionaries; this has entailed, besides the creation of neologisms, the evaluation of texts of ancient Arabic literature. Through its discussions since 1934 the _Madjmaʿ_ has established a sort of linguistic _idjmaʾ_ for Arabic, though the discussions themselves have taken place in a non-systematic way.

In the conclusion of his study about the _Madjmaʿ_ al-_lughā al-ʿarabīyya_ R. Hmamziou observes two features by which it distinguishes itself from other academies. In contrast to the Academies of Damascus and Baghdad, it concentrates completely on the Arabic language, and in its decision-making it tries to arrive at a linguistic _idjmaʾ_ of its members before giving any authoritative statement. As in the Academy of Damascus, the work of the Academy of Cairo takes its departure from the _Kūrān_ and seeks to ensure a cultural and linguistic continuity from the beginning of Arabic literature until the present day. This often leads to a purist stand, seeking to defend the _ʿarabīyya_ against encroachments by foreign languages, in particular modern Western ones. This approach to the modernisation of the Arabic language and of Arabic culture in general leads to compromise solutions and the rejection of any radical solutions which may be proposed.

Among the major publications of the _Madjmaʿ_ al-_lughā al-ʿarabīyya_ are _al-Muṣṭaḏfa al-wasītā_ (3 vols., Cairo 1960-3) and _Mujādara al-ṣūf al-Kurān_ (3 vols., Cairo 1953) as dictionaries; five volumes of _Mafṭūha al-ṣawāhid_ (1936-48), four volumes of the subsequent _al-Buḥūra _wa l-ṣawāhid (1959-62) as reports on the work being done and papers read by Academicians; the _Madjmaʿ_ al-_muṣṭaḏfa al-ṣawāhid_ wa l-_żimiyā_ wa l-ṣawāhid (8 vols., 1959 and 1968, and specialised listings of neologisms created by the Academy for particular fields; finally, the _Majallat madjmaʿ al-_lughā al-ʿarabīyya_ from 1934 onward as the regular journal of the Academy. One special volume was published of _al-Muṣṭaḏfa al-lughawā al-tāʾrīkh_ (Ibl al-ḥamza it-tābī), the project of the historical dictionary initiated by August Fischer but later abandoned (Cairo 1937/1967, 53 pp.). Two specimen volumes were published of the great _al-Muṣṭaḏfa al-lughawā al-tāʾrīkh_ meant to be an Arabic Larousse Encyclopédique: _Harf al-ḥamza—al-ḥādī_ (Cairo 1956, 519 pp.), and _Naskh al-ḥamza_ (Cairo 1957, 155 pp. in typescript). Several studies on the Cairo Academy have been published, as is shown in the Bibliography below.

(c) _Irlak_. The history of the _Madjmaʿ_ al-_lilm_ al- _Irlak_ goes back to 1945 when a _lilm_ al-tāʾrīkh wa l-ṣawāhid was established in the Ministry of Education in order to expand the sphere of scientific activities in _Irlak_ and to keep up with such activities in the more developed countries. Due to the initiative of Muhammad Rūḥ al-Shābībī and his collaborators, amongst them Fāḍil al-Djamālī, _al-Madjmaʿ al-_lilm_ al- _Irlak_ was founded by the government in 1947 and organised by the Ministry of Education, the Arab Scientific Union, and the IAAC. The project of the historical dictionary initiated in 1934 as the regular journal of the Academy (no. 62, 26 November 1947): _Madjallat_ 5, (1960), 10:

(i) to maintain the purity of the Arabic Language and seek to adapt it to the demands of the arts and sciences, and of the affairs of modern life;

(ii) to undertake research and writing in the fields of Arabic literature, the history of the Arabs, the history of the peoples of _Irlak_, their languages, sciences, and civilisation;

(iii) to study the part played by the peoples of Islam in the propagation of Arabic culture;

(iv) to maintain in safe-keeping rare Arabic manuscripts and documents, and revive them by publishing them according to the latest scientific methods; and

(v) to undertake research in the modern arts and sciences, encourage original writing and translation in these fields, and promote the spirit of scientific enquiry in the country.

The _Madjmaʿ_ clearly wanted to provide an impetus to the scientific _nāḥa_ in _Irlak_, as had been the purpose of the _Madjmaʿ_ in Damascus, founded after World War I, for the scientific _nāḥa_ in _Syria_. On 25 June 1949 (no. 40), ten Articles were promulgated as an Amendment to the Regulations. The first meeting of the _Madjmaʿ_ was held on 21 January 1948 and up to 30 June 1956, 66 sessions were held as well as 130 committee sessions. At the meeting of the _Madjmaʿ_ of 3 November 1956, there were ten active members, all _Irlaki_; at the beginning of 1949, the _Madjmaʿ_ was considered to be a government body, and since by law the accumulation of ministerial or parliamentary functions with any other state positions was forbidden, several members had to leave the Academy; later that year Fāḍil al-Djamālī and Mattīaʿ _Aṣīr_ left _Irlak_ on official duty and had to be replaced by...
others, though they remained honorary members of the Academy. At this stage also, 28 corresponding members were elected, both among 'Irākī and among Egyptian, Syrian and Lebanese scholars; four western orientalists also became corresponding members, A. Guillaume, H. A. R. Gibb, W. Marçais and L. Massignon.

The activities of the Academy in Baghdad consisted from the beginning both of purely internal activities and of activities directed towards the outside world; giving public lectures, bringing about publications, allocating funds in order to support the publication of books and awarding prizes for essays on particular subjects fixed by the Academy. Since 1950 it has publised the Madhja il-madżama il-timī il-'irākī on a yearly basis, to which Academicians and other scholars have contributed on a number of scholarly subjects. The public lectures organised by the Academy may be published in its Madjalla or separately. Each issue also contains a number of book reviews. In 1950 the Academy was able to acquire a printing-press. In its internal sessions, the Academy has established a number of new scientific and technical terms which are published in part in the Madjalla and in part on separate lists sent to various Ministries at their request. It should be noted that 'Irāk during the early years did not yet possess a university, the University of Baghdad being established only in 1958. Well-known Presidents of the Academy have been Muni al-‘irādk as from 1949 onwards, Muhammad Rida al-Shaibī from 1958 onwards, and Abd al-Razāk Muḥy al-Dīn since the later sixties, Yūsuf ‘Irīz al-Dīn being its permanent secretary since that time. The Law no. 49 of 1963 introduced certain changes in the Regulations of the Academy.

The Academy has continued to hold its regular sessions and committee meetings and also to give financial assistance to the publishing of books and to acquire books for its library as well as microfilms of manuscripts. In 1970 the library counted some 25,000 books, more than the bibliographies and more than 400 manuscripts on microfilm. It had developed a card-index system, assigned prizes to winners of poetry festivals and participated in inter-Arab conferences on cultural subjects. The Academy also gave its opinion on cultural treaties which 'Irāk was concluding with other countries. The Academy was liberal in giving its publications to numerous official institutions and personalities in the country and abroad; it gave assistance to students and scholars, photographed manuscripts from public and private libraries. Members participated in Committees for the Protection of Monuments, for a Translation Programme, etc. At present the Academy has active members (not exceeding fifteen 'Irākī scholars), associate members, honorary members and corresponding members, the last two categories including both 'Irākī and other nationalities.

(d) Morocco. Although not a madżama in the formal sense of the word, a similar institution in Rabat may be mentioned. After the first International Congress on Arabisation held in Rabat in 1961, a Bureau Permanent de l’Arabisation was established in Rabat and recognised by the League of Arab States in 1968. Subsequently, this became the Bureau de Coordonnation de l’Arabisation de la Ligue des États Arabes à Rabat, which was integrated in the ALESCO (Arab League, on the pattern of a regional UNESCO) in 1977, its definitive regulations being established in 1973. Since 1964 this Bureau has published al-‘Irāk al-‘arabī, with lists of neologisms and further articles of linguistic interest; it also publishes specialised listings of terms in particular fields with the Arabic, French and English equivalents. The members of the Bureau participate in meetings of the Academies in Damascus, Cairo and Baghdad. In its work on the modernisation of the Arabic language, the Bureau de Coordonnation de l’Arabisation de la Ligue des États Arabes follows less conservative lines than the established Academies and appears to work more efficiently. Finally it should be noted that by a shahir (dahir) of 24 Shawwal 1302, October 1977, the king of Morocco created a royal academy (al-Sabil ‘al-madżama‘), which consists of 60 members, 30 of which have the Moroccan nationality while 30 are foreign correspondents. The statutes of the academy have been published in al-Bābī il-timī, xxviii (1398/1978), 135-44.

A Union of Arab Academies was founded in Cairo on 30 March 1957, by Decree no. 2349.

(ii) Iran

The establishment of the first Iranian language academy (Farhangistān-e ta‘līmān-i ‘Irān) resulted from developments representing two separate but related types of concerns, both stemming from the advent of modernisation in the early 19th century, and resulting in the double nature of the activities of the two academies. These two sets of developments were: (a) the desire for purifying Persian from the foreign (mostly
Arabic) words, and (b) the need for new words created by the introduction of new concepts (technical and general). The history of the language academies and related events can be divided into five periods:

1. Historical background (up to 1921).
2. The immediate setting (1921-1935).
3. The first Farhangistān (1935-41).
4. Between the two Farhangistāns (1941-70).
5. The second Farhangistān (1970-).

(1) Historical background (up to 1921). Attempts to write in a Persian devoid of Arabic words go as far back as at least the 4th/10th century. In recent times, the opposition to foreign words was triggered far back as at least the 4th/10th century. In recent decades, it has come to be used also in the sense of "culture", and in the 1930s it replaced the Arabic Ma'dārif in the name of the "Ministry of Education".

(2) The immediate setting (1921-35). Rīdā Shāh Pahlawī took over the government in 1921, and became king in 1925. Because of the encouragement of nationalism by the new regime, and the emphasis on the glory of ancient Iran, the debate on the foreign elements in Persian acquired greater prominence. Opposition to loanwords grew and became more serious as their numbers increased. The debate spread to newspapers and journals. The government, and several of its agencies, also became involved, issuing public orders as well as internal memoranda, forbidding the use of European words and names, and even ordering that Persian writings on store signs should be made more prominent than anything in foreign scripts. Foreign words were considered "worse than a foreign army", their use a "literary disaster". The subject came up in parliamentary debates, and Rīdā Shāh himself took a direct personal interest.

(3) The first Farhangistān (1935-41). By 1934, the efforts to purify Persian of its foreign element had acquired the proportions of a movement. Starting mostly in some periodicals, it soon spread to the various government offices, and to a major department of the Ma'dżma 'ilmī. A widespread hunt was on for "pure" Persian words to replace many common Arabic words. The words were found in dictionaries as well as other sources, including the Shāh-udna. Articles written in Farsī-yi sara were accompanied by glossaries, without which readers would have been at a loss, but nevertheless correspondence in this style was often unintelligible. Difficulties often arose in intra-governmental communication, since each person felt free to use "pure" Persian words which he had found, and there was little or no common ground among the many enthusiasts.

Rīdā Shāh Pahlawī visited Turkey in 1934, where a movement for purifying Turkish from Arabic and Persian words was afoot, supported by the government of Kemal Atatürk, on whose order the Turkish Linguistic Society had been founded on 12 July 1932 (see section 3. below). Upon Rīdā Shāh's return to Iran, approached by a number of purification supporters, he ordered a committee to be selected in the Ministry of War to adopt Persian equivalents for military terms. The Army Staff had already adopted native Persian equivalents for a large number of military terms, which had been reported to the king and put in use. These included the words afsar "officer" and artistāk "army", both now established terms (and both objectionable from the etymological point of view).

The Ministry of Education, which was opposed to the movement, tried to subvert the new committee. Within a few hours after the committee's first meeting, Prime Minister Muḥammad 'All Forūghī, an experienced politician and a respected scholar, and unsympathetic to the cause of purification, recruited for the task by the equally unsympathetic Ministry of Education, suggested to the king that
a group of scholars be commissioned to study the matter, and to prepare the way for the establishment of an academy [Farhangistdn].

The idea of establishing a language academy was not entirely new. In 1903, the government decided to establish a Madjlis-i Akhâden, which, however, did not last long. One of its coinages was râh-i bâh "railway", a translation of French chemin de fer, now a well-established part of Persian vocabulary. The idea continued to come up from time to time, until Furüghî was permitted by the Shah to found an academy. Furüghî charged 'Âsa Sâdîk with preparing a plan for an academy. He drafted a constitution, based in part on that of the Académie Française. The idea of establishing a language academy was not entirely new. In 1903, the government decided to establish a Madjlis-i Akhâden, which, however, did not last long. One of its coinages was râh-i bâh "railway", a translation of French chemin de fer, now a well-established part of Persian vocabulary. The idea continued to come up from time to time, until Furüghî was permitted by the Shah to found an academy. Furüghî charged 'Âsa Sâdîk with preparing a plan for an academy. He drafted a constitution, based in part on that of the Académie Française. After some changes, it was approved by the Council of Ministries on 19 May 1935, and sent to the Ministry of Education on 26 May 1935 for action.

Article II of the constitution specifies the responsibilities of the Farhangistdn in twelve items. Items 1, 2, 4-7, deal with collecting, adopting, and coinings. Items 8-12 concern literary literature. Item 12 calls for "inquiry into the reform of the Persian script". References to purification of Persian are mild, and almost casual: Item 2 states that the words to be chosen "in all domains of life" should be Persian "as much as possible". Item 3 states the responsibilities of the Farhangistdn as "pruning (breshîtan) from the Persian language inappropriate foreign words".

The Farhangistdn held its first meeting on 2 June 1933, and a few days later the extraordinary plenary members present included Muhammad Ta'îlî Bahâr [q.v.], 'All Akbar Dîhkhûdâ [q.v. in Suppl.], Abu 'l-'Uzân Furüghî, Bâdî' al-Zanânî (Furünîfûrû), Husayn Gulgâlî, 'All Asghar Hikmat, Majmûd Hisîbî, Sa'da Naâfî, 'Abâd al-'Azmî Kârîb, Chulâm Rîdâ Râshîd-Yâmînî, 'Âsa Sâdîk, Sâdîk Râshîdâda Shâfâk, Husayn Samîlî, Hasan Wûdkhî, and others. Among members added later were Ibrahim Pur'âni, 'All Akbar Shi'âstî, 'Abbâs Ikâtî Aštyâyânî, Muhammad Hâjîzâlî, Muhammad Kazîmînî, Ahmad Bahmânînî and Êzâlî al-Dîn Humâî. Among the associate (vâhânîa) members elected at various times were the Iranian novelist Sayyîd Muhammad 'Ali 'Abâdî Darbârî, and a number of foreign linguists, including: Professors A. Christensen (Denmark), Henri Massâd (France), Jan Ryppka (Czechoslovakia) and Muhammad Hasan Hayûtî [Egypt].

The Farhangistdn adopted its internal by-laws on 4 August 1935, and later slightly modified them. Other by-laws were adopted later. The internal by-laws called for the establishment of seven committees. Although the designations of these committees, and the description of the tasks of the Farhangistdn found in its constitution, set down a wide variety of tasks for it, in practice it spent all of its time and energy in adopting Persian words to replace foreign words.

According to its constitution, the officers of the Farhangistdn consisted of a president, to be appointed by the king, and two vice-presidents and two secretaries elected for two years by a majority of the ordinary members. The first president was Premier Fûrûghî. He resigned as premier a few months later and after that did not attend its meetings. In March-April 1936, Hasan Wûdîkhî succeeded him.

Rîdâ Sâhî was dissatisfied with the speed with which the Farhangistdn was progressing, and ordered it to be reorganised. This reorganisation took place on 28 April 1938. Several new members were added; and three members, including Wûdîkhî and Dîhkhûdâ, were removed. The presidency of the Farhangistdn was henceforth to be given to the Minister of Educa-

tion. The president under the new system was 'All Asghar Hikmat. He was succeeded by 'Îsmâîl Mirî three months later. Mirî's presidency lasted until September 1941. The committees structure also was changed. Of a total of eight committees, five were charged with coined terms. The work of the Farhangistdn was now practically restricted, both officially and in fact, to the coinage of terms.

Not everyone was in sympathy with the aims and the activities of the Farhangistdn. Indeed, its founder, Fûrûghî, himself apparently became involved in it more to keep those whom he considered extremists from controlling it than to help the purification movement. In fact, in a public lecture he gave a few months after the Farhangistdn began work, he tried to correct what he considered mistaken ideas about the organisation's work; e.g. the idea that it was a "word-manufacturing plant", and that its raison d'être was "purging Persian of Arabic words completely". In March-April 1937, the Farhangistdn published an expanded version of this lecture under the title Pipâm ba-Farhangistdn ["Message to the Farhangistdn"]. Throughout this message, he stressed the importance of Arabic for Persian, and preached moderation in the attempts to purify Persian, and patience in introducing new Persian words and reviving old ones.

The first Farhangistdn was active for little more than six years (though it continued to exist on paper until 1951). It consisted of ordinary members. The first president was Premier Mirî; he was succeeded by Hasân Wûhkî in November 1935. During this time, it invented, revived and adopted over 2,400 words. These words were widely circulated in the press and in book form. The largest number of the words were technical terms in banking, medicine, zoology, arithmetic, geology, physics, botany, geometry, and government. In addition, it adopted Persian equivalents for some 200 Arabic expressions used in Persian; e.g. nawsât for dâjdâl al-îbâdî newlly built. It also changed some place names, mostly from Arabic to Turkish or Persian; e.g. Muhammadara was changed to Khuurâmâghâr, Anzât to Pahlawi. In their forms, the words adopted by the Farhangistdn fell into several categories: (a) old words revived, e.g. dâjdâl "advertising"; (b) compounds, e.g. na'îyân-nâmâ (from na'îyân "end" + nâmâ "letter") "thesis, dissertation (for a college or university degree)"; (c) words made with suffixes, e.g. dâjdâl (from dâjdâl "justice" + -gîh, a suffix of place) "court"; (d) dâjdâl (from dâjdâl, a prefix comparable to the English prefix re- + dâjdâl, past stem of the verb "to have") "detention. A few of the Farhangistdn words were European loanwords; e.g. min "mine" from French mine. Most of them, however, were made up of native Persian elements, and can be classified in several categories: (a) old words revived, e.g. dâjdâl "physician"; (b) old words given new or specialised meanings, e.g. dâjdâl (originally "judge") "arbitrator", ars ("value") "[foreign] exchange"; (c) assignment of different meanings to members of a doublet (or triplet, etc.), i.e. the different phonological forms of what was historically a single word, e.g. dâjdâl "secret police: aghât商业模式; (d) differentiation of meaning among a set of synonyms or near-synonyms, as in the geological terms dawr "epoch"; dawwara "period"; dawrân "era"; râgâr "age"; (e) in a few instances (mostly in place names), a slight change in the form of an existing word making it more Persian in appearance, e.g. from zarânina to zarânîn "quarantine", from avâsîz (orig. Arabic "pilgrimage") to ziârâ (an obsolete Persian masculine name); (f) in a few cases, Persianising the spelling of a word, mostly in place names,
The inactivity and later disappearance of the Farhangistdн did not for long weaken the movement for purification. After Rидд Shад, the debate on purification was revived, with the opponents once again becoming active and vociferous. They included Аbbас Rббй Абшйрадн and Валйд Дасдйрн, whose journals, Yдйдар and Aрашадн respectively, published attacks on the Farhangistdн. The major spokesman for the opposition was Sayyid Hasan Takйзда (г.r.). The chief advocate of language reform—not the same as purification—was Sayyid Ahmad Kasrawй (г.r.), who, however, disagreed with the majority of the proponents of purification. Both of these men became active in this area during Rидд Shад's reign. They exerted their greatest influence after his abdication, however, and for this reason it is appropriate and convenient to discuss them at this point. Sayyid Hasan Takйзда was a well-known, widely respected, influential politician, diplomat, and scholar. In 1933, he had attacked purification in an article published in the journal of the Ministry of Education. His reference to "the intervention of the sword in the work of the pen" as being "contrary to the taste and dignity of Iranians" was taken as an insult to the Shah, and the article was cut out of the issue and replaced. This paper was reprinted in 1942. On 24 February 1948, he gave a lengthy lecture entitled LUsum-i fййб-i Fйдйн-yi Fййб ("The necessity of preserving the Persian language") at the Dndйsй-yi Єлй (National Teachers' College) in Tehran. Almost three-quarters of it is given to the question of Arabic words in Persian. Among the points he made were that many Arabic words in Persian had been "naturalised"; that expulsion of Arabic loanwords was a "malicious attempt on the Persian language and Iranian nationality" and would impoverish the language; that purifying Persian would gradually cut off Iranians from the neighbouring Muslim nations; that Arabic was an extremely rich language; that words for new concepts should preferably be borrowed from "the more familiar, easier Arabic words common in Egypt and Syria". Finally, he believed that choice of new words should be left to writers, and that "legal and coercive force must not enter it".

The major proponents of purification since the discussion grew serious in the 1930s included Dйhйb Bilйrй (d. 1971); Abu 'l-Кsйm Azйd Нарйghй (d. 1948); and Ахмйd Kasrawй Tabшйrlй (1890-1946). Kasrawй was the most active of the nationalist advocates, and the most enduring. He was also the most relentless in ignoring the Farhangistdн and its instructions even in its heyday during Rидд Shад's reign.

Kasrawй was a historian, a linguist, and a jurist. In the early 1930s he also became an advocate of far-reaching social change in all areas of culture. It was in close connection with his extensive writings and lectures on Iranian society and its tiles that he pursued language reform. Kasrawй believed that, through the centuries, Persian had come to be a language fraught with problems in all its aspects, including grammar and semantics. The foreign element in it was only one of the problems in all its aspects, including grammar and semantics. The foreign element in it was only one of the problems.
else for the current decayed state of Persian—both its vocabulary and its grammar; and this decadence has harmful psychological effects on the speakers of Persian. On the Arabic words in Persian, he believed that those Arabic words that were common in Persian, and for which no native Persian equivalents existed any longer should be retained; that, except for scientific terms, no words should be invented, but people's usage should be followed; that needed new words should be coined from Persian materials (by compounding and affixation); that Persian words selected should be correct; that they should be so formed as to make possible the derivation of other words from them; that there is no need to find a Persian equivalent for each and every foreign word, since many of the latter words were superfluous; that each word should have only one meaning; and that each meaning should always be expressed by the same words, thus eliminating synonymy. Furthermore, he repeatedly emphasised that the question of language reform was a scientific matter, and that to undertake such a reform was a scientific endeavour, requiring certain qualifications.

Like Talashá, Kasrawi was opposed to the establishment of an academy. He felt that language reform should come about through the efforts of writers, who should improve their styles, and thus provide models for the people at large. Kasrawi, however, would permit the establishment of an organisation for coining and selecting scientific and technical terms.

(5) The second Farhangistán (1970- ). Kasrawi was assassinated in March 1966. For the next twenty years or so, there was a virtual lull in the debate on language purification and reform. The first break in the lull was a lecture by Dr. Muhammad Mukaddam of the University of Tehran in December 1963, and an interview with him published in 1966. Mukaddam believed that Persian was poor in technological and scientific terminology, but was fully equipped to meet its needs; that Persians should not, as was frequently suggested, confine themselves to the language of their literary classics; that, contrary to the suggestion made by many, coining new words from Persian resources would not cut off Iranians from other speakers of Persian, since no one was advocating the replacing of Arabic words with Persian in the writings of the past—that, in fact, the other Persian-speaking peoples should welcome the new terms.

Soon, discussions of language reform began to appear in the daily press (e.g. Kayhán), and in journals, such as Wahid, Yaghma, and Talaš. In 1970, the Ministry of Culture and Art sponsored a conference for discussing the Persian language, held on October 28-30, in Tehran. At the opening session, a message was read from Muhammad Rida Shah Pahlevi, in which he announced that he had already approved the constitution of the Imperial Foundation for the Farhangistán, which was to be established. He said that the constitution provided for a Farhangistán-i sahab-i Iran (“Language Academy of Iran”). On the last day of the conference, the Minister of Culture and Art presented the members of that Farhangistán to the Shah: Dr. Sądik Riddásá Shafak, Husayn Gulguláb, Dr. Mahmúd Hisábi, Dr. Isá Sádí, Dabīb Bihrúz, Esmáíl Rídá, Muhammad Mukaddam, Yáhýá Máihr-Núwábbú, Mohammad Mukarrám, and Šahúr Karmísh and Sádiq Kiya, who was appointed president of the body by imperial order.

In his message, the Shah referred to the old Farhangistán and to the new one as an expansion of the old one. Four members of the new one (Gulguláb, Sádí, Hisábi, and Shafak) had been members of the old one also. Another member, Bihrúz, had served on one of its committees. President Kiya had for many years been a collaborator with Mukaddam in language-reform activities. The new Farhangistán differed from the old one in that it was to be one of several such organisations. The Farhangistán-i Humar wa Adab (“Academy of Art and Literature”) was founded soon afterward. However, the Language Academy was the main focus, received the greatest financial support, and became very active.

The new body had an elaborate organisation, consisting of a Council, made up of the ordinary members; four Fardangistán (Research Centres); a library; a phonetic laboratory; and a secretariat. The four Fardangistán were: (1) Wistá-guyvái (Adoption of words); (2) Wáshá-yi Farsi (Persian words), which was charged with “collecting Persian words and showing the capabilities of this language in making words”; (3) Sabdán-yi farsí wa miýána wa gauyá-yi irání (Old and Middle Iranian languages and Iranian dialects); and (4) Dastár-sáh-i Farsi (Persian grammar). The first of these centres was the only one to be established. It began with 13 groups, each responsible for terms in a specific field or fields. By the end of 1975, they had proposed 30,000 Persian equivalents for some 15,000 foreign words.

One feature of the procedure followed by these groups is the publication of lists of words for which Persian equivalents are being sought, in monographs entitled Farsíwad-i shámí fiáli? (“What do you propose?”). These monographs are distributed worldwide. The proposals received were to be considered when deciding on new terms, which were to be approved by the Shah before becoming final.

As far as their forms and etymological histories are concerned, the words adopted by the second Farhangistán are by and large similar to those adopted by the first one. Several points are worth mentioning, however: (1) greater and bolder use of affixation and compounding; (2) greater consistency among the various adopted words; (3) greater tendency to revive obsolete or archaic words unknown to the majority of Persian speakers; (4) formation of words from Middle and Old Persian bases; e.g. parás “park” (cf. Mod. Pers. firdaus “paradise”, and English paradise, and its cognates in other European languages); parásá “campus” (related to the preceding); and (5) insistence on replacing some quite common words; e.g. mibrá for minbar “architect”; dášgúsh for dástgúsh “candidate”; forshá-yi farhang, wáshá-yi varshá-ye forshá-yi farsí “education”, parás for moháb and pérdáín “environment”, etc.

CONCLUSION

A brief comparison between the old and the new Farhangistán might be useful: (1) The new one is a far more serious undertaking—as evidenced in its elaboration organisation and procedures. (2) Its work is not
confined to word-making but covers the entire language. (3) Its members, as a group, believe in their work, while the old one was organised and at least at first controlled by people (e.g. Ferigh) not in sympathy with language purification. (4) Its members and those outsiders working with them are professionally more highly qualified than their predecessors, in linguistics and other relevant fields. (5) It is a more open operation, in that it consists the public, or at least the scholarly community. (6) Its work is more systematic, and its procedures more elaborate.

As for the future of the academy, and of language purification, it is difficult to predict after the February 1979 overthrow of the monarchy by a revolution with strong religious overtones. The Farhangistān is now inactive, if not in fact defunct. If the atmosphere prevailing during the first nine months of the new regime continues, any undertaking of his type would most likely discontinue, or at least be weakened and restricted. Under such conditions, the activities of any language academy would very likely be confined to the coining and adoption of technical terms.

Bibliography: A short history of the two language academies and similar organisations in Iran and of language reform is provided in M. A. Jazayery, Farhangistān: la Academia Iranía de la Lengua, Mexico City (forthcoming), which contains a comprehensive bibliography. A shorter account, from a somewhat different perspective, will be found in his article The modernisation of Persian vocabulary and language reform in Iran (forthcoming). For a list of the persons writing in pure Persian from the earliest times, see A. A. Elhamat, Farsī-yi naqša, Tehran 1951, where examples of such writings are given. See also M. Ishaque, Modern Persian poetry, Calcutta 1943. Information on the various terminological and purification groups is found in Muhammad Muhī-Tabātabā’ī, Naghābān-yi zaband Farsī, in Yazdānī, xxiii (1971), 569-75; Mūhsīn Shāmīl, Ta’rīkhī az wad-i baghat dar ʿIrān, in Wahēz, v (1969), 834-8; and in the Jazayery monograph cited above. On the committee at the Dānīṣūh-šāh-yi ‘Allī, see ‘Īsā Sadīkī, Yādātā-yi samā, Tehran 1959-75, ii, 109 ff. The constitution and internal by-laws of the Farhangistān, lists of its members and committees, and of words adopted up to 21 March 1942, are found in Wāḥshā-yi nuvān kī ādābī-yi sālī 1939 dar Farhangistān, Tehran 1973 (repr. of the original 1942).

A brief analysis of the words approved by the two Farhangistāns is given in Jazayery’s book and in A. Shākoor Ahsan, Modern trends in the Persian language, Islamābād 1970, 111-30. On the developments between the two Farhangistāns, see also Laosāhā-yi Farsī-yi hāft farsī, in Yādātī, vi (1946), 1-40. On Kasrawī, see now (in addition to Bibl. in the article, s.v.), Nūr-illusion-yi Kasrawī dar zamān-yi zaband Farsī, ed. Ḥusayn Yārdāndānī, Tehran 1979. For an analysis of Kasrawī’s views on, and methods of, language reform, see Jazayery, Yaddāštī-yi dar ʿirān-yi zaband Farsī, in Yādātī, vi (1942), 1-40. On Kasrawī, see now (in addition to Bibl. in the article, s.v.), Nūr-illusion-yi Kasrawī dar zamān-yi zaband, which appears on pp. 11-47 of that book in lieu of an introduction. On the second Farhangistān, see Jazayery’s monograph and article cited at the beginning of this bibliography, the Ashan book cited, and the publications of the Farhangistān itself. The latter include Farhangistān-yi zaband ʿIrān; kāf, lām, wādī, ʿaṣāf, fāʾ, šāḥīyāt, Tehran 1975, and the Pishkhnād-e shamāl-e tāsīr monographs of which four were published, Tehran 1972-6. Samples of its adopted words are found in Barābarshā-yi Farsi-yi barāhī az wādī-yi ansārī, Tehran 1971.

(M. A. Jazayery)

(iii) TURKEY

There are two academies in Turkey, the Society for Turkish History and the Society for the Turkish Language, both set up on the initiative of Mustafa Kemal Atatürk [g.e.], who supervised their work closely until his death in 1938, whereupon nearly all his estate was divided evenly between them. Both during and after his lifetime, these academies closely followed his views on the interpretation of Turkish history and the reform of the Turkish language respectively. In brief, they maintained that the Turks were an ancient people, connected with Anatolia since the oldest times, with a language of their own and responsible for major contributions to world civilisation. The operational results of this approach, which the academies were expected to foster, were to be an increase in pride among Turks regarding their past and their language and the will again to play a role in world civilisation through rapid modernisation.

The Türk Tarhi Kurumu (TTK) or the "Society for Turkish History" had as its predecessor the Türk Tarih Tətik Təyeti or "Committee for Research into Turkish History", founded in 1930. In 1931, this was succeeded by the Türk Tarih Tətik Təyeti or "Society for Research into Turkish History", whose own name was changed to Türk Turki Kurumu (meaning the same) in 1975.

The scope and goals of the TTK were to study the history of the Turks and of Turkey and to publish and disseminate the results of this research. The following methods were suggested for attaining these objectives: 1. Research and investigation of sources relating to the history of the Turks and of Turkey. 2. Translation (into Turkish) and publishing of these source materials. 3. Convocation of congresses for discussion of new findings and other scholarly topics. 4. Despatch of scholars (individuals or groups) for investigation of documents and other sources relating to the history of the Turks and of Turkey. 5. Cooperation with local and foreign scholarly institutions regarding the study and publication of relevant material.

The TTK, organised like other academies and learned societies throughout the world, is housed in its own building in Ankara, with an impressive library (including archival materials, 902 manuscripts, 180 microfilms, 172 photocopies of manuscripts, numerous local and foreign journals and 73,169 books and offprints, by late 1979) and its own printing press. The TTK's manifold activities, which include research, lectures, exhibitions and international congresses —convened approximately once every five years since 1932— as well as publication of the proceedings of these congresses under the title Türk tarhi kongresi sunulan bildiriler (later renamed Türk tarhi kongresi bildirileri) along with numerous other scholarly and popular publications. The TTK's conception of Turkish history is maximalist; one of its first publications was a four-volume textbook for secondary schools (ñîe), emphasising the overall history of the Turks and Turkic peoples) throughout Asia and their contributions to world civilisation. The 547 scholarly books—many of which comprise several volumes—published
neologisms are indeed words of Turkish and Turkic of Arabic or Persian origin. While many of these films and over 100 volumes of photocopies of 48 Turkish dialects. 3. To prepare and publish re-

moderate. Starting with 1932, the TDK has convened the coining of new words and terms to replace those which are attended by both local and foreign linguists.

The Türk Dil Kurumu (TDK) or the “Society for the Turkish Language” was preceded by the Dil Heyeti or “Language Committee”, established in 1929 to coordinate and advance—on a more institutionalised level—the language reform which had commenced one year earlier upon adoption of the Latin alphabet. In 1932, with the government’s blessing, the Committee expanded and became the Türk Dili Tektik Cemiyeti or “Society for Research into the Turkish Language” whose name was changed in 1934 to Türk Dili Araştırmaları Belleten (annual, 1953— ), Türk Dili: Türk Dili Tektik Cemiyeti Buluslari, renamed Türk Dili Belleten (monthly, 1933-50), superseded by Türk Dili: Aykik Dergisi (monthly, 1951— ).

By a law passed on 11 August 1983 (published in the Recem Gazetesi, no. 18518, dated 17 August 1983), the Türk Tarih Kurumu and Türk Dil Kurumu, along with the recently founded Atatürk Kültür Merkezi (the Atatürk Culture Centre), have been united in a new, state-sponsored Academy, entitled Atatürk Kültür, Dil ve Tarih Yüksek Kurumu (the Atatürk Culture, Language and History Higher Organisation), located in Ankara.

Under the auspices of the Muslim University, Aligarh, and in imitation of the Academies of Damascus, Cairo and Baghdad, the al-Madja' in al-imam al-Hindi was founded in 1368/1976, aiming mainly at expanding knowledge of Arabic in India, furthering studies on the literature, history, sciences and civilisation of the Arabs, publishing valuable manuscripts; publicising the work of Indian scholars; and stimulating the intellectual spirit of the country.

The Academy comprises twelve active members (‘almāni) of Indian nationality, 28 corresponding members (mustafimīn) representing the Arabophone countries (Syria, Saudi Arabia, Iraq, Jordan, Palestine [E], Egypt, Lebanon, Morocco and Kuwait) and 15 other corresponding members chosen from the Arab states of Iran, Pakistan, USSR, Germany, Great Britain, France, Hungary, Italy and the Netherlands.

MADJNUN (a.), pl. madjnnān, possessed, mad, madman; the passive participle of djinn, "to cover, conceal", passive, djinnā, "to be possessed, mad, insane".

Its meaning and usage have been closely related to belief in the djinn [q.2]. In pre-Islamic Arabia, soothsayers were believed to have received messages from the djinn during ecstatic experiences, after which they delivered oracles in short, enigmatic verses of rhymed prose called sa’di [see kāhin], and poets were believed to have been inspired by their individual djinn, similar to the Greek idea of Muses [see spā’tir]. Soothsayers and poets were both said to be madjnnān, literally "djin-possessed" or "inspired by the djinn". The term madjnnān occurs eleven times in the Kur’ān, where its exact, original meaning is not certain, but its usage is significant for the later history of the term. It refers explicitly to Muhammad seven times and probably alludes to him in the other contexts, where episodes in his life seem to be projected into stories about Moses (XXVI, 27, LI, 39 and Noah [LV, 9]) and the general statement that each of God’s Messengers was accused of being a sorcerer (sākJ) or madjnnān (LI, 32). In four of the seven contexts where madjnnān refers explicitly to Muhammad, it occurs in accusations against the Prophet quoted from his opponents: "O thou upon whom the Reminder has been sent down, thou art madjnnān" (XY, 6); "Shall we abandon our gods on account of a poet (gāhir) madjnnān?" (XXVIII, 36); "They turned from him [i.e. Muhammad] and said, ‘One who is tutored, madjnnān’" (XLIV, 24); "When they hear the Reminder they say, ‘Surely he is madjnnān” (LXVIII, 31). In the other three contexts God responds to these accusations, assuring Muhammad and his companions: "Thou art neither a soothsayer (kāhin) nor madjnnān” (LI, 29) "Thou, by the bounty of thy Lord, art not madjnnān” (LXVIII, 2); and “Your comrade is not madjnnān” (LXXXI, 23). In the Kur’ān the term madjnnān, always in the singular, functions sometimes as an adjective and sometimes as a noun. It occurs only in Meccan passages, only in the context of accusations made against Muhammad by his opponents (and against earlier Messengers by theirs), and only in contexts involving the question of the source and process of revelation. The primary meaning of madjnnān in the Kur’ān seems to be "djin-possessed, djinn-possessed person (like the ancient Arabian soothsayer)" or "inspired by the djinn, person inspired by the djinn (like the Arabian poet)". Muhammad’s opponents in Mecca, seeing the similarity between the form of his messages and the sadjī oracles of the soothsayers, argued that his messages were not revealed by God, but were inspired by the djinn. In response to this charge, the Kur’ān develops some interesting counter-arguments. Identifying the alleged djinn inspi-
MADJNUN—MADJNUN LAYLA

ments on XV, 6 and LXVIII, 1). An analysis of cognate expressions in the Kur'an also offers little new understanding of the concept madjnun. In late Meccan and early Medinan contexts, madjnun was replaced by the expression bii fi gharib al-lfur'dn (see VII, 184, XXII, 25, 26, and XXIV, 8, 46). This change of terms could be interpreted as a change or development of ideas within the Kur'an, but this possibility is unlikely since the two expressions seem to be synonymous (e.g., ma sâkhbun bi-madjnun, in LXXXI, 22, and ma bi-yâh saddun min gharib, in XXV, 49). In contexts where madjnun functions as a noun (e.g. XXIV, 24, LI, 32, and IV, 9), its meaning seems to be identical with the expression madinun in XXV, 25, i.e., both seem to mean "a jinn-possessed person". While Baydawi explains bii fi gharib al-lfur'dn (e.g. in XXIII, 25) as simply giving the synonym gharib, which has the same range of meanings (e.g. al-Zamakhshâri on the same verse).

One striking fact about the history of the usage of madjnun is that Muslims adopted the concept and gave it widespread currency, assuming it to be Islamic because it occurs in the Kur'an, whereas in fact the term never occurs in the Kur'an as an Islamic concept, but always as an idea of Muhammad's Meccan opponents and those who rejected Islamic belief and practices. When the Islamic world-view developed within the Kur'an, and when required Islamic beliefs and practices were introduced in a series of late Meccan and early Medinan credal statements, some of these pre-Islamic concepts, such as belief in the existence of ginn and deities other than Allah, came to be explicitly rejected, while others, such as madjnun and belief in the existence of the ginn, simply ceased to be mentioned in later parts of the Kur'an (see A. T. Welch, Allah and other supernatural beings: the emergence of the Qur'anic doctrine of tawhid, in fin of the manuscripts, p. 134, 771-773). Still, the concept madjnun, along with magic, sorcery, soothing and other related phenomena that were a vital part of the Arabian world-view of Muhammad's time, became part of popular Islamic belief and practice, and these have remained so in modern times (see e.g., E. W. Lane, Manners and customs of the modern Egyptians, London 1856, chs. 2-4; E. Poulet, Magie et religion dans l'Afrique du Nord, Alger 1909; D. B. Macdonald, The religions attitude and life in Islam, Chicago 1912, lectures 1-2; E. A. Westermarck, Ritual and belief in Morocco, London 1926, 1, ch. 4; C. Svanberg Hjorungne, Mosk, Leiden 1931, 39-70). The concept madjnun occurs occasionally in the classical literature, with the same literal meaning as in the Kur'an. In the hadith literature, see al-Bukhâri, Sahîh, II, 151; Muslim, Sahîh, DIYMAN, 45, and Hududd, 22; and J. Rothos, Michkat al-asbâb, Lahore 1965, 515, 1260 f. Al-Tabarî records an account in which Muhammad is reported as saying he feared he had become either a poet or a ginn-possessed person (madjnun), but then Gabriel appeared to him and informed him that he was a prophet inspired by God (Ta rebell, i, 1150; tr. A. Guillaud, The life of Muhammad, London 1955, 106). For a contemporary dependence of belief in the ginn and their influence on man by the al-Azhâr scholar, Sayyid 'Abd Allah Husayn, see his al-Dîjna fi sâhîh al-dîjna 'ahdul al-dîjna, Cairo n.d. The Islamic philosophers and a few scholars such as Ibn Khaldûn rejected the concept madjnun as related to the world of the ginn (see Macdonald, Religions attitude, 130 ff.). In later usage, the association of madjnun with the ginn has sometimes been lost as this term has come to mean simply "mad" or "insane".

Lane, An Arabic-English lexicon, 1/2, 462; and, for additional hadîths containing the term madj-nun, A. J. Wensine, Concordance et indices de la tradition Musulmane, i, Leiden 1950, 374.

MADJNUN LAYLA, "the Madman of Layla", or Madj-nun Ban'U 'Amir, the name given to the hero of a romantic love story, the original form of which could date back as far as the second half of the 19th Century.

1. In Arabic literature

This imaginary character (acknowledged as such even by some Arab critics; see Ahghâni, ed. Beinrat, ii, 6, 11) has been furnished by the ruwâd with an aren and with a complete genealogy; Kays b. al-Mulawwah b. Muzâhim b. Kays b. 'Udas b. 'Abâd a. Dja'da b. 'Amr b. 'Aqâf b. 'Amir b. 'Abâd b. Râbi'a b. 'Abâd b. 'Abî Sâ'da, but according to the evidence, although this filliation could be accepted from the starting point of Kays b. 'Udas, the latter does not have a son named Muzâhîm (see Ibn al-Kalâb-Casfer, Djamhara, Tab. 101, 194, 196). Furthermore, various other less common names have been given to him: al-Buhîbî b. al-Dja'd a, Mahîd b. al-Mulawwah, al-Akrâ or Kays b. Mûlîh (Ahghâni, ii, 8). Al-Djâhîs splits the character into two parts by distinguishing between a Madj-nun of the Banû 'Amir and a Madj-nun of the Banû Dja'd (Bayân, i, 385, illi, 224, iv, 22), where Dja'da is a descendant of 'Amir. As for his loved one, she is given the following genealogy: Layla bint Yûsuf b. 'Abî Sâ'da b. 'Abî 'Amir, Kays b. Râbi'a b. 'Abî 'Amir. The content of the romance, insofar as it can be extracted from the ancient versions, is relatively simple and commonplace. However, from the start, two opposing traditions have been current: according to one version, the two young people spent their youth together, tending their flocks in the DJabal al-Tawbâb (which belonged, however, to the Mubârîb; al-Ispâhânî, Bîdêl al-Arab, 182; cf. ikhît, s.v.); according to the other, Kays meets Layla by chance at a gathering of women, and the effect on him is devastating; he kills his camel as a contribution to the feast, but when a certain Mûnâzîl arrives, the women turn their attention to him, and only Layla, who shares his emotion, takes an interest in Kays. Subsequently he asks for her hand in marriage, but her father has already given her away in marriage to a certain Ward b. Muhammad al-Uqâyîlî. Gripped by the most violent anguish, Kays loses his reason and sets out to wander half-naked, refusing nourishment and living among wild animals. His father takes him on a pilgrimage to make him forget Layla, but his madness only inten-
sifies. He does, however, have moments of lucidity when he talks of his lady-love and composes verses which he recites to those curious people who come to see him. Until his death, he encounters Layla on only one further occasion.

It is difficult to establish the origin of the story. According to a remark in the *Agknh* (ii, 7, 10), the initial author would have been a young Umayyad who, under the pseudonym of Madjnun, circulated some stories designed to introduce verses in which he sang of his ill-starred love for his cousin. This identification is, however, isolated, and in any case, the poet is anonymous. The fact that historical individuals such as Nawfal b. Musaib, governor of Medina in 47/762, are mentioned in the traditions relating to the adventures of Kays, suggests that the latter came into existence at about this period, but this is all that can be said on the subject. The author, or rather the authors of the verses attributed to this Madjnun and the introductory or explanatory tales, will always be unknown, and it may simply be supposed that these creations are owed to the desire of the Arabs of the North, represented by the 'Amir b. Sa'ida, to show that unhappy love affairs were not the prerogative of those of the South, the Umayyads in this instance, and that they were capable of producing the equal of a Dami al-'Udhr b. [8].

From the moment that verses and akhbar concerning fictional characters achieved normative status, it is not hard to imagine the role played by inventive narrators and *masd* whom al-Asma'i (in *Agknh*, ii, 6) also accuses of having concocted this novel, which is included in a long series of imaginative works and fictionalised biographies of which the *Fihrist* supplies a detailed inventory (cf. M. F. Ghazi, *Sezgin*, GAS, iii, 392-3) who has written a book on *imagination*, in Arabic, iv/2 [1937], 174-8). The story of Madjnun and Layla, like many tales of the Middle Ages, has never obtained a definitive form. It is true that transmitters of tradition like Ibn Da*b, 'Umar b. Shabba, Ibn al-Kalbi or al-Zubayr b. Bukkâr, must at a quite early stage have set down in writing the more or less numerous and disparate elements, but independent akhbar continued to circulate orally and to be enriched according to the taste of the narrators. Evidence of this process is furnished by a study of the sources for the recension of the *Agknh* (ii, 1-78) which, after that of Ibn Kutayba (al-Sa'ida al-Ishârâ', 355-64 = ed. Shâkir, ii, 345-59), is the most ancient and the most developed. Abu 'l-Farajî, in order to bring a successful conclusion to his enterprise, which aspires to be a complete, if not coherent, history, takes effective precautions to shield himself from the critics by citing opinions for and against the historicity of the character, then combines, without regard for chronological order, a series of oral and written sources which have been inventoried by I. Y. Králëkovsky, in an article published in Russian in Leningrad in 1946 and translated into German by H. Ritter, in *Orhov*, vii/1 (1945), 1-50 [*Die Frühgeschichte der Erzählung von Mandûn und Layla in der arabischen Literatur*; cf. *Sezgin*, GAS, ii, 390).

The story of Madjnun and Layla seems to have taken precedence over the majority of others of the same genre towards the end of the 3rd/9th century or the beginning of the 4th/10th; the fact that numerous verses taken from it were set to music, plus the importance attached to it by the *Agknh*, leave no doubt that the vogue which it subsequently enjoyed was not an entirely new development. In the Arabic literature subsequent to the *Agknh*, the akhbar of Madjnun recur in a number of works of 'asab, in particular in those which concern famous romances (like the *Tayyyn al-asa'dh* of Dâwûd al-Antakî, ed. Beirut 1974, i, 97-188), but little is known of independent monographs, apart from the *Dârin* and two works which have yet to be edited: the *Nushat al-musdmir fi dîhâr bâl dîhâr Madjnun Banî 'Amir, by Yusuf b. al-Hasan al-Mibrâdi (d. 909/1503) and *Bâat al-sâmî* al-musdmir fi akhbar Madjnun Banî 'Amir, by Ibn Tûlah (d. 953/1404). It is remarkable, but not entirely unexpected, that the story of *Madjnun wa-Layla* should have inspired no literary work in Arabic in the Middle Ages; in fact, it is not until the present day that one sees the theme exploited by several dramatists: Ibrahim al-Abdâb (J. M. Landau, *Études sur le théâtre et le cinéma arabes*, Paris 1965, no. 39), Salim al-Hustani (ibid. no. 161), Abu Khalil al-Kabbâni (ibid. no. 406), whose works do not seem to have been performed, or even printed; the *Khitbat Madjnun Layla* by Muhammad Muslih Khayr Allâh, on the other hand, has been performed in Alexandria and published in 1968 (and 1982; Landau, no. 304); the most celebrated of these verses is undoubtedly the *Rivdat Madjnun Layla* by Ahmad Shawki (Landau, no. 517); J. Arberry, Cairo 1933; see also R. Robinacci, in *AVON*, vii [1957], 9-66; A. Bououd-Lamotte, *Abd al-Samâl, Damascus 1927, 275-82*). It is not known whether it is necessary to place at the end of the 2nd/8th century, since there is no mention of him in the *Fihrist*, a certain Abû Bakr al-Wâlîbî, to whom is attributed a recension of the *Dârin of al-Madjnun* of which a considerable number of manuscripts exists, containing or not containing relevant passages (ibid., ii, 7, 10), to attribute to Madjnun Layla the verses of any unknown poet where reference is made to a Layla; further-more, the homonymy with Kays b. Dharîb has certainly caused confusion. At all events, R. Blachtre, who has analysed this *Dârin* (*HLA*, iii, 69) considers that it "cannot be regarded as occupying an insignificant place in the study of archaic poetry". (Cf. *PILLAT*)

**2. In Persian, Kurdish and Pashto literature**

The poems of Madjnun and the tales of his love Layla (commonly named Layly in Persian) also became a part of the Persian literary tradition, where they were used in various ways. Quotations of Arabic lines of poetry ascribed to Madjnun occur quite frequently in Persian prose works. He was reckoned to be one of the great poets of love (cf.
The subject of Arabic origin existed in 'Ayyubid times. The theme was chosen for the requirements of a Persian romance. They were joined and wandered through the wilderness because of love (Whitaker, 476). According to Djalal al-Din Rumi, Madjnun's deepest despair; of autumn at the time of Layli's death. Much attention is given to Madjnun's role as a poet. In several places, ghazals are quoted in the text, which in metre and rhyme are adjusted to the prosodic characteristics of the mathnawi. It is quite evident that, to Nizami, the subject matter was not least interesting because of its emblematic possibilities. His poem is, therefore, a didactic work as well as a narrative. The former quality is noticeable in the frequent asides containing reflections on such themes as ascetism, the vanity of the world, and the like. Didacticism is also the main element of the introduction and the epilogue.

This Layli u Madjûn was the starting-point of a long series of imitations which were written in almost any language of the area where the cultural influence of Persian literature made itself felt. The poets who tried to emulate the model set by Nizami borrowed most of its contents and its metre but often also elements of its composition, e.g. the advice given to the son of the poet and the address to the cupbearer which both occur in Nizami's introduction. Each of them, however, made an effort to produce an original work by making changes in the episodes of the romances, by the addition of new stories or through a shift of emphasis from one motif to another.

No more than a few of these imitations can be rated as valuable literary works in their own right and have apparently enjoyed the interests of a wide public over a long period. The Madjûn u Layli of Amir Khusraw Dihlawi [q.v.] written in 1198 and the very first among them, belongs to a complete imitation of the Khamsa. This poem is much shorter than the model (2,650 bayts) and puts less emphasis on didactic aspects. New elements of the narrative are among others the designation of Madjûn's fate at the time of his birth and the wish expressed by both lovers to have their eyes picked out by the ravens who prey on the dead bodies left after the battle of the clans. Amir Khusraw dedicated his work to his spiritual guide Nizâm al-Dîn Avîlî and to the sultan of Dihlaw. The much longer poem of Qâmil al-Din Qâmil, written in 1229, exhausts the contents of the original abhâr. The beginning of the love story (the meeting of the two lovers is not situated at school but at the camp of Layli's clan) is also closer to the Arabic tradition. The mystical meaning attached to the romance cannot be mistaken, though the narrative as such is given its full due. In the song addressed to the cupbearer of the introduction, Dihlawi commemorates the development of a frantic love affair from the scene of the first meeting of the two lovers till the death of Madjûn at the grave of Layli. In some respects, the Bedouin setting of the original has been changed under the influence of urban conditions more familiar to the poet and his audience: the young lovers become acquainted at school; the generous Nawfal (whom the love between the main characters is reflected) is no longer an Arab official. Nizâmi added a second pair of lovers, Zayn and Zaynab, in whom the love between the main characters is reflected. It is Zayn who in a dream sees Madjûn and Layli united in paradise at the end of the romance. Several other features mark this new adaptation of the romance. Specimens of nature poetry were used to emphasise, symbolically, important points in the development of the plot: a description of a palm bush in spring where Layli sits in the flower of her youth; of the night at the moment of Madjûn's deepest despair; of autumn at the time of Layli's death. Much attention is given to Madjûn's role as a poet. In several places, ghazals are quoted in the text, which in metre and rhyme are adjusted to the prosodic characteristics of the mathnawi. It is quite evident that, to Nizâm, the subject matter was not least interesting because of its emblematic possibilities. His poem is, therefore, a didactic work as well as a narrative. The former quality is noticeable in the frequent asides containing reflections on such themes as ascetism, the vanity of the world, and the like. Didacticism is also the main element of the introduction and the epilogue.

This Layli u Madjûn was the starting-point of a long series of imitations which were written in almost any language of the area where the cultural influence of Persian literature made itself felt. The poets who tried to emulate the model set by Nizâm borrowed most of its contents and its metre but often also elements of its composition, e.g. the advice given to the son of the poet and the address to the cupbearer which both occur in Nizâm's introduction. Each of them, however, made an effort to produce an original work by making changes in the episodes of the romances, by the addition of new stories or through a shift of emphasis from one motif to another.

3. In Turkish literature

The Turkish poets were fascinated also by the Madīn Lāylā theme, in the first place, and above all, because they were inspired by the classical version of Niṣāmī [q.v.] and then later, when taking up a critical position contrasted the versions of other Persian and Turkish poets. Because the theme itself, the combination of the motifs, and, for the greater part, the metre as well, were all fixed, Turkish poets were able either to aim at a more exciting elaboration of the external motivation, or else to try to draw out the "meaning" of the story as included in the material. A comparative study of the poetical aims, which, because of the similarity of the theme, should also take into account Navaî and Gǔšč, is still lacking.

Gǔšč and Ašāfī Pāsha [q.v.] had already taken up the theme in the Maqṣūn" and Ghārîb-nāme. The line of independent Turkish versions starts with the lengthy mēkâna'ī [see MATHÂNĪ] written by Şāhîd on behalf of Prince Dīn [q.v.], and later plagiarized by a certain Navaî. Already in Şāhîd's poem, as well as in Madīn Lāylā of the late Turkish prince of poets Mir 'Abbâr Nawâvī [q.v.] and later principally in a certain Kâtîb. Already in Şāhîd's poem, the latter continued to be read till the end of the 19th/20th century, the Ottoman Ahmed Sinâş Bîhîšîf [q.v.], who lived for a time in Herat, wrote a mystically-inspired version influenced by Dżāmī [q.v.], to which he added some important alterations in the motifs. At about the same time, Hamd Allah Hamdî [q.v.] and Tutunûsî Ahmed Râfîwî composed their arrangements. The 19th/20th century was particularly rich in Lāylâ-Madjânn versions. Dżâmî Hamdîi-Râmî Bursâlî (d. after 977/1569-70) wrote his version in 968/1561-2, more or less simultaneously with his dramatically-shortened version of Shârān uШârâs, apparently concentrated, like the latter, on the external aspects of the action. Two years later Sâwâdî's arrangement appeared, in whose copy verses by Fudûl [q.v.] have intruded. In 931/1524-5 the Āghâsâhîvî Şâhîrî [q.v.] wrote a version, inspired by Navaî and Hâfiz [q.v.], which he transplanted to his native country (see 977/1571), and in which "chance plays an important role" (Levend, op. cit., in: Bīkî 235-6). Exemplary for Turkish poetry was the way in which Fudûl treated the subject. In his version, finished in 942/1535-6, Maqṣūn appears as the symbol of the religious ideology of love, whose task consists of freeing himself from the beloved. With this epic poem, which is strewn with gûzâsz [q.v.], does justice also to the feelings of Layîlā, who remains an earthly figure, Fudûl created an impressive Turkish counterpart to the Persian models, which he now came to equal. In 950/1543-4 Hamdî of Lundara wrote a little-known version again inspired by Navaî, Dżâmî and Nawâvî. In 969/1534-5 Sâlîh b. Dżâlî produced a version which slavishly follows Hâfiz. Shahîfî (d. ca. 980/1578-9) copied passages from Fudûl's work after having criticized him and Nawâvî in his preface. An Āghârî poet by the name of 'Āţâyî (11th/12th century?) transformed the story into a fairy-tale in which he inserted quotations from Dede Köşû [q.v.]. The version of Şâfîzâde Fudûl (d. 1031/1623-4) remained unfinished. The following...

published several times both before and after 1857; the later editions, however, tend to modernise the language, bringing it into line with the contemporaneous Urdu of Northern India.

Dakani Majdun Laylā maḫṣūsī is a characterised not only by their Indian flavour, but also by their concentration on the story, which is told in simple, at times naïve, language. The story derives considerably from the old Arabic versions. Thus Wāris makes Majdūn the son of a Ghaznavid king by an Arab woman whom he marries while on the

hardly. The king has to return home before the boy is born, and an astrologer foretells the boy's future, and suggests the lašab of Majdūn for him. The boy's mुrâmāt recommends night prayer and Kur'ānic reading, and on the basis of the pun between Layla and laš, Majdūn falls in love with an imaginary Laylā and wanders in search of her, his mind affected.

4. In Urdu literature

The story came into Urdu literature via Persian, not direct from Arabic, and it is most frequently called "Laylā Majdūn". It is found in three main forms: firstly, in casual reference to the lovers, especially in poetry; secondly, in narrative poems telling the story, generally in maḫṣūsī; and thirdly as the plot for early Urdu dramas of the late 19th and early 20th centuries, mostly written for various Parsi theatrical companies in Bombay. However, failing the discovery of some hitherto unknown manuscripts, the theme seems to have inspired no work of major literary importance.

Casual references to the lovers are far too numerous to permit detailed discussion. They date from the earliest period of Urdu in the Deccan and Gūjarāt, and continued into the present century, though with decreasing frequency. Nor were they restricted to ghazal, or even to secular poetry. For example, Wall Dakani [see majdūn, 4. In Urdu] in a ḫaṭā in praise of the Prophet (dar al-madār ḫayyār al-balqar) includes Laylā and Majdūn amongst several famous pairs of lovers, as a metaphorical representation of faṭ al-Allāh; Wall was, of course, a Sufi (see his work cited in Bibl., 361).

The narrative maḫṣūsī was a favourite poetic form in Dakani, the type of Urdu current in South India from the 15th to the 18th centuries. Several examples devoted to Laylā Majdūn are extant; they were modelled on Persian works, particularly those of Hāfiz, Nūrī and Dīlānī, and perhaps also on that of Amīr Ḥusayn of Dīl, composed in 1300/2000. In any case, despite the Persian models, the atmosphere in these Urdu works is distinctly Indian, as can be seen, for example, in the sarājā passages describing the heroine from head to foot. Hāfizīn, Bākīr and Dīlānī mention maḫṣūsī by Ahmad Gūjarātī and Muhammad Ḥāzī, both poets of the Kutb-Šahī period in Golkonda. These were written in 1486/1636 and 1490/1630 respectively. A late Dakani maḫṣūsī is Kišā Laylā va Majdūn, composed by 'Ubayd Allāh Wāris b. Isbāk in Gūjarāt in 1500/1662. It is included in a collection of 12 early Urdu maḫṣūsīs by an unknown editor, under the title of Bāna ḥa. This collection was very popular, and was

By the other three, it has now been republished in the Urdu script at Lahore.

These four plays are distinguished by a certain stagecraft and popular appeal rather than by literary merit. With this in mind, the famous Lucknow polymath and novelist, Mīrzā Muhammad Ḥādī Ruswā (1859-1931) [see k193a. 3. In Urdu] wrote his Murabba'-i-Laylā Madjīnān ("the Album of Laylā Madjīnān") published at Lucknow in 1885 and at Allahabad in 1887. He had seen plays performed by various touring Bombay companies in Lucknow, including doubtless Majdun Layla plays. As he
writes in his introduction, he was dissatisfied with their language, which he found to be not that of Delhi orLucknow, but of the Bombay fish-market! [Ruswa, *tashdid*, 5]. Encouraged by friends, he wrote this play to demonstrate how dramatic poetry should be. He employed different poetic metres to suit the characters and situations, and envisaged their being set to music, so that the result might be described as an Urdu opera. But no theatrical company would stage it, and critics generally regard it as a failure. [Ghraf Rahmán (cited in *Bihb*, 279) remarks that it was entirely in verse at a time when prose was playing an increasing part in Urdu drama. The poet, he suggests, had been "worked to death" and had lost its appeal. As a poet of Lucknow who had seen the heyday of the *marthiya* [see *Marthiya*, 4.] in Urdu, he was well equipped to write effective passages of melancholy and lamentation: in this respect, the play has much to commend it. But Ruswa was no dramatist; and the story does not lend itself easily to dramatic treatment.

At least one modern Urdu writer has brought *Madjfr* up-to-date in a short story. Sayyid Sadidjał Haydar’s collection of short stories *Khayaldistan* includes one entitled *Hikayat Layla va Majdfr* (cited in *Bihb*, 294-61). In it, the two lovers are reborn under modern conditions. Majdfr follows Layla about on a bicycle. Layla is ordained electric shock treatment, and at the time of this treatment, Majdfr has a fit. He is taken to Mecca to be relieved of his obsession, but prays only that his suffering may never be lessened. Thus ends this "whimsical and delightfully written story" (Suhrwaday, cited in *Bihb*, 216), which forms a fitting conclusion to an account of Majdfr Layla in Urdu literature.

*Bibliography:* For Dakanli _mathnawis* on the story, see Nashr al-Din Ḥashimi, _Dakhan min Urda*; Lucknow 1963, 62-3, 108-13 (including extracts); Majdfr Dihll, _Ta’rikb-i-adab-i Urda*; i. _Kadam dawr*, Lahore 1975, 249-50; for the text of Wāzīr, see Urdu _ki hadim mansūm dastān*; ed. Khaliṣ al-Rahmān Dāwūd, i, Lahore 1957, 1-10, 81-148; a critical assessment is given by Muhammad Bākir, _Urdu-i-Dakhan aur Pandjāb mina*; Lahore 1972, 77-85; the reference by Wali Dakanli to Majdfr Layla will be found in Kulliyāt Wall, ed. Allāb Šarāh Mawhrāwī, Aranwāgbād 1927; J. F. Bhumhrādt, *Catalogue of Hindustani books in the Library of the Victoria and Albert Museum, London*, 1896; mentions were published in Northern India in the 19th century. Plays on the story are listed by *Ghraf Rahmān, Urdu dramāt—‘tārikh-o-tahān*; Lahore 1957, 212-23. The Layla *Majdfr* dramas of Aṣām, Rawnaw, Zārd and Hāfiz ‘Abd Allah are included in the volumes of collected dramatic works of these authors published by the *Andijan-i-tarabāl-i-yr* in Lahore in recent years; the same society has published Mīrāz Muhammad Ruswa’s *Maraḥkha-i-layla va Majdfr* and *Urdu Rahmān*; Lahore 1965. This includes not only Ruswa’s own preface, but a useful introduction by the editor which lists previous dramas on the theme. Sādijdāl Haydar’s *Khayaldistan* was first published at ‘Allgār in 1932, and there is a Dihll edition of 1946; Shāyista Aghar Bānā Suhrwaday’s brief account and assessment of his *Hikayat Layla va Majdfr* is in her _A critical survey of the Urdu novel and short story_, London 1945.

(J. A. Havwood)

**Madjfr**, mediaeval Arabic name of the city of Madrid (Spain). The Arabic sources seldom mention this place in the Muslim period. According to al-Himyari, the _asyāf* of Majdfr was built by the Umayyad *amir* of Cordova, Muhammad I (926-928; 852-86). M. A. Makki believes that its foundation may be dated between 255/866 and 257/871 in the reign of three or four of the Umayyads. This year 238/850 marks the beginning of the reign of Alfonso III of the Asturias, whose military activities had the effect of destabilising the region between Medinaelmi and Toledo (*‘l-lagfr al-adnu*), which would then have been consolidated by the construction of the fortress of Majdfr as an important element in the military dispositions of the region, with a governor appointed by Cordova, ‘Ubayd Allah b. Sālim, who imprisoned and executed a rebel from Toledo named Ibn Bāhīj. From its foundation until the period of the *fama* of Al-Andalus (996-1009), the few facts supplied by the ancient sources on the subject of Majdfr are indicative of its role as a frontier fortress (*‘l-lagfr*). In 320/932, it was subjected to an attack by King Ramiro II of Léon, according to the Christian historian Saniro. In 324/936, a party of citizens of Majdfr undertook an expedition into Christian territory and, on their return, they were massacred by the enemy, according to Ibn Hayyān. The _bābā_ Ibn Abī ‘Amir al-Mansūr (Almanzor), in the course of his campaign against the fortress of La Muela in 366/977, met at Majdfr the governor of Mérida, Khālíṣ (Ibn ‘Utbaḥ). Ibn Haram supplies an interesting item of information concerning Majdfr: the slave of a perfumeseller known by the name of al-Fāṣīq led an insurrection in this town, pretending to be ‘Ubayd Allah al-Mahdi, but he was attacked and killed. J. Oliver Asin believed that this insurrection was inspired by Fātimids; on the other hand, M. A. Makki reckons that the rebel wished to be recognised as the son of the short-lived Umayyad caliph of Cordova al-Mahdi (996-1009 and 1009-1012). Thus the rebellion would have taken place at the time of the Umayyad caliph al-Mustakfi b’ilāh (414/1024-5).

In the period of the Taifis (*mudahl al-‘aṣaf*) Majdfr must have been attached to the kingdom of the Banā Dih ‘l-Nun of Toledo. The king of Castile Alfonso VI took possession of Majdfr as well as of other fortresses in the region, shortly before the fall of Toledo, in ca. 476/1083. It seems to have remained under Christian domination except for a very short period, at the time of the so-called Tulvārera conquest of 475/1082, led by the slave of a perfume-seller known by the name of al-Fāṣīq. Ibn Abī ‘Amir [see *Andalusi*, 224-61]. In it, the two lovers (cited in *Bihb*), 224-61). In it, the two lovers...
and other military constructions forming a citadel whose Arabic name was apparently al-Mudayna (Almudena), a name preserved by the church of Santa María de la Almudena, to the south-west of the hill, at the extremity of the Calle Mayor. It apparently had two gates, whose existence is known to us from Christian documents, the Puerta de la Vega, to the south-west of the hill, towards the valley of the Manzanares, and the Puerta de la Almudena, to the south-east, linking the citadel with the town or madina. The latter probably had its own surrounding walls, in common with many other towns of al-Andalus. The Arab madina must have extended towards the eastern end of the hill, covering a half of what is currently the Calle Mayor (Plateres), where the gate known as the Puerta de Guadalajara was situated. Its northern extremity was located to the south of the Plaza de Oriente and the theatre of La Ópera. On the other hand, the southern limits of the Arab Madrīt are the object of greater controversy, since to the south the hill of the Palacio Real and the madina overhang a ravine of considerable depth, which today is crossed by means of a viaduct and which opens on a small valley (Calle de Segovia) before climbing again towards other hills (Las Vistillas and San Andrés). Oliver Asin supported the hypothesis that the pre-Arab Madrīt first grew up in this narrow valley and that the walls of the town must have enclosed the valley, on the descent from the hill of al-Mudayna and the rise towards those of Las Vistillas and San Andrés, as was the case with the mediaeval and modern surrounding walls (see the engraving of Códice de Verguer, 1563-70). But the archaeologist Basilio Pavón is not in agreement with this hypothesis about the southern limits of Madrīt; he considers that the wall of the second enclosure skirted the northern ridge of the small valley, running parallel to the Calle Mayor, a hypothesis which had already been propounded by E. Tormo. It would be necessary to attribute an origin to the Christian period to the wall which encloses the valley, Las Vistillas and San Andrés, and which would have formed a third southern tier in the fortifications of Madrid. B. Pavón furthermore maintains that the citadel or first tier did not embrace entirely the hill of the Palacio Real; the southern section, currently occupied by the cathedral of the Almudena, would have formed a part of the second tier, as far as the Puerta de la Almudena. Almudena or al-Mudayna would thus be a toponym designating not only the citadel, but the madina or town with the sense of “small town”, in accordance with the text of al-Himyarī.

The site of the Great Mosque is also the subject of various hypotheses. It may have been on the former site of the church of the Almudena or that of the church of San Salvador, which has likewise disappeared and used to stand opposite the present-day Town Hall; it could also have been on the site where the madjar-style church of San Nicolás now stands, a few metres to the north of the extremity of the Calle Mayor. The Fuero de Madrid of 1202 also mentions the existence of asiques (markets, bazaars), the most important of which was situated along the Calle Mayor. There was also an almusa (al-musār), a promenade and place of recreation, as in other towns of the Muslim West; it was most probably located outside the walls. But the most remarkable characteristic of Madrīt, as also of mediaeval Christian Madrid, was its system of catchment and distribution of subterranean waters, this being the basis of the legend, documented from the 15th century onward, asserting that Madrid had been built on water. The hydraulic system of Madrīt— and of Madrid until the 15th century—was based on the catchment of water by means of wells linked by large subterranean galleries (kandt [gēr]), pl. kanaudt) descending from an elevated place towards the town, where they form new ramifications, on or below the surface, which emerge in public fountains, in gardens or in houses. It is highly probable that this technique was employed in various parts of the Iberian Peninsula in pre-Islamic times; but traces of it have only been preserved in Madrid, a huge complex which has lasted remarkably well over the centuries. This is perhaps a tribute to the quality of the soil of Madrid, noted by al-Himyarī, which is such that even today some public fountains of the town are supplied by this system of water distribution. The bands of Madrīt have been studied by Oliver Asin: the two most important canals are the Alto Abrofgal and the Bajo Abrofgal, whose respective sources are situated in two hills which are still known as Carillas and Carilejos, toponyms whose Arabic etymology is to be found in baṣati, of which the plural form bahniya is encountered in the Arabic of al-Andalus. The Alto Abrofgal came to an end by the site of San Nicolás, the church already mentioned, close to the citadel, in the heart of the Arab town. The Bajo Abrofgal terminated at the Puerta del Cerrado, on the hypothetical third tier of the town’s defences.

It is furthermore quite possible that the name of Madrīt should be associated with this hydraulic system, according to a popular etymology which has it evolving from madjar, canal or water-course. The origin of this name does not seem to have interested the Arab authors of the Middle Ages, but as soon as Madrid became the capital of the Spanish Empire at the end of the 16th century, many scholars tried to find Arabic origins for it, helped perhaps by the Moriscos: majjar, madara, madrīt, etc. Subsequently, an etymology of clerical origin prevailed: Maioritum (from the Latin maior), of which Madrīt would be the Arabic transcription. In the 16th century, faced with numerous ill-founded theories, the Maronite priest Michel Casiri (al-Gazri) was obliged to establish a compromise theory; the original name was the Latin Maioritum, but Madrīt was a word of African origin signifying canal or conduit (aquaeductum).

In the 17th century, and in the light of modern philological studies, R. Menéndez Pidal has constructed a hypothetical Celtic name Mezaruso with the sense of “ford” or “long bridge”. M. Gómez Moreno claimed to have discovered in Madrid a terminal -if having its origin in the Latin ending -datum, collective of abundance. Oliver Asin proposed a brilliant hypothesis, that Madrīt must be a hybrid formed from the Arabic word madjar, canal, and from the Roman suffix -if, of abundance; Madrīt would thus signify “place where canals are abundant”. He considered, however, that the present name of the town comes not from the Arabic name Madrīt, but from Madrīti, a Roman toponym having its origin in the Latin Materici, the primitive name of the small valley where the Calle de Segovia is currently situated, on the site of a pre-Arab settlement, according to this author. Finally, Joan Corominas has made some adjustments to this theory while retaining the connection between Madrīt and madjar. He rejects the possibility of the use of the collective -datum (if) other than in the sphere of plants, and he believes that Madrīt is a
metathesis of the word of Latin origin madridi (from matritem), according to a popular etymology which seeks to link it with madjiri. He also considers that the current form of Madrid may derive from the Arabic Madjirith, by means of an intermediary form meddirt with an epenthetic -d.

The best-known native of Madrid in the Muslim period is the astronomer and mathematician Abu l-Kasim Maslama al-Madjiri [g.v.], but other individuals of secondary importance who have been studied by Oliver Asin were also born there. Ibn Hayyân and other historical sources of al-Andalus supply some names of governors of Madrid in the Umayyad period, in particular numerous members of the family of the Banû Sâlim, of Berber origin, and especially in the region of Mâdînacélí firmly implanted in the central marches of al-Andalus. Some time later, he apparently brought the Rasa'il Hikmat al-Saâfi to public attention in al-Andalus. It is possible that he performed the duties of a court astrologer, since in a letter one attributes the cursive form which, according to Ibn Tîhâr (Bowin, ii, 189, 32, 334, vi, 73, 733) and (b) in a Hebrew version; the Arabic translation can be judged thanks to the Paris manuscript which contains Maslama's own commentary, (c) the latter's pupil Ibn BishrQn al-Majli having taught some of the tables of al-Batâini to public attention in al-Andalus. His disciples included: al-Kirmâni (d. 458/1066), who introduced the Rasa'il Hikmat al-Saâfi to Saragoza and the frontier regions of the North; Abu l-Kasim Abû l-Samh (d. 1026/1035), see Ibn Abî al-Samh [g.v.]; Abu l-Kasim Abî al-Esâfi (d. 1426/1435, see Ibn Abî al-Asâfi [g.v.]); the astrologer Ibn Khâyth (d. 1474/1455); the mathematician and astronomer, al-Fârâbî, of the family of the Banû Salim, of Berber origin, and especially in the region of Mâdînacélí (Medina de Madrid, Arbor, xxvii (1961), 155-79. the principal ones are the Kutbat al-hakim, the Qanats, and H. Goblot, das almuxaras: La elimologla de Madrid y la antigua Cta-}

level, the cult involved ceremonies at the hearth fire,
mountains above Ngâhpâr for farmers. Other fires are mentioned on seals and in texts, and although fire temples were usually state property, they could be founded and endowed privately. At the personal level, the cult involved ceremonies at the hearth fire, and emphasized the maintaining of a state of ritual purity by performing ablutions with bull's urine (gômêz) and cold water, by avoiding dead matter, by tying and untying the sacred cord (kahtn), and by eating in a state of ritual silence (âtâq) with only murmuring (sâmâme). The popular cult included food-offerings at fire temples, the veneration of sacred trees, and public seasonal feasts (gâhâmbârs) and dances. The bodies of the dead were exposed in the open. Elaborate private rituals contributed to social differentiation, with the standard of observance greatest among the upper classes and declining as one moved down the social scale among servants greatest among the upper classes and de¬

arguments concerning the definition of deity and of worship.

An elitist social ethic honouring establishmentarian virtues provided ideological justification for the hierarchic society of the Majûs. High values were placed on order, stability, legality and harmony among the functionally-determined divisions of society (priests, soldiers, bureaucrats, and workers, or else priests, soldiers, farmers, and artisans) so each would perform its specific duty towards the others. The justice of rewards and punishments was emphasised at the spiritual, political and social levels, while economic, legal, and religious sanctions were used to ensure the obedience of women and children. Consanguineous marriage (hâmûbôdâs) was approved as a means of preserving the social exclusiveness, solidarity, and purity of descent of the upper classes. Material wealth was equated with the virtue and goodness inherent in the upper classes, whose destiny or fortune (hârûnâh) it was to enjoy the good creation of Ohrmuzd. Naturally anti¬
asetic, their ethic equated poverty with the sin and evil inherent in the lower classes.

Consequently, the Majûs were vulnerable to the loss of political support and to the rejection of authority and material success by alienated members of their own society. In the Sasanid period their position was eroded by the internal ascetic, gnostic sectarian movements of Mani and Mzbdak and by conversions to Christianity in the west and to gnostic sectarian movements of Mani and Mzbdak and by conversions to Christianity in the west and to
In Iran the Madjús kept their fire temples, suffered little interference in their cult at first, and were allowed to pay džiyía. In some places, such as Rayy, Kúnim and Shíz, the peace terms provided for the preservation of their fire temples. However, there was no recognition of the priesthood as the representatives of a religious community by the Muslim state, and since no unitary organization or hierarchy of priests survived the conquest, leadership devolved on local priests and ḍhikhs.

The loss of political power and support had several consequences for the Madjús. First, the loss of members by conversion to Islam was added to continuing conversion to Christianity. The descendants of the Persian soldiers in Yaman (Abad [q.v.]) were converted to Islam in the lifetime of Muhammad, as were the marzbin of Fádjas with some of his followers. A number of ḍhikhs and units of the Sásanid army became converted to Islam in al-Tráq, and by the time of Umar II (691-1006/712-72), the Madjús of al-Hira had become Muslim. Generally, members of the Sásanid establishment became converts in order to avoid paying džiyía, to keep their property and position, and to join the Muslim army and administration. The Madjús also lost many members through captivity, since children taken captive were raised as Muslims. Nevertheless, there was a tendency to early mass conversions in Iran. The governor of Síjistán in 456/666-7, al-Rabí, is said to have encouraged conversion by a combination of persuasion and force, and he required converts to learn the Kurán, Kutubya b. Muslim [q.v.] also encouraged conversion at Buhkara in 94/72-12, built a Friday mosque on the site of the former fire temple, and attracted converts among the poor by paying them two ḍhikhs to worship there, although afterwards conversion was discouraged in order to preserve the tax base. Conversion was also discouraged by the Madjús themselves, who treated apostates as legally dead, disinherited them, and required property to remain within their community. Converts were also subject to discrimination by local authorities, such as Bahram Sís who, when appointed mérsah by the Muslim governor of Khorásán in 105/725 and charged with collecting taxes from the Madjús, collaborated with the Christian and Jewish agents to make 30,000 converts to Islam pay the džiyía and exempt 80,000 non-Muslims.

Second, the advent of Muslim rule subjected the Madjús to sporadic persecution. About 50-5/760-1, Ziyád b. Abífí, the governor of al-Tráq and the east for Mu‘áwiya, sent his cousin Ubayy Alláb b. Abí Balraw to destroy the fire temples and to confiscate their property in Fárs and Síjistán. Although Ubayy Alláb destroyed the fire temple at Káryán near Dárábjírd and killed the ḍhíbíd, the chief hídáš of Síjistán, Shíráq, escaped with his fire temple at Káryán near Zarán because the local divísh and Madjús appealed to the caliph. There were later rebellions in a village at Káryán by al-Hadídijad and at Íhad on the border between Kályán and Isfáhán in the time of Hárún al-Rášíd (170-93/386-909). Al-Mutawakkil (532-47/847-61) is said to have had a famous ancient cypress tree reputedly planted by Zoroaster cut down in 247/861. In 282/901, the Turk Barun, who was governor of Kánn, destroyed a pre-Islamic fire temple in the village of Fárdgán near Isfáhán, and in 289/901 destroyed the last fire temple in the village of Dáshmaran at Kánn. Sometimes fire temples were converted into mosques in places where Arabs had settled or as the result of conversion, although afterwards the Madjús often continued to venerate sites where fire temples had been.

Third, the Madjús gave an apocalyptic meaning to the events at the end of the Sásanid period, interpreting them as signs of the end of the millennium of Zoroastrians and the beginning of the millennium of Oshedar, which calculations based on the Letter of Tárus would place about 41/661 but which was later identified with the beginning of the era of Yazdahzad in 10/631. The end of the millennium was signalled by the advent of Arab rule and destruction by them, and by the overturning of social classes and values, when the nobles would be powerless, separated from their families and forced to share their status with people of low origin, and when people would copy foreign customs. Predictions of the arrival of the liberator, Varhrán Vardjivand, of the destruction of Muslim places of worship, and of a Roman invasion, may belong to the propaganda of Sásanid restoration attempts. The Madjús hoped associated with Abí Muslim have also been linked to Zoroastrian eschatology, the restoration of Zoroastrianism and the end of Arab rule in Káryán. It was against this background that a series of risings by Zoroastrian peasants provoked by fiscal oppression in eastern Iran in the 4th/10th century served as the occasion for the emergence of new anáma, anti-establishment Zoroastrian sects. This began with the peasant revolt near Nishápír led by Bihárfard from 129/766-7 to 351/780, who claimed to be a new prophet with a book in Persian, abolished zamán, the use of wine and meat, consanguineous marriage, and fire-worship, and limited dowries to 400 ḍhikhs. Although the médins got Abí Muslim to suppress the rebellion, his sect could still be found near Marw in the 4th/10th century awaiting his return, even though džiyía was not accepted from them. Madjús also joined the rising of Sínbd in 387/755, and followers of Bihárfard and Madjús in Síjistán and at Harát and Bajdi distributed Ustádhás in 350/767, his sect also survived until the 4th/10th or 5th/11th century. Muslim authors noted four sectarian divisions among the Madjús. Al-Sháhristání lists the Kayümáníyya, Zarawáníyya, Zaráshtíyya, and Sayááyíyya called Bihárfardíyya, while Al-Baghdádi says that the Kayümáníyya, Zarawáníyya, Zaráshtíyya, and Bihárfardíyya, while Al-Baghdádi says that džiyía was only acceptable from the first two.

Fourth, the stability of wealth and poverty among the sinners and apostates themselves produced a change in attitude towards non-conforming members of their own community. Persuasion replaced the threat of force lest sinners be tempted to convert. The nobility of the virtuous poor, whose good works cannot be stolen and who will be rewarded in heaven instead of on earth, appears as a theme in andárs literature. This was probably the result of the growing impoverishment of the priests and ḍhikhs as well as an attempt to keep the loyalty of still poorer members of the community and to prevent a degree of social levelling among Madjús after the Muslim conquest, although the sincerity of the sentiment was questioned in the apocalyptic Dzúsák-náma.

Fifth, unavoidable contact with unbelievers and the loss of texts led to changes in cult and custom. The more elaborate aspects of ritual purity went unobserved. Madjús were allowed to sell animals to non-Zoroastrians when survival depended on it, and they began to expose their dead inside an enclosure (dákhím) out of the sight of unbelievers. They did not consider it a sin to steal property from non-
Zoroastrians that had been stolen from them. Although they learned to be content with compromises that could not be avoided, they also exerted themselves to maintain their rituals whenever they could.

In spite of their decline in status and in numbers, the 3rd/9th and early 4th/10th centuries appear to have been a time of relative recovery, stability and consolidation for the Madjus. In the reign of al-Ma'mūn (185-218/843-33), a new didactic, apologetic and polemical literature was produced by Muḥammad ibn Abī al-Ḥasan (d. 211/826) for the cure of the most prominent and influential of the Madjus at Kairuyn, and in Farghānā, what remained of the old religious literature was collected and preserved by Aṭurūn-bāghi Fārsāhāštūn, mawdūd of Fārs in the reign of al-Ma'mūn. shrines on the pretext that they had replaced former fire temples.

Customs of Zoroastrian origin can also be found among Muslims, sometimes in secularised form such as the Iranian solar calendar, the celebration of the festivals Navroz and Mihrajgan, or astrology. The fires lit at 1 Safar about 31/32 to celebrate Muhammad's birthday seem to have been inspired by Zoroastrian winter fire festivals. Symbols associated with Zoroastrians such as the cup of Dariush, wine, the tavern, the old mowbad, and the youth came to represent those things forbidden by Islam in Persian poetry with middleasi africa connotations. It is sometimes suggested that so many similarities as these may have made conversion from Zoroastrianism to Islam easier, although it might also be suggested that many common features were the result of conversion.

The history of the Madjus in Iran after the 4th/5th century is little-known. They are presumed to have survived as local minorities suffering general disasters with the rest of the population, while their traditions were preserved in priestly and learned lay families. In particular, they preserved and transmitted their religious texts which have survived in India, and manuscript colophons indicate the presence of bchdins in Madjus in the 6th/7th century. A copy of the Vedudvad made in Sidjistan in 601-2/1205 was taken back to India by a Zoroastrian named Mhbar from Uch in the Pandjub who was instructed in the religion by the khvards of Sidjistan for six years. The copy of this text made at Cambay in 723/1323 is the source of the oldest known manuscript of this work. We are also told that in the early 8th/9th century the wazag ceremony for making the mouth-masks worn by priests attending the fire festival was abandoned at Yazd because there was no one left who knew the ritual.

At the same time, Zoroastrians were spreading in Gujdar&t and the Pendjub, beginning in the 6th/7th century as farmers, weavers, artisans, toddy dealers, and merchants in the coastal trade. By then they had returned to Cambay, and by 574/1174 there were Madjus at Navsari, at Andeasvar by 660/1223, and at Thana about 720/1320. By the 8th/9th century, Gujar&t was divided into five religious districts (fontakab). The sole first-rank fire, the Atsh Bahram at Navsari, was at Pendjub and in Sijistan in the 7th/8th century. A copy of the Vedudvad made in Sidjistan in 601-2/1205 was taken back to India by a Zoroastrian named Mhbar from Uch in the Pandjub who was instructed in the religion by the khvards of Sidjistan for six years. The copy of this text made at Cambay in 723/1323 is the source of the oldest known manuscript of this work. We are also told that in the early 8th/9th century the wazag ceremony for making the mouth-masks worn by priests attending the fire festival was abandoned at Yazd because there was no one left who knew the ritual.

The oldest secondary type of fire temple or Dar-i Mihr was at Navsari from about 574-7/1174 onwards, but did not have a permanent fire; the priest attending it brought embers from his own hearth fire every day. There was another Dar-i Mihr at Broach in the late 6th/7th century. By the 7th/8th century, vernacular Gujdar&t versions of Avestan and Middle Persian texts began to be made.

Important changes in the Indian community began with new pressures from Muslims and the Portuguese towards the end of the 9th/10th century. The Zoroastrians who joined the Hindus in the unsuccessful defence of Sambadi against Muslim attack in about 892/1490 left, taking the Atsh Bahram with them in a metal vessel, and eventually settled at Navsari in 922/1326, where a layman (behdin) called Canga Shah, who was the local tax farmer (desai), persuaded the Muslim ruler to exempt local behdins from the gusya. The 10th/11th century saw the rise of the Bhagaria priesthood at Navsari, based on fees for performing rituals, gifts of endowed property and Mughal patronage. In order to control income from fees, in 987/1579 the chief priest at Navsari, Dastar

Mehrdad Rana, required his personal permission for other priests to perform rituals. The priests from Sandjan were only allowed to attend the Atsh Bahram, and became increasingly impoverished as their numbers grew. The desai-gar of Navsari remained in the family of Canga Shah until 1490-5, when Kaykobad the son of Mehrdad Rana combined it with the priesthood. This concentration of priestly authority and control, as well as a greater degree of organisation, signals the formation of the Parsi community. To give it a backbone of uniform and authoritative content, from the time of Canga Shah onwards questions on doctrine and ritual were sent to the priests at Yazd and Kirman. Their answers survive in the form of letters (Rivayals), the earliest in 883/1478 and the latest in 1187/1773, which provide precious evidence for the circumstances of Zoroastrians in Safavid Iran.

By the end of the 9th/10th century, Yazd and Kirman had become the spiritual if not numerical centres of Iranian Zoroastrianism. The Rivayals reveal the presence in 926/1520 of 500 behdins as Yazd, with 400 more in the villages of Turkabad and Sharifabad, 700 at Kirman, 2,700 in Sidjistan and 1,700 in Khurasan. These figures must represent the minimum adult male population, for we also hear of a group of 3,000 behdins at one place in 883/1478 in Kirman, while 21 behdins from Kirman had their own congregation at Kirman in 966/1559. There was also a Gujarsap Fire at Kirman, and Zoroastrians could still be found in Fars. Local communities appear to have been under the joint leadership of desais and behdins. In the late 9th/10th century there were only four or five khvarts well-versed in Pahlavi at Yazd, who performed all the rituals. The priests complained of being unable to get behdins to give them the tithe of their income, although they performed all the meat offerings at Dar-i-Mihr because of their owners and the desai recognised by the offerer. Relations with non-Zoroastrians were rather ambivalent. Behdins were urged to keep their promises and to pay their debts to non-Zoroastrians, and the testimony of a non-Zoroastrian was accepted in a case between two Zoroastrians before a Zoroastrian judge. However, the robbery and murder of unfriendly non-Zoroastrians were condoned and there are references to forced conversions to Islam both in Iran and in India. There was a reliance on the apotropaic function of rituals performed to repel powerful enemies, the tyranny of rulers, the loss of property, conversion and disease, as well as to gain worldly advantages such as wealth, happy marriages or royal favour. Anxious behdins were exhorted to exert themselves and to hope for the best. Although the year 1000 in the era of Yazdadjird fell in 1040/1631, expectations of the arrival of the millennium and of the saviour Bahram Vardjivand or of Oshmid were expressed throughout the period, including in 883/1478, 935/1533, 977/1566, 982/1574-5, 1045/1637, 1054/1647 and 1083/1662.

In the 11th/12th century, the Zoroastrians of Iran are described as farmers, labourers, fuller嘴 manufacturers of carpets and, especially at Kirman, of woollen cloth, and they used their own dialect of Persian called Dari among themselves. Men wore undyed garments and women wore red and green clothing. In ca. 1077/1668, Shah 'Abbas I (955-1038/1588-1629), who is remembered as a just king, brought 1,500 peasant families from Kirman to Isfahan as labour and settled them across the Zanda Rijad near Dylius at Gabbrabad. In 1027/1618 their district consisted of about 3,000 plain, single-storied
houses along several long, wide, straight, tree-shaded streets, and the people worked as labourers and craftsmen in Isfahan and the countryside nearby. There was a dakhma outside their settlement where they placed their dead fully clothed. Most of them returned to Kirmān when ʿAbbās I died, and ʿAbbas II (1052-77;1623-66) turned the district into a suburban resort with palaces, mosques, markets, and baths and moved the remaining Zoroastrians to the oasis priests. Durham estimated that the Zoroastrian population of Kirmān at over 10,000 in 1064/1654, many of whom were involved in the wool industry. In 1064/1654 a new khāna-yi mīhr was built at Kirmān by a behdīn, and there are references to pilgrimage to the shrines of Kirmān and Isfahan.

The attraction of India as well as the possibilities for the religious integration of Zoroastrians had already been demonstrated by the syncretistic mystical movement of Atar Kayawī (1319-40 to 1337-53;1660-81) and his followers in Patna, Lahore and Kashmir in the first half of the 17th/18th century. Their allegorical interpretation of Zoroastrianism allowed them to combine it with Hindu asceticism and Sufi Neo-Platonism. Half of the group were Sabs north-west of Yasd at mid-century. Conditions appear to have worsened towards the end of the 17th century. The internal conflict, however, was continued in the 18th/19th century in a controversy over the ritual calendar at Surat, which was in economic decline in the 1740s/18th century with trade shifting to Bombay, while Marathā control of rural areas deprived the traditional elite of its former sources of income. In 1749/1750 an Iranian behdīn encouraged the laymen of Surat to adopt the old-style Kadimi calendar used by Zoroastrians in Iran instead of the Parsī calendar which had fallen one month behind it. This issue led to violence in 1747/1686, but the behdīns successfully boycotted the Bhagaria priests by establishing secondary fire temples (Dar-i Mihr, Agāsari) for laymen for the second-rank fire (Ardā Azar). The quarrel finally ended when the Atdsh Bahram was removed from Navsari and permanently established at Udvada in 1755/1792.

The Parsī community is reflected in the composition of the pandalayat appointed at the request of the British by the Pandi Andjoman in 1801/1787 which contained six behdīns and six priests, both Kadimī and Shāhānshāhī, while the pandalayat of 1818-36 had twenty behdīns and six priests. In addition to controlling
community charities, the latter panjâyât issued behavioural codes aimed at increasing conformity and eliminating popular syncretism and participation in non-Zoroastrian customs. The code of 1819 forbade Parsi women to attend Hindu or Muslim places of worship, to wear their charms or to perform their rituals. The code of 1823 forbade child marriage and costly rituals at weddings and funerals, while the Parsi Marriage and Divorce Act of 1865 ended polygamy.

In the 19th century, religious reform was an important means by which the new élite of urbanized, educated, westernising laymen, prominent in British and native administration, business and the professions, aimed to control the rest of the community, although they had growing cultural differences with the poor, rural, conservative majority of Parsis. Reform was also a reaction to the threat of conversion by Christian missionaries, which provided the immediate impetus for the foundation of the Rahnamâi Mazdayâsan Sabha by a group of young, wealthy, educated laymen in 1852 for the purpose of encouraging a return to the original ideals of Zoroastrianism. The same interests led to the foundation of a school in Bombay in order to train the sons of priests for the priesthood in 1854. Modernist reformers and apologists were attracted to the theories of Martin Haug, that the original monotheistic religion of Zoroaster had been corrupted afterwards into ritualistic dualism by the priests. Haug's theories were used to counter Christian criticism by intellectuals who were also attracted to the Theosophical Society. Reformers who favoured rational explanations for the cult objected to the use of texts that no one understood in rituals, while conservative priests insisted on the effectiveness of ritual liturgies and on the importance of purification from pollution, preserving a way of life increasingly limited to themselves and ignored by laymen. These issues became involved in the conflict between reformers and conservatives over the role and income of priests called the frasângi controversy, which mainly involved opposition to expensive, repeated ceremonies for the dead and which is still current and unresolved.

Nevertheless, the Parsi community multiplied in the 19th century. By 1841 they numbered 65,000 in India with 3,000 more abroad, about 10,000 of whom were Kâdâris. Although intermarriage between the sects was also allowed by the 19th century, objections to accepting non-Zoroastrians into the community as converts increased because of fears that lower caste Hindus would be attracted by Parsis also emerged as the leaders of the world's Zoroastrians as the result of changes in both India and Iran.

Although estimates of the Zoroastrian population of Iran in the early 19th/18th century that range from 100 to 1 million seem exaggerated, there can be no doubt that their numbers declined disastrously due to the combined effects of massacre, forced conversion and emigration in that century. Having suffered massacre and forced conversion at the hands of the Safavid army that expelled the first Afghan invasion in 1133/1720, the Zoroastrians of Kirmân and Yazd joined Mahmûd's Afghan army during the second invasion in 1135/1722 and also served as officers in the army of Nâdir Şâh (1149-60; 1173-47). The sack of Kirmân by the Afghans after the death of Nâdir Şâh, one repeated by the Kâdâris in 1209/ 1794, left the Zoroastrian district in ruins. By the end of the century, almost none of the 12,000 Zoroastrians at Kirmân survived, and the Zoroastrian population of Iran is estimated to have fallen to about 50,000 and then to about 30,000 in the reign of Muhammad Şâh (1234-48); of these, some 8,000 were at Yazd.

The late 18th/19th and early 19th centuries seem to have been a time of unprecedented insecurity, poverty, and discrimination for the Zoroastrians of Iran. The extent of the oppression they suffered then appears to have been more a reflection of contemporary social problems in Iran, where they served as scapegoats for the frustrations of their Muslim neighbours, than to have been characteristic of centuries-long conditions. However, Zoroastrians were vulnerable to robbery and kidnapping while their murder went unpunished. Although they were required to wear honey-coloured clothing and were officially forbidden to build new or to repair old houses, to wear new clothing, to ride horses, to travel outside of Iran or to engage in skilled crafts or professions that might bring them into contact with Muslims, summary rules were enforced in the usual selective way and exceptions can be found to many of them. Forms of economic discrimination that prevented them from accumulating wealth were probably more effective than social pressures. Zoroastrian merchants were subject to extra taxes, newly-acquired property was taxed up to one-fifth of its value and houses were liable to be lost. The activity of daily dârs, which was supposed to amount to 2,000 idâms, which by mid-century was paid by 1,000 adult males, was reduced to ten day's wages for a labourer. The Şâh legal provision that favours a Zoroastrian convert to Islam over other Zoroastrian heirs encouraged conversion and resulted in the loss of property. During the 19th century, forced conversions created a population of half-Zoroastrian, half-Muslim màjid-al-Islâm at Yazd with distinctive clothing and a separate cemetery.

For self-preservation, the Zoroastrian community turned inwards. The style of fire temples and homes provided a maximum of protection and concealment from unfriendly intruders. The exterior of fire temples resembled private houses, while inside was a confusing maze of rooms, passages, and low doors with the fire chamber behind a blank wall and inaccessible even to the faithful. A succession of defensible doorways guarded the entrance to homes, while access over the rooftops was restricted by covering the courtyards to protect the women, children, and valuables. Only property endowed as waqf for the benefit of the benefactor's soul was respected by Muslims. In spite of general illiteracy, religious learning was preserved among priestly families that provided local readership, especially in the villages. From the late 18th/19th century onwards, refugees who escaped to India became objects of Parsi aid and concern and helped to develop trade connections between Yazd and Bombay.

In 1854 the Persian Zoroastrian Amelioration Society in Bombay sent Manakji Limji Hataria (1813-90) to Iran, where he found the Zoroastrian community had shrunk to 7,725 people. Yazd was the main surviving centre, with 6,658 Zoroastrians in the city and 24 surrounding villages. Most of them were farmers, but there were also about one dozen merchants at Yazd, while the poorest were artisans, weavers, bricklayers and carpenters. Each spring a group of several hundred Yazdifs went to Tehran to work as gardeners, even in the royal
by the end of the century, while their children in cities and provincial towns but keeping up some is still transitional, with the labour force living increasingly Muslim as the result of immigration. entire deserted the villages south of Kirmān and increasing oppression. By 1962 Zoroastrians had conflicts over water, and moved to Kirmān to escape remaining Zoroastrians were at a disadvantage in move into them. In these newly-mixed villages the 20th century. As a falling water tabic, rural impover¬ based priesthood has been drastically affected by be challenged by the creation of a new secularly- based priesthood has been drastically affected by diversities and religious reforms from Bombay. ManakdjT revived abandoned rituals, forbade animal sacrifice, the eating of beef and camel meat, and he discouraged polygamy, the use of cosmetics and Muslim clothing styles as too immoral. The sons of priestly families took advantage of the opportunity for a secular education in the village schools and left for the cities in order to become physicians, teachers, engineers, bankers and merchants.

While villagers at Yazd remained engaged in the traditional fields of work from the Gulf across central Iran as camel-drivers and owners until the early 20th century, by the end of the 19th century many Yazdis were going to work in Bombay and the women they left behind often put themselves under Muslim law to claim a share of their inheritance. Zoroastrians from the provinces were also employed by the Indo-European Telegraph and by Tehran banks in the last two decades of the 19th century. Yazd merchants grew wealthy through their contacts with India by the end of the century, while their children left for Bombay and the import-export trade, re-investing their profits later in industry. Their numbers rose again to about 8,900 in 1879, over 9,000 in 1892 and about 11,000 in 1902, with the largely rural majority still at Yazd and Kirmān. However, modernising changes, new opportunities and wealth had begun to transform the Zoroastrian community by the late 19th century, breaking down village and communal ties and undermining the position of the priests, whose authority began to be challenged by the creation of a new secularly-educated elite of laymen.

The position and even existence of the village-based priesthood has been drastically affected by the increasing urbanisation of Zoroastrians in the 20th century. As a falling water table, rural impoverishment and the lure of employment in cities drew Zoroastrian peasants from the villages south of Kirmān early in this century, Muslims began to move into them. In these newly-mixed villages the remaining Zoroastrians were at a disadvantage in conflicts over water, and moved to Kirmān to escape increasing oppression. By 1962 Zoroastrians had entirely deserted the villages south of Kirmān and lived entirely inside the city, where they numbered 2,385 in 1963 in spite of emigration to Tehran. The villages around Yazd have also become increasingly Muslim as the result of immigration and conversion. The urbanisation of Zoroastrians is still transitional, with the labour force living and working, often seasonally, outside the villages in cities and provincial towns but keeping up some joint family ties and sending part of their income back to support the women, children and old people who remain behind to manage the land. People who have moved to Tehran still keep their houses in Yazd and return for the annual ceremonies for the dead.

Religious usages have been affected by strong Parsi influences, modernisation and changes in social context. Although a bull was sacrificed annually at Yazd until the late 19th century and sheep was offered to the fire until the early 20th century, most Zoroastrians in Iran have abandoned animal sacrifices since 1900 and object to calling those animals slaughtered and eaten at seasonal festivals sacrilegious. Nor has čoča been used since the middle of the 19th century, although offerings to water are still made. New Indian-style fire temples open to laymen were built in Tehran in 1906, in Kirmān in 1923 and in Yazd, and the fire now burns in silver vessels, Indian fashion, instead of in the stone altars. Old festivals such as Sada, 100 days before Nawrz, have been revived and new ones such as the birth—day and death of Zarōoster on 7 Farvardin and 5 Day respectively have been created. While rituals that survive have their meaning subject to reinterpretation, the elaborate details of purification have been observed only by priests since the early 20th century. Unable to live on the fees for rituals, the priesthood has declined in number. There are now only 15 Iranian priests, and only about half of all living older and no young Iranian priests are being trained. Since they are too few to serve all the fire temples, those are now sometimes kept up by laymen, and since the 1940s communal leadership has developed on the anda'dman in Tehran.

Several issues currently divide younger, educated, modernised Zoroastrians from the older, more conservative generation. The younger generation objects to interbreeding through marriage between converts, because of the high incidence of hereditary diseases within the community and favours inter¬ marriage with non-Zoroastrians, the acceptance of converts, and the re-admission of recent converts to Islam and the Bahá'í Faith. Their opponents wish to preserve racial purity, and fear that to encourage apostasy from Islam would provoke Muslim violence against them. Although the influence of the Bahá'ís is credited with improving their own security, most Zoroastrian families have lost members as converts to the Bahá'í Faith because of its appeal to young people impatient with priestly authority. The practice of interring the dead on a metal stretcher in a grave with cement walls and cover, instead of exposure in a daḵham was started at Tehran and Kirmān in the 1930s and was begun at Yazd in 1965. By 1975 a daḵham was used only at the village of Šahrābād. The sects formed during the calendar dispute still exist. Iranian Zoroastians adopted, in 1939, a seasonal calendar beginning at the vernal equinox, which is close to the Iranian secular calendar, although the community at Yazd reverted to the kyadnil calendar in 1940.

After recentently slighty to about 10,000 in the 1930s, the Zoroastrian population of Iran rose to 16,800 by 1938 and by the 1970s to between 20,000 and 25,000, with 19,000 in Tehran and other cities. The younger generation has taken advantage of the opportunities in management and in the professions provided by the economic growth in Iran in recent decades. In the 1960s and 1970s the five major Zoroastrian firms in Iran were all leaders in their fields and Iranian Zoroastrians were encouraged to
return from India. However, the Iranian revolution of 1979 has created anxiety in the Zoroastrian community and uncertainty about the future.

The relative circumstances of the two communities have been reversed in the 20th century, which has been a period of retribuncheon for the Parsi. The Isma’iil Ahmadi movement began in Surat in 1947 as a combination of Theosophical ideas with ritual purity which was justified as being the esoteric meaning of the Avesta. In a victory for the conservatives, membership was restricted to descent from Parsi families in 1909, the only exception being the child of a Zoroastrian man by a non-Zoroastrian woman. The communal welfare system, supported by the benevolence of the members of the few very wealthy families, leaders in Indian commerce and industry, and providing schools, hospitals, and the cost of marriages and funerals, as well as fire temples and daḵhmen, became increasingly inadequate to care for the growing numbers of the poor created by rural flight to Bombay. Social and economic changes since independence have eroded the economic base of the community still further. Increasing industrialisation has brought more management opportunities for other Indians than for Parsis: support for communal charities has been reduced by taxation to pay for the state’s socialist and welfare programs; and Parsis have been hurt by the effect of prohibition on the toddy industry, which began in Gujrat in 1937, and of land tenure acts on Parsi landlords with Dobra labour. The Parsi population in Gujrat in 1937, and of land tenure acts on Parsi

In spite of her tendency to minimise pre¬modern change, the most important work on modern Iranian Zoroastrians and the history of the Zoroastrian cult is that of M. Boyce, The fire temples of Kerman, in AO, xxx (1968), 51-72; idem, Bibi Shahbanu and the lady of Pars, in BSOAS, xxx (1967), 30-44; idem, The Zoroastrian villages of the Jupar Range, in Festschrift für Wilhelm Eduard, 149-36; idem, On the sacred fires of the Zoroastrians, in BSOAS, xxxi (1968), 52-68; idem, The pious foundations of the Zoro¬astrians, in BSOAS, xxxi (1968), 271-80; idem, Manuṣchi Lomī Hauria in Iran, in K. R. Cara Oriental Institute Golden Jubilee Volume, Bombay 1955; and the Feast of Sade, in Festschrift für Wilhelm Eduard, 229-236.

(M. MORONY)

al-Māḏīs, the term used by Arabic historians and geographers writing about the Maghrib and Mus¬lim Spain with the sense of Northmen, Vikings, denoting the participants in the great Viking raids on Spain. These raids were maned from Scandinavia, sc. from Norway, Denmark and to a certain extent also from Sweden, the raiders leaving Denmark, Norway and Ireland, where Norwegian Vikings from the end of the 830s had gained a firm footing and had founded some minor tributary states towards the beginning of the second millennium A.D. In western Latin and Spanish sources they are called, inter alia, Normanni, Normannni, Loridomani, Lor¬manni, Almoravides, Almunsūs and Almowndin.

1. The first attack by the Vikings on Muslim Spain took place in 230/844. As early as 1 Dhū 'l-Hijja 229/228 August 844, 54 Viking long ships (the Norwegian Gokstad ship from the latter half of the 9th century, the biggest ever found, was 23.8 m. long, 5.1 m. broad amidships, had 16 oars and 32 shields on each side, and could take 70 men, The Viking, London (1966), 254 appeared, and the same number of smaller ships, in the estuary of the Tagus, anchored there and fought three fierce battles against the defenders. After thirteen days they re-embarked and sailed south¬wards. The governor Wābb Allāh b. Ḥazm had in¬formed the amir ʿAbd al-Rāḥmān II, who advised his commanders to be on their guard. Part of the crew disembarked on the coast of the province of Shadhūnā (Sidónia) and occupied the harbour of Cadiz, but the main part of the fleet sailed up the Guadalquivir and encamped on a large island in the river about 20 km. south of Seville. A few days later, in the middle of October 844, the inhabitants of the city caught sight of the fleet, which then put to sea, sailed on the river. They tried to organise resistance, but as the city had no defences, could do nothing. The few ships they sent against al-Māḏīs were attacked with showers of arrows and were set on fire. The pirates went ashore in the city, where the main part of the citizens had fled precipitately. Those left behind were killed, even old and disabled people; women and children were taken prisoner; and they tried to set the mosque on fire, without success. The sack continued for seven days. ʿAbd al-Rāḥmān sent troops against the invaders, inflicting on them heavy casualties. In the decisive battle to the south of the city on 1 November 844, more than a thousand of the pirates were killed and four hundred others were taken prisoner; these were killed before the eyes of the others, who in great haste fled to the ships and set sail southward. Thirty abandoned Viking ships were set on fire. The defeat of al-Māḏīs was proclaimed all over the country, and ʿAbd al-Rāḥmān even informed the Berber rulers in Morocco, ʿAbd al-Raflmīn II, about the victory. The Viking fleet steered north towards Aquitania after some attempts at landing at Nībla, on the coast of Algarve and in Lisbon; in the meantime, a few Scandinavian ships had made a brief landing on the coast of Ašlā (Arcila [see Ašlā]) in northwestern Morocco, about 50 km. below Tanger. On the dating of the descent on Ašlā and the foundation of the town, see A. Mel¬ving, Les premières incursions des Vikings en Occident d'après les sources arabes, Upsala 1955, 51-5.

ʿAbd al-Rāḥmān II ordered defenses and an arsenal to be built in Seville, watch-posts to be set up along the Atlantic coast, and warships to be built in greater numbers, according to Ibn al-Kītīyīn, Hence when in 244/858 another Viking offensive, comprising 62 ships, was launched, the Muslim squadrons patrolled along the west coast of the peninsula up to the French coast. Two of the Viking ships sailing in advance were captured off the coast of Algarve, with their cargoes of silver and gold, prisoners and supplies. The rest of the ships sailed on towards the Guadalquivir estuary, but on discovering that a Mus¬
The Muslim army was advancing along the river valley, they sailed on to Algeciras (al-Dzāira al-Maġdra) [i.e., Algeciras], where they disembarked, took the town and burnt down the great mosque. They were soon driven away, but advanced along the coast of Tunsīr (near Murela) the fleet faced forward up the furrows of Uruyula (Orihuela, 23 km. north-east of Murela). From Algeciras, some of the ships sailed to the northern coast of Morocco, where they took the town of Nakīr, some 20 km. south of Alhucemas Bay, for eight days sacking and taking prisoners all those who did not flee, among those some members of the princely house, later ransomed by the ruler in Cordova. As to the timing of the attack on Nakīr, there is varying testimony among the Arab authors, mentioning the occurrence [see the long discussion in Melvinger, op. cit., 151-77], but the exact date cannot be established, since it has not been possible to investigate what Ibn al-Khṭīb in his still-unpublished part of Aʿmul al-Aṣām relates about Nakīr. After the attack on Uruyula, the Viking fleet sailed towards the French frontier, invaded the country, took rich spoils and numerous captives and passed the winter in the Camargue. Then they returned to the Spanish coast, but were met and attacked by Muhammad I’s ships, which set fire to two of the unbelievers’ ships and took two more as spoils. More than 40 of their ships had now been lost. The rest joined another Viking fleet which had harried the Balearic Islands, and a few smaller ships found their way up the Ebro valley or via the River Bidassoa and its valley from Irún on the Bay of Biscay, so that a contingent arrived at Bambaluña (Pamplona) [see Bambaluña] and in 347/859 captured the amir of the Basques, Gharšiyīn b. Wannajī (García Iníguez), who had to ransom himself for 70,000 dinars. This was published part of ʿAlī b. Ahmad al-Rūdmanī’s [see Al-Rūdmanī] Textos históricos del “Muḥāṣib” de Ibn Hayyān sobre los orígenes del reino de Pamplona, in Al-And., xix (1953), 300). After this Viking raid, which probably lasted till 347/859, it was more than a century before Muslims annals tell us about further attacks from al-Maġūṣ.

On 12 Radjab 353/23 June 966, the caliph al-Hakam II received from Rašīd Abī Dānīs (Alcazar do Sal, 94 km. south of Lisbon) a message that a Viking fleet of 28 ships had been seen in the neighbourhood. The Muslims marched on them when, after ravaging the coast, they reached the place around Lisbon; many were killed in the battle on both sides. The Sevile fleet left and found the enemy ships in the mouth of the River Silves, put several of them out of action, rescued the captured Muslims, whom they found on board, killed a great number of the unbelievers and put the rest to flight. News continued to reach Cordova from the west coast about the movements of al-Maġūṣ, until they disappeared. During the same year, al-Hakam II ordered Ibn Ḥayyān to keep the fleet ready in the Cordova River (se. the Guadalquivir) and to build ships of the same type as those of the Vikings, in the hope that they would come near the ships.

2. At the beginning of Ramaḍān 360f from 21 June 971, alarming rumours spread abroad about movements at sea by al-Maḡūṣ al-Urdūmāniyyīn [on this term, see below]. Al-Hakam II immediately sent the admiral of the fleet to Almeria to make it ready to leave for Sevile and to sail with all the naval forces to the western coastal district, but we hear nothing this time about any landing operation. Ibn Ḥayyān mentions in A.A. el-Hajj, Andalusian diplomatic relations with western Europe during the Umayyad period (A. H. 133-358/ A.D. 752-976), Beirut 1976, 163, also in Hespēris-Tamuda, viii (1957), 74 f.) that at the end of 360/971 the Vikings made an attack on the west coast but that the Muslim fleet was able to repel them. The last thing we hear in Arab sources about Viking raids on Muslim territory is a notice by Ibn Ḥayyān (Lévi-Provençal, Histoire esp., ii, 171 n. 2) about a summer campaign by land to Algarve in Ramayān 361/June 972; the Muslim army advanced up to the town of San-tarem to the north-east of Lisbon and returned to Cordova in the middle of September 972.

In all the previous texts except one, the word al-Maḡūṣ is used about the Vikings, but in the text of 353 the phrase al-Maḡūṣ al-Urdūmāniyyīn is used. The last two texts mentioned above by Ibn Ḥayyān are only available to the present writer in Anales palatinos del califa de Córdoba al-Hakam II, por ‘Uṣa Ibn Ahmad al-Rūsī (350-364 H. = 962-972 J. C.). Trad. por E. García Gómez, Madrid 1967, 76, 88, 101, 116-7. The translation has on p. 75 los Mayos, on pp. 88 and 102 lo s Mayos Normandos, and in the events of 17 September 972 on pp. 116-17 first los Mayos Nor¬mandos and then only los Normandos. So there is a certain doubtfulness here. It is no longer a question about al-Maḡūṣ in its earlier sense. This fits well in with the fact that, in this case, the attackers came from Normandy. The Vikings had, after the treaty of St. Clair in 914, been given the territory in northern France which got its name Normandy from them, and had settled there. They no doubt soon accepted the Christian faith, at least officially, but they sometimes received heathen reinforcements from their original fatherland. In the early 960s, one of these bands of reinforcements arrived from Denmark at the request of Duke Richard I of Normandy, who was in conflict with Count Thibaud de Chartres. When peaceful relations between them, the Viking presence was no longer desired in France. They gradually returned to the northern lands, but encouraged by Duke Richard, they made an expedition against Muslim Spain, in the course of which they also attacked Christian Galicia and in 970 occupied Santiago de Compostella, which they held for some time. It was these troops from Normandy, partly heathen and partly Christian, who are here quite logically described by the double name.

3. Only the term al-Urdūmāniyyīn (= Normans) is used by Ibn Ḥayyān in his account of the capture of the town of Barbastro [see Barbastro] in 361/972, when the inhabitants were treated in a very barbar¬ous way by the Christian army, in which Normans were included. The later geographer Ibn Ṣubī al-Munṣīr al-Himyarī uses in a summary account of this same capture of Barbastro the word al-Rudmāniyyīn for “Normans” instead (Melvinger, op. cit., 68 f.).

4. The Spanish-Arabian author Ibn Dīyā (d. 332/945) relates in his anthology al-Maḏḥib min annāf al-Maḏḥib that ‘Abd al-Raḥmān II (306-332/920-52), after the disembarkation of the Vikings in 844, was said to have had relations with them and sent an ambas¬sador to their country to come to an agreement with them. Ibn Dīyā’s report is founded on what this envoy told the vizier Tammam b. ‘Alīkama (d. 283/896) on his return twenty months later. The ambassador Yahyā b. Ḥakam al-Bakl (al-Ghazāl (d. 370/984) [see al-Ghazāl], who had led a mission to Byzantium in 844, does not give us any details from his journey to the country of al-Maḡūṣ which confirm the authen¬ticity of his report. But even if the journey never in reality took place, it is nevertheless probable
that we have here the contemporary Hispanic-Arabic view of al-Madžūs. The Viking king’s residence, it is related, was situated on a large island in the ocean. There are Madžūs there in great numbers, and in the neighbourhood of this island there are many other islands, big and small, where all the inhabitants are Madžūs… They used to be Madžūs, but now they profess Christianity, after having forsaken the worship of fire, and they continue to marry their mothers or sisters [a trait attributed likewise to the Persian Magians] and practise other infamous deeds. They fight them and make them slaves (Melvinger, op. cit., 58-61, with refs.; here it must be stressed that—pace p. 60 n. 1, the information about marriage with a near relative seems suspicious, and must be due to a misunderstanding on the Arabic side).

The reason why the Vikings and the people or groups of peoples living on the northern fringes of civilization were described by the Arabs as Madžūs was evidently the fact, as appears from the account by Ibn Dībya, that their religion reminded the Arabs of that of the Persian Magians. According to Islamic sources, Madžūs denotes “die Einwohner des alten Persiens, vor allem in ihrer Eigenschaft als Feuerverehrer” (E. Fruin, Feuerverehrung in Kleinasien und Iran, Lund 1946, in Skrifter utg. av K. human, ret.-samf. i Lund, xi, 28). The religion of the Scandinavians and other Germanic peoples was essentially the same. All-Madžūd mentions in his Murājī al-dhahab, written between 944 and 947 (Melvinger, op. cit., 47-8) that in 330/942-3 in Fustat in Egypt he had come across a book written by Bishop Ghudhab, which was first a Madžus and that his companion Ghurūdād (Chrodelchidi) made him a Christian.

According to western sources he was baptised in 496. The same Ghurūdād, whom we have dealt with before in this work,” in his K. al-Buldān (written 297/859), 354, the historian and geographer al-Ya’fī gives names those who in 229/843 invaded and sacked Seville as “al-Madžūs who are called al-Rūs” (al-Madžūs allaahuma yuqudu lahuum al-Rūs). Thus even very early Arabic authors linked the Madžūs with the Rūs, and both the above-mentioned authors were widely-travelled and knew from personal experience the conditions not only in the Middle East but also the western parts of the Mediterranean countries. A. A. EL-Hajji, The Recent Attack on Constantinople in 280, in The Mediæval Acad. of America, Public., xvi, Cambridge, Mass., 1946, 3-4 with refs.). The author al-Watwāl (d. 718/1318) assigns in his scientific and geographic encyclopedia (Melvinger, op. cit., 63) “to Ya’fī’s (Japhet’s) descendants, al-Rūs … They believe in the Madžūs religion and burn their dead in fire.” The Persian Magians, on the other hand, did not burn their dead. The Spanish-Arabic historian and geographer Ibn Sa’ūd al-Mağribī (d. 672/1274) writes in Bābi al-arqf fi jāhili wa l-arqf (Melvinger, op. cit., 62-3) about the great Şāliḳ Island, “whose length is about 700 miles (one mil = 4000 dhūra’) and its extent across the middle about 330 miles. There are mountains, rivers, towns, built-up areas and a numerous population. It is said that they still adhere to the Madžūs religion and worship fire, as they consider nothing more important than this (see first, rochinius, 1902, 7); the fire-scene is well-known, the Muslims in Spain used the term al-Šakāliba as a general word for slaves, procured to Spain from different parts of Europe; since many of them were of Germanic origin or from Scandinavia, in that way the Germanic tribes became known as al-Šakāliba: cf. A. A. El-Hajji, op. cit., 207, n. 1, with refs. and šaṣṭaṣta). The geographer al-Iṣfī (d. 565/1166) says in his Nisbat al-madžūs (Melvinger, op. cit., 37): “The fourth section of the seventh zone comprises the majority of the provinces in al-Rusiyya (Russia), the provinces in Finskirk (Finnmark or Finland), the country of Tabast (Tavastland), the country of Astalanda (Estonia) and the country of al-Madžūs.” R. Eckblom (Idrisi und die Ortsnamen der Gestirnländer, in Namen och bygd, xix (1931), 63-6) writes: “Madžūs … is in earlier Arabic sources the usual name for the northern Slavic peoples, and the name is also applied in 852/1449 to the Scandinavians living in North Russia. In the sixth century the Slavs had crossed the Dnieper Life and had thus been introduced into the Russian area. In 1446 the area was conquered by the Tatars, and the name Madžūs remained.”

Thus even very early Arabic authors linked the Madžūs with the Rūs, and both the above-mentioned authors were widely-travelled and knew from personal experience the conditions not only in the Middle East but also the western parts of the Mediterranean countries. A. A. EL-Hajji, The Recent Attack on Constantinople in 280, in The Mediæval Acad. of America, Public., xvi, Cambridge, Mass., 1946, 3-4 with refs.). The author al-Watwāl (d. 718/1318) assigns in his scientific and geographic encyclopedia (Melvinger, op. cit., 63) “to Ya’fī’s (Japhet’s) descendants, al-Rūs … They believe in the Madžūs religion and burn their dead in fire.” The Persian Magians, on the other hand, did not burn their dead. The Spanish-Arabic historian and geographer Ibn Sa’ūd al-Mağribī (d. 672/1274) writes in Bābi al-arqf fi jāhili wa l-arqf (Melvinger, op. cit., 62-3) about the great Şāliḳ Island, “whose length is about 700 miles (one mil = 4000 dhūra’) and its extent across the middle about 330 miles. There are mountains, rivers, towns, built-up areas and a numerous population. It is said that they still adhere to the Madžūs religion and worship fire, as they consider nothing more important than this (see first, rochinius, 1902, 7); the fire-scene is well-known, the Muslims in Spain used the term al-Šakāliba as a general word for slaves, procured to Spain from different parts of Europe; since many of them were of Germanic origin or from Scandinavia, in that way the Germanic tribes became known as al-Šakāliba: cf. A. A. El-Hajji, op. cit., 207, n. 1, with refs. and šaṣṭaṣta). The geographer al-Iṣfī (d. 565/1166) says in his Nisbat al-madžūs (Melvinger, op. cit., 37): “The fourth section of the seventh zone comprises the majority of the provinces in al-Rusiyya (Russia), the provinces in Finskirk (Finnmark or Finland), the country of Tabast (Tavastland), the country of Astalanda (Estonia) and the country of al-Madžūs.” R. Eckblom (Idrisi und die Ortsnamen der Gestirnländer, in Namen och bygd, xix (1931), 63-6) writes: “Madžūs … is in earlier Arabic sources the usual name for the northern Slavic peoples, and the name is also applied in 852/1449 to the Scandinavians living in North Russia. In the sixth century the Slavs had crossed the Dnieper Life and had thus been introduced into the Russian area. In 1446 the area was conquered by the Tatars, and the name Madžūs remained.”
5. R. Brunschwig put forward the hypothesis, that, as the law school of al-Awzâ'î (q.v.) declared as Madjus all heathen with whom they wanted to become to an agreement, this was the reason why the Vikings harrying in Spain have been called Madjus in Arabic; "leur premières apparitions sur les côtes d'Espagne en 844, il y a eu entre eux et l'emir de Cordoue des tractions de paix" (Ibn 'AbdAllâh al-Khabûrî et la conquête de l'Afrique du Nord par les Arabes. Étude critique, in AÉEO Aïger, vi [1942-7], 112; reprinted in Al-Andalus, xl [1975], 133 f.). But this hypothesis is groundless. There is no certain proof of relations between the Vikings and the Muslim rulers, and in any case, al-Awzâ'î's madhab had been pressed back in Spain by that of Mâlik towards the end of the 2nd/8th century [Melvinger, op. cit., 74-2].

6. Ibn Thârî relates [ibid., 116 f. with ref.] that the ruler Highâm I in 775/972 sent Abd al-Mallî b. 'Abd al-Walîhd b. Mugîtth on a summer campaign to the Rûm country. This expedition is famous in history and one of the most important. He came to Ifrahid (Gorona), besieged the town and made a breach in its walls by using catapults. And he got nearer to the land of al-Madjus, marched through the enemy's land and stayed there several months, burning villages and destroying strongholds. He attacked the town of Arbûna (Narbonne). It was a great victory, where the value of one-fifth of the prisoners amounted to 45,000 in minted coins. In 775/972 Highâm I b. 'Abd al-Rahîm, according to the same author [ibid., 14 fl.] sent out a commander on a summer campaign against Galicia. The latter was informed that Idifunî (Alfonso II el Castro) had asked al-Bashkurxigh (the Basques) for help and the people in this neighbourhood, viz. al-Madjus and others. Ibn al-Athîr [ibid., 10 fl.] speaks about his neighbours the Basques and those of al-Madjus who lived near them and the people round there. In Ibn Hayyân's al-Madâbîs (García-Gómez-Lévi-Provencal, op. cit., 296 f.) it is related about a summer campaign in the year 200/816 against the Prince of Pampeluna that in a battle lasting thirteen days many were killed, among others Saltân, the leader (el mejor caballero) of al-Madjus. Ibn Hayyân (Lévi-Provencal, Hist. Esp. mus., 1, 204) is the only one to mention a campaign against Alava, commanded by the idâb al-samdîy 'Ubayd Allah, who invaded the district in August 825/Ra'î II 210, caused devastation and finally met with the Asturian forces, who, after a battle, put an end to this campaign because the Muslims had asked the Basques to become to an agreement, this was the reason why the Vikings harrying in Spain have been called Madjus in Arabic; "leur premières apparitions sur les côtes d'Espagne en 844, il y a eu entre eux et l'emir de Cordoue des tractions de paix" (Ibn 'AbdAllâh al-Khabûrî et la conquête de l'Afrique du Nord par les Arabes. Étude critique, in AÉEO Aïger, vi [1942-7], 112; reprinted in Al-Andalus, xl [1975], 133 f.).

8. Al-Madjus was used in the West as a name for Vikings, evidently because they did not know of, nor did they use, the correct term al-Rûs, which was used by the Arabic Persian authors. Besides, the latter knew the difference, as far as religion was concerned, between the Rûs on one hand and the other the Madjus (Zoroastrians), who never burnt their dead. The Arabs in the West did not know the crucial difference between Vikings and Zoroastrians in the use of fire for funeral ceremonies, but mostly paid attention to the dominant element of the fire itself. And since the Vikings were neither Christians nor Jews, they were consequently assimilated to the Madjus because of the role of fire in their religious culture.

Bibliography: An addition to the works mentioned in the text: R. Dozy's monograph Les normands en Espagne, in his Recueils, ii, 250-371 and Appendix XXXIV, deals with the various attacks by the Madjus in Spain. At the beginning of this survey, references are given to earlier literature by Werlauff, Mooyer, Kruse and Kuhn. Dozy, Melvinger and El-Hajî have abundant references, Dozy and Melvinger also some Arabic texts; see also A. K. Fabricius, La première invasion des Normands dans l'Espagne musulmane en 844, in Actes du Xe Congrès international des Orientalistes, Lísbon 1952. A. Seppell has mentioned all the texts known to him, also dealing with other peoples than the Madjus, in Rerum normannicarum fontes arabici. E libris quam typis exsudat manus scriptis coll. et ed., Oslo 1896-1928, Norwegian tr. in Det Norske Videnskaps-Akad. i Oslo. Skrifter. II. Hist-filos. hi. 1931, no. 2 by H. Birkeland, Nordens historie i middealdelen etter arabiske kjelder. Overs til norsk av arabiske kjelder med innled., forfatterkatalog, bibliografi og merknader, Oslo [1955]; J. AL-MADJUS — MADMÛN

MADRAS, a major port and city on the Coromandel coast of southeastern peninsular India, in lat. 13°40' N. and 80°15' E., formerly a governorship of the presidency of the same name (the latter comprising the eastern coast of India from Cape Comorin to the Northern part of Calicut coast and as well as a large part of the interior of the Deccan, and the northern Malabar coast); since independence the capital of the Indian Union State of Tamil Nadu.

1. Nomenclature. The origin of the name "Madras" has been much debated. Perhaps the two most plausible explanations are offered by Hobson-Jobson, which says Madras was named for the Madras Presidency, and the Madras glossary. The former (532) points out that the "earliest maps" of the region show Madrasapatanam as a Muslim settlement, and "havine got so far we need not hesitare to identify it with Madrasa, a college... That there was such a Madrasa in existence is established by the quotation from Hamilton, who was there about the end of the 17th century. Fryer's map (1619, but illustratting 1672-73) represents the governor's house as a building of Mahomedan architecture, with a dome. This may have been the Madrasa itself. Lockyer (1711) also speaks of a college of which the building was very ancient, formerly a hospital, and then used apparently as a residence for young writers". The *Manual of the administration of the Madras Presidency*, ii, 311, dismisses this idea, however ("Madrasa, a Mahommedan school, has been suspected, which considering the date at which the name is first found seems fanciful"), and vol. ii of this work, the *Madras glossary* (144), offers the alternative explanation that "Madras", in Sarskrit *Mun达尔ipatanã*, is derived from the Telugu *Mundarddu*, the name of a local ruler.

Until the early 19th century Madras was a small fishing village. It is not mentioned by Ibn Batûta, who landed in *Mabhar* [q.a.] at the "large and fine city of Pattan" (though it has been Kaveripattanam, Gibb, op. cit. in *Bibl.*, 263-4 in ca. 739/1338. Marco Polo, however, writes at some length of the shrine of St. Thomas, built at Malipper, "the name of which is still applied to a suburb of Madras about 3½ miles south of Port St. George" (Yule, *The Book of Ser Marco Polo*, ii, 354-9).

2. History. In March, 1639, Francis Drake of the East India Company "obtained a piece of ground five miles long, and one broad"; (Manual of the administration of the Madras Presidency, ii, 279) at the small village of Madras, on which to build a town and fort. The land thus purchased, formerly a part of the vanning Vijayanagar Kingdom, was to become the nucleus of the modern city of Madras.

Called originally by its founders Fort St. George, Madras remained subordinate to the Chief of the Settlement of Bantam in Java until 1653, when it was raised to the rank of an independent presidency. In 1702 David Bhan, a general in the service of the Moghal Emperor Awrangzêb, blockaded the settlement for a few weeks, but without success. In 1744 the town was again attacked, this time by the Maratha, once again unsuccessfully. Fort St. George was expanded and strengthened in 1743, but this failed to prevent Labouissouins from bombarding and capturing it in 1745. The city, by this time the largest in southern India, was restored to the British in 1748 by the treaty of Aix-la-Chapelle, although the Government of the Presidency did not return to Madras until 1752. The French made a second, unsuccessful attempt to take the Madras in 1758; the city was occupied, but the French, under Lally, failed to take Fort St. George. After two months the French were forced to withdraw by the arrival of a British fleet in the Madras Roads. From this time the city, although threatened in 1769 and again in 1788 by the approach of Haydar Ali and Myson's cavalry, was to remain in British hands.

At the time of the 1971 Census of India, Madras, the third most important port and fourth largest city of India, had a population of 2,469,449 (Census of India, series 19, part X-B); of this number 210,083 (comprising 116,444 males and 93,639 females) were Muslims (Census of India, series 19, part II-C-I). The Census of India figures are not divided to show sectarian affiliations, but the great majority of Madrasi Muslims are Tamil-speaking, either Râthwâ or Lablab [q.o.]. South Muslims of the 'Hamân naqibâb who do not claim Arab ancestry and who predominate in the Imaging Tamil Nadu; or else Marakaray and Rayalar, South Muslims of the Shâfi 'naqibâb who claim some Arab ancestry and who predominate along the Coromandel coast.

MADRASA, in modern usage, the name of an institution of learning where the Islamic sciences are taught, i.e., a college for higher studies, as opposed to an elementary school of traditional type (kuttāb); in mediæval usage, essentially a college of law in which the other Islamic sciences, including literary and philosophical ones, were ancillary subjects only.

1. The institution in the Arabic, Persian and Turkish lands

The subject of Islamic education in general is treated under ARABIA. Here it should merely be noted that the earliest, informal institutions of learning in the Islamic world were probably children's schools, such arrangements doubtless going back to the pre-Islamic period. In Medina, the teachers were often Jews (see Al-Balākīhīr, 473 below); cf. the name rabbānī for the teacher: Kurān, III, 79; V, 44, 63; Bukhārī, ʿImām bāb 10; Yaʿqūbī, ii, 242); but ability to write was not so common here as in Mecca. After the battle of Badr, several captured Meccans were released to teach writing in Medina (al-Mubārakfī, Ḫāsim, ed. Wright, 171). A contemporary of ʿUmar's, Dūhbār b. Ḥayyā, who was later an official and governor, was a teacher (muṣallim kuttābī) in a school in Tāʾif (Ibn Ḥadジャar, ʿĪbāda, Cairo 325, i, 235). Muḥāwīyā, who had acted as the Prophet's amanuensis, took a great interest in the education of the young. They learned reading, writing, counting, swimming and a little of the Kurān and the necessary observances of religion. Famous men like al-Ḥadjdādī and the poets al-Kūmāyī and al-Trīmīmānī are said to have been schoolmasters. (Lammens, Muḥāna, 309 ff., 360 ff.). The main subject taught was ʿadāb, so that the schools of the children were called madījīs ʿadābī (Aḥḡānī, xviii, 87), and the teacher was called muḍādībī, also muṣalīn or muḥāṭīb (al-Makī, Kitāb al-ṣulūb, i, 138, i. 8), in modern times ṣafīb (see Lamo, Manners and customs, 61). The teacher was as a rule held in little esteem, perhaps a relic of the times when he was a slave, but we also find distinguished scholars teaching in schools; thus Dāhīb b. Muḥāmān, the exegete, traditionalist and grammatical, who died in 109/725 or 110/726 had a school in Kūfa, said to have been attended by 3,000 children, who used to ride up and down among his pupils on an ass (Yāḥyā, ʿUdābā, iv, 272-3). As language was of the utmost importance, we find a Dedūnīn being appointed and paid as a teacher of the youth in Baṣra (ibid., ii, 239). School spread during the Umayyad period, and instruction was also given at home in the houses (see Haneberg, Schule und Lehrweise, 4.4). For the subsequent development of children's schools, see kutābā.

2. Islamic studies in the mosque: the early period.

The madrasa is the product of three stages in the development of the college in Islam. The mosque or masjidī, particularly in its designation as the non-congregational mosque, was the first stage, and it functioned in this as an instructional centre. The second stage was the masjidī-kutāb complex, in which the kutāb or hostelry served as a lodging for out-of-town students. The third stage was the madrasa proper, in which the functions of both masjidī and kutāb were combined in an institution based on a single masjidī (q.v.) deed.

The masjidī (q.v.) appears early in Islam as a centre for instruction, above all for the inculcation of the sacred texts and scriptures. Within the masjidī, the focus of learning was the masjidī (q.v.), from gidāsa "to sit up" in contradistinction to the near-synonymous verb baṣada, which means "to sit down". Learning took place in the masjidī, a place of worship, specifically a place of prostration (from ṣajāda, "to prostrate oneself") in prayer before God. From the prostrate position of the prayer, the teacher and his students would then "sit up", and the class, or masjidī, would begin. (From the near-synonymous verb baṣada, the masjidī, i.e., masjidī, is a bunch, upon which one sits from a standing position).

In the new studies associated with the mosque, the learning by heart and the understanding of the Kurān formed the starting-point and next came the study of hadīth, by which the proper conduct for a Muslim had to be ascertained. The Prophet was often questioned on matters of belief and conduct, in or outside the mosque (al-Bukhārī, ʿImām bāb 6, 52; 23, 24, 26, 48). After the death of the Prophet, his Companions were consulted in matters of the law, and scientific study began with the collection and arrangements of hadīths. This process is reflected in the hadīth sciences. According to them, even the Prophet in his lifetime was asked about hadīth (ibid., bāb 4, 28, 30, 31, 51); the Prophets sit in a mosque surrounded by a halāka and instructs this hearer; the latter repeat the hadīth three times until they have learned them (ibid., bāb 8, 30, 35, 43). The Prophet sent teachers of the Kurān to the tribes, and so did ʿUmar in the year 17 (ibid., bāb 25). The place where this is strongly emphasised. Jewish influence is perhaps to be recognized when learning is compared with the drinking of water (Bukhārī, ʿImām bāb 20; cf. Proverbs, xvii, 4; Pirke ᾲbrōba, i, 4, 11) and the teachers are called rabbānīyyān (al-Bukhārī, ʿImām bāb 10). A special class of students, ahl al-ṣulūm, was formed who spread the knowledge of traditions throughout Muslim lands (ibid., bāb 7, 22). They collected people around them to instruct them in the most necessary principles of the demands of Islam. In this simple form of instruction, which was indistinguishable from edifying admonitions, lay the germ of Islamic studies. The knowledge imparted was ʿilm or hikma (ibid., bāb 15). It was from the study of the Kurān and of hadīth that a science of jurisprudence began to develop, since the principles which were to be followed by the faithful did not always come ready-made from the mere reading of scripture. Although the early religious scholars, the 'ulamā (q.v.) (sing. ʿulīm), were usually the experts on the Kurān and were called al-kutābī (sing. kūṭībī) [see KUTĀB, and 3 and KURRA], on the hadīth (q.v.), and were called al-muhaddīthīn (sing. muḥaddīth), and on Kūrānic exegetics and were called al-muṣaffārīn (sing. muṣafārī) [see TAṢBĪH], yet the 1st century of Islam saw the development of the jurist-doctor of the law, the muṣīfī-fatḥī. The turn of the century was later commemorated as "the Year of the Jurists", sanāt al-jahāli, because of a number, generally considered to be seven, who died in and around that time (J. Schacht, Origins, 243, and see AL-FUṢAHĀʾ AL-SBĀʾI). We hear of a muṣīfī for studies in the Medina.
mosque in the 1st century A.H. (Aghani, i, 48; iv, 192-3). Yâlid b. Abî Bâbû sent by 'Umar b. 'Abd al-Azîz as muftî to Egypt, is said to have been the first to teach in Egypt (Sunî, ibn al-mukhtarî, i, 131); he is mentioned along with another as teacher of al-Laylî (al-Kindî, Wulât, 89) and the latter, upon whose pronouncements fatwâs were issued, had his hadâ'î in the mosque (Sunî, i, 134). 'Umar II had before this sent al-Nâfi', the masûdî of Ibn 'Umar, to Egypt to bring them the sunan (ibid., 130). He also sent an able reciter of the Qur'an to the Maghrib as hadâ'î to teach the people bâ'î'a (ibid., 131). Education was arranged for by the government by allowing suitable people to give instruction in addition to their regular office. The first teachers in the mosques were the bâ'îs, whose discourses dealt with the interpretation of the Qur'an and the proper conduct of divine service. Their masûdî was the direct continuation of the moral instruction given by the old Companions (cf. al-Bukhârî, Jâm, bâb 29). The instruction started in the mosque of 'Amr was continued for centuries. In the 2nd/8th century, al-Shâfi'î taught various subjects here every morning till his death (304/918) (al-Suyûtî, al-muhadara, ii, 134; Talhî, Usûlan, vii, 63). It was after this time that the study of fiqh came markedly to the front and the great teachers used at the same time to give fiqhîs (cf. Sunî, i, 182-3).

Arabic philological studies were ardently prosecuted in the mosques. The interest of the early Arabs in rhetoric survived under Islam; the fakÎh Sa'id b. al-Musayyab (d. 95/713*4; cf. al'Tabari, caliphate, 218/833, the extension across the lands of the eastern caliphate during the 4th/10th century by Badr b. Hasam-awîy (d. 405/1014), governor of several provinces under the Buwayhîs (see HASANAWIY), such men of power and influence needed the good offices of the 'ulama', their sure link with the masses of the faithful. To establish this connection, such men founded for the 'ulama' institutions wherein they could teach the Islamic sciences. Besides carrying favour with the 'ulama', the powerful founders were perpetuating highly munificent acts of charity endearing them to the masses and the 'ulama' alike.

The terminology for legal studies developed before the flourishing of the madrasa in the 3rd/11th century. It derived from the radicals al-ru. The second form of the verb, al-nusrah, used without a complement, meant "to teach law", its verb noun was used in the sense of "the teaching of law", the function as well as the post of professor of law; the plural, tâdrîs, or "professorships of law", was of later development, when the holding of several professorships by one doctor of the law became a common practice. The term fakîh, meant "a lesson or lecture on law"; madi'da, the active participle, meant "the professor of law". It must be kept in mind that these terms had these significations in different senses, reference to law, especially when used in the complete form, without a complement. The term masâ'id, used in the sense of "doctor of the law", or "professor of the law", was of later development, when the holding of several professorships by one doctor of the law became a common practice. The term fakîh was used in the sense of "doctor of the law", or "student of law", particularly "a graduate student", in contradistinction to mudallâh, used to designate the "undergraduate". The accomplished fakîh was eligible to become a maddâris and a můjîf; for as a fakîh who had successfully defended his theses in disputations (mutâ'a), he obtained his licence to teach and to issue legal opinions (fûjud fi 'l-thulthî) (K. 122).

The college of law therefore began as a masâ'id and was soon joined by the hâmî or hostel for out-of-town students. The lodging place next to the masâ'id was especially necessary for the student of law as distinguished, for instance, from the student of the hadîth. Jurisprudence was by now a science whose rudiments had to be learned in a period of years, usually four, and these usually under the direction of one master. After this basic undergraduate training, if he was successful and chosen by his master as a sbîb or fellow, he went on to graduate studies, which lasted an undefined period of time, some followed working as repetitors (ma'dî) under their masters for as many as twenty years before
acquiring their own professorial chair. In contrast, the student of hadith travelled from one place to another, acquiring rare hadiths, and collections of hadith, from hadith-masters who often were the last link in the chain of transmitters, holding alone the authorisation to pass on their collections authoritatively to others. The hadith student travelled therefore from place to place and collected as many authorisations, iji'd, as possible from as many masters as he could reach. The law student was interested in an authorisation covering a field of knowledge, that of law, in one iji'd; the licence to teach law and issue legal opinions, iji'd al-adh, it was therefore necessary as a lodging-place for law students away from home.

3. The library as an adjunct to the mosque and other institutions of higher learning.

In the descriptions of the larger mosques the libraries are often mentioned. These collections were gradually brought together from gifts and bequests, and it was a common thing for a scholar to give his books for the use of the musjiin or al-ul'm (e.g. al-Shafi'i al-Baghdadi, Yikli, Udabha, 1, 252; cf. iv, 289). Many other libraries were semi-public. These often supplemented the libraries of the mosques, because they contained books in which the mosques were not much interested, notably on logic, falsafa, geometry, astronomy, music, medicine and alchemy; the latter were called al-ul'm al-basma or al-ul'm al-mad (cf. Goldziher, in Alh. Ph. Al. W., 1915). The academy, ba'i, or madrassa (e.g. al-Mahmud al-Razi, founded by al-Mahmud of Bagdad in 279/892), was a learned place for a scholar to give his books for the use of the musjiin or al-ul'm. It recalls the older academy founded in Gundeshapur in 198-218/813-33) in Baghdad, deserves first mention. With the dar al-ul'm or dar al-hikma founded by al-Hikim in 395/1005. It contained a library and reading-room as well as rooms for meetings and for classes. Librarians and assistants, with their servants, administered it, and scholars were given allowances to study there; all branches of learning were represented—astronomy, medicine, etc., in addition to the primary legal studies. Al-Hikim built similar institutions in the Umayyad (al-Maqrizî, i, 334 ff.). The whole institution was closely associated with Shi'a propaganda, which is obvious from the fact that it was administered by the dar 'l-darâ'it, who held conferences with the learned men there every Monday and Thursday (al-Maqrizî, iv, 226; al-Kâshâshâbi, al-aksâ's, iii, 487; see also madrasa. 2. In Isma'îlism usage). A similar missionary institute (dar al-darâ'it) was built in Aleppo in 507/1112-13 by the amir Fakhr al-Mulk (Ibn Taghribirdî, ed. Popper, ii, 362). We may assume that the accommodation and rooms were also arranged for the performance of the salât.

With the dar al-hikima, Islam was undoubtedly continuing Hellenistic traditions. Al-Maqrizî mentions a dar al-hikma of the pre-Islamic period, where the learned men of Egypt used to work (iv, 372); Ibn Abî Usaybiya also mentions pre-Islamic seminaries in Egypt where Hellenistic learning was cultivated (dar al-sîmû, i, 104), and the similarity with the Alexandrine Museion, which was imitated in Pergamum and Antioch, for example, is apparent (J. W. H. Walden, The university of ancient Greece, Bâle, 1919, 45-50). Al-Hikim's institution was finally closed with the end of the Fâtimid dynasty (567/1171). al-Din had all the treasures of the palace, including the books, sold over a period of ten years. Many were burned, thrown into the Nile, or thrown into a great heap, which was covered with sand so that a regular "hill of books" was formed. The number of books said to have disposed of varies from 120,000 to 2,000,000, but many were saved for new libraries. Buildings were also arranged for the performance of the salât.

1. The origin and spread of the madrasa proper. Although the madrasa proper now began to evolve, there was for a long time much overlapping between
the mosque and the madrasa, for even after the appearance of madrasas, the regular mosques remained school as before.

Ibn Battûta, who traveled in the 8th/14th century, in the period when madrasas flourished most, attended lectures on hadith in the Dâkimî of Shâhîz, and in the Dâkimî of the Maqâmar in Bâghdâd (I, 83, 210). In Damascus in 589/1194, Ibn Dâbîyâr only gave 32 rooms to the Umayyad Mosque, which were used for Shâfiî and Malikî students, who received considerable stipends (ṣâlîh, ʿāmmân) (Râhîa, 272, above). In Egypt in the time of al-Mâkûlî (5th/11th century), there were 8 rooms for iṣâh studies in the Mosque of ʿAun (al-Mâkûlî, iv, 20, 21). In al-Ashâr in the 7th/13th century, and later, after the earthquake of 702, many lecture-rooms with paid teachers were built (ibid., 52), likewise in the Mosque of al-Ḥâkîm (ibid., 57).

When a particular room was set apart for teaching purposes in a mosque, this was often called a madrasa; for example six of the Damascene madrasas were built in the Umayyad Mosque (I. A. s. 9, iii, 410, 432, 437; iv, 262, 270, 481; others: vi, 230). The madrasas were often also built close beside the large mosques so that they practically belonged to them. This was the case in Mecca (Chron. Mecca, ii, 104 f.; cf. Ibn Baṭṭûta, i, 342). The name of madrasa was decided on.

The building of madrasa was an independent institution, and the ordinary mosque was very slight, all the less so as the sermons were also preached in the madrasa. In the Nîzâmîyya in Nâysâbûr, services were held as soon as it was finished (by Abû al-Râhîm: Wiistenfeld, 1, 236), and for Rukn al-Dîn al-Iṣâfînî (d. 526/1132) a school was built which surpassed all others (ibid., 239). As early as the 4th/10th century, we find al-Mukaddasî praising the very fine school at al-Shârîn (EGD, iii, 313). In the first half of the 5th/11th century, there were four especially famous madrasas in Nîyâsbûr: al-Madrasa al-Bayhâkîyya, founded by al-Bayhâqî (d. 438/1046), when he became a teacher in Nîyâsâbûr in 441/1049-50 (Wiistenfeld, op. cit., iii, 270); al-Saḍîqîyya founded by the amīr Nasr b. Sâbûkhî (governor of Nîyâsâbûr in 359/969); one built by Abû ʿAbdallâh Isfâfî al-Astârîbâdî, and another built for the teacher Abû ʿAbdallâh al-Iṣâfînî. A Nîzâmîyya was also built here by Niẓâm al-Mulk for the Imâm al-Harâmâyn al-Dawâyîn (al-Mâkûlî, iv, 192; Husn al-mukâkkârîn, ii, 142-7). It was an event of great importance when Niẓâm al-Mulk (538/1142-92 vizier of the Sulṭâns Alp Arslân and Malik Shâh) founded the celebrated Madrasa Niẓâmîyya in Bâghdâd; the building was begun in 570/1174 and in 571/1175 it was consecrated. It was founded for the Shâfiî teacher Abû Isâbî al-Sâfîrî. The Muslim historians are in some doubt about the history of the madrasa. Niẓâm al-Mulk is given the credit of having founded it, but al-Mâkûlî and al-Sâfîrî point out that madrasas were already in existence before him and mention the four above-named ones; but, as we have seen, even they were not innovations. Al-Subîkî thinks (ṣâyî al-Sâfîrî) that the new feature was that Niẓâm al-Mulk endowed scholarship for the students. This again, however, nothing new, since the financial support and energy of Niẓâm al-Mulk marked the beginning of a new period of brilliance for the madrasa (cf. G. Makdisi, Muslim institutions of learning in eleventh century Bâghdâd, in BSOAS, xxiv [1961], 1-56; A. L. Tibawi, Origin and character of al-Madrasah, in BSOAS, xxv [1962], 215-28; H. Halm, Die Anfänge der Madrasa, in ZDMG, Suppl. III, 1, 19, XIX, Deutsche Orientalistensch (1977), 436-48). The sultan and men of high rank were now interested in it, and the type evolved by Niẓâm al-Mulk, a school in which the students were boarded, became the prevailing one after his time. We may presume that the older schools also had a place for prayer in them, i.e. they were a kind of mosques. The type of school
known to us is built as a complete mosque. Since even the older mosques contained living-rooms which were frequently used by students, there is no difference in principle between the school and the ordinary mosque; only the schools were especially arranged for study and the maintenance of students. This character is expressed by the name madrasa, plural madāris; it is a genuine Arabic formation from the word darasa, "to read", "to study", taken from Hebrew or Aramaic.

In the time of Nizām al-Mulk and immediately afterwards, the madrasas spread in Iraq, Khurasan, al-Andalus, etc. He was not content with the two he founded in Nāṣir al-Dīn and Bāghdād. There was also a Madrasa Nāṣimiyah in Bāghdād (Wüstenfeld, Schöfl, 240); in Mawṣil (ibid., 319); in Ḥarrāt, to which al-Shāghī (d. 485/1092) was called from Ghazna (ibid., 310); and in Ḥarrār (Yāḵt, iv, 509). The great vizier's rival Ṭāj al-Mulk (d. 468/1070) founded a Madrasa Tādjiyā in Bāghdād (ibid., 311). In Nāṣirābād, other madrasas were founded at the same time, for example one by al-Manfi (d. 469/1070-1; ibid., 277) and a Shābtīyā (ibid., 257).

The prosperity of the madrasas stimulated by the example of Nizām al-Mulk was developing in Bāghdād, all in the eastern part of the town, the most notable being the Nāṣimiyah, renovated in 504/1110-11 (Rīktā, 226). In 635/1234, the caliph al-Mustānṣīr founded the magnificent Mustanṣīrīyā as a school for the four rites, each with a teacher and seventy-five students and a teacher for Qur′ān, but also included merchants and quite a number of women also. This prosperity of the madrasa owes its main origin to two factors. It is a genuine Arabic formation from the word darasa. "to read*, "to study", taken from the word plural middris; it is a genuine Arabic formation. The prosperity of the madrasa is due to two factors. The first is the establishment of schools in the east. The Mongols also built madrasas, which were frequently used by students, there is no difference in principle between the school and the ordinary mosque; only the schools were especially arranged for study and the maintenance of students. The founders were mainly rulers and amirs, but also included merchants and quite a number of men of learning, and a few women also.

Sālhā al-Dīn introduced the madrasa into Jerusalem. According to Muḥammad al-Dīn (d. 927/1521), there were 31 madrasas and monasteries (which were in part used in the same ways as madrasas) in direct connection with the Haram area, 29 near it, and 26 at some distance. Of these, some 40 are especially called madrasa, one a dār al-Kur′ān and one a dār al-kalālah (Šaibil, Hist. Jirās al-Elmār, Paris 1876, 159 ff.; van Berchem, Corpus, ii, 11; cf. for Sālhā al-Dīn: Ibn Ῥaḥilīn, Wajjā, ii, Cairo 1310/1892-3, 401-2).

Next to Nizām al-Mulk, Sālhā al-Dīn has the greatest reputation as a builder of madrasas. He owes this mainly to the fact that his great activity as a builder lay in countries which became of great importance in the Muslim world: Syria with Palestine, and Egypt. Even before the fall of the Fātimids, in the year 586/1191: he had founded in Cairo the Nāṣirīyā for Shāffis and the Kāmiyā for Mālikis; for Shī′is also the Shāfiyīyā and notably the great Salāhīyā or Nāṣirīyā (for the identity of the two, cf. al-Maqrizī, iv, 231, with Ḥusn al-mukādara, ii, 140-2), beside al-Shāfi′ī's mausoleum (Ḥusn al-mukādara, ii, 141-2; al-Maqrizī, iv, 192 ff.; Ibn Ῥaḥilīn, ii, 402 ff). Those around him emulated this activity.

During the period of the Ayyūbids and Mamlūks, the number of madrasas increased to an extraordinary degree. In the street called Bayn al-Zafrayn there were two long rows of madrasas on the site of the old Fātimid palace in Cairo (cf. F. Ravasse, in MAF, i, 1089, 400 ff., pl. 3). Al-Maqrizī (d. 834/1428) mentions 73 madrasas, 14 for Shāffis, four for Mālikis, ten for Ḥanafis and Mālikis, six for Shī′is and Mālikis, one for Ḥanafis and Ḥanafis, four for all four rites, two exclusively used as dār al-kalālah, while the two of Shī′is were added. In the period of the Ayyūbids and Mamlūks, the number of madrasas increased to an extraordinary degree. In the street called Bayn al-Zafrayn there were two long rows of madrasas on the site of the old Fātimid palace in Cairo (cf. F. Ravasse, in MAF, i, 1089, 400 ff., pl. 3). Al-Maqrizī (d. 834/1428) mentions 73 madrasas, 14 for Shāffis, four for Mālikis, ten for Ḥanafis and Mālikis, six for Shī′is and Mālikis, one for Ḫanafis and Ḫanafis, four for all four rites, two exclusively used as dār al-kalālah, while the two of Shī′is were added. In the period of the Ayyūbids and Mamlūks, the number of madrasas increased to an extraordinary degree. In the street called Bayn al-Zafrayn there were two long rows of madrasas on the site of the old Fātimid palace in Cairo (cf. F. Ravasse, in MAF, i, 1089, 400 ff., pl. 3). Al-Maqrizī (d. 834/1428) mentions 73 madrasas, 14 for Shāffis, four for Mālikis, ten for Ḥanafis and Mālikis, six for Shī′is and Mālikis, one for Ḫanafis and Ḫanafis, four for all four rites, two exclusively used as dār al-kalālah, while the two of Shī′is were added. In the period of the Ayyūbids and Mamlūks, the number of madrasas increased to an extraordinary degree. In the street called Bayn al-Zafrayn there were two long rows of madrasas on the site of the old Fātimid palace in Cairo (cf. F. Ravasse, in MAF, i, 1089, 400 ff., pl. 3). Al-Maqrizī (d. 834/1428) mentions 73 madrasas, 14 for Shāffis, four for Mālikis, ten for Ḥanafis and Mālikis, six for Shī′is and Mālikis, one for Ḫanafis and Ḫanafis, four for all four rites, two exclusively used as dār al-kalālah, while the two of Shī′is were added.
and al-Kayrawan. Education in the Maghrib was on a madrasa in Tunis and the Maghrib but laments of 490; Margate, Boldin de la Real Acad., de la Hist., xxvii, was founded in Granada by the Nasrid was given in the mosques (al-Makfearl, instruction). Manuel d'art musulman, J.A.ser. n, x [1917]. xii [1938]; C. Margate, 34 [Arabic] — 44 [French]). Other Marind and their Hespiris, edition by Lévi-Provengal, in in 684/1285 (also called al-talaf'd'iyytn; see the of law continued to teach there, as for instance, cither type of college of law was usually twenty.

In Spain, according to Ibn Sa'd (7th/13th century), there were no madrasas; instruction was given in the mosques (al-Makfearl, Analec, 1, 136); in the following century, however, a large madrasa was founded in Granada by the Nasrid Yusuf Abu 'l-Hakim in 730/1330 (Almagro Caracas, in Bolletin de la Real Acad. de la Hist., xlvii, 490; Marçais, op. cit., 316-17).

Ibn Khaldun (808/1406) testifies to the spread of madrasas in Tunisia and the Maghrib but laments the decline in education. In the Andalus, Muslin culture was dying out and after the decline of Kortuba and al-Kayrawan, education in the Maghrib was on a low level, while the old schools in sharik were no longer of importance. Cairo was a centre of learning to which all made their way, and studies also flourished in Persia (Mubadilun, foest 6, no. 2). This decline in learning of the time lacked vitality, and international scholarship was affected by political conditions. In 1517 A.D., Leo Africanus says that the lecture-rooms in Cairo were large and pleasant but the numbers who attended them were small. Some still studied fiqh, but very few the arts (Decte. de l'Afr., iii, 324, in Rec. de Voy. et de Doc., ed. Schefer, Paris 1896-9).

5. The constitution of the madrasa.

We have seen that, already in the 4th/10th century, there were a number of madrasas outside Baghdad, the cultural centre of the Islamic world, but we have also noted the impetus to madrasa-building which took place in the next century and is associated especially with Nīṣām al-Mulk. Even so, as further noted, earlier types of educational institution continued to flourish.

The madrasa, combining the functions of the masjid and its nearby hād in one architectural unit, was new to medieval Islamic society. Nor was the student body more numerous in the madrasa than it was in its predecessor; the number in either type of college of law was usually twenty. Nor did the new madrasa put an end to the masjid as a college; these last continued to be established as charitable foundations. Indeed, many "ulama" deposed the innovation of the madrasa which provided for all the needs of the student, including room and board, and encouraged, according to the "ulama" complaints, the worthy and unworthy alike to pursue knowledge for the wrong kind of motivation, a parasitic life of ease, instead of learning for the greater glory of God. Thus the masjīd-hād type of college continued to be founded, and many professors of law continued to teach there, as for instance, within the Hanbal madakh, whose first madrasa was founded only in the first part of the 6th/12th century. This lingering preference for the masjid is not surprising, given the place of the mosque in the Muslim community and the encouragement of the faithful to build mosques: "The Apostle of God ordered . . . that masjīd be built" (quorora rasul Allah . . . bi-budūt al-masjid).
After the masjid and madrasa, other institutions came into existence, especially the dar al-hadith \([q.v.]\), the first of which was, as already noted above, founded by Nūr al-Dīn b. Zangi in Damascus. In this institution, the mubāhāt thā al-badīf, the ulama an obligation incumbent upon the dar al-stūnna, occasional terms that dir al-tadris dir al-hadirh must not be confused with either The nationalism represented by the ddar al-‘ilm may thus be seen as a further manifestation of the and to bring together students of all madhhab tended to be divisive, The level of the madrasa was raised to mikhaddih from those of private individuals; they were moti¬vated by the prestige brought by their foundations. This combination of the two institutions became quite frequent, for example in the Niẓāmiyya in Cairo of the year 757/1355 (Van Berchem; Corpus, i, 242 ff.) and in the mausoleums of Barsbāy, 855 \(\text{ibid.}, 356-60\): cf. Ibn Iyās, ii, 21, 22, 24, 41, of al-Mālik al-Asghārī Inšāl, 855-60/1453-6 \(\text{ibid.}, no. 271\); no. 272). In the east, Ibn Baṭṭūta found the same relationship, for example in Shīrāz and in Karbala\(\text{i.}\) (ii, 78-9, 85, 96), and this is what he means when he says the Persians call the sāliha the madrasa (ii, 30, 32). In the west, he lauds his own sovereign, who had built a splendid sāliha in Fās (i, 84); here also learning and Sīʿām were associated (see the quotation in Dozy, Supplement, s.v. sūlū). The madrasa still plays an important part in North Africa.

Learning further took place in the hospitals (madīṣidān, from the Persian bi-mārīsīn \([q.v.]\) which were also used as schools of medicine, as well as in the private homes of scholars and elsewhere.

6. Courses of Instruction and Personnel.

As already explained, in the earliest period the principal subjects studied in the mosque were Kur'ān and hadīth, to which was added the study of the Arabic language. In al-Balāshīri (Kūḥ ʿal-l-Tim), in the 9th/15th century, this combination can be detected in several cases, for example in the mosques of al-Asghārī in Basra, al-Aṣ'ārī heard al-Djūbudī who taught in the Friday mosques. In the mosque of al-Maṣūṣ in Basra, al-Aṣ'ārī heard al-Djūbudī who taught in the Miḥāzāt kalām (Wüstenfeld, Schafs, 135); closely connected with this was methodology (al-maḥkāhara wa l-natur: cf. Yāḥūt, Uṣūl, vi, 383). But many different subjects could also be taught. Al-Khaṭṭāṭ al-Baqhdādī, who taught in al-Maṣūṣ's "Dar al-Mālikah" in Baghhdād, lectured on his history of Baghdād (Yāḥūt, i, 271 ff.); this disappeared however, disappeared from the mosques. In Spain, we are told, falsafā and tādhīm were only cultivated in secret, as those who studied them were branded as sindīb, and even stoned or burned (al-Maḳkārī, Aṣnaqī, i, 236). The madrasas were mainly established to teach the systems of fikh, and originally each school was intended to represent only one madhab. Where the four madīṣidān are represented in one school, one can speak of four madrasas, e.g. al-Maḍirī al-sulṭānīyya (al-Maṭṭārī, iv, 209, 358).

The ordinary madrasas, however, included other subjects beside the study of fikh alone. Special mention is made of māṣūṣ (al-Ṣāḥīḥyya; al-Maṭṭārī, iv, 209). In the Niẓāmiyya in Baghhdād and in other
madrasas in the east, philological studies were prosecuted (cf. Yākūt, Udābā, v. 473-4; vi. 409). The custom, often occurring before Niẓām al-Mulk's time, of founding a dār al-hadith was continued after him, e.g. in Cairo and Damascus. In 604/1207 al-Malik al-Muqaffā' built beside the Sāhāra mosque a Madrasa Nahawwā', exclusively for Arabic linguistic studies (Sauvain, H. J. E. H., 86, 110), and schools for special subjects were not rare (cf. al-Sudkī, Nā'ūl al-nawm, ed. Myhrmann, 153). Al-Suhbī mentions, in addition to the special hadīth schools, also madāris al-tasāfiyya and madāris al-nahw. In his Ḍāhī'uddin (fatī 5, nos. 4 ff.), Ibn Khaldūn gives a survey of the divisions of Islamic studies. They are divided into ʿulūm tabbīyya and nahlīyya. The former are based on observation by the senses and deduction and are therefore also called fakrīyya or nahlīyya; the latter are dependent on revelation by the lawgiver (al-ʿādī al-ṣāliḥ), and are therefore based on special transmission. The ʿulūm nahlīyya therefore comprise all branches of knowledge which owe their existence to Islam, namely Kurʾān, i.e. insāfīr and the seven bīrūfī (no. 9), hadīth with the sciences auxiliary to it, including al-nādīsūr, ʿuqūfīn fī al-masālik, ṣuṭūrīn al-mālikī, hadīthīn al-fatīy, al-fatāwa, the law of inheritance (nos. 7-8), ʿuṣūl with the principles of law including methods of deduction and the differences between the mudḥāba (no. 9), al-kalīm, theology, which is nahlīyya in as much as it is really a further development of īmān which comes under the head of religious duties, but is šābīyya in its nature since it is entirely based on abstract proofs (no. 10), al-tasawwuf, something like practical theology (no. 11) and ʿuṣūr al-rūʿyā, interpretations of visions (no. 12).

Linguistic sciences are related to the study of Kurʾān and hadīth (cf. nos. 4, 37 beginning), which are divided into 4 parts; al-nābī, al-ʿādīh, al-bayān and al-adāb (no. 37), and in the last named category comes the whole study of Arabic literature.

The ʿulūm nahlīyya are variously classified, usually into 7 main sections (no. 13), and are al-māndīfī, logic which is the foundation of all others (no. 17), al-arqīnī, arithmetic, including ḥaṣāb etc. (no. 14), al-ḥanās, geometry (no. 15), al-ḥayāt, astronomy (no. 16), al-μuṣīkī, the theory of tones and their definition by number etc. (see no. 13); then there is al-tabībīyya, the theory of bodies at rest and in motion—heavenly, human, animal, plant and mineral; among its subdivisions, special mention is made of al-ṣīḥ, medicine, and al-falāḥa, agriculture (nos. 18-20; cf. no. 29). The seventh main head is ʿilm al-taḥāyya, metaphysics (no. 27). Magie, talisman, mysterious properties of numbers, etc., also form branches of Muslim learning (nos. 22 ff.).

Medicine was not only taught in special schools but also in the mosques and the madrasas; about 600/1204-5, ʿAbd al-Lattīf lectured in the Azhar Mosque, but it is not quite clear whether his instruction in ʿībī was also given there ( Ibn Abī Usaybī, ii, 207) and in any case the "philosophical sciences" were cultivated outside the mosques.

The method of teaching was by lecturing and learning by heart (talābkīn). The first task was to learn the Kurʾān by heart and then to acquire as many traditions as possible. The hadīthīn was repeated three times so that the student could remember it (Bāghārī, Ḥim, bāb 30). Lecturing soon became dictation (mīṣūr), when the student wrote down what was said, except in the case of the Kurʾān (approved: al-Buḫqārī, Ḥim, bāb 34, 35). The method was the same for linguistic or literary subjects as for hadīthīn, ʿĪsāfī, etc. The philologists not only used to dictate their grammatical works, as for example Ibn Durayd (Wustenfeld, Schfelt's, 1729) or Muḥammad b. ʿAbd al-Wāḥīd (d. 345/957), who dictated from memory 30,000 folios on Ṣūhā (Yākūt, Udābā, vii, 26), but also the text of the poets, like al-Tābarī, who lectured on al-Tirmīzhī in the Mosque of Ḥam in 125/780 (ibid., vi. 432). Dictation was especially important in the case of ʿībī, as the exact establishment of the text was the first necessity. It is therefore always said "he dictated ʿībī" (Ibn al-Muḥāṣṣara, ii. 139; Yākūt, Udābā, i. 126). The class of a teacher is therefore madāris al-ʿādī (ibid., ii. 243; vii. 74), and his fimālu under the students is al-mustāmil (cf. ibid., vi. 282; vii. 74). Problems of ʿībī were also dictated (for Abū Yūsuf, Ibn Ḥuṭluṣ- būgḥā, ed. Fügel, no. 249).

All this meant that reliance on the memory, for the learning above all of the Kurʾān and hadīthīn, was highly prized, and repetition much cultivated. Jurisconsults were quoted as saying that in their student days they used to repeat each law lecture fifty times or more in order to imbed it in the memory.

A school exercise was developed, whereby students quizzed one another as an aid to learning their lesson and as a contest to see who knew more than the other. The term used for the exercise was madārṣa- kara ("a calling something to mind with another, conferring with another"). However, the importance of understanding was also recognised, above all as legal studies developed, and this is the lexical meaning of the term ʿībī (q.v.), which comes to have the technical meaning of "positive law". This shift of emphasis to both memorisation and comprehension is illustrated by the saying that "learning is a city, one of whose gates is memory and the other is understanding" (al-ʿīm al-mudin, ṣāhāt al-riwāy, wa-l-ḥakīr al-dīrūyā).

But the most important method developed for legal studies was the method of disputation (mudnā, fāṣlāt al-ṣāqa), the legal school exercise par excellence. It consisted of (1) a thorough knowledge of ʿībī, that is, the divergent legal opinions of jurisconsults; (2) a thorough knowledge of ʿībī, dialectic; and (3) mudnā, disputation. The disputant had to know by heart as extensive a list as possible of the disputed questions of law (al-maṣūf al-ḥaṣīf, fīṣīh), and have ready answers for them. It was his skil at disputation which earned for him the licence to teach law and to issue legs* (al-Malik al-Mu ʿīt, ii, 86, 140), and his famulus among the students was al-mustāmil (cf. ibid., vi. 285; vii. 74). Problems of ʿībī were also dictated (for Abū Yūsuf, Ibn Ḥuṭluṣ- būgḥā, ed. Fügel, no. 249).
was used to designate the director, Shaykh al-Riḍā, i, 253). It was only natural that the dictation of text, able to get copies for themselves. The text was in copies of the chief texts that the students were handed to a teacher in the Ni?Amiyya in Baghdad (Yakut, Ḫudayr, vii, 20) and the method of having a text read aloud, while the lecturer explained only any remarkable phrases, was used as early as by the teacher of hadīth, Ibn Kaysān (d. 299/1112; ibid., vi, 282).

Ibn Kaldūn laments that so few teachers in his time understood the correct methods of teaching (jarūk al-taλawī). They put difficult questions at once to the pupil instead of arranging the taqddīm so that it is always combined with explanations, and it is a fundamental principle that the pupil should not mix the different subjects. They laid too much stress on learning by heart (ḥafīz) (Mukaddasī, faso, i, 6, no. 2, 29, 30; cf. al-Subkī, Mukaddasī, ii, 351). Mechanical learning by heart is recognised for the Kurān.

When the above-mentioned Ibn Kaysān expounded hadīths, he also asked his hearers about their meaning. Conversely the class was at liberty to ask questions of the teacher. Al-Shāfīi used to sit in his great ḫalqa in Mecca and say: “Ask me what you want, and I will then give you information on the Kurān and sunna” (ibid., vi, 391; cf. al-Mukaddasī, in B.G.A., iii, 379). The teacher was sometimes overwhelmed with questions (Yakut, Ḫudayr, ii, 272). Ibn Dūḥayr saw written questions being handed to a teacher in the Niṣāʿīyya in Baghdaḍ (219/521). Both practices are still in vogue, and even in large classes the student may interrupt with questions.

7. The scholastic community: the teachers.

The general designation for master was shaykh. When used with a complement, the term designated the master of various fields: as, for instance, shaykh al-hadīth, shaykh al-fīrsā, for the professor of hadīth and the professor of Kurānic studies respectively. The termОсновной term was a kind of honorary title (see Yaqūt, Ḫudayr, i, 123, 209, ii, 277; v, 355; 354, 358, 449); it has continued in use till the present day and in a contemporary Arabic usage is the equivalent of the Western term “professor”, “holder of a professorial chair”. But in distinction from these more general terms, the professor of law had a designation all his own, a term used without a complement, ḥāfīz. He was not referred to as shaykh al-fīrsā. The term ṭudurās with a complement was sometimes used to designate other professors. Shaykh al-ṭudurās was used to designate the director, or abbot, of a monastery. The ṭudurās, like the bābī, was entitled to have a deputy, a ṭudurās, who taught during his absence. The ṭudurās could, in fact, have several ṭudurās. This happened when the professor of law held several posts (ṭadris, pl. ṭadrisā); he would teach in one or the other of these posts and hire deputies to teach in the others. Thus, as the chair for the professorship of law could be divided, the professorships could be multiple.

The term ṭadrisī was applied to any scholar who had reached the summit of his field in his locality. It was used especially in the field of law; biographical notices often express it by saying that “leadership in the school of law ended up with him” (intṣās ṭalḥiyā ṭudurār al-ma?ṣūma). The terminology used in these notices is indicative of the competition that existed among the jurisconsults: bārāʾ (the excelled in the field of law); la yugbabī ghabarār (“his dust cannot be penetrated”—comparing the legal scholar to a thoroughbred so swift that other horses in the race fail to keep in sight, the dust of his hoofs having settled by the time they get to where he was); kāna bābī al-magārā (“he was the multiplier of his peers”); etc. The titulature is also indicative of this competition for the gain, the nobility, and in government: amīr al-uṃarā (“prince of princes”), naṣīr al-mulk (“king of kings”), sūlūn al-sulūn (“sultan of sultans”), bābī l-kullād (judge of judges), sīām al-sīāh (“scholar of scholars”), and even of the term ṭadrisī itself, ṭadrisī al-rasīd (leader of leaders’).

In places where the term ṭadrisī designated a post, as for instance in Maysābīr, where there was also a nāṣibī, a sub-leader, or deputy-leader, the post appears as one requiring, besides the qualification of leadership, that of non-partisanship, that of some one capable of acting as peace-maker, a moderator between opposing factions among the scholars.

This, however, was not the head of a guild of masters. Such an organisation was unlikely in a system highly individualistic in character. The concept of a guild or corporation based on juristic personality was unknown to mediaeval Islam, where juristic personality belonged to the natural physical person alone.

It has often been said that teachers were organised into a guild, and the usual argument advanced for this assertion is an anecdote cited in Yakūt, Ḫudayr, i, 246 ff., according to which al-Khāṣīb al-Baghdādī (d. 46/1057; q.v.) had the permission of the Caliph to lecture in the Mosque of al-Manṣūr because the nāṣibī, al-Nāṣibī, in order to teach hadīths in Baghdād’s Mosque of al-Manṣūr. The function of the nāṣibī al-nāṣibī was also confused with the term ṭadrisī, further adding to the concept of a head of a guild of masters. No one has claimed to know how the guild worked, which is no surprise, since there was none. The nāṣibī was the marshal of the nobility, the aṣlīfī. His function was to investigate all claims to descent from the Prophet’s family and to keep rolls of the legitimate descendants of the Prophet, for they were entitled to a lifetime pension. There were two nāṣibīs: one for the Sunnīs, nāṣibī al-ḥadīthīyyīn, and one for the Shīʿīs, nāṣibī al-takhrīsīyyīn.

The so-called anecdote has to do with the nāṣibī al-ḥadīthīyyīn. The Mosque of al-Manṣūr was located in the quarter of Bāb al-Bayrā, on the west side of the city, the stronghold of the constituency of the nāṣibī. This constituency was made up of traditionalist aṣlīfīs and an overwhelming majority of Hanbalīs. Al-Baghdādī had been a Hanbalī, had changed over to the Shīʿī school of law, but was suspected of Aṣhrāmīs, to which the Hanbalīs were highly hostile. Al-Baghdādī asked the caliph’s permission to lecture in the Mosque, for
It was his declared, lifelong ambition to do so, the Mosque being known as the institution with the highest reputation for the science of hadith. The caliph, aware of the hostility of the people of the Bâb-al-Basra to the lecturer, called on the naib as the Marshal of the Sharifs of the Bâb-al-Basra quarter, to see to it that the event would not produce a riot. The naib agreed to do so, but reluctantly, since he felt that the idâd was in danger of control if it should get out of hand. An incident did occur, bricks were thrown at the speaker, and turbans were snatched, but the naib succeeded in limiting the damage.

Thus permission to lecture in the Great Mosque was sought from the caliph, who alone made appointments to the teaching posts, the halâkas, of the great mosques (there were, at the time, six of these) in Baghdad. The naib was not the head of a guild of masters, such as the universitas magistrorum of the Latin West; there was no such guild in mediæval Islam.

In spite of all flexibility, a certain stability developed in the teaching staff of the mosques. This was connected with the question of pay. It was for long in dispute whether it was permitted to accept payment for giving instruction. In the collections of hadith the practice is both supported and condemned, and it is said that the teacher may accept money, but not demand it, and avaricious teachers are strongly condemned. There are continual references to people who gave lecturers without payment (al-Buḫârî, igâza, būb 16; Abî Dâwûd, Baγîk, būb 36; Ibn MâDîq, Ta沐浴ât, būb 8). The custom of the older Jewish scholars of exercising a handicraft was not common among the Muslims, but was found occasionally among men who made shoes, locksmiths and sandal-makers (Wustenfeld, Schådî'fî, 227, 231, 237; cf. also Mea, Renaissance des Islam, 179). It was the rule, however, for the teacher to be paid for his work. This might be a wholly personal donation from a prince or other rich man; for example al-Ṭabarî was given a sum of money when he taught in the Mosque of “Amr (Yaḳûtî, Udâbî, vi, 428; cf. the remarks above on wandering scholars). It was as a rule, however, a regular salary which was paid out of endowment, so that the position was a regular professional chair; this was especially the case in the madrasas. The salaries of the teachers (ma'mûm, also dâlamâh, dâlamûk; see Dozy, Supplement, s.v.) varied considerably, according to the endowment. According to al-Mâkrî, learned men might have 50 dünds a month in all in addition to allowances in kind (ii, 364). On ceremonial occasions, they often were given special marks of distinction, such as gifts in money and robes of honour.

There were a very large number of teachers in the great mosques. In the madrasas at first only one was appointed. A madrasa frequently took its name from a distinguished teacher (e.g. the Ghaznaviyya in Cairo; al-Mâkrî, iv, 235; Shafiîyya, originally the Nisârîyya; ibid., 193; cf. the Masjid al-Khâṣî in Bagdad). In the larger madrasas, however, several teachers were appointed; Šalîh al-Dîn appointed 4 lecturers to the Šamîbîyya in Cairo (ibid., 203); in this case a definite number (26) of students was allotted to each teacher (cf. Chron. Mekbû, ii, 205-6).

It is easily understood that the conditions in the older mosques, where every one could come and go, were freer than in the madrasas, which were built for particular teachers and students. There was probably as a rule no official recognition of the teachers in the earliest period. After textbooks had come into use, the certificate of qualification was the igâza, and so it has remained to modern times. Anyone who had studied with a teacher could get permission from him to teach from the book, which he had copied out and studied from his dictionary; the teacher reserved this permission (igâza) in the book (e.g. Yaḳûtî, Udâbî, 253; 272). A teacher also gave an igâza šama, which permitted the individual concerned to teach from all his works (Ibn Baṭṭûta, i, 253). It was the usual thing for a travelling scholar to collect numerous igâzat; thus Abî al-Lâtîf had certificates of this kind from teachers in Baghdad, Khurasân, Egypt and Syria (Ibn Abî Uṣaybi'â, ii, 204). There were special formulae for the igâza for kadîs and jûfâys (al-Kalâshândî, Šahiba al-'âqîf, xiv, 322 ff.). Some scholars only gave occasional lectures, and others only dealt with a very limited subject; thus one was appointed to the Nişâmîyya to lecture in al-Buḫârî’s Šâhid because he was the only lecturer on this from a celebrated teacher. There were however many learned men who devoted themselves mainly to teaching and taught several subjects; often they taught many hours every day (e.g. Yaḳûtî, Udâbî, vi, 282, 383; vii, 176), and pious teachers even spent the night in the mosque in prayer (Wustenfeld, Schådî'fî, 258).

Sometimes a young teacher began by dictating hadîth and later received a post with a wider scope in a mosque (ibid., 239).

The distinction between teacher and taught was not absolute; any one could have an igâza in one subject while he was still a student in others, and even men of ripe scholarship attended the lectures on this from celebrated teachers. This led students to travel from one seat of learning to another, just as they used to travel in early days to collect ṭidâs (al-Buḫârî, Šim, bûb 7, 9, 26). All the biographies of learned men give examples of this; the old Hellenistic custom was thus continued (cf. Walden, The universities of ancient Greece, and royal courts still played the same part; at them learned guests received donations, which enabled them to appear as teachers in the mosques (e.g. Ibn Baṭṭûta, i, 72 ff.; Ibn Khâlid, Khâṣî al-'Thâr, Bûlìq, 1284, vii, 432; Ibn Abî Uṣaybi'â, ii, 205; cf. Mommsen, Römische Geschicht, vi, 509). Distinguished scholars were of course much visited by lovers of learning; of one of the latter, it is said ṭidâs šâfi'î or šâfi'î khabar al-raziha “they used to travel to him” (Yaḳûtî, Udâbî, vii, 174; Ḥasan al-muḥâdara, i, 207; cf. 141).

The blurring of the distinction between the teachers and the taught only really applied to fields where the authoritative transmission of a text was involved. This occurred especially in hadîth. In this field one remained, in a sense, a student all one’s life, collecting authorisations (igâza) from the transmission of one or more hadîths. There were many instances where an accomplished scholar of hadîth would seek the authoritative transmission of a collection of hadîths, or even of a single hadîth, from one many years younger than he but who had the igâza of his teacher (e.g. Mâlik’s hašîba), and was, most likely, the last to receive that authority from its last holder.

This situation was due to the oral character of authoritative transmission. The perennial preoccupation of the conscientious hadîth scholar was to travel in search of those rare hašîbas, whose rarity was due to the ever-decreasing number of transmitters duly authorised to transmit them. Biographical notices sometimes tell of the authorised transmitter
who had made a collection of such ḥadīths and had waited until he had survived all other authorised transmitters before making them available, at which time he could exact his own price for them. This practice was, of course, condemned. There are well-known ḥadīths not only encouraging the gathering and spreading of knowledge but also condemning those who would gather and conceal it.

On the other hand, the distinction between teacher and taught in the field of law was quite clear. To obtain the licence to teach law, one had to study many years under a professor of law, become proficient in the scholastic method of disputation and build up as vast a repertoire of disputed questions of law as possible, together with solutions to those questions; then one had successfully to defend one’s thesis or theses against the adversary, often one’s own master. This long process could take place under one master alone; but it sometimes took place under two, one for the basic four years, another for the graduate, apprentice, period. More rarely, a law student could study under as many as five professors, but the process was always the same: the defence of a thesis or theses which learned him the licence to teach and to issue legal opinions, a licence attesting to his competence in the law as a field of knowledge.

Islamic law is individualistic; this may be seen in the function of the ḥādiṣ, the mujtahid and the mudarris, or professor of law, as well as in the madrasa, the college of law. The ḥādiṣ was alone responsible for his legal decision; the mujtahid was alone responsible for his legal opinion, based on justiṣṣ, and individual, personal activity of research in the sources of the law. Likewise, every madrasa represented one muṭḥab: a double madrasa represented two muṭḥabs where students were kept separate; so also with the triple, and quadruple madrasa; and every muṭḥab was represented by one professor of law, who might have under his direction one or several muṣlis and muṣfīds. Some instances is history illustrate this unicity of the professorial chair in the college of law. In the university it was the duty of the muṭḥab (Abū ʿAbd Allāh al-Ṭabarî to the NijAmīyya’s chair) to teach and to issue legal opinions, a licence attesting to his competence in the law as a field of knowledge.

The teacher had his particular place in the mosque. Of course, a teacher, like any other pious individual, could stay in the mosque and even have a room there; al-Ḡazālī for example lived in the mosque of the Umayyads, where Ibn Djuḥayr saw his room. But these were exceptions; al-ʿAẓīz built a dwelling-house for the teachers in the Azhar near the mosque (al-Makrīzī, iv, 49). The earlier madrasas founded by Nizām al-Mulk often had lodgings for the teacher, especially as the teacher sometimes made his lodging his classroom, and this is also found later. Thus in the Sālāḥiya, the head of the college had his home within the buildings (Ibn Djuḥayr, 48).

Of the teachers, many were also ḥādis (as in their day were the ḥādis, who were in a way the predecessors of the teachers). The ḥādis frequently were able to accumulate a considerable number of disciples. The chief ḥādiṣ Ibn Bint al-ʿAẓīz (ca. 700/1300-1) had 17 offices (Quatemère, Hist. Sult. Maml., ii/1, 137-8). The teacher could also be a muṣīf (e.g. Yākūt, ʿUdāba, iv, 156).

The professor of law was assisted by the “repetitor”, muṣīf, as drill-master. The professor of law was also assisted by the muṣīf, a sort of “scholar in residence” who imparted “useful information”, faṣīda, pl. faṣīdān, to the students of the institution. The post of muṣīf was also used in the field of ḥadīth, for the same general purpose. There were usually two muṣīfs for each teacher. The muṣīf’s duty was to read over with the students the lecture after the class and explain it to the less gifted students. The celebrated fāṣīda al-Buḳīlī began as a repeater with his father-in-law in the Khurābīya (al-Makrīzī, iv, 202); it was also possible to be an independent teacher in one school and a repeater in another (al-Nasīr, d. 690/1290-1; ʿUsān al-muḥādara, i, 189). The Sālāḥiya, which ought to have had 4 teachers with 2 repeaters, was run for 30 years by ro repeaters and no teachers (al-Makrīzī, iv, 251; cf. also 210; al-ʿUbūkī, Muṣīf al-nīṭām, 154-5; al-Kalāṣaṣṇī, Suṣū al-ṣāḥīb, v, 464, and Hāneberg, Schriften und Lehrwerken der Mamlukener, 25; ʿAbbāsī, ʿIbrāhīm, Muṣīf, 464; W. Leibnitz, Lehrer, 1837). As noted above, the counterpart of the muṣīf in law was the muṣfin in ḥadīth, whose function it was to repeat the ḥadīth dictated by the professor of ḥadīth to a class that could often run into the hundreds and thousands. In the case of such large classes, several muṣfinīs relayed the ḥadīth to those who were not within earshot of the professor.

Other posts in the various institutions included the grammarian or nabhū, who taught grammar and the other literary arts generally, and the various preachers. These comprised al-ḥaṣīb (q.v.), who preached the Friday sermon in the ḥādīṣ; al-ʿidāq (q.v.), who preached the academic sermon and taught the art of the sermon; and the popular preachers called al-bāṣṣ (q.v.) and kātiib al-kurāt. Other holders of posts included al-imām, who led the five daily prayers in the mosques; the elementary school teacher of the muḥādb and ḥadīth, called variously al-muṣālim al-muṣ añīd and al-fāṣī, colloquially, in Egypt, esp., al-fāṣī; the monitors, al-ʿarīj, kātiib al-ghāyba; the抄ists of manuscripts, al-nāṣīḥ and al-marrāk (the latter term was also used for the bookstall; it would seem that the marrāk copied books for sale and hired the nāṣīḥ, pl. muṣaṣṣar, to copy for him); the corrector of copied manuscripts, al-muṣākhī; the collator of copied manuscripts, al-muṣākbī or al-muṣārīd; and the scribe, al-ḥaṣīb, a scribe who worked for a professor or a rich student while pursuing his own
studies. Most of these functions were performed by students working their way through college.

8. The scholastic community: the students.
Every one was absolutely free to join a hulka in the mosque in order to hear a teacher. Al-Muqaddasi for example tells us that the learned men of al-Fars used to sit from early morning till midday and from yarr to magrib for the common people (lit. 'l-umām') (BG.A, iii, 459). But as soon as the teachers developed into a regular class of society, the students (jalaba, tuṣab, sing. ḥulba) who were systematically training in the Muslim sciences also became a recognised section of the community. Together with the teachers, they formed the guild of the educated, āṣhab al-ṣimāma (now al-ṣimām in Egypt). They were able to select their teachers as they pleased; the most celebrated teachers had therefore large numbers of students. Many never finished studying, for they could always find new teachers to study under until their old age, even if they themselves also taught. The ambitious would only study under (darasa 'ālī) great teachers and therefore travelled about the Muslim world a great deal (cf. al-Muqaddasi, 237). This travelling, partly as teacher and partly as student, for the sake of jalab al-ṣim was long kept up in Islam.

When the student had completed his teacher's course, he declared his knowledge mature in the particular subject and the student was able to regard himself as perfect in it (tibkarradāja 'alayhi). The relation of student to teacher is patriarchal and the student kisses his hands. This does not prevent quarrels breaking out, and in such cases the teachers might be treated very disrespectfully (cf. Sulaymān Raṣād, Kunt al-ja'miyr, 142 ff., 194 ff.).

The madrasa introduced an innovation into the relationship of teacher to student, when a definite number of students (as a rule, twenty) was allotted to a particular teacher. Instruction was thus organised on more systematic lines. But even then irregular students were also admitted. It is only in quite modern times that the instruction has been made properly organised.

We have exceptionally of women students; one was a member of al-Ṣafī's madrasa (Iṣnān al-nawāhāra, i, 187, below). In the early centuries it cannot have been unusual, for it is several times mentioned in hadiths, which reserve special days for women (al-Buḥārī, Ḥlm, būb 32, 50, 56).

In the madrasas and some mosques, students were offered lodging and certain allowances in addition, food, bread (djarā) and money.

A student living in a mosque is called muḍajār (al-Makrīzī, iv, 54), a word which is also applied to Meccan pilgrims ( Ibn Dūbhayr, 222) and to anyone living in a mosque. The students' apartments are divided into arwāḥa, usually according to nations, a word which is derived from the fact that they originally lived in the colonnades. Each rīṣāḥ is under a ḥulba. Many students live in ḥanākhāhs, other in private houses.

9. Conclusion.
The Muslim system of education in the Middle Ages was based on the wasf, which, as already mentioned, gave the founder a free hand in determining the course of his foundation, as long as his stipulations were in keeping with the tenets of Islam. The historian must be circumspect about generalising for one institution on the basis of the particulars of another. The history of Muslim education must therefore be written on the basis of the deeds of the wasf, of which few are extant, and are in any case mostly late in date, as well as on the basis of biographical literature and the chapters on wasf in the ūṣūs-works. These are the main sources to be consulted for the history of institutionalised education; that is, that education which took place in the djami', the masjid, the madrasa, the dār al-ḥadīth, the dār al-Kur'ān, the ribāb, the khānāḥ, the ṣeṣiyā and the various combinations of these.

II. In MUSLIM INDIA
The madrasas in Muslim India were institutions of higher learning similar to those in other parts of the Islamic world. Their principal function was to train personnel for government service, more particularly for the administration of justice. They were either founded and subsidised by the state or established by private individuals. The education provided in them dealt mainly with religious subjects, and was offered by well-qualified teachers. The real foundations of Muslim education in India may be traced back to the establishment of the Dīhil Sultanate in 1206 and the emergence of Dīhil as an important seat of Islamic learning. Evidence points to the existence of two major madrasas in Dīhil in the early years of Muslim rule. One of them was the Mu'izziyya, an institution probably founded by Ilutmish (607-33/1211-36), and named after Muḥammad Ghūrī's title Mu'izz al-Dīn. The other
known as Nasiriyah, was built by Balban while he was working as chief minister to Nasir al-Din Mahmud (644-64/1246-60), from whom the madrasa took its name. As the Mongols overran the heartlands of Islam, many refugee scholars from Central Asia and Persia took shelter in Dhill, and their presence gave further momentum to educational activities in the capital. During his early Muslim period, Tuglul (752-90/1351-88) who, according to Firighta, built a large number of madrasas which had fallen into disrepair. Among the institutions founded by him the most outstanding was the Madrasa-yi Firdusi-Sahi, constructed in Dhill in 753/1352-3. It was the biggest madrasa in the capital, with residential facilities for both teachers and students. It stood on the southern bank of the Hawali-i Khayy, an enormous tank built by Ali al-Din Shuhuli in 695/1296. It was a double-storied building with arched galleries on all sides and projecting windows overlooking the tank, and its imposing facade gave further momentum to the task of establishing schools and colleges in the country during the 8th/14th and 9th/15th centuries. This, in turn, led to the growth of a parallel school system distinct from the regular madrasas. The emphasis on religious subjects in their curriculum seems to have remained constant throughout, and was the forerunner of the modern seminary of Deoband. Its organisation and working of the madrasa. The emphasis on religious subjects in their curriculum seems to have remained consistent throughout their history. An attempt was made during Akbar's time to give importance to the instruction of mediaeval rational sciences such as logic, mathematics, medicine and astronomy, but it is doubtful whether this was followed by every madrasa. The Dars-i Naqshbandi, after its introduction in the mid-15th/16th century, was adopted by the madrasas all over the country, thus standardising the syllabus for traditional education. It included Arabic grammar and syntax, logic, philosophy, mathematics, rhetoric, jurisprudence, principles of jurisprudence, scholastics and dialectics, exegesis and traditions. The cause of traditional Muslim education received a setback in the years following the decline of the Mughal rule. It suffered further reversal with the expansion of English education and spread of Western knowledge and ideas. Nevertheless, many madrasas continued to flourish in later times. The oldest among these was the Madrasa at Farang Mubals; another important madrasa was that of Deoband, a small town north of Dhill. It was founded in 1867 by Mawlana Muhammad Rasul Nizamuddin (d. 1879) in conjunction with other ulama. The last of the traditional institutions to be mentioned is the Nadwet al-Ulama of Lucknow established during his reign. But under his successor, Akbar (963-1014/1556-60), numerous madrasas were founded by the state as well as by private individuals. Akbar built a big college in his new capital Fatehpur Sikri [q.v.], and, in Dhill, his wet-nurse, Maha Anja, founded a madrasa in 969/1562-2, which was noted for its architecture. Akbar also laid down that the curriculum of the madrasas should include subjects such as ethics, mathematics, agriculture, geometry, astronomy, physics, logic, natural philosophy, theology and history. In response to Akbar's policy of religious accommodation, non-sectarian institutions increased in number, providing common education to Hindus and Muslims alike. During Akbar's reign (1014-37/1605-27), many madrasas which had ceased to function or had fallen into decay were restored and revived. The ruler issued an ordinance which required that if a wealthy person or a traveller died without an heir, his property should revert to the state and be utilised for the building and maintenance of the madrasas. Shahjahan's (1057-8/1648-57) name is associated with the imperial madrasa attached to the congregational mosque built by him at Dhill in 1610/1660. Under Awrangzib (1068-1118/1658-77), special emphasis was placed on the diffusion of Islamic learning. The foundations of the famous seminary in Lucknow, known as Farang Mubals [q.v. in Suppl.], were laid during this time. The name actually referred to the building granted by Awrangzib, towards the end of the 11th/17th century, to a family of scholars who made Farang Mubals a leading centre of Islamic learning. Mullâ Najm al-Din, author of Darari Nawâlid, the syllabus named after him, used to teach at this place. Another well-known institution, opened in Dhill during Awrangzib's reign, was the Madrasa-yi Râbihshul. Among the noted divine and father of Shâh Wali Allâh, this madrasa specialised in the teaching of exegesis and traditions.
in 1894. Among its founders was the reputed scholar Shibli Nu'mani (1857-1914), who remained actively associated with it from 1904 to 1913. All the above madrasas have survived up to the present time, despite their limited financial resources and meagre enrolments.

**III. Architecture**

The madrasa was a response to the specific needs of the Muslim community; it was a custom-built structure tailored to serve an institution which was itself a collaborative effort. Moreover, the madrasa was the creation of a self-confident, well-established civilization near the peak of its achievement: the earliest madrasas recorded are those of eastern Iran in the early 4th/10th century, and evidence unearthed by modern historians working on the pre-Saljûq period in eastern Iran suggests that the "prehistory" of the madrasa can be traced for at least one and a half centuries before the official Saljûq adoption of the institution. It is, however, highly unlikely that these earlier madrasas were substantial public buildings. Their very number argues against it. By 418/1028-9 there were twenty madrasas in the modest provincial region of Khuttal [g.v.], and each was fully endowed with waqfî. The missionary Karânjîmî movement [g.v.] which was so strong in eastern Iran in the 4th/10th and 5th/11th centuries had a strong educational and polemical bias, and both khânâkhs [g.v.] and madrasas were built in quantity by the adherents of this sect. The Ghaznavids also used madrasas endowed with waqfî in order to establish Islam in the stubbornly pagan territories of Ghur, possibly through the intermediary of missionaries from the Karânjîmî.

Above all, such foundations should be seen within the context of a well-established tradition of building madrasas in the large cities of the eastern Iranian world. The best documented case is Nishâpûr, where no less than 36 madrasas predating the great Niẓâmîyâ of the Saljûq empire (found ca. 456/1067) are recorded, though none of them survive; for further details, see above, section i, 4.

The apparently Eastern Iranian origin of the madrasa makes the obvious area in which to seek the architectural origins of the institution. Two major possibilities present themselves, and these are not mutually exclusive. The first, espoused by Bartold over sixty years ago, would link the madrasa with the Buddhist viharas as attested in Central Asia and Afghanistan. This area had been saturated with Buddhism in the centuries immediately preceding the Muslim conquest, and it seems not surprising that a Buddhist institution combining the functions of worship, education, communal life and burial should have flourished in the almost very area associated with the earliest madrasas. Bartold's preciosity was confirmed by the discovery of one such site at Adzhina-Tepâ just across the Oxus to the north-east of Balkh. This consisted of a monastery and stupa complex, the whole comprising two equal halves joined by a gangway and each measuring some 50 m square. Both elements use a four-aisled plan focused on a central courtyard. The monastery element consisted of temple structures, cells for the monks, and a large assembly hall, plus various ancillary buildings. All this is linked by corridors. In its essentials, and even more in its four-aisled plan, this 7th-8th century monument comes remarkably close in spirit to a madrasa, though the Islamic emphasis on education is somewhat more marked. Numerous other Buddhist sites have been excavated in Soviet Central Asia over the last two decades, among them Ak-Beshim, Airam, Kalâj-Kafirînqan and Kuba, while perhaps the most important Buddhist site in the Iranian world was just south of the Oxus—the Nawbahâr of Balkh.

The other architectural source which has been proposed for the Iranian madrasa is the typical Khurâsânî house. Godard, the champion of this theory, concentrated at the expense of the broken continuity of tradition between the mediaeval and the modern houses of the area. He then compared this domestic form with that of later madrasas and concluded that it was the private structure that had generated the public one. While the literary evidence gives ample warrant for the functions of a madrasa being carried out in private houses, no such houses which can be shown to have served this function have survived. Not as Godard's theory is, it cannot be more than speculative.

The formal, as distinct from the informal, history of the madrasa is commonly taken to begin in 468/1076 when the great Niẓâmîyâ madrasa was inaugurated in Baghdad. In short succession, a whole series of state-sponsored and largely state-financed madrasas sprang up throughout the Saljûq empire (see above, section i, 4). Two related factors deserve special emphasis here. One is the whole-hearted state support for these buildings, which is reflected in the name Niẓâmîyâ which they bore. They represent, in short, a state investment of the first magnitude. The other is their carefully calculated location in the major cities of the Saljûq realm. From this one may deduce that each was designed to serve as a provincial centre with a wide catchment area embracing the smaller towns and villages of the region. Such a function presupposes buildings of considerable scale and capacity.

The reasons behind this sudden spate of building activity, which significantly enough was confined to the Saljûq empire, are probably to be connected with the resurgence of Sunnite orthodoxy, spearheaded by the Saljûqs after their entry into Baghdad in 442/1055, as a counter to the propaganda efforts of militant Ismâ'îlî Shî'ism organised by the Fatimids from al-Azhar (founded in 359/970 [g.v.] and other
centres (see above, section 1.3). In fact, the Sunni orthodox madrasa-building activity soon stimulated a Twelver Shi'i counterpart movement, for according to the Kūthb al-Nabādī the latter 6th/12th century saw Shi'i madrasas appear in Ray, Kūn, Raḵān, Aša, Warāmīn, Sabzawār and elsewhere. One of the madrasas at Sāwā had indeed been found as early as the mid-9th/15th century. The form of these madrasas is as obscure as that of their Sunni counterparts, but to judge by the parallelism between Sunni and Shi'i madrasas in the Islamic world, there was probably no formal distinction between them.

The number of madrasas erected within a short space of time throughout the Sāljuḵi empire at the order of Niyām al-Mulk and by others is itself a clear indication that some kind of blueprint had been developed for this purpose. Unfortunately, none of these early Iranian madrasas has survived; in fact, the earliest extant Iranian building of this type is the Madrasa-yi Ḩācffī of 723/1325 in Isfahān. It is a compact structure (some 92 m × 72 m at its widest extent) employing the standard Iranian 4-iwan plan, but the modifications to the traditional layout are significant. The iwān no longer rear above their roof-line the tall arcades of the roofed iwān as in Khargird. This simple change entirely reverses the traditional pattern, in which the iwān was the dominant feature and dwarfed the flanking arcades. Two stories of continuously niched façades, behind which the cells for student accommodation were located, form the principal accent of the elevation and engulf the central iwān on each side. The question is, of course, whether such massy, cliff-like façades also characterised the elevations of the first Nizāmīyyas. The example of the Madrasa Ḩācffī, the known Sāljuḵi predilection for the 4-iwan plan, and the need to accommodate some 1,000 students living in the building as distinct from visiting it, all combine to suggest that the first official Iranian madrasas were indeed fairly similar to their Ḩācffīyān descend-ants.

So far the discussion has assumed that the more important of these early madrasas were purpose-built structures intended solely for the students accommodated in them. Other possibilities have, however, been aired. Perhaps the most extreme is that the buildings generally accepted as the major urban mosques of the Sāljuḵi period—those of Ardīstān, Qaswīn, Gulpāyagān and so on—were actually madrasas. This theory runs counter to common sense, for it does not account for the resultant absence of Friday mosques in these centres. More intrinsically likely is the proposition that the larger mosques contained an inbuilt madrasa element in the provision of a second storey around the courtyard. On occasion, the niched façades of these upper storeys could indeed lead to separate chambers, but the extremely diverse functions discharged by a Friday mosque in a large city means that a wide range of other purposes can be suggested for such rooms. Elsewhere in the Islamic world such joint foundations were labelled as such; cases of mosque-madrasa (see above, section 1.2) or mosque-mausolea and various other combinations abound in Manṣūrī Cairo. A further argument against the madrasa function of the upper storeys of large urban mosques in the Islamic world is provided by the well-documented practice of adding self-contained madrasas to established mosques (e.g. Isfahan and Maḥbād). There would have been little need for such new foundations if the mosques in question were already serving inter alia as madrasas. If one bears in mind the noted imprecision of the Arabic terminology of building types, and also the virtual interchangeability of these types, it will be clear that no firm conclusion as to the form of the pre-Mongol madrasa in Iran is warranted. Rather does the evidence suggest that the forms of the madrasa were scarcely less varied than those of the mosque itself. But the sad lack of standing buildings hangs like a cloud over any discussion of these early madrasas. Their organisation, curriculum, staff and finances, and arrangements can be followed up in minute detail in the literary sources; but the all-important question, for the student of architecture, namely the precise material form which they took, remains obscure.

With such a plethora of literary evidence available, it is ironic that Iran should retain not one pre-Mongol madrasa that is universally accepted as such. Two Sāljuḵi buildings have been identified by some as madrasas, but others deny this. The more controversial of them is a mud-brick ruin at Khāffīdī (ʿr.), whose damaged inscription specifically identifies it as a foundation of Nizām al-Mulk. Its principal surviving feature is a broad and deep double iwān with at least one room of comparable depth flanking it on either side. Little sense can be made of any other part of the structure, but the dimensions of the courtyard in front of the iwān might well be about 22 m × 28 m. In favour of the identification as a madrasa may be cited the very fact that Nizām al-Mulk is cited in the inscription as the official founder, although a mere Ḥācffī actually carried out the work of supervising construction. Why should this august personage, the pivot of the Sāljuḵi state, take an interest in Khāffīdī? The family of Nizām al-Mulk hailed from Sabzawār, and he himself was born in Tūs, so there can be no question of explaining his connection with this monument by his desire to erect a public building in his native town. Khāffīdī was a small town of secondary importance. Moreover, this structure is, as Herzfeld noted, very small for a courtyard mosque of its period, and the row of windows high up in the kibla iwān would make much better sense in the context of the cells on the first floor of a madrasa than as an element of mosque architecture. These various factors suggest that the most natural interpretation of the ruins is to see them as the sole surviving trace of Nizām al-Mulk's extensive programme of building madrasas, though against this it must be admitted that the presence of supplementary mihrābs does suggest a mosque rather than a madrasa. The flanking halls have also been cited as evidence that this is a mosque, but this feature occurs consistently in Anatolian Sāljuḵi madrasas. To summarise, the evidence seems to incline towards interpreting the Khāffīdī structure as a madrasa, but without fresh evidence there is no clinching the matter.

The other putative madrasa is a shoddily-published structure found in excavations at Ray in the late 1930s. Godard himself, the source of all the information available, at first expressed himself with reserve as to its function but eventually shed such caution and treated the identification as a certainty. Nevertheless, he produced no arguments to offset his earlier qualms about the eccentric orientation of the structure and its equally atypical emphasis—by means of the differential size of the iwāns—on the east-west rather than the north-south axis. It must also be admitted that the 16 habitable spaces which together parcel out the ground plan do not correspond in their layout to any known madrasa. All this being
admitted, it would be still more accurate to say that no mediaeval house of this kind is known either; that no of the ground floor spaces could well have functioned as cells accommodating one or several students, to say nothing of the capacity of an upper floor; and that cases of the faulty orientation of religious buildings are legion in mediaeval Islam and may vary with the efficiency of the local cleric. Commonly, by this building disappear if one assumes that the west iwan was intended to function as if it faced south-west, the direction of the kibla. Finally, and most significantly of all, the presence of a mitrâb is not easily explained away. Unfortunately, Godard's plan does not mark it, so that to identify it as a mitrâb is itself somewhat hazardous. Nevertheless, despite the fact that in its present form, on display in the Tehran Museum, it is largely a figment of the restorer's imagination, the published photograph of it in situ shows clearly enough the Kur'anic Kufic inscription which it bore. The presence of a mitrâb with a Kur'ânic inscription in a private house takes somewhat more explaining than does the eccentric orientation of a madrasa. Even so, it may be felt that the building at Ray presents rather more problems of identification than does its counterpart at Khârgird. Whatever conclusion is reached, it is regrettable that the undoubtedly seminal role of Iran in the early development of the madrasa is so unjustly obscured by the lack of early surviving specimens whose claims to be madrasas are not disputed.

It is with some relief, therefore, that one turns to an examination of the surviving madrasas whose identification as such is incontrovertible. The earliest of these, the madrasa of Gumbârgânî in Boşrâ, built up apparently by late date—532/1135—and located in Syria, an area which has not yet entered the discussion, is followed in brick succession by some fourteen surviving madrasas in Syria all dated or datable before 700/1300, and the literary evidence confirms that these are only a fraction of what was built in this period and has since vanished—82 madrasas are mentioned in the detailed chronicle of mediaeval Damascus, for example, and 41 in the more summary account of mediaeval Aleppo (see above, section 1, 4).

These numbers, impressive though they are, are, need not, however, be interpreted as confirmation of the primacy of Syria in the architectural development of the madrasa. Nor, pace Creswell, can this honour be claimed by Egypt without further ado. He lists some 29 madrasas in Cairo dated before 700/1300, and of these a scant four have remained. From the undoubted fact that the latter group includes the first cruciform four-rite madrasa to survive he has built an elaborate edifice of argument designed to establish the innovatory role of the Egyptian madrasa.

As will shortly be apparent, however, the area with the largest number of surviving madrasas datable before 700 is Saldjûk Anatolia, which boasts no less than 50 examples, of them datable to the 6th/12th century. Egypt and Syria together cannot match the latter tally, and indeed have only a third as many madrasas datable before 700/1300. Yet these buildings figure not at all in Creswell's history of this architectural type. Common sense dictates that the Anatolian madrasas, built in an area culturally dependent on Iran and geographically close to it by patrons who themselves sprang from Great Saldjûk stock would be likely to reflect the Saldjûk madrasas of Iran, whose decisive role in the formation of the genre has never seriously been questioned. Iranian influence may in any case readily be detected in the plan types, brickwork and the decoration of much of Rûm Saldjûk architecture. The historical background outlined above encourages the assumption that it is precisely in these unfortunately vanished Iranian Saldjûk madrasas that the essential original lineaments of the official madrasa are to be sought. Hence the paramount historic importance of the Anatolian Saldjûk madrasas as the closest surviving relatives of the Iranian type. Many of their features are duplicated in contemporary Syrian madrasas, which may be seen as a parallel and coeval group.

Returning to the Boşrâ madrasa, one notes that, like most Syrian madrasas, it is diminutive; for all that its patron was a senior amîr serving the Atabegs of Damascus, its external dimensions do not exceed 20 x 17 m. On this tiny scale, there is scarcely room for a proper courtyard, and the space which would normally be designated as such is, instead, a feature which was to recur a century later in some of the Saldjûk madrasas of Konya and elsewhere. Two lateral iwans open off this space, while a prayer hall and a kind of narthex to the south, the latter reached by narrow entrance vestibules to east and west, fill up most of the remaining area. In this single-storey building, the only space left over is the area flanking the prayer hall, which yields two rooms per side. Since these each average less than 4 m square, the total number of students accommodated in this madrasa can scarcely have exceeded a dozen. Such a building will simply not fit the popular image of officially sponsored madrasas located strategically throughout the Saldjûk empire and serving, at least in part, significant political ends.

Later Syrian madrasas rejected many of the solutions found in the example at Boşrâ. Perhaps the most distinctive local characteristic was to be the laterally developed prayer hall entered by a triple archway and vaulted in a variety of ways (Dâr al-Ḫadîjî [q.c.], Damascus, between 549/1154 and 569/1174; Madrasa Kân al-Tutun, Aleppo, 564/1169-5; Madrasa of Nûr al-Dîn, Damascus, 567/1172; and Madrasa of Shâdbakht, Aleppo, 589/1193 among others). Sometimes the central bay of the masâqal is domed, with groin vaults covering the flanking iwans facing each other across an empty space. Altogether exceptional is a joint foundation: in al-Ḫadîjî, for example, there are one large and one small courtyard unit, each with a pair of iwans facing each other across the court, an intimately domestic arrangement encountered earlier in palaces and caravanserais.

The emphasis on one rather than several iwâns may reflect the fact that the great majority of these buildings—all but seven of the 128 madrasas
in Damascus and Aleppo which pre-date 700/1300 and are recorded in the literary sources—were erected to serve a single madhhab and therefore required only one location for teaching. But this is purely supposition, for the two-inlin madrasas at Bôrâ was built to serve the Hanafi madhhab alone, while the two-rite Sultânîyya madrasa at Aleppo (620/1223-4) has no idâs at all. It therefore seems equally possible that any causal connection between the number of idâs in a Syrian madrasa and the number of madhâbahs which it served is more apparent than real. This conclusion seems all the more appropriate when it is remembered that neither Anatolian nor Turkish madrasas attest any consistent connection between the number of idâs in a madrasa and the number of madhâbahs which it serves. Against this wider perspective the Egyptian cruciform four-rite madrasa is nothing short of freakish, reflecting perhaps a conciliatory religious policy on the part of the founder. Not surprisingly it remained very rare; the overwhelming majority of mediaeval madrasas throughout the Islamic world were built to serve a single madhhab.

A cursory examination of the Syrian madrasas is enough to establish that the provision of student accommodation was not a major priority. The information available on this score is unfortunately not very precise, for most of these buildings are long since disaffected and modern houses have encroached on them. But the Bôrâ madrasa, as noted above, suggests in the gross disproportion between public and private space that the structure was purpose-built to accommodate no more than a handful of students, and that its catchment area was probably no wider than Bôrâ itself. Nûr al-Dîn’s Dir al-Hadîth in Damascus also seems to have had no more than four rooms, and although the other surviving Syrian madrasas are more generously provided with student cells, not one of them approaches the larger Maghrîbi madrasas, let alone those of Iran, for capacity. The Rûm al-Tutun madrasa in Aleppo probably had ten cells, while the Dar al-Hadîth, which was purpose-built to accommodate no more than a single student, is belied by the epigraphic evidence, which suggests that the teacher appointed to decorate them lavishly. What decoration there is, large capacity, just as it would have been wasteful to decorate them lavishly. What decoration there is, however, maintains a high level of quality and is set off by the consistently fine stereotomy of Syrian tradition. The stone vaulting of the time deserves particular commendation. Thus these madrasas were firmly rooted in a topographical, sociological and artistic context which depended little on external influence.

Perhaps the main distinguishing feature of these Syrian madrasas is the inclusion of a mausoleum (barâk [q.s.] or turba). Indeed, it is doubtful whether the connection between the madrasa and the mausoleum was ever closer than it was in Ayyûbîd Syria. Once again, epigraphy provides a clue for this, for incriptions in the Sultânîyya and Attabakîyya madrasas, located in Aleppo and Damascus respectively, refer to the recitation of the Qur’ân there. Provision was made for this recitation to be unceasing—an Islamic parallel for the Christian custom of paying for masses to be said for the souls of the dead. Burial in a madrasa, then, was—like burial in the neighbourhood of a saint—intended at least in part to confer barâk upon the dead. It was in Syria rather than in Egypt that the exaltation of the mausoleum at the expense of the madrasa proved itself a distinctively Syrian practice. One finds (e.g. Farrukh-Shâhiyya and Amjadîyya turbars, Damascus). Conversely, it sometimes happens that the inscription of a turba may mention the madrasa of which the mausoleum was part, and may indicate the only surviving evidence that such a madrasa ever existed (‘Izizya madrasa, Damascus).

The intimate symbiosis of turba and madrasa is epitomised by a curious joint foundation in Damascus. The Farrukh-Shâhiyya madrasa, with the mausoleum of ‘Uzz al-Dîn Farrukh-Shâh attached, dates from 578 or 579/1182-3. A generation later, in 628/1230, another madrasa was built beside it and this
tion was provided with a mausoleum, which housed the son of fizz al-Din, al-Malik al-Amgijd. Father and son, then, are buried in adjacent turbas; the turba of the former is, perhaps appropriately, the larger of the two. Similar pairs of tombs survive in Damascus and later in Mamluk madrasas. If the madrasas of Ayyubid Syria were analysed from the purely formal point of view, with no backward glance at their eastern origins, the obvious conclusion would be that a major, if not indeed the primary, purpose of the institution was to contain a monumental mausoleum. Is it fair to assume, then, that the term madrasa did not have a consistent meaning throughout the mediaeval Islamic world? Certainly, Ayyubid Syria provides evidence suggesting that the term did not denote one single type of building. Thus the Dur al-Hadidh or al-Ashrafyya in Damascus (654/1257) is called a madrasa in its foundation inscription, and in its sequence of entrance vestibule, prayer hall and turba conforms to the standard type of contemporary madrasa as illustrated by the Murshidkaya madrasa in Damascus. Conversely, the Khidryya, also in Damascus, is defined in its foundation inscription as an institution for teaching hadith, but is identical in form to the Murshidkaya. As in Iran and Egypt, it was common for a private house to be converted into a madrasa, but more ambitious conversions are also recorded and it is these that testify yet again to the loose boundaries between mediaeval Islamic building types. Thus the Halaiiyya madrasa in Aleppo was successively a church and a mosque before it became a madrasa, while the Madaddiyya served in turn as a madrasa, a burial ground and mosque. Thus the mere fact that a structure was founded with a given purpose in mind was no guarantee that it would continue to function as such, especially if the value of its endowment fell; it might easily shed some functions or acquire additional ones. The absence of any sign of student cells in many of these admittedly half-ruined Ayyubid madrasas invites speculation that at least some of these foundations were never intended to be residential.

If the Syrian madrasa tradition, as it developed during the scant century of its heyday, is analysed as a whole, the sheer variety of types encountered cannot fail to make an impression. It is hard to avoid the conclusion that these differences are not casual or contingent on the local topography, but rather reflect a basic uncertainty about the ideal form such buildings should take. For a long time, Syrian architects were sidetracked by the influence exerted by the mosque. The prestige of that long-established model helps to explain why ideas derived from mosque design permeate these madrasas. They were after all religious buildings. The Shaddabkhiyya madrasa in Aleppo (565/1170) is essentially a mosque writ small, especially in its laterally developed domed mosque that joined to the prayer hall by the plan alone, the teaching function of the building is plainly secondary.

Since Fatimid Egypt was officially Shi'i, it was impossible for the explicitly Sunni madrasa movement to establish itself there, or for that matter anywhere else in the Fatimid domains, before the fall of that dynasty in 585/1190. Within five years of that date, however, under the militant orthodoxy of Salah al-Din there were already as many madrasas in Cairo, swiftly to be followed, no doubt at least partly for propaganda reasons, by examples at Mecca and Medina. However, the long start which Syria had enjoyed in building madrasas seems to have resulted in a more lavish provision of these buildings in that area than in Egypt, where the total recorded before 700/1300 is only 31, about a third of the comparable figure in Anatolia or in Damascus alone. These figures are enough in themselves to cast doubt on the supposed primacy of Egypt in the architectural development of the madrasa.

The building of madrasas in Cairo gathered new momentum with the coming of the Mamluks. The largely vanished Zahiryya madrasa (686-9/1286-7) of Sultan Baybars was a gigantic 4-iwan structure with a stalactite portal probably of Syrian inspiration, a theme repeated in the deep niches with muqarnas hoods which articulated its façade. This building inaugurates, if indeed it was not preceded by some comparably magnificent earlier madrasa, the distinguished tradition of Cairoene madrasas with splendid façades and interiors to match. Anatolia was about a generation earlier in this development, so far as surviving evidence indicates, while Syria lagged behind.

This notable degree of splendour can be explained on both political and economic grounds. Mamluk madrasas in Cairo are overwhelmingly the product of royal or high official patronage, a fact consistently reflected in the names they bear and in their lavish decoration. Outward splendour would be the natural corollary of such patronage. But it would be inaccurate simply to treat these buildings as instances of conspicuous consumption, even though the lengths to which an amir or sultan would go to secure a fashionable site with ample street frontage do suggest such a conclusion. Many of them were endowed far more generously than their size and therefore the scope of their activities dictated, and while these endowments (nakfi) were inalienable under Islamic law, that same law permitted any surplus from an endowment to be applied to the benefit of the descendants of the original endower. The more lavish the endowment, therefore, the more such a foundation would approximate to an investment. Not surprisingly it was among the first concerns of an amir, upon reaching power, to found some charitable institution, not was there any bar to his adding pecuniary to its endowment over the years.

Perhaps the most ambitious of these multi-purpose Mamluk foundations, and the one which seems to have set the fashion for such institutions, is the al-Mu'tases tomb and madrasa of Sultan Kal'Uun, the whole built in a mere thirteen months (683-4/1284-5). As in the case of the al-Muhawwara (635/1237), the Sharif wa'din al-'Uqba, its internal arrangements are at odds with its façade, which at nearly 70 m is exceptionally long and to which a sense the whole building is subordinated. Mausoleum and madrasa are surmounted by a long corridor which led to the now largely-vanished hospital. It is no doubt significant that the Mamluk, now enlarged by a functionally dispensable courtyard, occupies a far larger proportion of the combined tomb and madrasa portion of the ensemble than it did in the al-Muhawwara. The madrasa itself has a generous courtyard with two fases on the longitudinal axis and cells disposed laterally. Its most notable feature is without doubt the qibla iwan which is divided into three naves and therefore explicitly associated with the traditional architecture of the mosque. Interestingly enough, Khallaw's son, al-Nasir Muhammad, himself built a mausoleum-madrasa cheek by jowl with his father's grand foundation, and in this later ensemble (655-703/1255-1303), the mausoleum is relegated to a subsidiary role beside a substantial 4-iwan madrasa.
This latter building has the peculiar distinction of being the first known cruciform madrasa intended to serve all four madhhabs.

By common consent, the masterpiece among these Mamlik ensembles, (150 x 68 m.), and certainly the largest of them was the mosque, madrasa and mausoleum of Sultan Hasan (737/6-1335-63). Its lofty portal, originally designed to have flaming minarets, and with a spacious vestibule behind it, bears the unmistakable imprint of Anatolian Seljuk architecture, but most of the detailing within is typically Cairoene. At first sight, the layout seems familiar enough, focused as it is on the ample tertia plan. But—and here again foreign influence, this time from Iran, must be taken into account—this cruciform plan is employed, exceptionally in the case of Egypt, for a mosque, while each madhab has its own madrasa in one of the corners of the building. The Sultan's own mausoleum, a gigantic dome chamber, extends the full width of the kibla wall and is placed emphatically not in Iranian fashion directly behind the kibla wall. It therefore usurps the position of the dome sanctum in the classical Iranian mosque. The building thus epitomises the vitality and versatility of the traditional tertia formula.

Several prestigious Mamlik buildings in Cairo, such as the various funerary madrasas of Sultan Qalawun and the funerary complex of Sultan Hasan, followed the lead of the Sultan Hasan ensemble. But its principal impact on later buildings was through its tertia schema, which henceforth was to be repeatedly used for mosque architecture until the Ottoman conquest. In other words, the architecture of the madrasa had now come to influence that of the mosque; indeed, the unprecedented expansion of the kibla tertia into a full-scale masjadda in later Mamlik buildings (e.g. the Káhit Bay complex) can only be explained by such a process. Presumably the decisive factor was that the mosque thereby gained a large unbroken space for the masjadda, which, unlike mosques with the tertia wall (which is sufficient indication that their role as places for prayer was not paramount.

At the mosque-madrasa of Burjikl, built a generation later (786-8/1384-6) the emphasis is reversed in favour of the madrasa without any fundamental change in plan. Thereafter, while true tertia mosques or madrasas remained the exception rather than the rule in Egypt (e.g. the foundations of al-Malik aI*N-Din of 845/1449 and Sultan Iskander of 860/1459), the principle that the same building could serve both functions was unassailable. It is not surprising, therefore, to discover in 717/1317 and 858/1454 century Mamlik architecture a marked propensity to use tertas, though the combinations varies widely—one, two or three tertas may be used in conjunction with courtyards, halls, madrasas or sets of smaller chambers; acute shortage of space was no doubt a contributory factor in these developments.

The diminutive scale of many Circassian Mamlik foundations, noted above, a set of domed bays forming miniature compartments take up the areas normally reserved for tertas. The liturgical distinction between the kibla tertia and the subsidiary ones was expressed in architectural terms too. The former was vaulted, and thereby given the illusion of still greater spaciousness, while the scale of the latter was reduced and their ceilings were now flat.

The madrasa to influence mosque design was indeed a momentous change; it signalled a new relationship between the two buildings. Earlier, the dependent status of the madrasa had been vividly expressed by the way it had been tacked on, very much in the manner of an afterthought, to the parent structure. Examples abound; they include the madrasa of 507/1113-14 beside the Great Mosque of Urfa and a trio of madrasas—those of the amirs Taybars (709/1309-10), Abuqbug (720/1320) and Æavanaugh (before 844/1440)—attached to the Azhar mosque in Cairo. Henceforth, however, these two institutions could combine their functions within a single building which was highly desirable given the chronic shortage of space in Cairo) and with minimum trespass of one upon the other. For it is noticeable that in the Sultan Hasan complex a novel solution for the madrasa has been devised: not only does each madhhab occupy a corner of the building, but certain aspects of the traditional full-scale madrasa are retained even on this miniature scale. The cells for students are clustered on two sides of a diminutive courtyard, except in the case of the Mlik madrasa situated in the western corner, where the exigencies of the site bisected the space available. Since the Mlik ete enjoyed relatively less popularity than the other three (though the Mliki professor was allotted the prestigious kibla alwi in the funerary madrasa of al-Mlik al-Na'ir), this solution was not as unjust to that madhab as might at first appear. Furthermore, the small size of the student cells meant that their numbers and dimensions could be readily adjusted to fill the space available, thereby obviating the need toNONE
al-Ghanndmiyya 1372 in Cairo, dated 774

al-Sh's ensemble conferred an implied legal recognition on al-Sh's madrasa, built in conjunction with a madrasa. This madrasa, the mausoleum occupied such a significant portion of the ensemble that it appropriately takes second place to the madrasa itself. The mausoleum in turn would have provided access for buildings behind it.

Among the surviving madrasas in Cairo one type is clearly predominant—the funerary madrasa. So traditional was this kind of building in Cairo that (to judge by surviving structures) it was the madrasa tout court that remained exceptional. In the earlier funerary madrasas, the mausoleum occupied such a significant portion of the ensemble that it is appropriate to describe such structures as joint foundations. Five such monuments survive dated between 677/1278 and 715/1315 alone, and they were only gradually superseded by foundations of still wider scope. It is hard to deny the conclusion that in the madrasa a convenient means of justifying the mausoleum was a conventional means of justifying the large room behind it—a focus both for the relentless emulation of the earlier Islamic orthodoxy. An example of this process is the vanished madrasa built in conjunction with a mausoleum near the grave of the Imam al-Shafi'i (d. 204/820) in 572/1176-80. This ensemble conferred an implied legal recognition on the cult of the imam; after all, if a funerary madrasa could be erected in honour of the founder of one of the four major madhhab, the practice could henceforth safely be regarded as unimpeachable. Nevertheless, the mausoleum continued to provide the true focus of the building, and it is almost invariably usurps pride of place. This is particularly evident when the ensemble includes two mausolea instead of one (funerary madrasas of Salar and Sardjar al-Djawili, 703/1303-4), although later in the century such double mausolea appropriately enough take second place to the madrasa itself madrasa of Khwain al-Baraka, also known as that of Shabtin, 770/1373-9). The inclusion of minarets, which by this time were too common in the city for fresh ones to be anything but redundant, may also have been designed to ward off pious disapproval. Even so, it was the mausoleum and the mausoleum, not the madrasa itself, which gave these buildings their distinctive stamp externally. Perhaps the competition of these already well-established building types was one of the factors which prevented the madrasa from developing its own instantly recognisable form. A modest edifice in the name of the Mamluk Khalik al-Djawand (719/1320), described as a masjid in its inscription, has long been demolished; rooms on the roof, the striking resemblance to the slightly later Mihr'ihilyya and the historical evidence all point to its being a madrasa, epitomises the simplicity and austerity of the madrasa, once the conspicuousness of such parodic structures. It is the first Cairo madrasa to have the sabil roofed in the Anatolian manner. This feature continues in later madrasas and results in the courtyard shrinking to the level of a large room (madrasa of Jaiat Bay, 808/1403).

These remarks should not be construed to suggest that Caliphs' madrasas served exclusively educational, religious or funerary purposes. A casual resemblance set down by al-Makridi indicated that the madrasa-mausoleum of the Aflār Karasunkur was used as a hostel by couriers of the barid service preparing for their return journey to Syria and elsewhere. The same source mentions a ribat for women attached to the madrasa and mausoleum of the Aflār Sarkour Sa'dī (715/1315). But above all, the madrasa provided a focus both for the relentless emulation of the Mamluk anton in architectural projects and for their desire to make financial provision for their descendants.

Just as the madrasas of Syria in the 6th/12th and early 7th/13th centuries yield valuable data not available from Egypt as monuments, so for Mamluk Egyptian madrasas provide both the basis and the opportunity for their emulations. This decline is not reflected solely in Syria; it is a widespread characteristic of later mediaeval architecture in Syria, and is only to be expected given the henceforth provincial status of the area. After the death of Baybars, whose own early career adequately explains his interest in Syria, it was very rare for a Mamluk sultan to undertake a major building project in Syria in the 8th/14th and 9th centuries, such as that of Sha'bun, 770/1370. The funerary mosque of Sulaym Shajrī (719/1320), described as a madrasa and a mausoleum of the Sultan Shajrī (808/1403), may also have been designed to ward off pious disapproval. Even so, it was the mausoleum and the mausoleum, not the madrasa itself, which gave these buildings their distinctive stamp externally. Perhaps the competition of these already well-established building types was one of the factors which prevented
The ensemble takes an unusual form which is due only in part to the exigencies of the site. At ground floor level it comprises three elements. The most important of these is a large assembly hall (ma'djma)
whose capacity and spatial extent are much reduced by the architect’s decision to retain in his remodelling (the original piers of) the arcade enclosing the Haram. Here congregated the judges, fukah, and other notables connected with the madrasa. Behind the hall is a series of three adjoining square or rectangular rooms whose western walls about the Bala-diyu madrasa; they neatly subdivide an awkward lateral corridor of space. The third component of the ground floor layout is the entrance complex, which comprises a vaulted porch open on all four sides and leading to the entrance itself flanked by stone benches (masbahas), which opens into a tripartite area. The last two are ingeniously and slightly planned to serve as a self-contained madrasa. As such it immediately recalls, for example, the Djamhiriyya madrasa in Jerusalem itself, which like the Ashrafiyya is intimately dovetailed with a pre-existing structure, or the Mihkkiyya madrasa in Cairo. The first-floor unit divides naturally into two areas, one north of the minaret above the staircase and the other west of it. The latter area consists of an L-shaped open-air terrace (sâha) with twenty rooms, disposed roughly as uneven pairs, to the south and five identical rooms plus a washroom (mustandar) to the west. Even if the larger rooms are excluded and only symmetrically repetitive chambers are identified as student cells, the number of resident students which were catered for here can scarcely have been less than twenty. Its sister foundation in Mocca had (according to one account) forty students attended by four lecturers (madarrisûn) plus a jurisconsult (jâkêb), Kurân rectors (hurûd) and, somewhat surprisingly, muezzins. The area north of the minaret comprises another open-air terrace to the west, lavatories with a reservoir, and a remarkably compact cruciform madrasa adjoining the terrace to the east and thus placed directly above the madina, comprising a rectangular hall some 25.7 x 12.1 m. in area. The east side of this takes pride of place among the others since it is the one which looks out on to the Haram. It has in effect been transformed into an open loggia offering spectacular views over the Haram. This architectural form, known as maqÂd or fârma, has a wide distribution in domestic architecture throughout the Near East, and may parenthetically be compared with similar forms in contemporary Renaissance architecture; it underlines yet again the deep roots of the madrasa in domestic prototypes. But this development, for all its domestic flavour, also had religious implications, for the view from this loggia was over one of the holiest sites in the Islamic world. A note of luxury is struck by a huge stained glass window and is echoed through the complex—in the two-tone (abiak) masonry, the polychrome marble flooring of the ieddeh and inner courtyard (a practice frequently encountered in late Mamlûk Catreme madrasas), the veneered wooden ceilings of the ieddeh, the lead sheeting of the roof and in its carpets and lamps, whose beauty, in the words of a contemporary historian, was "unequalled elsewhere". In short, there is ample evidence that the Ashrafiyya was a metropolitan import into the local architecture of Jerusalem.

In the earlier part of this section the discussion focused on literary references to the earliest madrasa. This emphasis was dictated by the lack of surviving structures. It is unlikely that future excavations will substantially illuminate this crucial early period. After all, the written sources indicate clearly enough that the early, pre-Saljûk, madrasas, in keeping with their private and non-official character, were of a domestic nature. Frequently a house became a madrasa without, if it seems, any structural alteration, or served impartially as house and madrasa by turns. It follows that excavated ground plans will not be enough in themselves to prove that a given pre-Saljûk structure functioned as a madrasa. Even in the Saljûk period itself, the two Italian buildings identified by some as madrasas (the ruined structures at Khirûrâd and Ray) have aroused a controversy still not laid to rest. In this situation it seems sensible to accept that the architectural history of the madrasa before 530/1136 (the date of the first reference) is irretrievably lost, no matter how rich the documentation of its character as an institution may be.

Such a conclusion inevitably confers particular evidential value on the earliest considerable group of madrasas to survive, namely the examples in Saljûk Anatolia, where 95 surviving examples permit a more searching and reliable analysis of trends than do 15 Syrian ones. These Anatolian buildings have been quite unjustifiably neglected in the history of the genre; Creswell’s obsession with absolute chronology and his bias towards material from Syria, Palestine and Egypt led him to over-estimate the geographic area in the development of the madrasa, and his views have dominated subsequent discussion. However, the Anatolian madrasas are the best available guide to the nature of the building in Saljûk Iran; thanks to the work of Kurân and Sozû, they are much better known as a group than any others in the Islamic world. Some of them datable before 910/1500 survive, and this figure can be supplemented by a further 58 vanished buildings of the same period recorded in the literary sources. In both categories, incidentally, the numerous Ottoman buildings, which form a separate study, are excluded; the grand total of Anatolian madrasas surviving or recorded in this period is probably about 200. The preponderance of surviving over vanished buildings is highly unusual in the medieval Islamic world and is unlikely to reflect the true state of affairs. But the two sets of figures do complement each other significantly. They confirm what may be deduced from other sources—that building activity was most concentrated in the 9th/13th century, that is, under the Saljûks of Rûm. Forty-nine surviving and 27 vanished madrasas, that is almost half of the entire recorded output of Anatolia in the period 1000-1500, date from this century. The comparable figures for the 8th/12th century, are 22 and 15, comprising about a quarter of the output of the whole. The Karamanids, the principal patrons responsible for new madrasas in this period. In the 9th/15th century the rate of construction declined still more sharply by a further 70%. Even the 6th/12th century saw more construction than this, with nine surviving buildings and a further six so far recorded in the literary sources; but of course the decline of Baylîs madrasas in the 9th/15th century directly mirrors the growth of Ottoman power. Indeed, the earliest Ottoman madrasa to survive, that of Sulaymân Pasha at Iznik, predates 759/1359 and was itself preceded by a now vanished madrasa at Bursa. With the 9th/15th century, Ottoman madrasas began to be erected over much of Anatolia.
slow spread of the madrasa in this area and period. But with the consolidation of Rûm Seljûq power, the movement gathered such momentum that it long outlasted the disintegration of the Seljûq state. Clearly, it had deep roots in the society which it served.

Not surprisingly, therefore, and in contrast to the situation in Egypt, Palestine and Syria, and for that matter in the Maghrib, these mediaeval Anatolian madrasas were not confined to a few large cities. The surviving examples alone are distributed among 39 cities, towns and villages throughout the length and breadth of the land, while the literary sources add a further dozen localities. In the fullest sense, therefore, this was a popular movement. Naturally this did not exclude a concentration of madrasas in a few key centres. Konya, as the Seljûq capital, obviously took pride of place, though only seven of its 24 madrasas have survived. Next comes Mardin, the Artuqid capital, where surprisingly enough 11 of the recorded 13 madrasas remain; similarly, Kayseri retains 9 of its 11 recorded madrasas. These are without doubt the three major centres of the time. However, quite a number of towns had between four and six madrasas erected in this period—Sivas, Sivrihisar, Alaplı, Tirc, Aksaray, Erzurum, Diyarbakir and Karaman. Thus there is ample evidence to indicate that the intensive building activity of a few centres was complemented by provision in depth at a good many more. Finally, seven sites are recorded with two or three madrasas apiece. Such a remarkably even spread of facilities throughout the land may best be explained by the interaction of two complementary trends: a centralised building programme and—though probably to a lesser degree—a popular fashion for the madrasa as an institution, or at any rate as a suitable object of modest architectural patronage.

It is in fact these Anatolian buildings which provide the best evidence of the multi-functional nature of the mediaeval madrasa. In so doing, they are a reminder that the form of these buildings is not an infallible guide to their function. Many a building now conventionally termed madrasa/madrasa/medrese and subsumed in the present discussion was actually intended to serve as a medical school, a hospital, an observatory, a mental hospital, an imaret, a tomb, a mausoleum, though the complex of İsmâ'îl Bey at Karaman (836/1433) comprising mosque, hospital, tomb, mausoleum, and madrasa, is the complete model. In the case of Long-An (880/1475) runs it close comprising mosque, hospital, tomb, mausoleum, and madrasa, but the complex of İsmâ'îl Beg at Kastamonu (ca. 850/1445) runs it close comprising mosque, hospital, tomb, mausoleum, and madrasa. Such buildings make most sense in an Ottoman context. Any attempt to characterise the mediaeval Anatolian madrasa must therefore reckon with this very varied background, but it is their paucity that is most striking. Even the most splendid of all domed Anatolian Seljûq madrasas, that built in Konya in 611/1215 by the vizier Djalâl al-Dîn Karatay and bearing his name, has no more than a dozen cells. The most capacious madrasa of the period, on the other hand—the Çifte Mihrâb in Erzurum, which at about 48 m is the largest Anatolian madrasa of the period—still has a mere 19 cells on each of its two stories and therefore lags far behind the larger madrasas of the Maghrib or Irâq. In the 8th/19th century, the capacity of the average Anatolian madrasa declined still further. Seljûq Anatolia shows just as clearly as do Syria, Egypt or Iran the growth of the multi-purpose foundation, and several Anatolian madrasas were built in conjunction with structures serving another purpose altogether. Thus the madrasa at Cay bears the same date (677/1279) as the caravansarai which adjoins it. Presumably as in the case of similar though later joint foundations (those of Amir Mirjân in Bagdad, 736/1336-7 and Şeh Şultan Huseyn in İsfâhân, 1105-1105-1272), the revenues of the commercial establishment were intended to finance the running costs of the madrasa. It was common enough, too, for a madrasa to adjoin a mosque (Zingirîyya madrasa, Diyarbakir, 595/1198; Ḥâdiṯ Umâd madrasa, Kayseri, 649/1250-51) or may not have a portico around the central space—

a place of prayer, an elaborate façade, a mausoleum (or even two, as at the Boyâlîkî madrasa), a minaret, a bath, a fountain or halls for public gatherings. Not surprisingly, the cells are usually tiny, a mere three paces per side. But it is their paucity that is most striking. Even the most splendid of all domed Anatolian Seljûq madrasas, that built in Konya in 611/1215 by the vizier Djalâl al-Dîn Karatay and bearing his name, has no more than a dozen cells. The most capacious madrasa of the period, on the other hand—the Çifte Mihrâb in Erzurum, which at about 48 m is the largest Anatolian madrasa of the period—still has a mere 19 cells on each of its two stories and therefore lags far behind the larger madrasas of the Maghrib or Irâq. In the 8th/19th century, the capacity of the average Anatolian madrasa declined still further. Seljûq Anatolia shows just as clearly as do Syria, Egypt or Iran the growth of the multi-purpose foundation, and several Anatolian madrasas were built in conjunction with structures serving another purpose altogether. Not surprisingly, the cells are usually tiny, a mere three paces per side. But it is their paucity that is most striking. Even the most splendid of all domed Anatolian Seljûq madrasas, that built in Konya in 611/1215 by the vizier Djalâl al-Dîn Karatay and bearing his name, has no more than a dozen cells. The most capacious madrasa of the period, on the other hand—the Çifte Mihrâb in Erzurum, which at about 48 m is the largest Anatolian madrasa of the period—still has a mere 19 cells on each of its two stories and therefore lags far behind the larger madrasas of the Maghrib or Irâq. In the 8th/19th century, the capacity of the average Anatolian madrasa declined still further. Seljûq Anatolia shows just as clearly as do Syria, Egypt or Iran the growth of the multi-purpose foundation, and several Anatolian madrasas were built in conjunction with structures serving another purpose altogether. Thus the madrasa at Cay bears the same date (677/1279) as the caravansarai which adjoins it. Presumably as in the case of similar though later joint foundations (those of Amir Mirjân in Bagdad, 736/1336-7 and Şeh Şultan Huseyn in İsfâhân, 1105-1105-1272), the revenues of the commercial establishment were intended to finance the running costs of the madrasa. It was common enough, too, for a madrasa to adjoin a mosque (Zingirîyya madrasa, Diyarbakir, 595/1198; Ḥâdiṯ Umâd madrasa, Kayseri, 649/1250-51) or may not have a portico around the central space—

222x155}Madrasa

The rich quantity of Anatolian material available permits a variety of conclusions. The most important of these is perhaps that no single type of arrangement was dominant. This in turn invites speculation that the evolution of the genre was by no means complete. In some madrasas (Tokat, Karahisar), a whole cluster of rooms of varying shapes and sizes mirror the uncertainties of the architect. In many of these buildings, too, the notional purpose of a madrasa—to house students seeking a theological education as a first step to joining the Islam—obviously comes a poor fast to such other functions as providing
a more rewarding subject than its architecture, therefore deserves separate consideration.

The most convenient explanations—that the form is dictated by function or by climate—will obviously not do. After all it is the domed, not the open, madrasa that is exceptional in Anatolia. Nor can regional preferences be invoked, for the type occurs with variable consistency throughout the country. An important factor in its genesis is clearly to have been that interchangeability of building types so typical of mediaeval Islamic architecture. The association of the madrasa with burial and worship would make it natural for the forms of mausoleum and mosque to be integrated into the structure of the madrasa—as indeed happens—and eventually to exert influence upon its form. Moreover, it can scarcely be coincidence that it is precisely the madrasas of smaller surface area which attest the domed type. If very few students were to be accommodated in the building, the need for a substantial courtyard would diminish. In such a situation, the building would gain extra dignity and monumentality by the placing of a dome over the central space, while the primary function of the courtyard would be retained by means of a skylight and/or a fountain. This ablutions fountain or ẖaḍirvan readily brings to mind the impluvium of the atrium in a Roman house, and thus underlines yet again the domestic origins of the madrasa. The integrating power of a central dome may also have been a relevant factor in the growing popularity of the domed madrasa.

Two further considerations, which are perhaps only at first sight mutually exclusive, may be borne in mind. First, the compact madrasa with large central dome and smaller domed or vaulted areas surrounding it cannot fail to recall the standard type of mid-Byzantine church which was widespread in Anatolia at the time of the Turkish conquest. Nor is this resemblance simply a matter of external silhouette; the rear ẖaḍirvan flanked by dome chambers in the domed madrasas of Konya brings to mind a Byzantine church apse flanked by diaconicon and prophets. Secondly, when these domed madrasas are seen not simply in their contemporary context but against the later background of Ottoman architecture, especially mosques, their emphasis on an integrated multi-domed and -vaulted space may be recognised as prophetic. Indeed, some of these domed madrasas, such as the İnçe Minârellî madrasa in Konya or the Taş madrasa in Akşehir, actually incorporate earlier mosques in their structure. This close link with mosque architecture is incidentally not to be seen in the courtyard madrasas, which in Anatolia at least developed quite separately, but whatever the origins of the idea, its development was fortunately consistent right up to the Ottoman culmination.

Anatolian courtyard madrasas, like those of domed type, do not readily fall into formal sub-categories, although attempts have been made to analyse the buildings on the basis.

Certain generalisations about these buildings may be made. It is clear, for example, that the typical rectangular madrasa kept the façade short in relation to the sides. This had the advantage of concentrating student cells on the long sides and separating them physically from the rooms serving other functions. Most cells had a fireplace and a cupboard, but sanitary facilities were communal and there was usually no provision for meals to be cooked on the premises. Equally characteristic is a tripartite division of the building parallel with the major, that is the longitudinal, axis, as in contemporary caravansaries.

At the far end of that axis, marking the kibla and continuing the major chord first sounded by the portal, is a wide ẖaḍir or dome chamber serving as the mosque and frequently flanked by a subsidiary vaulted or domed room on either side. Evidently some honorary intent lies behind this placing, though it must be conceded that the mosque was sometimes located elsewhere in the madrasa (for example, next to the entrance vestibule at the Çifte Minâre madrasa, Erzurum). When the madrasa form was used for an observatory (Wāziyâliya madrasa, Kütahya, 714/1314), a small opening in each of the lateral dome chambers served for star-gazing. In a true madrasa, these two chambers most likely functioned as classrooms and for the library; smaller rooms flanking the entrance perhaps accommodated the professors. In the 4-ẖaḍir plans the kibla ẖaḍir is typically the broadest and the most richly decorated of all, and it has a similar pre-eminence in two-ẖaḍir madrasas, in which the ẖaḍirs, as in Iranian Saljûq building of that type, are confined to the longitudinal axis. However, the form of the ẖaḍir within these buildings—as distinct from their exteriors—does not follow Iranian precedent, in that its façade comprised the ẖaḍir alone without a framing ẖajâjûn.

The discussion so far has touched on the question of the originality of these Anatolian madrasas, but the dearth of contemporary comparative material from elsewhere forbids any very positive statement on this score. Even so, one may set against the occasional echo of Syrian madrasas or of Iranian buildings, a growing sense of confidence in forging a local style. Imported ideas are rapidly given Anatolian garb, as the fate of Persian elements shows. Minarets become stumper and stockier than in Iran, with tiers of well-articulated balconies; in 4-ẖaḍir plans, the ẖaḍirs are diminished and subordinated to the emphasis on continuous arcades surrounding the courtyard, and a pronounced longitudinal axis—at odds with the centralising function of the 4-ẖaḍir plan—makes itself felt. It should also be pointed out that the first four-ẖaḍir madrasa to survive is in all probability not, as is often thought, the Mustaṣarîyya in Baghûd but the Masûdîyya in Diyarbakir, founded in 590/1193-4. Such a detail symbolises the central importance of mediaeval Anatolia to an understanding of madrasa architecture.

Ottoman madrasas inevitably look somewhat tame when measured against the output of the preceding centuries, but what they lost in unpredictability they amply made up for in symmetry and scale, characteristics hitherto undervalued. Long, uncluttered façades are preferred, and this change is symptomatic of the security which was to replace the luxuriant idiom of Saljûq and Beylik architectural ornament. But it is more than a matter of stylistic preference. The typical Anatolian Saljûq and even Beylik madrasa was a self-contained foundation, even if its raison d'être was as often funerary as educational. Exceptions are not hard to find, but they are distinctly recognisable as such. With the advent of the Ottomans to supreme power, the joint foundation—typically a mosque- or dome-madrasa, but frequently a still larger complex—becomes commonplace, and sometimes several madrasas cluster around a mosque; such an ensemble is conceived as an architectural unity and often executed in a single building campaign.

These changes left their mark on the madrasa. Its function as a place of prayer was now positively subordinated to its role as an educational institution, and this change is swiftly mirrored in its architecture.
The main is domed and by degrees removed, and in its place appears the dominant dome chamber; the Çelebi Mehmed madrasa, Merzifon (817/1414), illustrates an intermediate stage of this process, with its compact, square layout focussed on a central courtyard, ideally adapted to a cruciform Islamic plan; but the facias no longer dominate the arrangement, for behind each of them rises a powerful, foursquare domed musalla.

The closer relationship between mosque and madrasa in this period was to have still more far-reaching results. There was less need to provide ample facilities for prayer, so the musalli or musallâ occupies a smaller proportion of the surface area. Innovations in mosque design are swiftly reflected in the planning of madrasas—for example, in the provision of a mediating cloister, each bay domed, between courtyard and cells. Above all, the madrasa was now readily conceived as a mosque with small proportions reserved. Thus the domed musalli shrinks to a few metres square, although it is symbologically singled out by virtue of its isolation at the far end of a marked corridor. Madrasas were typically large, but not as large as the great congregational mosques to the west. From the rest of the madrasa, as at the madrasa of Bayâzid II at Edirne and, still earlier, the Muradîyya and Yezdî madrasas in Bursa. Instead, the courtyard enclosed by cells on three sides takes pride of place. The resultant U (or reversed U) shape soon became standard in the Ottoman madrasa.

Perhaps the most important change in emphasis in Ottoman madrasas vis-à-vis their predecessors lies in the hugely increased numbers of student cells. The designer had a free hand and did not have to tailor his plan to an awkward and immovable site, so that as a result, perhaps, space is used quite prodigally; the cells are now domed, and often have two windows apiece. The courtyard has not only a prodigiously large open space, but the cells are now domed, and often have two windows apiece. The courtyard has not only a prodigiously large open space, but is also planted with trees, possibly in an attempt to minimise the sense of the central pool or fountain but is also planted with trees, possibly in an attempt to minimise the sense of the central pool or fountain but is also planted with trees, possibly in an attempt to minimise the sense of the central pool or fountain but is also planted with trees, possibly in an attempt to minimise the sense of the central pool or fountain but is also planted with trees, possibly in an attempt to minimise the sense of the central pool or fountain but is also planted with trees.

The difficulty, of course, lies in identifying such "hidden" madrasas. Inscriptions might provide the requisite clues; in fact, Sauvaget interpreted the Arslânî ğhâni as a madrasa on the strength of a Kur'ânic inscription in the hûla ifrîd mentioning the ways (ma'dâshî) of reaching God. But this is too fast. Rather would it be justifiable to infer from that inscription that at least the hûla ifrîd of this mosque may have been used for teaching purposes in the Sa'djuk period. Such Iranian mosques as have rooms of various kinds on the first floor might be regarded as prima facie candidates for residential madrasa status, in addition to their primary role as communal places of worship; but unfortunately, published plans are virtually without exception confined to the ground floor and give no hint as to the disposition of the upper level. The lack of formality which characterised mediaeval Islamic teaching methods enabled virtually any mosque to perform the teaching and religious functions of a madrasa; special lecture rooms were not required. This close functional correspondence between mosque and madrasa clearly favoured composite foundations, or at any rate the use of one building for several distinct purposes, and such a concept was of course widespread in other categories of Islamic architecture.

Enough has been said to highlight the difficulties of matching the physical and literary evidence about the early history of the madrasa in the Iranian world. In this area the earliest madrasa identified as such by inscription is the example dated 571/1175-6 at Shâhî Maghdâd in north-western Afghanistan. Ruined as it is, it nevertheless yields much useful information. To begin with, its splendid ornament proclaims it to be a monument of the very first importance, and in size alone, the building is re-
MADRASA

markable for its time, measuring as it does some 44 m. per side. This far exceeds the dimensions of 6th/12th century madrasas further west, but it was to find many subsequent parallels in the Iranian world. Nothing on such an ambitious scale survives from the following two centuries, and the obvious question is why this exceptionally large and expensive building was erected in an area which was always remote. The minaret of al-Qāsim (see qābūd) may provide the necessary clues.

The role of that tower as a beacon of Islam in a context which until recently had been pagan goes far to explain its site, size and epigraphy; and the madrasa of Shāh-i Makhad, with its fifteen inscriptions, may have been intended in similar vein to stamp an Islamic presence on a stubbornly pagan countryside.

Ilkhān madrasas are on an altogether smaller scale, but before they are considered, one building from an area hitherto neglected—Tirik—deserves notice. Already in the late 5th/11th century, Ibn Qudāmah [q.v.] had recorded some thirty madrasas in Baghdad alone, all of them in the eastern sector of the city. All of them, however, were eclipsed by the madrasa of al-Mustansīr. The originality of its design is in itself and subsequently as the exemplar of the genre and its fullest, finest expression. Its endowments (awqāf), too, exceeded those of other madrasas. To a later age, it is the obvious symbol of the rejuvenated late ʿAbbāsid caliphate, and several factors suggest that this symbolism was deliberately intended at the time. The madrasa was built in Baghdad, which for six centuries had been the spiritual and intermittently the political centre of the Islamic world. It proclaimed the essential unity of orthodox Islam. Its patron was the caliph himself, who lent his name to the building.

It was the first madrasa specifically designed to serve each of the four major madhābī, as well as containing facilities for the two fundamental cullinary disciplines taught in a dār al-hadīth and a dār al-kurān. Each madhābī had its own place of worship. Thus the building explicitly claimed universal status. The long band of foundation text inscribed in letters a foot high, that unfolds, in defiance of the site's pre-eminent status. The long band of foundation text, in defiance of the site's pre-eminent status.

The madrasa of Shāfāwī al-Dīn in Yazd, otherwise known as the Zindān-i Iskandār and datable to the 8th/14th century, is of substantially lower quality than the two Isfahān madrasas; indeed, it is constructed of mud bricks. Despite subsequent modifications, enough survives of the original layout to suggest that the inscriptions on two adjoining sides of the courtyard were complemented by another pair opposite. Apart from this, there is little observable regularity in the plan; its rooms are indiscriminately oblong or square, broad or narrow, multi-reeceded or without unbroken walls, and are bundled together with outright carelessness. The Shāfāwī madrasa of ca. 765/1365, also in Yazd—indeed, the literary sources record the names of about a score of 8th/14th century madrasas built in that city—is an incomparably more soigné variation on the same theme. Here the design is tauter and fully integrated, each half a mirror reflection of the other: the portal qābīr announces the major axis, which continues without interruption until it terminates in the square mausoleum which adjoins the madrasa proper but projects well beyond it; and long lateral halls flank the portal minār in a foretaste of Timurid buildings at Ḵāvīz and Gāzūr Gūh in Ḵᵛārezm.

The Timurid period was unquestionably the golden age of the Iranian madrasa. Khurāsān and Transoxiana were the foremost ground for new developments, though competently-designed madrasas were also built in southern Iran, and features from that area are sometimes incorporated into the monuments of the north-east, like the biqābīr [q.v. in Suppl.] at Ḵāvīz. The four-iwan type predominated and was executed on a scale consistently more spacious than had earlier been the norm anywhere in Iran. This ambitious scale often generated comparably ambitious decoration; the finer madrasas of the period yield nothing in the quality of their ornament to contemporary mosques, and occasionally even strike out in new directions, as in the murals with trees, streams and birds in the madrasa of Tūmān Āqīḵ at Khišān (844/1440-1). Such was the prestige acquired by this kind of madrasa that it became the model for nearly all the notable madrasas erected in the Iranian world in subsequent centuries; numerous madrasas in Safawī Isfahān, Shāykhābād Buḵhrā and even Moghal India, illustrate this dictum.

It was in the Timurid period, then, that the consonance between mosque and madrasa became so marked that there is little to distinguish them so far as external and internal façades are concerned. What goes on behind the façades, however, is very different in the two cases. Within the general format of the four-iwan plan, there was ample room for experimentation in the placing of mosques, mausolea, lecture halls and residential accommodation. A side-
effect of the greatly expanded size of these foundations was that room could now be found for a wide range of ancillary units, such as libraries and khana-khābs for example, and for differentiated summer and winter chambers. Sometimes—as at Ukhudwudan, Khārāzmd and in the Ulugh Beg madrasa at Bukhārā—the complex contained a mosque, and often a lecture hall as well. Sometimes both units were mosques (as at Turbat-i Dām) or lecture halls. In other madrasas, such as that of Ulugh Beg at Samarkand, dated 820/-1422, the mosque extended the full length of the yābd side opposite the portal ledān. By contrast, a trio of madrasas in the Magḥībī shrines (Dā Dar, Parzīkūl and Bābā Saī) have the mosques placed in the corners of the courtyard. Indeed, the Dā Dar madrasa even has a second mosque in a corner of the building. There was no general rule governing the siting of the mausoleum in these royal Timūrid madrasas, but the examples of the Gawhar Shāh and Sulṭān Husayn Baykūrā madrasas in Harāt, and that of Fīrūz Shāh at Turbat-i Dām, show that they could be the single dominant feature of the entire complex. Indeed, the fashion of the time firmly favoured the incorporation of mausolea into madrasas, and free-standing mausolea of high quality are exceptional. As a curiosity, the siting of a diminutive madrasa in the entrance complex of the ZiyAratgAfr i^jarai is noteworthy. In smaller madrasas, such as those of Maghībī, the incorporation of mosques and mausolea seriously overbalanced the ensemble and cut down the space available for student cells. But these cases are somewhat unusual, since the architects had to make do with a site which was already heavily built up and therefore had to sacriﬁce symmetry to expediency.

The new emphasis on scale implied almost by deﬁnition a corresponding emphasis on external façades. Minaret are used to mark the corners—e.g. the Ulugh Beg madrasa at Samarkand and numerous later examples such as the Mīr-i Aṛūb madrasa at Bukhārā, 947/1540; and the portal is now apt to be recessed and thus streamlined with the curtain walls of the façade rather than projecting from it. Sensitivity to the setting of the monument made it natural to group such buildings together, notably in the Rūstān at Samarkand (Ulugh Beg, Šīr Dar and Tilla Kari madrasas) or the Labān Hawd complex at Bukhārā.

As in Ottoman times, again, there was a tendency for these very large madrasas, all endowed by royal patrons or high ofﬁcials of state, to cluster together in the major cities. Thus the original plan conceived by Nīgān al-Mulk, whereby madrasas would be built in large numbers but distributed evenly over a wide area, was abandoned in the wake of the Islamic world of today.

In Iran proper, Kūn, Maghībī and Isfahān account for nearly all the significant post-Iṣkandī madrasas, while similar concentrations can be observed in Samarkand, Bukhārā, Harāt and Khiva. The latter city, with its quartet of highly traditional madrasas erected between 1280 and 1300 (Pahlawān Mahmūdī, Allāh Kull Khān, Amīl Khān and Islām Kh画Δja) shows how fossilised the Timūrid manner had become.

A more appropriate envoi to the madrasa, however, is provided by the buildings of Šafavī Iṣṭābān. Several madrasas of medium size were erected there in the course of the 15th/16th century, such as the Madrasa-yi Nāṣīr Kūlī, built in 1456/1458 by the grandmother of Shāh ʿAbbās II and with accommodation for 67 students, the Madrasa-yi ʿAbbāsī ʿAdī, and Kasangārān (1130/1623). But these are only of secondary interest when set beside the two large madrasas, which flank the great dome chamber of the Masjīd-i Shāh, let alone the great Madrasa-yi Mādār-i Shāh (1176-1207/1765-1796). The two madrasas in the Masjīd-i Shāh are longitudinally conceived, and with their miniature garden courtyards make a delightfully bijou impression; and they exploit the available space to the full for student cells. The Madrasa-yi Mādār-i Shāh, sited in an originally idyllic environment fronting the Čahār Bāgh, injects a new dynamism into the traditional four-inūnī layout by means of a large extra dome chamber in each of the diagonals, and the cells, too, are unusual in their trapezoidal form. Indeed, the recess bracket the cell itself. The main prayer chamber here is not easily distinguishable from that of the Masjīd-i Shāh, and the continued intermingling of the two forms in Iran is attested by several joint foundations in Kūstār times.

Although dependence on Andalusia is a constant of Maghībī architecture, little trace of Spanish influence can be detected in the ground plans of the local madrasas. Indeed, since the madrasa movement was primarily an oriental Iranian one which by degrees moved westwards, it would be only logical to assume that in this particular genre of building it was typified the Maghībī that influenced Andalusia. The countervailing physical evidence of the Andalusian madrasa confirms this supposition. This is the structure built by the Nasīrī monarch Yusuf I in 750/1349, in the golden age of the Marīnī madrasa. Though largely demolished in the 18th century, the prayer hall was excavated and restored from 1853 onwards; it has nothing to differentiate it from its Marīnī contemporaries in Morocco. Of the madrasa built by the Almoravī ruler Yaʿlīb al-Maṣūr (580/1184-99) in Spain as elsewhere in his dominions, nothing survives, nor is there any record of further Nasīrī madrasas, so the question of reciprocal inferences between Andalusia and the Maghībī in this genre is not to be regarded as finally settled. Valuable as this literary evidence is, its very paucity is instructive, for it suggests the virtual absence of one of the major Islamic building types in Muslim Spain. Yet that area was unquestionably the foremost of Islamic art west of Egypt. In fact, however, this dearth can easily be explained. By the time that the madrasa had established itself in the eastern Islamic world, the great days of the Cordovan caliphate were long over, and the fate of Muslim Spain sealed. The cities of the north, Toledo, and even Cordova itself, had been lost. With the splendid exception of the Alhambra, signiﬁcantly, Nasīrī monuments which can really be regarded as finally settled, little architecture of note was erected in the Iberian peninsula in the last three centuries of the Muslim presence there.

Although, as already noted, the madrasa genre is ﬁrst recorded in the eastern Islamic world in the late 3rd/9th century, it was not for another 500 years and more that the full weight of ofﬁcial backing had resulted in madrasas being erected in most major towns of the area. Theoretically, the fashion could have spread to the Maghībī around that time. Yet it is doubtful whether the Almoravīs had at their disposal the necessary administrative expertise to launch and execute a programme comparable to that of Nīgān al-Mulk. It seems that the Maghībī in any case produced only a tithe of the buildings erected in Iran during the same period, and in the
context of such limited building, madrasas would obviously have claimed less priority than mosques. Moreover, such an association of the name itself indicates—were noted primarily for building madrasas, not mosques, as their name suggests. Not only is there no mention of their building madrasas; it seems, rather, that it was precisely in these *rabiʿ* that some of the teaching functions later performed by the madrasa were carried out.

The consonance of plan between the two institutions leaps to the eye. Moreover, the early and marked association of the madrasa with the Shafiʿī madhhab, and to an only slightly lesser extent with the Hanafi and Hanbali ones, would perhaps not immediately have struck a chord in the predominantly Mālikī Maghrib. Ironically enough, the first recorded madrasas (in late 3rd/9th century Nešāpur) was in fact Mālikī, but in subsequent centuries that madhhab noticeably lagged behind the others in the number of madrasas allotted to it. It is perhaps relevant that the religious message preached by Ibn Tūnart, the ideological founder of the Almohad dynasty, was disseminated in mosques rather than in special educational institutions. Hostile as he was to the prevailing orthodoxy of his time, it is not surprising that he did not use the madrasa as an instrument for his preaching, since that institution was itself the very emblem of orthodoxy by his time. Finally, one may perhaps adduce the generally conservatism of Maghrīb society as a reason for the late spread of the madrasa movement to this area. Thus the fashion for building madrasas probably reached the Maghrib later—too late, for example—to make an impact on Andalusia. The references to the late 9th/10th century madrasas built by the Almohad ruler al-Mansūr are somewhat unspecific—indeed, the statement of Ibn Saʿdī that there was *no* madrasa in 7th/13th century Spain partially contradicts them—and the first securely dated madrasa in the Maghrib, the Shammāliyya, was built in Tunis by the Ḥāfiz Abū Zakariyyā in 647/1249, and within a decade was followed by the Mālikīyya madrasa built by his widow. Neither has survived, and thus the Saffarīn madrasa in Fāṣīs, founded by the Marinid sultan Abu ʿAlī al-Mulk in 560/1167, is the earliest Maghrīb example to survive. Its location may be seen as prophetic since for some reason the institution of the madrasa took deepest root in Morocco, and specifically in Fāṣīs, where most of the round dozen Maghrīb madrasas predating 1300 are situated. Moreover, the majority of these madrasas are of the Marinid sultans and were erected between 670/1271 and 757/1356. Several Algerian madrasas belong to the same group. This sudden efflorescence of a building type which had hitherto been virtually unknown in the area demands some explanation. Perhaps the answer lies in the fact that the Marinids, unlike their more illustrious predecessors the Almoravids and Almohads, were not swept to power by a wave of religious fervour. Their uncomfortable consciousness of this deficiency may have led them to make restitution of a kind by providing the patronage for religious buildings. Madrasas fitted the bill admirably. They were much less expensive than mosques, a very relevant factor since the Marinid empire was much smaller than that of their predecessors. Marinid mosques would have suffered by comparison with those of the Almohads; Marinid madrasas, being effectively a new genre, were safer from such unwelcome comparisons. Moreover, they underlined the orthodoxy of their patrons and thus provided a counterweight not only to Shīʿīsm and to the Almohad movement but also to the increasingly popular Sufism. Indeed, a crucial epigraphic document indicates that the Marinid sultans were actuated by motives which had much more to do with a community-wide commitment to the eschatological worldviews of those two centuries earlier. The very first surviving madrasa in Morocco, the Saffarīn madrasa in Fāṣīs (670/1271) mentions in its foundation inscription the need to resurrect the forgotten religious sciences, a clear attack on Almohad heterodoxy:

"Praise be to God, Master of the Two Worlds! Who exalts the status of men of learning, Who recompenses with a generous hand those who devote themselves to acts of piety; Who by means of madrasas revives the vanished traces of faith and of religion, using as His instrument those of His good servants whom He has specially singled out for His guidance and ennobled by His solicitude and by His care..." Finally, the desire to make Fāṣīs an intellectual centre—the sultans Abu ʿIjḥās and Abu Ṣāfīn both prided themselves on being men of learning—may help to explain not only the concentration of madrasas in that city through the Marinid period but also the endowment of several madrasas with fine libraries in the 7th/13th and 8th/14th centuries (Saffarīn, Fāṣīs; Būʿānānīyya, Fāṣīs).

These madrasas all obey a well-defined schema. Their dimensions are smaller than those of any other groups of madrasas elsewhere in the Islamic world, ranging from 35 x 36 m. (115 x 118 ft.) to 14 x 14.5 m. (46 x 47.5 ft.). Perhaps their exclusive use by a single madhhab made larger buildings unnecessary. Around a central courtyard are grouped on the ground floor a mosque, galleries facing each other along the lateral axis and an entrance vestibule which is frequently open onto the courtyard along its entire length. Unlike the universal practice elsewhere in the Islamic world, the courtyard façades of these various halls are not marked by colonnades or fāns, but are fenced off by an unbroken surface of wooden panels. On the first floor, a narrow gallery overlooking the courtyard gives on to the cells in which the students lived; sometimes in the earlier madrasas these cells are also ranged behind the galleries on the ground floor. No madrasa had facilities for all four madhhabs incorporated into their ground plans are known in the Maghrib. One legal school—the Mālikī—maintained a virtually unchallenged dominion over the Maghrib throughout the mediaeval period. Perhaps this exclusiveness, which made it unnecessary for architects to provide separate teaching areas reserved for other madhhabs, was the factor which kept the madrasas of this area small.

This diminutive size gives such buildings an essentially human scale which well expresses the informality of teaching in the mediaeval Islamic world. They are made more even more inward-looking and cloistered by the downward pitch of their roofs as seen from the courtyard. Yet the organisation of space within the building is by turns ingenious and dramatic. On the first floor the needs of circulation and accommodation are admirably deviated; the corridor which encircles the courtyard and gives access both to individual cells and to the corner staircases is kept so narrow that two people can barely squeeze past each other in it. This frees extra space for accommodation. At the same time, it is no mere walkway but has some aesthetic distinction. The openings at regular intervals along its shaded length allow the viewer to catch partial glimpses of a courtyard bathed in sunlight. Most Moroccan madrasas have a central pool with a
fountain. Given the somewhat cramped dimensions of these courtyards, the presence of rippling water sets space into motion to a degree that would not be possible in larger expanses. This introduction of nature into the ordered, man-made world of architecture is typically Islamic. These fountains serve a further, more directly scenic, function too. For anyone within the halls bordering on the courtyard, the view into that courtyard is firmly directed by the act that the only entrance to these halls is a specific arch frames the fountain, which thus becomes the centrepiece of a carefully calculated composition.

Most Moroccan madrasas were produced either under the Ebayids in the 8th/14th century or under the Sa'dian or Filâfî sultans in the 17th/18th century. Since these two periods also saw a much greater production of mosques and mausoleums than other periods, it is unlikely that the building campaigns of the two periods in question themselves constitute evidence that a specific penchant for madrasas can be attributed to the patrons of the time. But the political background outlined above provides the missing explanation. Given the somewhat influential Mâllîî ibn as-Salâh al-Asbâyîî's (d. 1677) teachings in Islamic jurisprudence, and the cross-references to his influential biographical work bi Sarraj as-Sa'dîîrîn, in training the students who taught there (al-Abîdîî al-Imaâmî, al-Imâmî, al-Mahîîî, al-Ismâmî), and occasionally even those who taught there (al-Mîbâhîî bi the name of its first professor, Mâllîî bi al-Abîdîî al-Ismâmî) as the subjects in which the madrasa specialised (thus the Sâbîî ibn as-Salâhîî's madrasa derives its name from the study of the methods of reading the Qur'ân). Like so much religious architecture in Islam, these madrasas are often sited in the midst of bazaars—though there seems to be no connection between the presence of a madrasa in a particular quarter of the bazaar area and its endowment. Thus, while certain trades or crafts might singly or in concert put up the money for a mosque, the foundation of madrasas seems to have been the result of official patronage.

That the teaching function of these madrasas was paramount is suggested by the almost total absence of the patron's tomb in them. One may note as exceptions the case of the 18th century Sulaymâniyya madrasa in Tunmus, founded by one Ali Paşa and containing the tomb of his son Sulaymân and earlier the case of the vizier Ibn Tâfrîgh who was buried in the madrasa he had founded in 758/1356. Both this official had significantly enough spent some time in Egypt, where this practice was widespread.

Such oriental influences, though rare, are of crucial importance. A later Tunisian madrasa, the Mustasîîrîî al-Zaqîîî (854/1451-54) again demonstrates Egyptian influence in the unusual feature of a rectangular bastion or salient placed in the middle of each of the courtyard façades. These projections do duty as portals to significant parts of the building and are thus explicable as interpretations—though in a different idiom—of the iwans in cruciform disposition found in madrasas further east. The lateral lecture halls of the Bu 'Inâmîyya madrasa in Fâs also seem to be a local interpretation of the iwân scheme. Yet another derivation from eastern models may be the use of the madrasa as one element in a larger complex. A typical example of this fashion is the madrasa built in Tlemcen in ca. 754/1354 by Sultan Abû 'Inâmîn in association with the mosque, tomb and sahîîbîî al-Islâmî, or the mosque, tomb and madrasa of Sîdî Idrîîsîî built in Tlemcen by the Zayânîî Abî Hamîîmî. The Sakârikîî madrasa in Fâs (727-31/1327-31) is situated right next to the mosque of the Andalusians; but as if this juxtaposition were not enough, it was by 750/1350 given dependencies significantly larger than itself. These included a now-vanished guest-house, the Dâr Abî Habasîî with 21 rooms, a large abutions hall and—most important of all—another madrasa, that of al-Sâbîîî ibn as-Salâh, which still survives. This latter phenomenon of paired madrasas linked by a passage cannot but recall the Sakârikîî complex in Cairo. Also relevant in this connection was the Kadima madrasa built by Abû Hammûdîî I in Tlemcen in ca. 710/1310 for two pious brothers, it comprised two halls linked by a house attached. Thence, it seems that the principle of separate premises for separate courses was accepted even when there was no question of different madâhîîb being accommodated within a single building. For all their strong local character, then, these Magribîî madrasas attest the strength of eastern Islamic influences in this genre of building.

In many cases, the connection between a mosque and a madrasa is so close that the obvious conclusion to draw is that the mosque served inter alia as the oratory for the madrasa (e.g. the滨h al-Ismâm mosque, Tlemcen, erected in ca. 710/1310 next to the Kadima madrasa). Conversely, the oratory of many a Magribîî madrasa served as the mosque for the quarter where it was built. Accordingly, many of these madrasas have minarets, and one even has a minbar, thereby qualifying it to be a dîmâr. It has even been suggested that the madrasa, by dint of becoming the most typical and widespread structure of the later medieval Magrib, began in its turn to influence the layout of the mosque itself, specifically in its preference for square rather than rectangular courtyards, shallow rather than deep prayer halls and monumental portals on the major axis of the building. Something of the same process has been noted in Mamlûk Egypt, where the cruciform plan developed in the madrasa was subsequently adopted quite widely for mosques.

Although the casual visitor to these Moroccan madrasas is apt to believe, after walking around half a dozen of them, that they follow a standard pattern, such an impression is quickly modified on closer examination. Their layouts suggest that while the architects in question had a firm grasp of the essential constituent elements of a madrasa, they were unable to impose a preconceived solution on the sites allotted to them. These madrasas are located within an extremely cluttered urban setting, and so they commonly betray the various shifts of their designers to make the most of a difficult site. In these circumstances, it would be idle to expect to find a model which was more or less faithfully copied, or even a consistent, rational development of plan in these madrasas. Even so, all the Moroccan buildings of the genre share an emphasis on interior rather than exterior façades is that they focus on a central courtyard; and their decoration is extraordinarily consistent in medium and orna-
mental repertoire alike. In these respects, then, it is justifiable to point to their marked generic similarity, which easily asserts itself over such contingent factors as site and size. Moreover, most of the Moroccan madrasas were erected—as noted above—in less than a century, from 670/1271 to 757/1356, a period which also encompasses the surviving works in Algeria and Spain.

Externally, their most striking characteristic is a negative one: they lack a monumental façade. This is no novelty in Islamic architecture, but it is a feature which recurs so consistently in these buildings that it seems justified to regard it as a deliberate principle. The only exception is itself so consistent that it proves the rule: virtually every madrasa has an elaborate portal, usually a densely carved overhang or hood on brackets, a kind of awning executed in wood. By its marked projection—a feature which recurs so consistently in these buildings—a bend entrance, partly to ensure that the interior height above the bustle of the street, it signals the entrance of the madrasa from a distance. The tortuous alleyways of these Moroccan towns would discourage any more marked emphasis on the façade; there is simply no point of vantage from which a general view of the building could be enjoyed. In addition, one or two madrasas have a porch in front of the main entrance (e.g. the Bū Ḥanāfiyya, Fās, where the vault is crowned by a pyramidal roof). This is more in the nature of the ishārāt of eastern Islamic bazars than a monumental enclosed construction like the porch of mediaeval parish church, where the vault is crowned by a pyramidal roof.

In common with contemporary local domestic architecture, these madrasas nearly always contain a bent entrance, partly to ensure that the interior of the building is sunned from the outside world—a matter of noise as well as proximity. Corridors leading off the entrance passage from left to right respectively give access to the latrine area and a staircase leading to the upper storey (ʿAttārīn and Miḥbāḥiyya madrasas, Fāṣ), though other locations for the latrines do occur. The standard practice is to provide a series of cubicles around a subsidiary entrance to the rear of the building, as indeed did many mosques outside the old city, clustered around the Karawiyyin mosque, and the new foundation of Fāṣ al-Djadld, which at that time (751/1350) had not yet been given a Friday mosque. Thus the minaret of the Bū Ḥanāfiyya could pass on the adhān given in the Karawiyyin mosque which was too far away to be audible in Fāṣ al-Djadld, and the Friday prayer could accordingly begin there at the ordained hour. The foundation inscription of the Bū Ḥanāfiyya madrasa (originally named al-Mutawakkiliyya after one of the titles of its founder) specifically states that the building has the advantage of serving as a qāmūs. This madrasa has many of the appurtenances normally reserved for Friday mosques—a minbar, a māḥṣūra, a mortuary and a Kur'ān school, plus a unique external clock with a set of songs presumably intended to mark the divisions of the daily prayers. It even has a subsidiary entrance to the rear of the building, as well as an unusual division of the main entrance into two sections, one of which is intended for those with bare feet and is accordingly provided with a threshold of running water. The same idea is applied within the building, for a water-channel runs laterally across the façade of the prayer hall and is crossed by a slab of marble at each side. The building is raised above the level of the bazaar and is reached by a staircase provided with benches; but its roots in everyday life are aptly emphasised by the shops which line its main façade. It is precisely in its flexibility and in its multiple functions that the Bū Ḥanāfiyya madrasa approximates most closely not to other madrasas but to the classical type of mediaeval Friday mosque, as much a community centre as a place of worship.

Although the Bū Ḥanāfiyya madrasa is unique in the Maghrib in its comprehensive range of functions, it is typical in that it is a royal foundation. In this particular case the ruler bore not only the expense of building but also financed the provision of water and endowed the salaries of the staff, the board and other expenses of the students and the upkeep of the building by making over to the institution a formable list of properties.

Various methods are employed to emphasise the students, mostly drawn from southern Morocco until recently, were enrolled in studies in the mosque. The ʿAbdurrijal and ʿĀṣifiyin madrasas illustrate the same phenomenon. Similarly, most Tunisian madrasas are found in Tunis itself, where the students could benefit from the teaching offered in the other great Maghribi university-mosque, the Zaytūna. To concentrate the teaching function in a single urban centre in this way obviously made good sense from the economic point of view, and it meant also—in both cases, the centre in question was also the capital city—that the educational activity of mosque and madrasa alike would be directly under the eye of the sovereign. Once again, then, the inherently political nature of the madrasa asserts itself.

In view of the diminutive size of these Maghribi madrasas vis-à-vis equivalent institutions further east in the Islamic world, the emphasis laid on the prayer hall—which functioned concurrently as a lecture hall, as indeed did many mosques outside the regular hours of prayer—is noticeable, and is especially relevant in the context of the preceding remarks. As the Bū Ḥanāfiyya was a prayer hall, those madrasas functioned quite widely as teaching mosques. The case of the Bū Ḥanāfiyya madrasa in Fāṣ, though admittedly exceptional, offers supporting evidence for this theory. It is placed midway between the old city, clustered around the Karawiyyin mosque, and the new foundation of Fāṣ al-Djadld, which at that time (751/1350) had not yet been given a Friday mosque. Thus the minaret of the Bū Ḥanāfiyya could pass on the adhān given in the Karawiyyin mosque which was too far away to be audible in Fāṣ al-Djadld, and the Friday prayer could accordingly begin there at the ordained hour. The foundation inscription of the Bū Ḥanāfiyya madrasa (originally named al-Mutawakkiliyya after one of the titles of its founder) specifically states that the building has the advantage of serving as a qāmūs. This madrasa has many of the appurtenances normally reserved for Friday mosques—a minbar, a māḥṣūra, a mortuary and a Kur'ān school, plus a unique external clock with a set of songs presumably intended to mark the divisions of the daily prayers. It even has a subsidiary entrance to the rear of the building, as well as an unusual division of the main entrance into two sections, one of which is intended for those with bare feet and is accordingly provided with a threshold of running water. The same idea is applied within the building, for a water-channel runs laterally across the façade of the prayer hall and is crossed by a slab of marble at each side. The building is raised above the level of the bazaar and is reached by a staircase provided with benches; but its roots in everyday life are aptly emphasised by the shops which line its main façade. It is precisely in its flexibility and in its multiple functions that the Bū Ḥanāfiyya madrasa approximates most closely not to other madrasas but to the classical type of mediaeval Friday mosque, as much a community centre as a place of worship.
the role of the prayer hall in the Maqribi madrasa. It was the constant concern of the architects to give this hall pride of place in the overall layout, and the majority of them achieved that aim by means of axiality. Sometimes, as in the Šabīrī and Bu'l-İńâniyya madrasa, Fās, the entrance, courtyard and mosque were all disposed on the major chord of the building, and in the former case even the elongated rectangular pool played a spatial role. More often, the exigencies of the site and the predilection for a bent entrance meant that this axial emphasis could assert itself only at the entrance to the courtyard (al-Ubūbdā madrasa, Tiemcen; Miṣbāḥiyya madrasa, Fās). So firmly did this axial arrangement establish itself that it was even maintained when it ran counter to the correct orientation of the prayer chamber, as in the 'Aṭṭārī madrasa, Fās, where in order to mark the qibla accurately, the miḥrāb has to be placed to the right of the entrance instead of opposite it as the internal logic of the layout demands.

The placing of the chambers for students varies quite markedly. In the earlier madrasas, all the living accommodation was confined to the ground floor (Ṣafīrīn madrasa; madrasa of Fās al-Jābdālī). In the following decades, it continued to be standard practice for the more commodious madrasas to provide, in addition to the main accommodation at first-floor level, at least some student accommodation on the ground floor. It is here that the ornate wooden lattice-work screens known as ṣarābiyyas come into their own. Placed between the arcades or other openings of the court, they close off from the public gaze the sections of the madrasa which serve for student accommodation. The bleakness of the latter area is therefore masked by a lavish exterior. Symbolically enough it is only the outer, namely courtyard, face of these ṣarābiyyas that is richly carved; the inner face is plain as perhaps befits the sparse facilities offered to the students. Between these screens and the cells runs a corridor, for all the world like the cloister of some mediaeval western monastery. These screens continue on the upper storeys where their principal function is obviously to decorate the interior façade rather than to serve the student cells. Sometimes the corridors or galleries are located only along the lateral walls of the courtyard (Aṭṭārīn madrasa, Fās; Taza madrasa), but they often extend to three sides, especially in the later examples of the genre, and there is even an isolated case of a madrasa with student cells arranged unevenly but on all four sides of the ground floor (Ṣabīrīn madrasa, Fās). The extra height required for a suitably imposing prayer hall meant that there was frequently no room for student cells above it, and there is even a case of a prayer and assembly hall located on the first floor (Miṣbāḥiyya, Fās).

Ning this likewise more forcibly to the inadequate publication of these buildings than the widely divergent figures given for the number of student cells which they contain. Often enough these statistics are confused with the number of students which the madrasa could accommodate. This figure is in itself wide open to discussion. According to some estimates, a typical cell can hold as many as seven or eight persons in such a room. That many cells were intended to house only a single occupant is clearly indicated by the custom that the student "paid" for his room by buying the key for it from his predecessor. Besides, in many cells the floor space was reserved for living as distinct from sleeping accommodation—a feature which will be discussed in more detail shortly. Within a given madrasa, moreover the size and layout of individual cells will often fluctuate quite markedly. This is especially apt to occur when the madrasa has walls built at acute angles because of the spatial constraints of the site. While windowless cells are known, it was standard practice to provide tiny windows, often with metalwork grilles, opening on to the corridor, the main courtyard, a subsidiary courtyard (especially in post-Maqrīn madrasas), or even—though rarely—on to the street.

The spartan fittings of these cells do suggest that the provision of maximum sleeping space was a priority of the designer. There was no bedding to clutter up valuable space. Students slept under a blanket on a mat. Often projecting shelves below the ceiling function as bunk beds; they are reached by wooden bars mortared diagonally across the corners of the rooms so as to form a simple ladder. Sometimes a small table is provided—the students were, after all, issued with paper, pen and ink. A narrow slot beside the door permitted the daily ration of flat bread to be distributed with maximum speed. Since that ration was fixed at one piece per student, the amount of bread set aside per day for the madrasa provides the necessary clue in calculating the maximum occupancy for which the building was designed. This quantity of bread was made available daily, according to the requirements of the wakf which financed the institution, irrespective of whether the building was fully occupied or not; in practice, therefore, it often happened that at least some students would have extra rations. The largest of the mediaeval madrasas in Morocco is the Miṣbāḥiyya, for which a tally of 117 rooms has been proposed, with 23 on the ground floor and the balance in the upper floor. A two-storey design is commoner, however, and therefore the Aṭṭārīn madrasa, in which Bel counted 34 cells, or the Bu'l-İńâniyya madrasa, whose capacity he has been able to estimate at around 100 students. Between these extremes, large numbers of buildings designed on such an intimate scale, especially when it is remembered that the prayer hall of such a madrasa could serve as the masjidī not only for the students and staff but also for the people of the area. It is hard to avoid the conclusion that the students lived a hard life—frequently cold, cramped and underfed.

With the fall of the Marinids, the golden age of the Maqribi madrasa was over. Not only are there comparatively few surviving madrasas of later date, but the majority of them are either attached to mosques or shrines, and dominated by them, or they are intrinsically of very little interest (Rabat, Ceuta, Tangiers and Ksar el Kebir/Algeraquique). Only two deserve closer inspection—the Ben Yûṣuf or Yûsūfiyya madrasa in Marrakesh, dating to 752/1354-5, and the Sharīfī madrasa in Fās, dating to 1085/1670, both royal foundations. Their interest lies in their plans rather than in their decoration or structural techniques, for in these latter respects they are disappointingly derivative. Although the Ben Yûṣuf madrasa is traditionally believed to have a plan based on that of the Marinid madrasa whose site it occupies, it has a degree of
integration and symmetry foreign to its predecessors. Externally, it forms an almost perfect square but for the projecting polygonal mihrab. The internal disposition is admirable in its clarity and economy. Broadly speaking, the arrangement is tripartite, with a large porticoed courtyard—containing a substantial pool instead of the usual fountain—acting as the focus of the design and the student cells relegated to the flanking tracts. The oratory, placed as usual along the main axis, is also divided into three parts, a device already encountered in Marinid madrasas. The arrangement of the cells, however, is novel; for instead of lining a long corridor they are clustered symmetrically in sizes or sevens around a single central courtyard or dayyaras. There are accessible via a cloister-like corridor which encloses the courtyard on three sides and also leads into the patio for ablutions. A similar arrangement is followed on the first floor, so that the madrasa contains about a hundred rooms.

A comparable lucidity of planning informs the Shārīfī madrasa. Here too the polygonal mihrab projects forcibly, breaking the even tenor of the perimeter wall. This wall is stepped in three places but is otherwise straight. Exceptionally, three separate entrances give access to the corridors which debouch into the courtyard. Each of the three lesser courtyard façades is broken by three bays, and the whole elevation rises to an unexpected three stories. Student cells, mostly arranged around somewhat poise dayyaras more like pits than courtyards, occupy three of the four sides on the ground floor; traditionally, students from various parts of the country—the Tafillalt, the Rif and eastern Morocco—congregate around the appropriate dayyara to that each courtyard becomes in some sense a local microcosm. The oratory on the fourth side is similar to that of the Ben Yāsur madrasa. Despite the proximity of the building to the Karawīyīn, the mihrab is seriously out of true, facing as it does the north-east. The high walls, cramped courtyard and blank spaces of the building give it a somewhat oppressive atmosphere. Its history is somewhat involved: an unusual madrasa was erected on the site of a Marinid foundation, the Madrasa al-Labbādīn, which Mawlay al-Raghib had ordered to be demolished because its students had brought women there and given themselves over to debauch. Despite the radial symmetry of its plan, the building fails far below Marinid standards so far as its decoration is concerned. The large capacity of these two later madrasas and their eminently logical layout put them in a category of their own among Moroccan madrasas and make them a worthy coda to a distinguished tradition.

sawah, or rice-fields. Another source of income is fishing and trading. As skilled sailors and shipmasters, the Madurese have developed their own type of vessels (perahu Madura).

Islam is the religion to which the Madurese generally adhere, but as in other Indonesian societies, adat law still exercises its influence. In pre-Islamic times, Madura was divided into two main parts: Western Madura with traditionally close relations to Surabaya, and Eastern Madura with Sumenep as its most important centre. The ruler of Sumenep is said to have played an active role in the transition period between the kingdoms of Majapahit and Madura which was characterised by the turbulences caused by Kubiilay Khan’s military plans. In both East and West Madura the ruling families are said to have had matrimonial relations with the court of Majapahit. Thus the first (legendary) ruler of Sampang, Lembu Peteng, is described as a son of the Majapahit king Bra Vijaya and the famous “princess of Campa” who confessed Islam. One of his grandsons, according to tradition, was the later Sunan Giri, one of the “nine udings” (real songs) who spread Islam in Java. In Sumenep, a certain adipati Kanghuruan, presumably a son of the first Madurian ruler of Demak, Raden Patih (d. 1532) played a role during the second and third quarters of the 16th century. These were probably the first Muslim rulers in Madura. After the final fall of Majapahit in 1527, Sunenep participated in fighting the still “heathen” kingdoms in the eastern corner of Java which were supported by the Bakhinean king of Gelig (Kuningan). The court of Aros Baya (Bengkalan) embraced Islam in 1528, and the crown prince and later ruler, pasembahan Lemah Duwur, tried to keep peaceful relations with Demak. Later he married a daughter of Adi Vijaya, the raden of Pajang (1546-82), and matrimonial relations with the Javanese su丹ans continued to exist after Pajang was succeeded by Mataram (1589). Descendants of (West) Madurese nobility were influential in Mataram, especially in the 17th and 18th centuries. The relationship between Sunenep and Mataram, however, was less fortunate: after the whole of Madura was conquered by the army of Sultan Agung in 1624, the ruling family of Sunenep was extinguished. A Javanese prince, Angga Dipa (from Jepara?) became governor, residing in Sumenep.

After 1670, the situation in Madura became turbulent again. After the defeat of Mahassar [q.v.] by the Dutch admiral C. Speelman in 1667 and 1669, part of the Makassarese nobility and their soldiers fled to Madura and other areas in North Java to earn their livelihood as pirates. In 1677, the susuhunan of Mataram, Amengku Rat II (1677-1703), took stern measures against his former protegé Truna Jaya and attacked Kediri. Truna Jaya escaped, but finally, at the end of 1679, he was taken prisoner and a few days later killed by the susuhunan.

After 1683, the V.O.C. virtually ruled over East Madura; this was legalised by Mataram in 1705, and in 1743 the V.O.C. extended its suzerainty over the whole island. Having old grudges against Sultan Agung and his house of Mataram, the Madurese were in favour of Mataram’s being divided in 1755. In the “Javanese War” of 1823-30, they sided with pangerang Dipa Negara. This led to a limitation of the local rulers’ power by the Dutch, until in 1885 the island was put under direct Dutch rule. During the revolutionary years after World War II, Madura was part of the republican territory as acknowledged by the Linggajati Agreement in 1947.

[M. H. RASSEK * O. SCHUMANN]}

MADYAN SHU‘AYB, a town of northwestern Arabia. It is located on the eastern shore of the Gulf of ‘Akaba; it is mentioned in the mediaeval Islamic geographers as lying on the pilgrimage route between the Hijaz and Syria, which there went inland to avoid the mountainous coast of the Gulf.

The name is connected with that of the tribe of Midianites known from the Old Testament (I.XX Madia, Madian; in Josephus Madainve, Μαδαίνη Κομπέρνοι but it can hardly be used without further consideration to identify the original home of this tribe, as the town might be a later Midianite settlement, and besides, it is difficult to fix the real home of such wandering tribes. In the Old Testament, a town of Midian is not mentioned (not even in Kg, xi, 18 where “Ma‘on” may conceivably be read). On the other hand, Josephus (Antiquities, ii, 2, 1) knows Madiane as a town on the Erythraean
Sea, as does Eusebius (Onomast., ed. Lagarde, 170); in Ptolomy (vi, 7, 2) it is mentioned as a town on the coast and called Moriana or Medoniana while in another passage he gives it as an inland town under the name Mediana, a difference which is explained by the actual position of the town. In Muhammad's time there is only one reference (in Ibn Ishaq) to the town of Madyan, when the Prophet sent an expedition under Zayd b. Haritha thither. There are occasional references in the poet Khiyayir (in Ya'qubi), who speaks of the monks there and in the record of Muhammad b. al-Hanafiyah's journey to Ayya. According to Ya'qobi also, Madyan was occasionally the residence of the Umayyad princes Abd al-Wahib b. Suhaym, and visits to him by the poet Ibn Harma [24-1] are mentioned. In the geographers we find Madyan only as a town near the coast, six days journey from Tabuk; it was the second station on the pilgrim's road from Ayya to Medina and was a dependency of Medina. In the 3rd/9th century al-Yaqubi speaks of its position in a district rich in springs and watercourses, gardens and date groves and of its mixed population. Al-Ishaqhi says it is larger than Tabuk and describes from his own observations the spring there, from which Moses watered the flocks of Shu'ayb (see below); it was now covered by a house which had been built over it. The town then lay in the bed of the Wadi 'l-Abyad (or Wadi T-'Afai, as its name reads), a watercourse by which Moses watered the flocks of 'Abu 'ayb (see below); it was now covered by a house which had been built over it. The town then lay in the bed of the Wadi 'l-Abyad (or Wadi T-'Afai, as its name reads), a watercourse by which Moses watered the flocks of 'Abu 'ayb (see below); it was now covered by a house which had been built over it.

The town then began to be visited by western travellers with declining trade, and as having various remarkable sites of interest. Al-Idrisi says it is an unimportant little trading centre with scanty buildings; the surface pottery is largely Nabataean and Roman, while additions of the 7th/13th century al-Idrisi says it is an unimportant little trading centre with scanty buildings; the surface pottery is largely Nabataean and Roman, while additions of the 7th/13th century al-Idrisi says it is an unimportant little trading centre with scanty buildings; the surface pottery is largely Nabataean and Roman, while additions of the 7th/13th century al-Idrisi says it is an unimportant little trading centre with scanty buildings; the surface pottery is largely Nabataean and Roman, while additions of the 7th/13th century al-Idrisi says it is an unimportant little trading centre with scanty buildings; the surface pottery is largely Nabataean and Roman, while additions of the 7th/13th century al-Idrisi says it is an unimportant little trading centre with scanty buildings; the surface pottery is largely Nabataean and Roman, while additions of the 7th/13th century. The town then lay in the bed of the Wadi 'l-Abyad (or Wadi T-'Afai, as its name reads), a watercourse by which Moses watered the flocks of 'Abu 'ayb (see below); it was now covered by a house which had been built over it. The town then lay in the bed of the Wadi 'l-Abyad (or Wadi T-'Afai, as its name reads), a watercourse by which Moses watered the flocks of 'Abu 'ayb (see below); it was now covered by a house which had been built over it. The town then lay in the bed of the Wadi 'l-Abyad (or Wadi T-'Afai, as its name reads), a watercourse by which Moses watered the flocks of 'Abu 'ayb (see below); it was now covered by a house which had been built over it.
a passage from Ibn Hazm’s *Dīwān*-ār, and finally, a list of the Almoravid governors of al-Andalus according to al-Warrāq’s *chronicle* (12-1).

The only indication about the anonymous author comes from the biography of the *shaykh* Abū ʿAlī Shihāb b. Abū al-Ḥassin, where it is said that the latter was alive in 712/1312, the very year in which the compilation was put together. But we have here quite the same problems, namely, that although a good Muslim, he is especially proud to belong to a people whose entitlement to glory be undertaken to proclaim, since many people consider this people as “the most erring people, the most ignorant, the most lacking in good qualities and the farthest from virtuous deeds”.

In order to achieve this aim, he entails retelling all the history of the Berbers since the time, so he says, when they settled in the Maghrib after having fled from Syria in the wake of David’s killing of Goliath, and limits himself to recalling their part in al-Mansūr Ibn Abī ʿAmir’s expedition against Algiers in 368/978-9, but he nevertheless intends to speak of the times preceding the Islamic conquest, of these chiefs, their rebels, their genealogies and some of their famous men. This programme seems then to have been carried out.

Lévi-Provençal thinks that Ibn Khaldūn probably used this *Kitāb Mafākhīr al-Barbar*, and his opinion is substantially shared by Maya Shatzmiller, who has recently drawn attention to the existence, in the Bibliothèque Générale de Rabat, of a ms. (cote K 1275), whose contents she has studied in a note *Une source méconnue de l’histoire des Berbères* (le *Kitāb al-Ansāb* li-Abī Ḥayyān, in Arabic, *xx*; 1983), 7-9. It is quite certain that the fragments published by Lévi-Provençal belong to this ms., so that the problems posed by a compilation of this kind can now be examined with greater sureness. Moreover, Lévi-Provençal has published *Un nouveau rêt de la conquête de l’Afrique du Nord par les Arabes*, in Arabic, *i* (1954), 17-43, based on a text which appears equally in the ms. in question, and he considered that the *Mafākhīr al-Barbar* could well be attributed “with likelihood to Ibn ʿIyāhī”, but Mme. Shatzmiller comes very near to attributing it to Abu Ḥayyān (854-715/1256-1344) the authorship of the compilation which she describes.

AL-MAFARRUKHĪ, MUHARRRĪR B. SAʿD, author of the local history of Isfahān in Arabic entitled *Risāla Muḥarrar Māṣākān Isfakhān*. The work appears to have been written during the reign of Malik Shāh (465-85/1073-92). Nothing is known about al-Mafarrūkhī’s life, but it is apparent from the wealth of poetry contained in the work and from the frequent use of rhymed prose that he was an *adīb*. He cites his father, Abu ʿI-l-Faqīr Saʿd, as his *idrākh* and quotes several of his poems.

He claims descent (q2) from one Mafarrūk b. Bahšiyāʾ who in turn was descended from Abūshurshābūrā b. Abūghurmanān, whom he describes as completing the building of the walls of Daḵyān, the fortified nucleus of pre-Islamic Isfahān, one hundred and seventy years before Islam. His claims (Asbāb, fol. 50a) that the name al-Mafarrūkī comes not only from that of the original Mafarrūk, but the genealogies of earlier bearers of the *nāma* seem in several instances to go back to Mafarrūk himself (cf. Abu Nuṣaym, *Aḥbāb Isfakhān*, i, 134-5; 2, 142, 272, 325). On his grandmother’s side, al-Mafarrūkī claims descent (25-6) from a poet in the retinue of ʿAdud al-Dawla named Abū Muslim Tāhir b. Muhammad, himself allegedly descended from Abū Muslim the ʿAbbasid revolutionary. A final ancestor cited on his maternal grandmother’s side was related to a one-time governor (99).

Al-Mafarrūkī’s book reflects his education in *adab* and familiarity with court culture. Unlike other local histories of the period, it pays little attention to religion and contains no biographies of *ulama*.

Instead, it contains poetry in praise of Isfahān, descriptions in the area’s points of interest, tales from the pre-Islamic period, and encomiums of Bāyūd and Sālidjākī rulers.

An 8th/14th century Persian translation of the work contains many interpolations that postdate al-Mafarrūkī’s composition. These have been identified by Browne.

**Mafia, the name of a group of islands off the Tanzanian coast in approximately 8° and 40° E. They consist of a main island commonly known as Mafia Island, but by its inhabitants as Chole Shamba (Swah. “Plantation Chole”); a very small island known as Chole or Chole Mjini (Swah. “Town Chole”); Juani; Bwejuu; and Jibondo. The only references in Arabic literature are in Abūmād b. Madiḍ al-Nahlī’s log books, where it is called *Μαναλίγια*, and in the anonymous *History of Kilwa*, where it occurs once as *Μαναλίγια*, four times as *Μανπίγια*, and three times as *Μανφία*. In Portuguese there are four references, one in a now lost *Chronicle of the Kings of Kilwa* (“Chronicle of the Kings of Kilwa”), where it is generally spelt Monfia, and in other historians and archives. In Swahili, Freeman-Grenville has published a traditional history of the town of Kua, Juani Island, Mafia; a variant version of this by Amur Omar Saidi, a former king, has been published by D. W. I. Pigott, and another version by T. M. Revington. At Kisimani Mafia (Swah. “at the well of Mafia”), H. N. Chittick has excavated the remains of a mosque and other buildings; he has likewise cleared the palace and a number of mosques at Kua, Juani Island.**

No consecutive history can be established for the main island. The founder of Kilwa, Abū al-Husayn b. All, retired to Mafia in his old age, and set up his son Muhammad as ruler in ca. 386/996. He was succeeded by his brother, Bashat, who ruled for four-and-a-half years. The third ruler of Kilwa, Dawūd b. All, also made Mafia his residence, after abdicating at Kilwa in favour of his son. In the reign of Dawūd b. Sulaymān of Kilwa (7 ca. 526-661/1131-70), Mafia is mentioned as a mere appanage of Kilwa. It is not mentioned again until the reign of Sulaymān b. al-Hasan II (ca. 593-630), when it revolted. It was recovered post 1310 by his son, al-Hasan b. Sulaymān II (ca. 1310-33). When the Portuguese took Kilwa in 1505, Mafia passed quietly into their hands. They bartered goods for local produce, cattle, ghee and gum copal. They had a small blockade house, but its site has so far not been identified. In 1553 the islands were pillaged by the King of Pemba, who was forthwith punished by Francisco de Seixas Cabreira. When the Portuguese lost Mombasa to the Omani Arabs in 1698, Mafia again quietly changed hands.
and when, after a brief comeback (1728-9), the *Umahls again expelled the Portuguese from Mombasa, several Portuguese residents in Mafia deemed it wise to become Muslims. Under the *Umahls, Arabs gradually acquired the southern part of the main island, turning it over to coconut plantations, for which its sandy soil is especially favourable.

The excavations carried out by Chittick show that Kisimani Mafia was important from the 6th/7th to 8th/9th centuries, but that it thereafter declined. According to the diary of L.t. (later Admiral) J. B. Eustace, the last inhabitants departed after the disastrous cyclone of 1872. In Kula it has been shown that most of the buildings belong to the 12th/13th century. The site covered some thirty to forty acres, including the palace, and there were at least seven mosques and two cemeteries. It is now totally deserted. There are also late mediaeval Islamic remains on Chole and Jibondo Islands.

In *Umahl times, the islands were ruled from Chole. When the Germans took the islands over when German East Africa was proclaimed in 1885, they built a headquarters there and a street of shops, which still survive. The administrative headquarters were in 1912 transferred, however, to Kilindoni, on the main island, and this is the present seat of government. The greatest number of the inhabitants, in all about 6,000, live in the northern part of the main island. They are almost all Muslims. Some as- pects of their society have been described by A. P. Caplan. Regrettably, there is no description of the state of Islamic learning, albeit clearly there is a class of literati; at other levels witchcraft practices abound.

In mediaeval times, there was no adequate, single term for designating furniture and furnishings; this idea was expressed rather by the term *farak* (meaning not only "that which is spread out" but also, by extension, the more solid domestic objects which filled the role of "furniture" according to western concepts—whence the adjective *mafrashes* "furnished, provided with furnishings" [see *Athar* in Suppl.]) or else by colocations of words such as *fars* and *dla* (lit. carpets, mattresses and utensils), *fars* and *athak* (carpets, mattresses and domestic articles), etc. Carpets, mats and cushions played an important part in domestic interiors, at this time. Complete furnishing ensembles were often put together as units of various cushions, set around low oriental tables which were quite unsuitable for the use of chairs and stools (seats of this kind existed, but had restricted functions; they were rarely used at meal times [see *Athar*]), and by use of cushions there were formed circles (balha, with its *sad* or place of honour, often a seat or a throne, *sarir, lakht*, in palaces) for gatherings of friends, family celebrations, literary discussions, etc. The use of rigid seats and of sofas and couches was more limited, and that of cushions, for sitting upon, more widespread (but this depended on the circumstances and the social setting). People leading a simpler life made do with sitting on very simple cushions or on a carpet or mat, but rarely on the actual earth. However, in the gatherings of high society, the persons farthest from the *sad* received the lowest seats and had to make do with a single cushion (other persons each got two cushions, one on top of the other, or a cushion folded into two—quite a social hierarchy!) or a carpet. Actually to sit on the earth was considered, in such social groups, to be a sign of mourning.

In many households, the carpets and mats were protected by means of a lining, and it was difficult to distinguish the carpets from the mattresses, but better-off households had clearly-distinguishable mattresses which were placed on beds with frames (a rare and expensive piece of furniture). On the carpets [see *nisk* in Suppl.] were placed other domestic articles which served as mattresses, seats and bedding at one and the same time, according to the so-called "oriental" way of life. Mattresses (*bardha*, *gidha*, *fara*, *jardh*, *haqiyaa*, *towat*, *madarooba*, *marita*, *matefa*, *mifraga*, *jarbiha* and *finissa*) were usually placed on the ground. Cushions (*bardha*, *dikeera*, *haqiyaa*, *jama*, *misnaha*, *mahhdada*, *mi'dakha*, *misnadha* or *misnada*, *madawara*, *numrul*, *finissa*, *luka*, *ikribaa* or *isiinde*) were used greatly; they were distinguished by their functions (in domestic interiors, in palaces: *mufarraba*, *marzad*, *martaba*, *mtfrasik* or *fartdba*) and by their shapes (big, small, elongated, round, rectangular, etc.). Often, however, their original function had become changed. Thus *mifhawkad*-properly "pillow", might be used for sitting upon, and *wisdada*, properly a much larger cushion often used for supporting the back, might be used for "pillow"; in the spoken language of mediaeval Egypt, *mifchada* was used for all kinds of cushions and the word *wisdada* had almost disappeared from usage so that, in order to designate a pillow, resort had to be made to a phoneme, *mifhatada* or *'hakada* "pillow (or the back)"; lit. "for the cheek". "Offering" a cushion (to someone who had been invited) was literally "throwing down" (*zarafa*) a cushion, but this verb was also used, by extension, in the meaning of offering someone a chair, stool, etc., and thus symbolises the transition between a purely "oriental" mode of life and the use, in certain circles, of solid furniture.

Sedentary civilization was always proud of its luxurious cushions ([see J. Karabacek, *Susa und Chiraz*, Leipzig 1881, e.g. 71, 81: cushions covered in embrodered tapestry], and sometimes it accused the ancient Arabs of never having had any of them ([Ben Khalid, *Muhadda*, tr. Rosenthal, 1, 347-8 and n. 85]). But this accusation was far from the truth; the Bedouins had their own kinds of cushion [see al-Tha'labi, *Fih al-al-faha*, Beirut 1881, 130-1, and
other sources. The arts of weaving, making tapestries and embroidering couches were widespread amongst Bedouin, country-dwellers and city-dwellers all through the ages. Iconographic evidence of the richness of shapes and functions of mattresses and cushions, as well as the forms and colours of curtains, is given in well-known miniature paintings (e.g. in the series illustrating the works of Dioscorides and al-Harrî). Curtains and hangings had been known amongst the Arabs since pre-Islamic times; their role in Islam sedentary civilisation was even more important, as much for the daily life of the greater part of the various social classes as for the palaces and their modes of behaviour (see Ibn Sîda, al-Muhàqasat, Cairo 1316/1899-9, iv, 75: Fâdîbîsh, K. al-Tâlî, tr. Pellat, Paris 1934, 56 ff.; al-Wâshabî, al-Muwàaqabât, Cairo 1953, 230-1; al-Shabûbî, K. al-Dîyàdîh, Baghdad 1966, 49, 43, 45, 170, 188, 474: al-Kâmi 'l 'Abl al-Zubâyry, al-Dhârîfîr wa-l-Nîhâj, Kuwait 1959, passim; W. H. Worreil, in Art Islam., i (1924), 219-22; M. Canard, in Byzantion, xxii (1951), 365; D. Sourdel, in REI, xxii (1960), 123; E. Ashîor, Histoire des prix et des salaires dans l'Orient medéval, Paris 1969, 87, 178, 255). The term mâfrûshât (modern Tâdi mafûsh) still appears today in the labelling and signs of shops which sell curtaining, decorative fabrics, cushions, etc.

(C. CAHEN)

MAGHÂRîBA (A., pl. nomen), denotes the Arabic-speakers of the Muslim West (Maghribî, pl. Maghâribî), as opposed to those of the East (Mashrikî, pi. Mashrikî), known as Mashrikî. This division of Arabic-speakers into Maghâribî and Mashrikî—which is a continuing process, discernible in the contemporary dialects, variously categorised as Oriental and Maghribî—may be traced from its origins. The frontier between the two major groupings—Muslim Spain included, in spite of its special circumstances and its separate destiny—is still located to the east of Tripoli, at Lebela, which accounts for the peculiar situation of Libya, constantly divided between its Maghribî and Oriental ascensions.

The Arabs who settled on a permanent basis in the West rapidly became sufficiently Maghribîised or Hispanised to appear different from their racial compatriots who had remained in the East, as is indicated by a considerable quantity of concordant evidence. From the middle of the 2nd/8th century onwards, the Arab colony which established itself in the province of al-Kayarawân (the Al Ibfîyîyîh) became aware of its specific local identity (see M. Talbiî, al-Maghrib min al-futh sûd mûshûr al-rûh al-awwal min al-karn al-thâni wa-badâjîr al-mushûr bi-kawmiyâtîyal maîshûrûyîh, in no. 4 of Silsilat al-Idrîsîyâ, CERES Tunis 1979, 207-30) in violently opposing, at the time of the great Kâfrûlîb uprising of 122/740, fellow-Muslims who had come from the East to support it, while regarding it, it is true, with all the contempt hitherto reserved for Berbers alone. A similar evolution, with opposition between indigenous Arabs (balâdûyûn) and "foreigners" arriving at a later stage, is also to be observed in Muslim Spain, although the distinction became blurred in the course of time (see E. Lévi-Provençal, Histoire esp., Paris 1950, i, 44-55, 83, 170, 345). In the East, the Maghribî (pl. Maghâribî) in turn created the impression of a poor relation, and this old medieaval reflex is so tenacious that it continues to the present day, with varying nuances and in varying degrees, to colour Mashrik-Maghrib relations at all levels, including that of music. In spite of all the developments that have taken place, the Maghribî still admires the Mashrikî and imports from it, much more than it exports to it, cultural consumer goods such as books, films and records.

We are concerned here with a very ancient phenomenon which deserves analysis and explanation, and to which no overall study has yet been devoted. The following are examples dating back to the first two centuries of Islam: Âbû Muhammad Ibn 'Imân al-Tâdîjî (d. 225/743 or 745), resident in Tunis, cherished a genuine feeling of exile in this "barren corner", that is the Maghribî. (M. Talbiî, L'Emerîdt aglîlîdî, Paris 1966, 43); the Tunisian Ibn Farrîshî, who studied in 'Irik under Abu Hanîfa (d. 255/870), humiliated on account of his Maghribi background, his Maghribi accent, that is the Maghribî (M. Talbiî, in Corn. talbiî, Cairo 1358/1931, ii, 2). This attitude of the Maghribî towards the Mashrikî, the adage that its western part is far the best province of the Maghribî, is an ancient and to a group of Egyptians, because he was too intelligent to remain in the class of the Maghâribî (ibid., 20); etc. The Maghribî was thus visibly subject to an inferiority complex vis-à-vis the Mashrikî, a fact which led Ibn Bassâmî (d. 542/1147) to write indignantly: "The people of our lands are eager to ape the Orientals... to such an extent that if a raven were to croak in those distant horizons, or a fly to buzz in the furthest extremities of Syria or 'Îrâk, they would fall on their knees as if before an idol, and recite all this like words of Scripture" (Dhâkîhîrât, ed. Cairo 1358/1931, i, 11, 2).

This aversion of the Maghribî towards the Mashrikî, for the movement of élites has above all been established as from the West to East. For purposes of demonstration, it may be noted that al-Makkârit (d. 1041/1631) compiled a list of 307 Andalusians who visited the Orient (Naîfâ, ed. Istân 'Abbas, Beirut 1968, ii, 5-702) as against 148 Orientals who made the reverse journey (ibid., iii, 5-149). An even more significant fact is that no great poet of Damascus, of Baghdad or of Cairo, in fact, no poet at all, ever set out on the road to the Maghribî. The niqâh, a journey usually with the combined objectives of pilgrimage, of study and occasionally also of trade, took place, for evident religious cult and cultural reasons, in an eastward direction. The traveller usually returned to his own land endowed with knowledge and prestige.

But it very often happened that a traveller settled permanently in the Orient. Thus Maghribî colonies were formed in the major eastern metropolises which marked the pilgrimage routes, particularly at Alexandria, at Cairo, at Khîs, at Damascus, at Medina and at Mecca. In the absence of a systematic general study, their history is still fragmentarily and imper-
Berber women were highly regarded in the Umayyad and Abbasid courts. Highāma b. 'Abd al-Malik (105-25/724-43) requested some of them from his governor of Ifriqiya (M. Talbi, op. laud., 33); Abū Dīyar al-Manṣūr (345-54/754-73), himself the son of a Berber mother, Salama, married a woman from theiership of Tariq b. Ziyad, Berbers played a decisive role of the Māḥribīs, without ever looking down on the Maghribīs, as they were the mother of Ṣa'īd al-Kayrawān, Umm Mūsa, mother of the future IHa'far al-Mansūr (136-58/754-75). himself the son of governor of Ifrūdya (M. Talbi, op. laud., 42-3). 933-4; M. Talbi, op. laud., 33); Abū Ḥabīb al-Dakhil (138-72/756-88), originating from the Nafza tribe, was the mother of *Abd al-Rabman al-Dakhil (156-98/775-89); Risāla originating from the Nafza tribe, was the mother of 'Abd al-Raḥmān al-Dākhil (138-72/756-88), the founder of the Umayyad dynasty of Spain; Katābi was the mother of al-Mu'tadīdī (378-9/989-92); and Kāriḍī was the mother of al-Kāhir (320-3/932-4); M. Talbi, op. laud., 42-3).

In the armies of the Umayyad and Abbasid caliphates, the role of the Maghribīs, without ever looking down on the Maghribīs, was a major asset, which ultimately met with failure, on Constantineople (Abu 'l-'Arab, Tabākīdī, ed. Ben Cheneb, Paris 1913, 22; Ibn Ṭabākīdī, Bayānī, ed. G. S. Colin and E. Lévi-Provençal, Leiden 1948, i, 49). In Baghdad, it was from the time of the reign of al-Mu'tawakkil (232-47/847-61) that the Maghribīs began to play a role in the army and under officers drawn from their own ranks, a considerable role. They received pay equal to that of the Turks (al-Ṭabarī, Taṣārīfī, ed. Abu l-Fadl Ibrāhim, Cairo 1968, ix, 155), and, with the latter, they were nominated al-Mu'tazīs (248-54/862-66) as successor to al-Munṣūrī (247-8/865-66); the latter, 256). They abandoned him subsequently, taking an oath of loyalty, again in partnership with the Turks who played the role of a driving force, al-Mu'tazzī (al-Ṭabarī, ix, 287) and participated actively in the civil war which broke out between 351/965 and 352/966 (al-Ṭabarī, ix, 290, 291, 304-39). In 352/966 they took part in the dethronement and assassination of al-Mu'tazzī, who was unable to pay their salaries and those of the Turks, and, from this moment onward, they ceased to occupy the forefront of the stage.

It is not until the time of the Fāṭimids that the Maghribīs are seen making a massive influx into the Orient. The Fāṭimids owed their victory to the Kutāma Berbers [q.v.], and the latter followed them to Cairo and to Damasc, forming the spearhead of their army and of their Inshāfī propagation. Dīwawḥ al-Ṣikḥ, the conqueror of Egypt, gave them positions of authority at all levels of powers. "In all functions, without exception, Dīwawḥ appointed a Maghribī as partner to the official who already held the post", writes al-Maqrīzī (11th/15th, 78). Between 361/972 and 363/974, the Kutāma were the instigators of numerous riots in Cairo. In 365/976 they imposed their chieftain, Ibn ʿAbd Allāh, on the caliph al-Ḥākim (370-89/984-92). In Damascus, the presence of the Maghribīs also led to trouble. The most serious riot, in which they clashed with the indigenous population, broke out in 493/1050. The town and the Great Mosque suffered severe damage.

Numerous representatives of the Maghribī elite were not content with visiting the East; they settled there. Obviously, an exhaustive list cannot be presented here, in view of the present limitations of illustration, the following are among the most eminent: al-Tūrāfī, born in Tortosa in 451/1059 and died ca. 525/1131 in Egypt, where he exercised wide influence as a fāṣīḥ and ascetic; Ibn Dīwawḥ, the celebrated author of a riḥlah, born in Valencia in 540/1145 and died in 612/1217 in Alexandria, where he gathered around him a circle for the study of tradition and of ʿṢafīṣā; Mubīl ʿIl-Dīn, Ibn al-Arābī (580-688/1183-1280 [q.v.]), the most famous and most controversial of the ʿṢafīṣā, born in Murcia and buried in Damasc in the turbe of the distinguished family of the Ibn al-Zākī, who had welcomed him; the historian Ṣa'īd al-Wahāb al-Marrūkṣī, who, born in Marrakes, in 518/1128, took the road to the East in 613/1216 and died there some time after 621/1224, having lived successively in Egypt, Baghdad, the Hijāz and Damasc; Ibn Mārūk (ca. 710-81/1370-90), who, born in Tlemcen, left in 577/1570 for Cairo where he enjoyed high repute and became fāṣīḥ, preacher and teacher; Ibn Khalīdat, who, born in Tunis in 703/1373, settled permanently in Cairo (789-848/1382-1456), without ever relinquishing his Maghribī clothing; al-Mākṣūrī, who, born in Tlemcen in 595/1152, left in 707/1305 for the Orient, where he composed at the request of his students in Damasc his much-praised Nafās al-ḥijā, dying in Cairo in 594/1584.

Among the contemporaries, the following may be noted: Bayram al-Tūnūsī (1820-89), author of the Saʿūfa al-ṭibbī, who settled in Cairo; the amīr Ṣa'īd al-Kādir (1807-83) who, freed and given a pension by the French authorities, in 1853 chose to live in Damasc where he played an appreciable moderating role; 'Abd al-Kāhir al-Wardīghī al-Maghrī (d. 1895), who was one of the most eminent teachers of al-ʿAshārī; and 'Abd al-Kādir al-Dīwānī (1870-1943), a distinguished member of the Arab Academy of Damascus. Finally, it may be recalled that the founder of a religion—that of the Bargāwāṭī [q.v.];—Yūḥān b. Iyyās b. ʿṬārīf (227-71/842-84), sought his inspiration in the Orient (M. Talbi, Histoire, acculturation et nationalismes des Berbères Barghawit, in Actes du premier congrès d'études des cultures méditerranéennes d'influence arabo-séfévite, Algiers 1973, 217-33), and that the founder of a school and of a state, Ibn Tūmārī [q.v.], ca. 476/1085-1130), brought together the elements of the doctrine which gave birth to the Almohad movement.

The presence of Maghribīs in the East was not confined exclusively to distinguished individuals. It also comprised populous colonies of merchants, students and various types of émigrés. Information on these colonies is very scanty. Only that of the Barghawita Jews who settled in Cairo between the 11th and 13th centuries is fairly well-known today, through the medium of the Geniza documents, edited by S. D. Goitein (A Mediterranean society, i, Berkeley-Los Angeles 1967, ii, Berkeley-Los Angeles 1971, iii, Berkeley-Los Angeles 1978; and Letters a Genizah) (ed. F. F. Pernickin 1974). These documents reveal a well-organised and perfectly-structured world, endowed with efficient means of communication and of currency transfer, all of this in the service of important commercial operations covering not only the whole of the Mediterranean basin but extending as far as the Indian Ocean. The recent study by J. C. Garcia has in addition underlined the decisive role played by...
the Maghribi in the restoration and reinforcement of Sunnism in Egypt after the fall of the Fatimid. At Kuna [q.v.] on the pilgrimage route and a day's march to the north of Kufa [q.v.], they settled in large numbers. "The town to a large extent owed its new prosperity to the prestige which it acquired when certain saints persons, most of them Maghribi, settled there, died there and were buried in its cemetery which became a place of pilgrimage in its own right. These ascetics and mystics were distinguished by their Sunnism, and it was through them rather than through the direct influence of circles in Alexandria or Cairo that the Sunni 'counter-reformation spread among the people" (Un centre musulman... Qjas, Cairo 1976, 151). This example is not unique. Louis Pouzet, in a well-documented article (Maghrébins à Damas au VIIIe/VIIIe siècle, in BEO, xxviii [1977], 167-99) stresses how the Maghribi, installed in large numbers in Syria, "were able to profit from circumstances relatively unfavourable towards them (exile and partially enforced emigration, personal difficulties of a doctrinal kind and otherwise, political agitation and upheavals in the very land of their origin) to establish, particularly in the parts of the country lying higher up, a level for some of them, and quite prestigious for the Maghribi colony of Damascans as a whole" (191). In the 19th century, the presence of the Maghribi in Cairo is seen to be more numerous and varied than ever: students at al-Azhar having at their disposal a rūmāb of their own and constituting a pressure-group which could show itself formidable on certain occasions; traders exercising a monopoly over the marketing of certain products such as oil or tarbūj; etc. [A. Raymond, Artisans et commerçants au Caire au XVIIIe siècle, Damascus 1974, i, 172, 191, 101, ii, 51, 71, 157, 178, 190, 507, 531. Their number is estimated at 15,000 or 20,000 persons, firmly installed in certain quarters such as that of the Ibn Tulūn Mosque. On his arrival in Egypt, Bonaparte clashed with them; unable to dislodge them from Cairo, he contemplated utilising them and decided to raise a "Maghribi battalion" constituted of energetic scoundrels, as pitiless as their chief" (A. Raymond, Tunisins et Maghrébins au Caire au dix-huitième siècle, in CT [1959], nos. 267-2, 264-5). This enterprise failed, since the Maghribis were among those who responded most enthusiastically to the call for resistance. The establishment of the French in North Africa gave rise to a vast migratory movement, essentially in three phases: 1882-4, 1890-1908 and 1909-14. In general, Algerians settled in Syria, and Tunisians in Constantinople, in Egypt and in Tripolitania (P. Bardin, Algériens et Tunisins dans l'Empire ottoman de 1848 à 1914, Paris 1976).

Recent history provides further examples of the continuity of the Maghribi presence in the East. The Tunisian nationalist leader, al-Shakhīl al-Tunṣī (1843-1911), visited Egypt in 1868, met the reformist scholar Muhammad 'Abdul, was influenced by him and introduced his ideas in Tunisia (N. A. Zadeh, Origins of nationalism in Tunisia, Beirut 1962, 97 ff.). Later, when the Arab League was created, President Habib Bourguiba, then leader of the Néo-Destour Party, travelled secretly to Cairo in March 1945. With the Moroccan Istiklāl and the PPA (Parti Populaire Algérien) he established there, in 1947, the "Bureau du Maghreb" before returning to Tunis on 8 September 1949.

graphical nature, in particular from the Rībās and the Tabākāt. (M. Talibi)

Al-MAGHĀZĪ (also maghāţi 'l-nabī, maghāţī rasūl allāh), a term which, from the time of the work on the subject ascribed to al-Wāridī (d. 209/823), if not earlier, has signified in particular the expeditions and raids organised by the Prophet Muhammad in the Medinan period. The first such sortie is reported by al-Wāridī to have involved a party of thirty men led by Ḥamza b. Abd al-Muttaṭīb, which in 1/623 briefly intercepted a Kūshī caravan heading for Mecca from Syria on the coastal route (other accounts differ). The last was an expedition in the direction of Syria by an army of 5,000 men under the command of Uṣāma b. Zayd in 11/632, immediately following the Prophet's death. For al-Wāridī (largely followed by Ibn Sa'd), the compass of the term al-maghāţī appears to have included important ghansūs (such as those of Ubūd, al-Khandāk, al-Hudaybiyya, Khiybar, Mecca, Hūṣayn and Tabūk; Badr is elsewhere styled a ghansūs, but not by al-Wāridī), small-scale suhrās (such as that of Hamza), acts of assassination and other violence, and also Level (exile and partially enforced emigration, personal evacuations; traders exercising a monopoly over the market of certain products such as oil or tarbūj; etc. [A. Raymond, Artisans et commerçants au Caire au XVIIIe siècle, Damascus 1974, i, 172, 191, 101, ii, 51, 71, 157, 178, 190, 507, 531. Their number is estimated at 15,000 or 20,000 persons, firmly installed in certain quarters such as that of the Ibn Tulūn Mosque. On his arrival in Egypt, Bonaparte clashed with them; unable to dislodge them from Cairo, he contemplated utilising them and decided to raise a "Maghribi battalion" constituted of energetic scoundrels, as pitiless as their chief" (A. Raymond, Tunisins et Maghrébins au Caire au dix-huitième siècle, in CT [1959], nos. 267-2, 264-5). This enterprise failed, since the Maghribis were among those who responded most enthusiastically to the call for resistance. The establishment of the French in North Africa gave rise to a vast migratory movement, essentially in three phases: 1882-4, 1890-1908 and 1909-14. In general, Algerians settled in Syria, and Tunisians in Constantinople, in Egypt and in Tripolitania (P. Bardin, Algériens et Tunisins dans l'Empire ottoman de 1848 à 1914, Paris 1976).
The published papyri shed little light on the general character of early maghāzī works. The earliest relevant document so far known is an eight-line papyrus text dated by Grohmann to the early 2nd/8th century, which contains some details about the battle of Badr (Arabic papyri from Ḥiṭeh al-Mīrād, Louvain 1965, 82-4, 105). Kister (Notes on the papyrus text) has pointed out that the last section of the Chicago papyrus (Or. Inst. 17635) dealing with Badr, Dīw Maʿṣūma and the B. al-Nadir, which is dated by Abbott to the late 2nd/8th century and attributed by her to Maʿṣūm b. Rāshīd (i, document 5), is textually almost identical with a passage in Abū Nuʿaym al-Dalāʾīl al-mugḥāzī (Hyderabād 1930, 176), in which the events relating to the Prophet’s marriage and the digging of the well of Zamzam (as does Yūnus b. Būkayr’s recension of Ibn Isbāq) are drawn at least from the period of Allahyarūsī (d. 196/810), while the few works dating from the same period which contain the term sīyar in their titles bear no relation to the Prophet (see Hinds for references).

The earliest biographies, of Abu Bakr at the Sāqifah bayt al-Saʿd and the meeting at al-ʿAqabah, the conference of Ḥiṭeh al-Mīrād, are accorded the same interest as the account in Or. Inst. 174, which has an almost identical text and is dated by Abbott to the late 2nd/8th century. The earliest relevant document so far known is an eight-line papyrus text (Hyderabād 1930, 176), in which the events relating to the Prophet’s marriage and the digging of the well of Zamzam (as does Yūnus b. Būkayr’s recension of Ibn Isbāq) are drawn at least from the period of Allahyarūsī (d. 196/810), while the few works dating from the same period which contain the term sīyar in their titles bear no relation to the Prophet (see Hinds for references).

It is therefore clear that only the eight-line papyrus text can conceivably be regarded as being from the earliest (i.e. pre-ʿAbbāsid) period, and that it is obviously too truncated to provide any definitive picture of the shape of the maghāzī works which are reported to have existed at that time. Otherwise, we have only citations at one remove or more in later works, and later references to the existence of early maghāzī works. One such report, which has been noted in modern studies, is given by al-Balāqī (d. 279/892), with an insād going back to al-Zuhār, according to which the caliph ʿAbd al-Malik, on seeing one of his sons with ḍhīṣār al-magḥāzī, gave orders for it to be burned and enjoined him (instead) to recite the Kūtāb Allāh and know and act according to the sunna (Anonymous Arabic Chronicon, Band XI, 172; Goldziher, Muḥ. St., 1, 206 (Eng. tr. 291-2); Abbott, i, 17). Goldziher, while remaining that there seems to be nothing against admitting the existence of such literature in early times, also comments that "the text of this account unmistakably bears the stamp of those circles who condemned unauthenticated magḥāzī in favour of authentically recommended traditions", and in this connection he goes on to cite the saying attributed to Ibn Hanbal that "three things have no aṣl: ifṣār, the maddāʾiḥ and the magḥāzī" (see also Goldziher, Richtungen, 57).

The purpose of, and the climate of opinion about, the study of al-magḥāzī from the second half of the 9th century onwards are, however, matters requiring further research and only a few brief additional comments can be made here. Ibn Isbāq is reported to have committed his material on al-magḥāzī to writing for the ʿAbbāsid caliph Maʿṣūr, who instructed his son al-Mahdī to study the subject with that compiler (Abbott, i, 89; Watt, The materials used by Ibn Ḥishām, 31); and Hārūn al-Rashīd’s chief kāfī, Abū Yūnus, who had been Ibn Isbāq’s pupil (Abbott, i, 92), is said to have been interested in magḥāzī, ṣifāt and asyāʿān al-arab (Goldziher, Muḥ. St., ii, 207). It is apparent that one practical application of the subject was in the case of those circles who condemned unauthenticated magḥāzī in favour of authentically recommended traditions, and in this connection he goes on to cite the saying attributed to Ibn Hanbal that "three things have no aṣl: ifṣār, the maddāʾiḥ and the magḥāzī" (see also Goldziher, Richtungen, 57).

on maghāzī (for references, see Hinds, Maghāzī and Sirā). This declining interest in maghāzī as such was accompanied by the emergent view that Ibn Isḥāk had drawn material from Jews and Christians (Yāqūt, Udbāli, vi, 401; Ibn Ḥadāj, Tahdhib, ix, 45) and that he and [at least some] other asḥāb al-maghāzī had ḫudūl inclinations (Udbāli, vi, 400). In addition, Ibn Ḥanbal is reported as having said that Ibn Isḥāk's handling of ṣiwāk rendered him unsuitable as an authority that the earliest form [Tahdhib, ix, 43], and the same consideration may have been behind his reported denunciation of al-Wakīlī as haddīḥī Bahā'ī (Tahdhib, ix, 394).

There remains the question of how useful the maghāzī material is for the purpose of historical reconstruction of the early Islamic period. Here it may be remarked first that there are considerable chronological and other discrepancies between the accounts available; these have been discussed most recently by Jones (On the chronology... and Küster (The expedition of Ibn Mā'mūn). In more general terms, however, Watt sees "little ground for doubting the truth of the main events of Ibn Ḥaddīthī" and is of the opinion that "the maghāzī-material (in the special sense of the main outline of events, and omitting all anecdotes) ... is an essential foundation for the biography of Muhammad and his times" (The materials used by Ibn Isḥāq, 28). On the other hand, Sellheim has attempted to discern the main tendencies of Ibn Isḥāq according to "layering" of sources (Quellenuntersuchung), involving an original layer which reflects historical reality, a further layer made up of legendary material about the Prophet, and a top layer reflecting political tendencies of Ibn Isḥāq's own time (Prophet, Cātihat und Geschichtsbericht). Such an approach is not wholly incompatible with Schacht's conclusions that an intrinsic layer "can substantiate the authenticity of a work ascribed to an author of the early 2nd/9th century and that in general the "more perfect the simūd, the later the tradition" (JRAS 1946, 147). From this standpoint, Schacht has examined the short Māṣūm b. ʿUkhṭī text (an edition of the 4th/9th century) published by Sachau and has challenged Sachau's view that the text contains no elements from the ʿAbbāsid period. Schacht has seen the growth in the 2nd and 3rd centuries of traditions ascribed to Māṣūm as typical of the way in which spurious information was put into circulation, and has concluded that "the whole of the standard biography of Māṣūm in the later works is without documentary value, particularly the touching picture, taken seriously by Sachau and Hovezī, of his regular lectures to a circle of pupils in the mosque of Medina. This presupposes the concept of Medina as the home of Islamic learning, a concept which was as yet unknown to Ṣafīyy (d. 204)" (On Māṣūm b. ʿUkḥtī's kitāb al-maghāzī, 299).

More recently, Wansbrough, who also doubts the feasibility of historical reconstruction of the Islamic period up to ca. 200 A.H., has viewed the sirā-maghāzī literature (as he terms it) as an Islamic adaption of Biblical salvation history. In his opinion "the earliest expression of Islamic soteriology consisted in membership of the umma and it is in the sirā-maghāzī literature that the earliest formulation of Muslim identity is contained" (The sectarian milieu, 89), the conceptual motive in this (as in scripture and sunna) being polemic (101). Wansbrough sees a transition from the sirā-maghāzī literature, where ecclesia is the dominant cognitive category and precedent is historically articulated, to the suumah-hadīth literature, where nomos is the dominant cognitive category and precedent is "idealized and hence shorn of its historical dimension" (87); for him, the Ibn Isḥāq-Wakīlī-Bulhārī development from sirā to sunna marked a passage from loosely structured narratio to concise exemplum (77-8). In modification of this view, however, it should be remarked that the signification of sirā was also close to that of exemplum and that the passage was rather from maghāzī to irāzī, with the sirā material being essentially maghāzī material viewed in a new light. It can also be noted that, while the narrowing-down of the scope of the maghāzī to the period and background of the Prophet seems to have been conventional from the 3rd/9th century onwards, it is nonetheless difficult to discern a point at which al-Wakīlī's even narrower definition gained any exclusive currency. It seems rather that the two senses of maghāzī co-existed: in the broader of the senses, the term echoed an earlier scope which had been yet broader (note particularly the title of al-Kalām's work) and seems to have been used in a more or less synonymous with the term sirā as a genre label. But it appears to have been a more technical one, i.e. the maghāzī "proper", as distinct from the mubāthā, for example. The term sirā, while occurring as a genre label more or less synonymous with maghāzī, also came to signify preponderantly the account of the Prophet's life and background as transmitted by Ibn Hishām on the basis of the work of Ibn Isḥāq—the maghāzī which became sirā as exemplum, only to be largely superseded by the suumah-hadīth literature.

Bibliography: For a general survey, see F. Sægø, GAs, i, Leiden 1967, 237-239, 275-302; Sezgin is incorrect when he suggests (309) that Ibn Ḥuṣayn Tāhīṭī ascribed a work of similar material to Wāḥib b. Munabbih (the reference is to maghāzī material from [ʿAbd Allāh b. Wāḥib)—for further critical comments on Sezgin's remarks about Wāḥib b. Munabbih and al-maghāzī, see R. G. Khoury, Wāḥib b. Munabbih: der Heidelberger Papyrus PSR Heid Arab 23, Wiesbaden 1972, Teil 1, 12; Sezgin is also incorrect in saying (39) that the Frisbt (see 228, 9) attributes a work on al-maghāzī to Hujayr b. Bāṣhrī.

MAGHILA, a Berber tribe belonging to the
great branch of the Butr and related, if one is to
believe the ancient Berber traditions cited by Ibn
Khalūd, to the tribes of Darīsa, Saṭṭīra, Lamīya,
Madmūta, Sadīna, Māliziya and Mādānīya who lived,
in the early Middle Ages, in eastern Barbary.
It is also apparently in the same region that the
ancient habitat of Maghīzī is to be sought in the
period in question. According to the Berber traditions
cited by various early Arab historians, the Maghīzī,
after coming from Palestine into North Africa,
reached Lūbiya (Libya), from where they made
their way to the Maghībīr, establishing themselves,
before the Arab conquest, in the mountainous
regions of this land, probably in the Ḍībāl Dāhband
and Ḍībāl Dāhband in southeastern Tunisia. Vivien
de Saint-Martin has suggested seeing in the Maghīzī
the Libyan tribe of the Mecāles or Imzāles of Corippus
(6th century A.D.). This hypothesis appears very
probable, despite the opposition of Stepanov Gsell.
Similarly, another hypothesis of Vivien de Saint-
Martin and J. Desanges appears highly likely,
according to which the Mecāles of Corippus and
the Maghīzī of the Arabic sources were none other
than the Makblūnes of Ḥerodotus, a Libyan tribe
who lived, in the 5th century B.C., in south-eastern
Tunisia. It is there, to the south-east of the Shott
el-Dijird, that J. Desanges places the Makblūnes
and the Mecāles. As for the Maghīzī, we lack proof
of Arabic sources on their habitat in eastern Barbary
in the 5th/6th century. However, Ibn Khālūd
raddadhībī enumerates them, in his geographical
work composed ca. 829/840-9, among the Berber
tribes of the east, counting them alongside well-
known eastern tribes such as the Hawrādā, Darīns,
Waragīfdōmā, Māzīta and Nafīsā.

Algeria. The Arab historians and geographers
note the existence of two groups of the Maghīzī in
this country. One of them occupied, in the 8th/9th
century, according to Ibn Khālūd, the countryside
from the mouth of the Chelif on the west as far
as the town of Mazouna on the east. It seems that
formerly the possessions of this group of Maghīzī were
larger and that they extended towards the east as far
as the environs of the town of Tlemçen. Ibn Khālūd
locates, in the 5th/6th century, (at the entrance
of the great desert), the town of Tāmnaghīt, whose
name seems to be strictly linked to that of Maghīzī.
Further to the west, al-BAkīr places, at two days’
journey from Tābert, a castle which also bore the
name of Tāmnaghīt. It is again in the environs of
Taḥart that there is to be found, according to al-
BAkīr, at a distance of five fasāḥs from the sea,
very near Oued el-Khamis, to the north of the town
of Mazouna, a locality called Ka‘a Maghīzī Dalāl,
also doubtlessly named after a section of the Maghīzī
who lived there. On the west side also, the limits of
the territory of the town of Tlemçen exceeded, in the
5th/6th century, those of the 8th/9th century. Indeed,
it is in the territory of the tribe of Maghīzī that the
town of Aslān was situated, which was to be
found immediately to the east of the mouth of the
Tafna, and to the east of the island of Araghīl,
Raschoum on our maps. It is from one of the ports
of the Algerian Maghīzī that there set sail, in 1287/755,
the founder of the Umayyad dynasty of Spain,
Abū al-Raḥmān I b. Mu‘āwiyah, in order to disem-
barsh at al-Manakhab (Ain Mek nickname) in al-Andalus.
In our opinion, this port is none other than Marsa
Maghīzī, an anchorage situated a little to the west
of Tēmsās, which is noted in the geographical
work of al-Bakīr of M. Hinds.

Another Algerian section of the Maghīzī lived,
in the 2nd/3rd-5th/6th centuries, in a region situated
in the province of Tlemçen. Ibn Khālūd says that
the Zanātī tribe of Banū Ifrīn domiciled in this
region, supported by Berbers of the tribe of Maghīzī,
recoiled in 148/765 against the ‘Abīsābīs, “having
chosen as their chief Abū Kurra the Ifrīn, or rather the
Maghīzī”. In another passage of his work, Ibn
Khālūd however puts in doubt Abī Kurra’s
gnong to the Maghīzī. He says only that the
Banū Ifrīn and the Maghīzī lived alongside each
other, the Banū Ifrīn being stronger and more
numerous. According to another passage of Ibn
Khālūd’s work, the Maghīzī protected the Banū
Sufīn and the Banū Sa‘īd, which seems to indicate
that the town of Tlemçen towards the middle of
the 4th/5th century, and al-BAkīr cites an Arabic
poem which speaks of the losses of this tribe in a war
which took place in 338/949-50.

Morocco. In Morocco also, there were, according
to al-BAkīr, al-Idrīsī, Ibn Khālūd and other Arab
mediaeval authors, two branches of the tribe
of Maghīzī, of which the remnants lived in the
8th/9th century dispersed in the triangle formed by the towns of Fas, Meknes and Seffou. One of these branches occupied the region situated to the south-east of Fas, where the medieval Arab geographers placed, halfway between Fas and Meknes, the fortress called Maghilla. Al-Bakri also locates there a district called Maghilla, which, in his period, was under the command of a certain MUS. B. Jaldil. Al-Bakri located this town to the north of present-day Morocco. Another branch of Abd Allah in the town of Fas, Meknes and Salhdna, supported the cause of the Idrisids and opposed the fakih R. al-Maghilla. They were also perhaps the same Maghilla as those who, united with the Awadha and Sadina, supported the cause of the Idrisids from the arrival of Idris I b. Abd Allah in the north of present-day Morocco. Another branch of the Maghilla occupied, in the 9th century, the district of Maghilla which al-Bakri locates to the south of Oued Ouerga, to the north-west of Fas and which has to be distinguished from the district of Maghilla situated to the south-west of the same town.

It may further be added that it is to the tribe of Maghilla that Ibn Abi l-Majdi al-Maghlil belonged, author of a genealogical work devoted to the Berbers and quite frequently cited in the Maghrbi chronicles.

(T. Lewicki)

AL-MAGHILLA, MUHAMMAD b. 'ABD AL-KARIM, reformist of Tlemcen, chiefly famed for his persecution of the Jewish community of Tuwât (Touat) in the Algerian Sahara and for the advice he gave to Sudanic rulers. The general outline of his career is fairly well established, but many details remain obscure. He was born in Tlemcen, ca. 1440, from the stock of Berber stock and studied under 'Abd al-Rahman al-Thal'i (d. 875/1470) and Yahya b. 'Abd al-Turab (d. 875/1472). At an uncertain date he took up residence in Tlemcen, then the principal fortified town (kasi) of the Tuwât oasis, which was closely linked to Tlemcen and to the towns of the Sudanese belt by the ties of commerce.

The prosperity of the Jewish community there and in the neighbouring oasis of Gurara, and the connivance of the Arab chiefs in ignoring the letter of the law in regard to these "protected persons", aroused his ire. He wrote a treatise (R. si ahkam ahad al-dhimma) asserting that the Jews of Tuwât had broken their pact (ahd) with the Muslims, and thus forfeited their protection, by not paying diyas regularly in a state of "abuse and humiliation" (asi ahkam i-l-jahd) and by "rebellng against Islamic laws" (al-tamarrud al-ahkam) through too close an association with their Muslim overlords. He also claimed that the existence of the Tuwût synagogue was contrary to Islamic law and demanded its destruction.

Both he and the kadi of Tamanrasset, 'Abd Allah al-
'Aswam, who opposed his views, sought the support of North African scholars. The majority favoured al-
'Aswam's interpretation, but the support al-Maghilla received from two Tlemcen scholars, the historian al-
-Tanassi and the theologian al-Sanusi (al-Wajshari), al-
-Mu'ayr al-Maghilla, Fas 1395/1879-80, ii, 170-262; tr. in Archives Marocaines, xii (1908), 244-95, who adds his own view which supports theirs, was sufficient to encourage him to rouse a mob to destroy the synagogue. He also offered seven mkhabar of gold for every Jew killed.

Not long after these events, which probably took place shortly before 1490, al-Maghilla left Tuwât, possibly expelled on account of his unwelcome zeal, but this is not clear. It may be at this period that he visited Fas, where he made an unsuccessful attempt to establish his influence with the Wazzid sultan Muhammad al-Shaykh (Ibn 'Asfar, Dauja, 96, is the one source to report this bizarre episode). He then left North Africa for Bilad al-Sudan, stopping first at the important commercial centre of Ta-kikda (Tegida, identified with Azelik in the south-west of the Air massif) to teach and preach, and passing on to Katsina and Kano, then burgeoning city-states. He had contact with the ruler of Kano, Seriki (sudan) Muhammad Runci, as early as 1491-2, when he addressed him a letter on "determining people from forbidden acts" (text in B flora's edn. of Ahkam al-dhimma, misleadingly titled Mi-asib al-arrida [a different work by al-Maghilla], 27-7-7). He evidently resided several years in Kano, for a family there still claims descent from him (and "Shafii" status), and it is no doubt while he was there that he wrote his longer treatise of advice for Muhammad Runci (published under the invented title Taha al-din fi ma ya'dib al-ilmu, Beirut 1931).

The date and duration of his visit to Katsina are not known but before the close of the century he was in Gao advising the Songhay ruler Askia Muhammad b. Abi Bakr after the latter's return from pilgrimage. His replies to that ruler's questions legitimised the Askia's seizure of the goods and chattels of his predecessor, Sunusi 'Ali, and strengthened his claims to sovereignty over a wide area of Muslim territory in the Sudanic belt. On hearing of his son's death in Tuwât at the hand of a group of Jews, al-
-Maghilla called on the Askia to arrest all Tuwâtis in his realm and only the opposition of the kadi of Timbuktu, Muhammad b. 'Umar, prevented pecu-

His known writings total twenty-six items, mainly on topics of fikr and tawhid. He also had an interest in formal logic (maqhb). He exchanged verse polemics with al-Suyuti, who declared his study forbidden, and wrote a treatise called Minas al-Wahhab fi radd al-fikr al-sal al-jahd, which was widely studied in West Africa. The treatises he wrote during his Sudanic tour were known to the 19th century reformers of

(T. Lewicki)
and it is doubtful if al-Maṣṣilsa, consider him an important link in the clam, “regenerators” (mudiaddidi) of the order.

though this chain can be shown to be ahistorical, the Hidjra. They, and all other Kadirls of West Africa whose affations go back through the Kunta sultana, consider him an important link in the chain, though this chain can be shown to be ahistorical, and it is doubtful if al-Magḥil himself had received the word of the order.

The Kunta [q.v.] revere him as one of the four “regenerators” (mudādīdī) of the 10th century of the Hija. They, and all other Kadirls of West Africa whose affations go back through the Kunta sultana, consider him an important link in the chain, though this chain can be shown to be ahistorical, and it is doubtful if al-Magḥil himself had received the word of the order.

MAGHILTIS

MAGHNATIS, Maghiltis, Maghnatîs, Arabic rendering of ḳalvûgûrî (kâlûqir), indicating 1. the magnetite and 2. the compass.

1. THE MAGNETITE AND MAGNETISM

The magnetite [lodestone, magnetic iron ore, Fe₃O₄] is a very widely-spread mineral, well-known since antiquity, and found in huge quantities in individual deposits as well as a finely-allotted constituent of almost all kinds of volcanic rock. The Islamic natural scientists, geographers, cosmographers and encyclopedists transmit much information about its properties. The magnetite is first of all “the stone which attracts iron” (see e.g. al-Ṭabarî, Magḥilî, ed. Van Votten, 1861). Al-Birûnî, Dāmâghîrî, Hârbaštîbî, 155, 212-15, has a circumstantial chapter on it. According to him, Sahâra with amber (hârâbî) is the property of attraction, while he is more satisfactory that the latter for extracting particles of iron from the human body. The name is correctly explained as being Greek, while ara¬mîliha ( UIAlertView or aRuhlrintov) and abarakalî (擂Οο* ^ξε how is given as synonym, although the first, as is well-known, indicates the diam¬ond; for the confusion of the magnet and the diam¬ond in antiquity and in the Middle Ages, see E. von Lippmann, Die magnetischen Stoffe und das Kreuztuch, in: Vierteljahreschrift für Naturforschung und der Technik, i, Berlin 1923 (new impression Wiesbaden 1972), 182, 194, 213 ff. Referring to earlier authors, al-Birûnî records that the blue magnetite—which he did not know himself—was considered to be the best; it was burned by many people and sold as al-bâda’â (haemafite). According to the same author, the black-brown, and further the iron-coloured, were equally appre¬ciated. The richest deposits known to him were those in the Mediterranean Sea carpentered by nails, he concludes that the richest deposits

III, 363; Hiskett, An Islamic tradition of reform in the Western Sudan from the 16th to the 18th century, in: BSOAS, xxv (1962), 572-97; G. Vajda, Un traité maghrébin “in¬versus judaeus”; “Aṣḥâb al-asrār al-dimshqiyya” (new impression Wiesbaden 1971). 182, 194, 213 ff. Referring to earlier authors, al-Birûnî records that the blue magnetite—which he did not know himself—was considered to be the best; it was burned by many people and sold as al-bâda’â (haemafite). According to the same author, the black-brown, and further the iron-coloured, were equally appre¬ciated. The richest deposits known to him were those of Zihaţar in south-east Anatolia. From the fact, however, that ships in the China Sea were kept together by vegetable fibres, but those in the Mediterranean Sea carpentered with nails, he concludes that the richest deposits of magnetite occur in the submarine mountains of the China sea, since it is exactly there that the nails would be extracted by magnetism and ships would disintegrate. In the mountains of Ǧabulûstân [q.v., in eastern Afghanistan] magnetite is said to occur as solid rock; on their sunlit outer surfaces the power of attraction would be weak, but in the inside strong, as al-Birûnî himself had ascertained by means of collaborators. Other denominations of the lodestone, based
on confusion, are: bâkṯ or ḥādār al-bāltû (i.e. the haematite, which results from converting magnetite or other minerals), ādāmas al-ḥāṣfārī (i.e. the diamond; ḥāṣfārī means "indomitable"), from which ḥāṣfārī can possibly be explained, bâkṯ (see below), karrāmīl (possibly through Romance calomnitis, derived from kalomnitas, but cf. this E. O. von Lippmann, Geschichte der Magnetnadel usw. zur Erfindung des Kompasses [London 1860], in Quellen und Studien zur Geschichte der Naturwissenschaften und der Medizin, ii/3 [Berlin 1932], esp. 15-26).

The notion that lodestone and iron are connected as the lover and the beloved, was spread very widely; iron is "obedient" to the stone because of a divine power inherent in the latter, and is attracted to it. Edward the Confessor (cf. Ibn Hūrin, Tārikh al-ṣafārī, ed. Wüstenfeld, i, 239, below); between the two exists a profound inclination: when iron "smells" the magnet, it moves towards it until it clings to it and holds on tight to it, as the lover to the beloved (op. cit., 325; cf. also Râšîl lṭūwān al-Sâfî, i, Beirut 1375/1957, 110 f.). This image was expressed poetically by Ibn Hażm, Tawq al-baḥātūna, ed. Pérot, 8, 20-9, 9, cf. E. Wiedemann, Aufsätze zur arabischen Wissenschaftsgeschichte, ii, 149-51. In other comparisons, the sexual connexion is formed by the contrast of reaction: the "phlegm" (bālgham) combines with the soul quicker than iron with the magnet (M. Ullmann, Katalog der arabischen alchemistischen Handschriften der Chester Beatty Library, ii, Wiesbaden 1976, 99). This conception is connected with certain theories developed by Dâbrî b. Hayyān in his Kitab al-Rujma: "The strongest factors existing in this world are the delicate spiritual things which cannot be observed with the senses, but only with the intellect, like the stone which attracts iron through an immaterial power that can neither be felt nor seen. It permeates the solidity of brass (jaf) which finds itself between it (i.e. the magnetite) and the iron" (Ar. text in M. Bcrthelot, La Chirurgie au Moyen Age, iii, Paris 1983 [repr. 1967], 144-5; French tr., i, 175). Thus the Arabs were aware that the magnetite is efficacious through other bodies. A few sentences further on it is said: "We found (?) a magnetite which lifted a weight of two dirhams (= 314.5 gr. according to W. Hinz, Islamische Masse und Gewichte, Leiden 1955, 3). We left it alone for a while and then tested it with another piece of iron, which however it did not lift. We thought this to be heavier than the two dirhams which it had lifted earlier. But when we weighed it, it had a weight of less than 80 dirhams, so its power had decreased, although its mass (jîrm) had remained the same." From these observations it was rightly concluded that in course of time the lodestone loses part of its power of attraction. Thus the carrying capacity of the magnet used by "Geber" was quite considerable; for further quantities see by al-Ṭabarî and al-Thābit, cf. E. Wiedemann, Aufsätze, i, 33.

Iron filings, put in a pan which one keeps in one hand while with the other a magnetite is moved backward and forward underneath the pan, follow these movements. Also, when the stone is brought near to a needle, it attaches the latter to itself, and likewise other needles which are strung to the first one, so that finally all of them are joined as it were to a string by an "immaterial power"; in the same way rings can be hung to one another (J. Ruska, Der Steinboth des Aristoteles, Heidelberg 1912, Ar. text 108, Ger. text, 154).

Next to its attractive power, the magnet has also a repelling power: when held over an ant-hill, it drives the ants away. When smeared with the saliva of a fasting man, it loses its attractive power. This power disappears also when the magnet is rubbed with garlic or onions, but when cleansed from garlic and put in the warm blood of a freshly-slaughtered billy-goat, the power returns (al-Kanzî, Ḥâḍidra, 238; al-Dîmâṣqî, Nûkhball al-dahr, ed. Mehren, St. Petersburg 1866, Arabic text 73 f., French tr. 85; Ibn Kûsîbîa, ʿUyûn, i, Cairo 1346/1928, 105; Pseudo-) Magîrîト, Ghâyat al-hâkim, ed. H. Kitzer, Leipzig-Berlin 1933, 399, 15-6, tr. 406). The following observation of Ibn al-Fâkîh (īdâra, vi 5, 134) is also worth noticing: When a knife or sword is rubbed against the rocks of a mountain near Amîdî, they carry iron and attract needle magnets; but they lose their power. The latter itself does not possess attractive power, but when a knife or sword is rubbed against it, it attracts iron. This power is said to be preserved for a very long time, namely a hundred years. As Wiedemann (op. cit., i, 36) remarks, magnetism is preserved in sword and knife because they are made of steel: they are a "permanent" magnet.

The question of the causes of interaction between magnet and iron has apparently also been studied in a more general way. No less a person than al-Râzî wrote an essay entitled Kitâb fahm al-wâqîf li-bâdîd al-maghnâfî, ed. Ibn al-Nâdîm, Fihrist, 301, 145-5. The essay probably examines whether and how the magnet is effective through empty space. Al-Thâbit recognized the chemical relation between iron and magnet from which the effectiveness is deduced. According to him, the attraction is based on reciprocity; deep inside, the lodestone has transformed itself into iron, for both minerals have the same nature which explains the inclination and love to each other "since the beginning of their existence" (Wiedemann, op. cit., i, 34 f.). According to al-Tuchîrî (ṣūr al-Wiedemann, i, 699), the lodestone belongs to the stones which contain spirits.

It was believed that there existed a number of other stones with attractive power, apart from the iron magnet: the gold magnet which attracts gold, and when put in the water of a well, it increases the efficacy of the iron magnet; the silver magnet which is extraordinarily powerful (at a distance of five ells it attracts an ounce of silver); the brass and copper magnet, which, among other things, are used as a remedy against epilepsy; the lead magnet, ugly and evil-smelling; the flesh magnet, so-called because, if put on flesh, it sticks fast to it and, if pulled away, rips off pieces of it; the hair magnet which attracts hair and, if moved over the head, tears it off; finally, the nail magnet, which pulls out fingernails (J. Ruska, op. cit., Ar. text, 109-11, Ger. text 155-9). Other magnets are enumerated by al-Dîmâṣqî (Nûkhball al-dahr, Arabic text 74-7, French text 85-9), who remarks inter alia that gold is the magnet of mercury: when they come together, gold attracts the mercury and mixes with it; when filings of gold, lead, copper, iron and tin are mixed and mercury is then added, the latter goes in search of the gold filings and mixes with them, but not with the other filings because a "magnetic friendship" (katalh maghnâfîs) exists only between mercury and gold. A number of similar magnets are catalogued by al-Kanzî (op.
It is hard to be wondered that, already in early times, all kinds of legends were coupled to the attractive power of the magnet. Al-Djawbari, for instance, relates that in the "monastery of the idols" [lāzīmat el-dīnāt] an iron idol is floating free in space under a cupola. This statue is said to be the work of Vabilius (Apollonius of Tyana), who had constructed a cupola from lodestone in such a way that the magnetic power was acting upon the statue so evenly from above and from the sides that it was floating exactly in the middle of the space. In order to attract and remove them. "Strewn on gaping wounds in pulvurised form, it contracts them."

In medicine, the lodestone does not seem to have been applied widely, although it is found in almost all pharmacopoeias (see D. Goitia, Studien zur Geschichte der Mineralnannen in Pharmacien, Chemie and Medizin, 1971). An iron idol is floating free beneath a cupola. It is potent for draining away thick mucus and, if held in the hand, for removing spasms and pains in hand and foot. It is administered to those who have swallowed iron filings or rust in order to attract and remove them. Strewn on gaping wounds in pulvurised form, it contracts them. In cases of gout caused by heat, it allays the suffering if applied after being rubbed with vinegar. He who

wears a lodestone round his neck will have a good memory and does not forget anything. Used in pulvurised form as an eye make-up, it stimulates love relations. It helps a pregnant woman to have an easier confinement; worn in a seal-ring, it brings good luck; etc.
voyages by sea (cf. R. Henning, Verhandl. der Gesellschaft, deutscher Naturforscher etc., 84th Versammlung, 71f [1922], 95).

In deciding the direction by means of a magnetic needle, the Muslims used the end which pointed to the south; as Mecca lay to the south of most places, in Syria etc. the kibla [qf.] corresponded almost exactly to the south.

The oldest passage in which the word haaramt perhaps corresponding to "magnet" (calamita) occurs is given by Dozy for the year 230/854 in his Supplement, ii, 337, that found it in al-Bayân al-muṣṣâlīb (Histoire de l’Afrique et de l’Espagne) edited by him. Serious objections have however been raised to interpreting the word as compass in this passage (MSOS, Berlin, xi, 1-2 [1900], 268). From the fact that in narratives of travels of the 9th century A.D. and that in al-Maṣdūl (923) the directions are given in the same way as on compasses, G. Ferndan concluded that the compass was already in use then.

The next oldest absolutely certain reference is in the Kitāb al-ḥikdātī of "Avfī, it is in his Lubāh al-abhā (ed. Browne and Mirzā Muhammad Kazwīnī). A captain during a storm in the Red Sea or Ferairān Gulf finds his true course by means of a fish, of which we are expressly told that it had been rubbed with a magnetī. A similar statement regarding the use of a magnetī as a guide at sea is made by al-Makārī in his Kitāb (fī dārām 1270, i, 240; Cairo 1324, i, 557; Z. f. Phys., xiv [1924], 160).

A very full description of the compass and its use in the Mediterranean was given in 640/1242 by a certain Baylak al-ḥikdātī in the Kitāb Kunās at-tuḥādry jī mārfyaf al-ḥāhār. A needle which has been rubbed with a "female" lodestone is placed diagonally through a rush or piece of straw, etc. Sometimes a counterpoise is placed to weigh the arrangement, which is floated on water set to rotate by a lodestone held in the hand and moved in a circular direction; the latter is then quickly withdrawn. The needle places itself pointing to the south, which is the same as the kibla. The turning is probably regarded as magical, but it has a physical significance. By the turning, the very tenacious skin of the water is broken and the apparatus bearing the magnet is enabled to move freely. The turning is, however, not always done, but the needle with its support is simply placed on the water.

Al-Zarkhūrī describes several forms of compass in a work on mechanical toys, for example a small, beautifully-painted, wooden fish, in which a magnetic needle is placed. In place of the fish, which might hurt the feelings of pious worshippers, a wooden disk with a nihrāb drawn upon it is also used. Finally, an apparatus just like our compass is described. Two magnetic needles are placed symmetrically in the centre under a circular piece of paper. Under the centre of the paper, a needle is placed which turns on a point; the whole is enclosed in a cylindrical receptacle with a glass top and is called bukk al-kibla "vessel, box for the kibla", or bayt al-tib, "house of the needle"; according to Niebuhr, the same name is still given to the compass. At the present day, similar compasses are used along with a simple sundial. Another very full description is given by a certain Muḥammad b. Abi’l-Ḵayr al-Ḫassānī in his al-Nuđjum al-gāhīrī (cf. E. Wiedemann in the Z. für Physik, xiii [1923], 173; there is a manuscript in Beirut in addition to those mentioned here. Whether the Cambridge bridge one was written in 1203 or 1258 cannot be ascertained with certainty). The needle is fastened to a copper plate hollowed out or raised in the centre and placed on a copper stand. One end of the needle, no doubt the south end, has something put on it to mark it.

An important passage in an anonymous work "Preparation of the bowl (ḥassa) to ascertain the kibla and points of the compass" is in a Berlin manuscript (Adler Antiquities of the Greeks, 1871). Here in Syriac the needle points south, the eye to the north (the rubbing [haḥahr of the needle explains the peculiar modern name kibla for the compass).

It would take us too far to deal here with the box compass proper which is called in Turkish e.g. ìs-suasia from the Italian. We will only note that on the rhomb-stand the south is called al-kibla and also al-juhandī (cf. thereon, for example, K. Fey, Die Wiedereinführung des Orts- und Gradens mit Benutzung der Fahrride des Admirals Petri Réts vom Jahr 1526, in MSOS, Berlin xi [1908], 234 ff.).

Wiedemann, Über Geschichte des Kompasses bei den Arabern, in Verhandl. der physikalischen Gesellschaft, ixx (1928), 764-73; xi (1929), 262-6; xxi (1959), 655-7; Z. f. Physik, xii (1925), 13-26; xiii (1923), 240; xvii (1942), 266-8; G. Ferndan, Nasa al-ṭarih al-iṣṭiṣlaḥī (contribution à l'histoire de la boussole), in Publications de l'Institut des hautes études marocaines, Mélanges René Basset, i, 1923, 1-16; W. C. Ernle, Compasses, compassi and Kandils, in JSS. xxi (1924), 109-78.

In the Beiräte, ii, the earlier literature is collected. This is also done in other works e.g. by Clément Mullet on the compass. Of special importance are the works of A. Schückler (Der Kompass, etc., Hamburg 1909-1915 ff.), which deals with the Boussole in China. (E. Wiedemann)

MAGHNISA, modern Turkish form Manisa, classical Magnesia, a town of western Anatolia, in the ancient province of Lydia, lying to the south of the Gediz river on the northeastern slopes of the Manisa Dağı, which separates it from İzmir or Smyrna (lat. 36° 36' N., long. 27° 27' E.).

In Greek and then Roman times, Magnesia ad Sipylum was a flourishing town, noted amongst other things for the victory won in its vicinity by the Scipios over Antiochus the Great of Syria in 190 B.C., and continued to flourish under the Byzantines (see Pauly-Wissowa, Realencyclopädie, xxvii, 472-3). After the capture of Constantiople by the Latins in 1204, the Byzantine emperor John Dacius retired to Magnesia and held out there till 1255; it was also the seat of a bishopric, which seems to have disappeared however by the 14th century.

Out of the ruins of the Saljūk kingdom of Rum, a Turkmen chief Şāh-Ḵān (d. 1345) established himself in the town in 1313 and made Magnesia the capital of his beylik, one which endured for over three-quarters of a century. Ibn Batūṭa, Ribā, ii, 312-14, tr. Gibb, ii, 447-8, visited what he called Maghāniša during Şāh-Ḵān’s reign, and stayed in a zārīya or hostelry of one of the local fiyān (i.e. of the Aḥsīs [g.v.]); he praises its size and its amenities. The Ulūlāmjādī of Magnesia dates from this period also, and re-uses Byzantine materials.

The Şāh-Ḵān-e ogluhārī (g.v.) continued to hold the town till 749/1350 or the next year, when the Ottoman Beyazid I [qf.] conquered it and gave it to one of his sons. After Timur’s victory at Ankara in 1402/1405, Timur gave Magnesia to his grandson Muḥammad (see Shāraf al-Dīn Allāh Yazdī, Zaftar-nāma, ed. 74.
Calcutta, ii, 466-7), and the town was then briefly restored to the descendant of Šâh-Khan, Khód Şáh Beg; but the latter was deposed and killed by the Ottoman Mehmêmed I in 813/1406.

Under the Ottomans, Manisa, from its nearness to the capital Istanbul, was often governed by the sultan's eldest son and regarded as a stepping-stone to further advancement. After his abdication in 848/1444, Sultan Murad II retired to Manisa, leaving it to combat the Hungarian Crusaders but returning after his victory at Varna later that year (von Hammer, GOR, ii, 351, 357); the remains of his palace and garden are still visible.

Concerning the tax-paying population of the town, we possess figures for 935/1528-1 and again for 938/1535-6. Compared to other Anatolian cities, Manisa during the 10th/16th century experienced only moderate growth: from 6,000-7,000 inhabitants at the first date to 1,995 taxpayers (about 7,000-8,000 inhabitants at the second one). This is all the more noteworthy as Manisa during this period continued frequently to house the courts of Ottoman princes, so that much public construction took place in the town. The Külu'niyye mosque was built in the name of Prince Sháh-i Afsáh, while the Sultánáyye mosque, which possessed shops and taxation rights in Urfa near Izmir, was founded by Khán Sháykhun Suleyman's mother Hâfiz Sultán. As the last Ottoman prince residing in Manisa, Murad III (989) had the Murâdîyye külliyûse or complex constructed by his chief architect Kókú Sinân (984/1580)

In the second half of the 10th/16th century, the area between the Gediz Cay and the Bilyûnq Menber rivers produced grapes and figs for consumption in Istanbul. To assure a regular supply for the Ottoman capital, a large number of official rescripts prohibited both wine-making and the exportation of raisins. Throughout the 10th/16th century, the exportation of cotton was equally forbidden. But for reasons not completely understood, this prohibition was reversed in the 1620s. Export trade in cotton particularly developed in the course of the 10th/16th century, when the area was controlled by a family of ayyûn or notables known as the Karâ 'Othmân Orchardar (see below). The French traveller Pitton de Toumefort, who visited Manisa about 1700, stated that the cotton trade was the only major activity visible in the town (see on this trade, KURN. 2. In the Ottoman empire).

When Ewlyi Celebi visited Manisa in 1683/1673-2, he was much impressed not only by the historical buildings, particularly by the Murâdîye mosque, but also by the opportunities for entertainment. Apparently the coffee houses of Manisa could rival with their more famous counterparts in Aleppo, Cairo and Damascus. Ewlyi also mentions the existence of more than 3,000 shops, aside from two covered markets. But he equally reports that one of the covered markets had been partially converted into a mosque. This observation, if correct, may indicate that business life in Manisa was in fact stagnating.

From the 11th/17th century onward, Manisa was increasingly eclipsed both politically and commercially by İzmir [q.v.]. The latter had been a minor port in the 10th/16th century, containing less than 500 tax-paying inhabitants. But the transit trade in Persian silk lead to İzmir's rapid growth, and Manisa took on the characteristics of a minor regional centre, which specialised in the marketing of agricultural goods. However, a certain amount of textile manufacture survived into the 1890s, and so did the tanning industry, which had already been famous in the 11th/17th century.

In the 11th/17th century, Manisa became the capital of a powerful family of derebey [q.v.], the Kara 'Othmân-Orhun family [q.v.], whose authority stretched from beyond Sârûbîn itself as far as the Sea of Marmara to the north. It was not until 1244/1829 that the central government was able to replace members of the family (whose administration is praised by the English traveller G. T. Keppel, Narrative of a journey across the Balcan... in 1829-30, London 1831, ii, 294-301) by its own nominees.

Late 19th century population figures reflect the relative decline of Manisa, now in the midst of Aydûn, compared with İzmir; Cunet assumed that the former contained 35,000, the latter 200,000 inhabitants, and Samî Bey, Kâmî ne-i-a'lem, Istanbul 1896, estimated Manisa's population at 35,025, of whom 31,000 were Muslims, 1,000 Greeks, 2,000 Armenians, etc. During the Turkish War of Independence, the town suffered heavy destruction, and the first census of the Turkish Republic credits Manisa with only 28,664 inhabitants. By 1950, the late 19th century level of 35,000 had again been reached; by 1975 the town had increased to 78,114 inhabitants.

Terram Sanctam, in P. G. Golubovich (ed.), Biblioteca
bibliografia della Terra Santa e dell' Oriente
Francese, iv, Florence 1923, 467-7). Seized by
Genoese trickery in 1373, and held by them for a
century, the town lost much of its local trade.
Then a series of disasters—earthquakes, hurricanes,
and shifting trade routes—left the town
crippled. Nicolai de Martoni (1394) observed:
"The city of Famagusta is large, as large, I reckon,
as the city of Capua, and his fine squares, and houses
very much like those of Capua, but a great part,
almost a third, is uninhabited, and the houses are
destroyed, and this has been done since the date of the
Genoese lordship. The city has finer walls than
I have seen in any town..." (Cobham, 22 ff.;
Rever de l'Orient Latins, iii [1854], 68 ff., 957 f.) Long
before 1435 when Pero D'Oriente visited it, the adminis-
tracy had abandoned Maghohia for Lefkohia or
Nicosia, and most trade and economic activity had
followed thereafter. "This place is depopulated on
account of the bad air and bad water", particularly
because of the nearby lake Constanza (Cobham, 31;
Andaças e viagens... in Colecction de libros espaMes
raros o curiosos, Madrid 1874, viii1, 135). Venetian

The Mycenaen town of Alasya was located on
or near the delta of the Pediyas, at Enkomi village.
Its successor, the port of Salamis, only 1/2 miles
to the east, became a great metropolis during the
Roman empire. Restored by Constantius II on a much
smaller scale after the severe earthquakes of 332 and
342, with the new name Constantia, it survived until
Arab Muslim raids of the 7th century led to its trans-
ferral to Ammochostos (Magughia) 6 miles to the
south (Cobham, i, 56 ff.; and D. P. TikoHos, Enkhos:
excavations 1948-1952, Mainz 1969-71; for
Salamis and Constantia, see Hill, i, passim, and
V. Karageorgefios, Salamis in Cyprus: Homeric,
Helleno-
sitic and Roman, London 1969). The town passed
to Guy de Lusignan in 1322. The Genoese occupied
it between 1353 and 1464; the Venetians took the
from the Lusignans in 1489. The Ottomans
conquered it after a prolonged and extremely costly
siege of eleven months in 1572, with tens of thousands
of lives lost. After the Turkish conquest much Latin
property was turned over to the Orthodox; however,
from 1575 the latter were forbidden to live in the
walled town, as in Rhodes. In 1609 a Turkish naval
expedition of eight galleys and nine galleons failed
in a surprise attack upon the town (Hill, iv, 48 f.).
The Knights of Malta, as well as English, Dutch,
Tuscan and Turkish pirates, regularly harassed Levantie
shipping for more than a century after 1572. A
fire in 1640 and plague in 1641 are known, as
well as severe earthquakes in 1557, 1569, and 1735
(Hill, iv, 67 f.). No area was more vulnerable to
malaria, plague, and locusts.
The Ottomans failed to revitalise their great prize
Magughia, but it is obvious that by the last quarter
of the 15th century the town had already been
reduced to a third-rate commercial centre. The
harbour remained a prize worth fighting for, but
the Ottomans were unable to transform it into a
useful naval base. Its growth was further limited
by official ambivalence; the Porte sometimes
dreamed of using the naval and commercial potential
of Magughia, but at other times appeared terrified
that the prize would fall to enemies who might
again use it against them. Although the Ottomans
never had the energy to restore Magghohia, they
guarded the fortress too zealously to allow economic
development, and the small garrison became the
greatest part of the population.
After the fall of Acre or 'Akka [q.v.] (1291) to
the Mamluks, the ascent of Lusignan Magghohia
was meteoric. Little more than its good harbour was noted
by W. von Oldenburg in 1557 (C. D. Cobham,
most of the small population of the town must have been soldiers; some Christians settled in houses with gardens half a mile to the south in a village called Marash (Varoşha). R. Pococke (1728) encountered a settlement of Christians who "are not permitted to dwell within the city". To the west was a large fertile plain inhabited mostly by Muslims because it was relatively "secure from the privateers", while Christians, who were not enslaved by them, lived near the sea. Most of the sparsely inhabited town was destroyed by a severe earthquake in 1755, making both the mosques of S. Sofia and S. George unfit for use so that S. Catherine's church became the principal mosque. The town walls were severely damaged. The Swedish visitor Frederic Hasselquist (1751) estimated the population as 300 inhabitants, "chiefly Turks", who "occupy the miserable ruins..." (Cobham, 254-5; in Pinkerton, ed., op. cit. I, 577-8; Cobham, 307, *Ier Paletastinum, Stockholm 1757, 175 ff.).

Archimandrite Cypriano (published in 1728) described the Ottoman occupation of Maghôsha in some detail: the inhabitants "... remained in their houses, and appeared at the time to be the owners, yet afterwards by the Turks they were made to think many of them, on the pretext that they were tenants; not owners..." when the Greeks of Maghôsha petitioned, the vizier Mehmed Pasja they were permitted "... to live as Greek Christians, on condition that no Christian of the Latin Church should be found among them: for to the Latins he would grant neither church nor house, and those who remained in Cyprus were obliged to frequent the Greek churches, and forbidden to hold property in the island". Greeks were allowed to buy, sell, and inherit houses, fields, and property not already occupied by Turks. In 1815 W. Turner reported: "... of its numerous palaces and churches not one remains entire". It had only a hundred people, including three Greek families. They lived in ruins, in low houses, mostly of mud, and no-one cultivated the countryside. Nearby was a village of Christians living surrounded by gardens (Cobham, 347 ff, 434-5). The estimate of 3,000 Muslims, 5,000 Greeks, and 200 Armenians attributed to the governor Ta'fat Eldeni seems too large (M. Louis Lacroix, *L'Univers, Histoire et description des tous les peuples des de la Grice, Paris 1833, 88). The last Ottoman census reportedly showed 500 Muslims in the walled town and 2,200 Greek Orthodox in the suburbs. At this time, Maghôsha was used as a place of banishment for those under political or religious clouds; hence Naim Kemal [28] and the Bahá'í leader Subb-i Ezel [see BAHÁ'Í ALLAH] spent time there in exile.

According to the census of 1861, Maghôsha with Marash (Varoşha) was the fourth leading town of Cyprus with 2,609 inhabitants, of whom 2,845 were Greek Orthodox (71%), 727 were Muslim (28%), 5 were Roman Catholic, 22 Maronite, 1 Armenian Gregorian and 8 Church of England and Protestant; there were no Jews. There were 666 adult males over 20, one per 3.92 people; of those 184 were Muslim (one per 3.93) and 482 Christian (one per 3.90) (Cypres Gazette, no. 82 [4 April 1881] census, 3 March 1882, 17 June 1882). By 1881 the population had grown 30% to 3,367, but the Muslims had increased only 15% to 835, falling to 25% of the town's population (Cypres Gazette, no. 342, 25 May 1881). By 1900 the population had increased to 3,825, 47% larger than in 1881. The Muslims had grown only 18% to 859, while the Christians had increased 58% to 2,968. Of 1,094 adult males 818 (3.65 per
capital were Greek Orthodox and 833 (3.02 per capita) were Muslims (Cyprus Gasir, no. 597, 26 April 1901; 30 August 1901).

**MAĞHRÂWA**, a major confederation of Berber tribes belonging to the Butr group and forming the most powerful branch of the family of the Zansta.

The ascendency, real or imaginary, of this confederation is traced back to Maghrâwa, who is said to have been, according to the medieval Berber genealogists, the ancestor of the Maghrâwa as such. Following the Arab and Berber sources utilised in the 8th/9th century by Ibn Khalûdîn in his *History of the Berbers*, the "cradle" of the Mağrawa and "the ancient seat of their power" was the territory located on the Chelif in the north-western part of what is now Algeria, probably bounded by the Mediterranean to the north, the mountain of Wanas (Wassabah, currently Ouarsenis) to the south and Tlemcen to the west. Leo Africanus [*π. ρ. Λύγιον χάρακτα Μαγγραυα ή Μαγγραυά* *πεποιησθέν*] says in his *Description of Africa* written in about 1525-6 that the "Magraua (Maghrâwa) mountain" stretched over a distance of some 40 miles (approx. 64 km), "close to the town of Mustuganin" (*Mostaganem*). The Maghrâwa have left a relic of their presence here in the name of Cap Maghraoua situated 104 km to the east of *Mostaganem* and 56 km to the west of *Tânès*. It should be added at this point that, according to Abu 'l-Fida' (*1273-1331*), *Mostaganem* served the Maghrâwa as a port. Leo Africanus extolls the dignity and the courage of the inhabitants of the Magraua mountain, who were probably descendants of the Maghrâwa of mediavel Arab sources. The Maghrâwa lived in this land in a nomadic state, but they also possessed (at least in the 8th/9th centuries) fixed dwellings and fortresses. In the 4th and 5th/6th-11th centuries, the individual segments of this confederation were spread throughout North Africa, from Morocco in the west to Tripolitania in the east.

Little is known of the origins and earliest history of the Maghrâwa. According to Ibn 'Abd al-Fida' (*d. 140/1497*), they arrived in North Africa in ancient times and established themselves "on the frontier of Africa", alongside the Maghribi (i.e. in eastern Algeria), while the region which later, in the Middle Ages, became their homeland, in other words the territory located on the Chelif, constituted in ancient times the domain of "Adidâra, father of Zansta". If Ibn Khalûdîn and his sources are to be believed, there is no doubt that the confederation of the
Maghrawa already existed immediately before the Arab conquest of North Africa, probably in the first half of the 7th century. Alongside two other major Zanata branches (or possibly confederations), these being the Djarawa, the people of the famous Kâbîma, and the Banû Ifran. In all probability, the origins of the Maghrawa could be traced back still further towards the beginning of the Christian era, through linking their name, in accordance with a hypothesis propounded by J. Desanges, with that of the Moors peoples known to Pliny as the Mserubri and to Ptolomy as the Makkhourébi. The latter seems to attribute to the main mass of the Makkhourébi a very large coastal zone situated between the Zæcca and the Grande Kabylie, in the Roman province of Mauritania. In spite of the quite different localisation of the Maghra and the Makkhourébi (the latter tribe mostly occupied territory a little to the east of the cradle of the Maghrawian confederation on the Chélif), the hypothesis of J. Desanges appears wholly acceptable and it seems that the Maghrawa belonged among those exceptional Berber tribes of the Middle Ages whose names are attested in the ancient Greek and Latin texts. It may further be added that another segment of the Makkhourébi is mentioned by Ptolomy among the peoples of Inner Libya (i.e. of southern Barbary). Ptolomy locates it, in fact, on the central reaches of the Draa. It is probably this group of the Maghrawa which entered, in the 4th-5th/7th century, in the neighbourhood of Sidjilmasa and which succeeded in founding a kingdom with this city as its capital. There will be further mention of this kingdom below.

The Maghrawa were related, if Ibn Khaldûn is to be believed, not only to the Banû Ifran and the Djarawa, but also to the large Zanata tribe of the Banû Irmiyân. It seems furthermore that the genealogy of this tribe is linked to that of the Lawati Berber group, in particular the Lawatian tribe of the Sadrâtta. Among the numerous branches and subdivisions of the Maghrawa confederation mentioned by Ibn Khaldûn and other mediaeval Arab authors, the first half of the 13th century and gave his name to the historical dynasty of the Banû Khaldûn. This is traditionally taken to indicate that the Banû Khaldûn were a Zanata branch of the Banî Khaldûn in the region of the Chélif. From the beginning of the 7th century, the Banû Khaldûn and the Berber genealogists quoted by this author, were the Banû Sindjas, the Banû Righa, the Banû Laghwâ and the Banû Warrâ (var. Warraï), although according to Ibrâhim b. 'Abd Allah, the best Zanata genealogist of the 8th/9th century (a native of the Maghrawa town of Timāghat, situated in the region of the Chélif), these four tribes formed part of another branch of the Zanata family. According to other Berber genealogists quoted by Ibn Khaldûn, there were yet more tribes belonging to the confederation of the Maghrawa. These were the Banû Zandjâd (Zandjâj), the Banû Wariyân (or Wariyân), the Banû Zadldik (or Zadâik), the Banû Izmaraîn (also Izmaraîn or Izmarti), the Banû Sâ’îd and the Banû Ilît (var. Ilant). It is interesting however, to note that Ibn Hawâsî included, in his list of Berber tribes compiled after 976-7 A.D., the Banû Sindjân (Sindjas), the Banû Zandjâ and the Banû Wariyân among the Zanata tribes unrelated to the Maghrawa. There are also certain Berber genealogists quoted by Ibn Khaldûn who mention the Banû Sindjân (Sindjas) and the Banû Wariyân without indicating their membership of the Maghrawa confederation.

According to Ibn Khaldûn, the Franks (in this case, Romans) had imposed the Christian religion on the Maghrawa, likewise on the Djarawa and the Banû Ifran. Later, probably towards the end of the 7th or 8th century, the Banû Ifran became converted without difficulty to Islam. They were governed in this period by an ancient and powerful dynasty, later known as Banû Kharzâr and owing its name to Kharzâr b. Hâfâs b. Sûlûb b. Wanzâmâr (Wâzmâr) b. Maghrawa. Ibn Khaldûn gives us a list, in his History of the Berbers, otherwise very incomplete, of the princes of this family which ruled the Maghrawa in the central Maghrib, at Fas, at Sidjilmasa and in Tripolitania. Another even less complete list of the amirs whose genealogies date back to Kharzâr b. Hâfâs is provided by Abd al-Zayyâq Yahyâ b. Khaldûn in his history of the Banû 'Abî al-Wad. According to these lists, Sûlûb b. Wanzâmâr was the contemporary and client of the caliph 'Uthmân (644-56). In fact, he was apparently taken prisoner in one of the battles that took place between the Arabs and the Berbers at the time of the first Arab invasion of North Africa (26/647-8). Sent to 'Uthmân and pardoned by the caliph, he became a Muslim, and on returning to his country he was proclaimed chief of his tribe (according to a passage in Ibn Khaldûn's History of the Berbers, he had previously been chief of the Maghrawa and of other Zanata peoples). If this tradition is correct, the Banû Wanzâmâr must have been a Maghrawian family which lived, around the middle of the 7th century A.D., in eastern Barbary, bordering on the Hilîkiya, in the land which would have been, as stated by Ibn 'Abî al-Darrî, the original cradle of the Maghrawa in ancient times.

After the death of Sûlûb who survived, in all probability, into the second half of the 7th century, the government of the Maghrawa passed to his son Hâfâs, who is considered by Berber tradition as one of the greatest princes to rule over the Maghrawa. He also became, following this tradition, the chief of other Zanata tribes. The tribes in question were probably the remnants of the great Zanata confederations of the Djarawa and the Banû Zandjâd, formerly ruled by Khabit b. Khâlid. The Banû Kharzâr, also Zanata and Maghrawa relatives of the central Maghrib. The power of the Maghrawa also increased during the reign of Kharzâr, son of Hâfâs. He lived in the first half of the 2nd/8th century and gave his name to the historical dynasty of the Banû Kharzâr. A tradition quoted by Ibn Khaldûn states that this powerful prince took advantage of the Khargîrite revolt of Maysara [i.e. in the Farthest Maghrib (in 122/739-40) and of the weakening of the Umayyad Arab governors of Kayrawân which resulted from it, to extend his authority over all the Zanata nomads of the central Maghrib, with the exception of the powerful tribe of the Banû Ifran, master of the regions of eastern Barbary. The text makes no mention of Maghrawa involvement in the Khargîrite movement. However, this would not seem impossible, in view of the fact that a little later a member of the Maghrawa, Nahdî b. 'Asim al-Zanâtî (or Nahdî b. 'Asim al-Maghrawi) was appointed governor (probably of a segment of the Maghrawa) by 'Abî al-Wâhâb b. 'Abî al-Rabûn b. Rustum, Ibîdî imâm of Tâhâr (168/785-85, 843), and that in the Kitâb al-Siyar of al-Shamâlî (10th/16th century) and in a list of Zanâtî Ibîdî Shaykhî, compiled in eastern Barbary in the 19th/20th centuries, there are found numerous Maghrawa individuals belonging to the Ibîdî sect. Kharzâr b. Hâfâs died after the fall of the Umayyads of the East (132/750), leaving control of the confederation...
of the Maghrāwa to his son Muhammad b. Khazar. The last-named made war against the Banū Hran, from whom he captured, in about 172/786-9, the town of Tiemcen. It was during the reign of this prince that there took place the foundation of the kingdom of the ʿIrāḍids in the Maghrib al-ʿĀsā by ʿIdrīs b. ʿAbd Allāh [q.v.] with the support of the powerful Berber tribes of Avara, Sadhla and Maghāla (172/786-9). In 173 or 174/789-91, Idrīs invaded the central Maghrib and occupied the submission of the Maghāra, whose amīr surrendered to him the territory of the Chelif and the town of Tiemcen; the latter later became the capital of another ʿIrāḍid principality. Muhammad b. Khazar also assisted ʿIdrīs b. ʿAbd Allāh to snatch from the ʿAbbasids all the provinces of the central Maghrib. Later, in 175/792-3, he found him pledging loyalty to Idrīs II. As for the Maghāra, in this period they continued in possession of the plains of the central Maghrib, as well as the open country round Tiemcen, which they shared with the Banū Hran. Throughout the 3rd/9th century they remained vassals of the ʿIrāḍid state. It was probably also in this period that the dynasty of the Banū Khazar founded Madīnat Banī Khazar, “the city of the Banu Khazar b. Hafs who was ancestor, as stated above, of the mediaeval Banū Khazar” in an arid plain of the central Maghrib. We find in this period the exact position of the city, which is mentioned by Ibn Hammad in his biography of ʿAbū Yazīd Muhajjad b. Kaydād, “the man on the donkey”. This Khāridīite chief sought refuge there after his defeat in the year 335/946-7.

This situation continued unchanged until the formation of the Fāṭimid empire. When the Mahdi ʿUbayd Allāh sent to the Maghrib, in 308/919-20, an army which took possession of the ʿIrāḍid dominions and compelled the ʿIrāḍid princes to recognise his authority, the Berber tribes of the central Maghrib, led by the Maghāra and other Zanātā tribes, rose in revolt against this sovereign. The rebels were commanded by the Maghāra prince Muhammad b. Khazar, one of the grandsons of that Muhammad b. Khazar b. Hafs who was amīr of the Maghāra towards the end of the 2nd/8th century. Ten years later, in 309/921-2, the Mahdi ʿUbayd Allāh sent an army against him which was however routed by the Maghāra. The following year, ʿUbayd Allāh dispatched against Muhammad b. Khazar a fresh army commanded by his son Abu ʿl-Kāsīm. At the approach of this army, the Maghāra of the central Maghrib (or the majority of the tribes of this confederation) led by Muhammad b. Khazar fled into the desert, having traversed the Moulouya. They took refuge in the territory of Sigilijana, thus in the region where Poteney had located, in the 2nd century A.D., the homeland of a group of the Makkhūrebī, ancestors, as stated above, of the mediaeval Maghāra. Some time later, Muhammad b. Khazar returned at the head of the Maghāra tribes to the central Maghrib, towards the former homeland of these tribes in the region of the Chelif. On this occasion, Muhammad b. Khazar took possession of the territory of the Chelif and of Ténès, expelled the supporters of the Fāṭimid from the Zāh and captured the town of Oran, where he installed, as governor, his son al-Khayr. He also conquered other sites in the central Maghrib, and subjected the whole of this land to the authority of the Fāṭimid caliph of Spain. However, this success did not last long. In 315 or 316/927-9, the Fāṭimid army commanded by Abu ʿl-Kāsīm, son of ʿUbayd Allāh, set out to pacify the central Maghrib. This army routed the Maghāra and forced them again to flee into the desert. But in 333/945-6, Muhammad b. Khazar, who had regained his position as the most powerful chieftain of the central Maghrib, attacked the western provinces of the Fāṭimid empire for the second time. He benefited in fact from the revolt of the Zanātā tribes of the central Maghrib and of Ifrīya, who professed the doctrines of the Khāridīite sect of the Nukhār (Nakhrār), and rebelled against the Fāṭimid. The insurgents were commanded by the famous Zanātā chieftain, the Nukhrārī imām ʿAbū Yazīd [q.v.]. It seems that at least some of the Maghāra, who were predominantly Sunnī, acted in collusion with Abu ʿl-Farāh and that Muḥammad b. Khazar, brother of this Muḥammad, was a loyal supporter of the Nukhrārī chieftain. Muḥammad b. Khazar was taken prisoner, in 340/951-2, by the Fāṭimid sovereignty Iṣtimul al-Mansūr and suffered the death penalty. Another of the brothers of amīr Muḥammad b. Khazar, Fuṭūḥ, embraced the cause of the Fāṭimids. However, the Maghāra who occupied the territory of Chelif collaborated at this time with the army sent to the central Maghrib by the Fāṭimids to conquer Spain ʿAbd al-Rahmān III al-Mānrī. In 333/945-6 two Maghāra expeditions took place against the Fāṭimid provinces of the central Maghrib. These expeditions were commanded by the amīr Muḥammad b. Khazar, brother of al-Khayr, son of Muhammad b. Khazar, and by his two sons al-Khayr and Hamza. They were directed primarily against the Fāṭimid garrisons of Biskra and of Tāhārī (Tirant). Also participating in the second expedition was the Umayyad army commanded by the Berber general Ḥānīb b. Yāṣā. These two expeditions had a successful outcome for the Maghāra and their allies, the Fāṭimid province of Ifrīya, in fact, Biskra and Tāhārī were captured by Muḥammad b. Khazar, by his son al-Khayr and by their allies (ca. 333/945-6). However, soon after these victories and the success of Abū Yazīd (whose army even succeeded in conquering Ifrīya, the nucleus of the Fāṭimid empire), the military forces of this empire regrouped under the command of Iṣtimul al-Mansūr and routed the Berber warlords of Abū Yazīd in a battle near Māndara (Bordj Magra), then turned against the Maghāra. Muhammad b. Khazar surrendered to al-Mansūr in 335/946-7. According to one source, he subsequently broke faith with the Fāṭimidids and was only in 340/953-4 that he returned to the Fāṭimid camp and abandoned for ever the cause of the Umayyads. His position towards the latter dynasty was again equivocal in 347/958, at the time of the expedition of the Fāṭimid general Ḥāwar who set out for the central Maghrib with the object of pacifying this land, but ultimately, intimidated, he took part in this expedition. After this he paid a visit to the caliph al-Muʾtazz at Kāyrāwān, where he died in 350/961-2, aged more than a hundred years. According to another source, Muḥammad b. Khazar embraced the cause of the Fāṭimids soon after 340/953-4 and remained loyal to this dynasty until his death. As for al-Khayr, son of Muḥammad b. Khazar and chief of the land of Laghouat, he did not share the pro-Fāṭimid policy of his father and remained a loyal supporter of the Umayyad caliph ʿAbd al-Rahmān III of Cordova, except for a certain period ca. 334/945-6, during which he recognised the authority of the Fāṭimid caliph. In fact, in 340/953-4 he sent his son Fuṭūḥ to Spain, to the court of the Umayyad caliph. Finally, it was accompanied on this journey by the skaykh of Tāhārī and of Oran, supporters of the Umayyads. Subsequently, this delegation returned to Africa.

After the death of amīr Muḥammad b. Khazar,
the supreme command of the Maghrawa passed to Muhammad b. al-Khayr, grandson of this amir and son of al-Khayr. Even during the lifetime of his grandfather, Muhammad b. al-Khayr had forged links with the court of Cordova, obtaining from the caliph 'Abd al-Rahman III, in the year 349/959-60, the governorship of Fas. However, he requested from this caliph, in the same year as his appointment, permission to embark on a holy war in Spain. Having received this permission, he set out for Spain, leaving his cousin Ahmad b. Bakr at Tangier which remained, as stated above, under the domination of the Umayyads. From there they made contact with the caliph al-Hakam II. It was thus that a section of the tribes which had formed the ancient confederation of the Maghrawa left their homeland in the central Maghrib, not to return until about a century later, after their expulsion from Morocco by the Almoravids. Among the Maghrawa amirs tracing their origin from the princely family of the Banu Khazar, there were two who received from their relatives Biskra who set out to seek new territories in the Maghrib al-Aksa after their war with Bulukkln b. Ziri. Ibn Khaldun mentions, besides Muhammad b. al-Khayr, the close kinsmen of the latter, these being Ziri b. Khazr, Ziri b. Atiyya, Mukhali b. Atiyya (brother of the last-named), Kharun b. Muhammad and Fulfal b. Sa'd. They are all encountered, in 356/965-6, in the entourage of the general Dja'far b. All b. Hamdun, who was appointed by al-Hakam II governor of the Maghrib on behalf of Cordova. As for Bulukkln b. Ziri, he received from al-Mu'izz in 356/972, the mandate to govern Ifriqiya and the Maghrib as dependencies of the Fatimid caliph of Egypt.

Thus, after 357/967, the history of the majority of the Maghrawa that had previously constituted the confederation of the Maghrawa was closely linked with the country that is now Morocco, where the various princes of the Banu Khazr family established three states, those of Fas, of Sidjiilmas and of Aghmat. We shall begin with the history of these dominions, subsequently considering other segments of the Maghrawa who remained, after 361/971, in the central Maghrib and in Ifriqiya, or those who returned, after the conquest of Morocco by the Almoravids, to central and eastern Barbary.

A. Morocco. 1. Fas. Bulukkln b. Ziri was not content with the expulsion of the Maghrawa and their Banu Khazar allies from the central Maghrib, from Tuba, from Biskra, from TAhart, etc., but pursued them, with great success, towards the interior of present-day Morocco. He finally caught up with them near Sidjiilmas and defeated them in battle. The amir al-Khayr b. Muhammad fell into the hands of the Fatisms and was put to death. After this battle, Bulukkln b. Ziri retraced his steps and returned to central Morocco where he carried out a massacre among the Zanata tribes. Al-Khayr b. Muhammad left a son named Muhammad b. al-Khayr, whom a group of Moroccan Maghrawa entrusted with the command. Besides him, the sources mention two other powerful and influential amirs who enjoyed, in this period, considerable authority among the Maghrawa. These were two kinsmen of Muhammad b. al-Khayr b. Muhammad, namely Ziri and Mukhid, sons of Atiyya b. 'Abd Allâh b. Khazar. These three amirs led the Maghrawa after 971. It seems that some years later, the Maghrawa of the Maghrib al-Aksa divided into two groups, a northern and a southern, both obedient to the Umayyads of Cordova. The sources provide a list of the Maghrawa princes belonging to the first of these groups who were to be found, in 356/965-6, in the entourage of Dja'far b. All b. Hamdun, "Umayyad governor of the Maghrib al-Aksa. This list includes Muhammad b. al-Khayr b. Muhammad, whose name is followed by those of Bakar b. Suyyin b. Nâs, Mukhid b. Atiyya, Kharun b. Muhammad and Fulfal b. Sa'd. The southern group of the Moroccan Maghrawa were commanded by another prince of the Banu Khazar family, Kharun b. Fulfal b. Khazar. This prince set out in 356/972-7 to conquer Sidjiilmas, a town gov-
ered by the amirs of the Muknása family of the Banu Mudár. After the seizure of Siqilmása, Khâdir received from the hâdîb of Cordova, al-Mansûr Ibn Abi 'Amir, the mandate to govern this town which remained in his family, as will be noted below, until the arrival of the Almoravids.

Muhammad b. al-Khayr b. Muhammad seems to have still been the head of the Banu Khazâr family in 356/969-80, when Bulûkîn b. Zîrî b. Manîd undertook a new expedition to the borders of the Maghrib al-'Ash. This prince fled to Spain, where he requested the support of the hâdîb al-Mansûr who governed Spain on behalf of the Umayyad caliph Hishâm (356-978-979). The latter responded to his appeals and sent an expedition to the Maghrib under the command of Dja'fâr b. 'Abî b. Hamdân. The Andalusian army, which included Maghrawâ and Ifran contingents, advanced to a position near Ceuta; Bulûkîn b. Zîrî declined to give battle and withdrew to take possession of the remainder of Morocco. Later, in 372/983-4, Muhammad b. al-Khayr is mentioned at the head of a list of Maghrawâ amîrs who rallied, according to Ibn Khâdir, around the flag of Abu 'l-Hakam 'Amîr b. 'Abî 'Allâh b. Abî 'Amir, Umayyad governor of the Maghrib. However, it is not true, but his cousin Mukâtí b. 'Atîyya and the latter's brother Zîrî b. 'Atîyya who are noted on this occasion as being among the Berber princes most loyal to the Umayyad cause. It seems that Muhammad b. al-Khayr b. Muhammad lost the leadership of the northern group of the Maghrawa in 372/983-4 or shortly after this date, to Mukâtí b. 'Atîyya. After the death of the last-named in 378/992-3, it was his brother Zîrî b. 'Atîyya who was proclaimed leader of the northern group of the Moroccan Maghrawa. This amîr had in addition been appointed (by the Umayyad hâdîb Ibn Abî 'Amir) king of the Maghrib al-'Ashî before this date, in 377/987-8. Zîrî b. 'Atîyya founded a kingdom in the north of this country and made the town of Fās the capital of this dominion, which remained in the possession of his successors until the arrival of the Almoravids. He settled the Maghrawa (of the northern group) in the outskirts of the town. It should also be remembered that the family of Zîrî b. 'Atîyya descended from 'Abî 'Amir, who was the brother of the powerful Maghrawa amîr Muhammad b. Khâdir, king of the central Maghrib who, as stated above, was a supporter of the Fâtimîds and died at Kâfrâwân in 356/969-70.

Some years after his appointment as sovereign of the Maghrib, Zîrî b. 'Atîyya went to war against the Sanhâdja (acting on the orders of the hâdîb al-Mansûr) and substantially increased the size of his eastern provinces. In 382/993 he travelled to Cordova at the invitation of al-Mansûr. It seems that the reign of Zîrî b. 'Atîyya was a period of some instability, with this prince and his Ifranid rival Yâdû b. Ya'llâ changing places on the throne of Fâs according to the vicissitudes of war. In fact, on his return to Fâs from Cordova, Zîrî saw his place taken by Ya'llâ and it was only at the cost of a murderous struggle that he recovered his throne. Because Zîrî constantly had in mind the reconquest of the territory of Chellâ, Zîrî took advantage of the restoration of the ancient Zanâta and Maghrawa kingdom of the Banû Khazar in the central Maghrib, he found the location of Fâs too remote for the capital of the future state. Therefore he decided to construct a new capital for himself and for the principal chiefsmen of the confederation of the Maghrawa. In 382/993 he founded the city of Wâdjdja (Oujda) on the borders of Morocco and present-day Algeria and installed himself there, accompanied by his court and his household troops. In the same period, he decided to reject the authority of Cordova, and ultimately the relations between him and al-Mansûr Ibn Abi 'Amir were broken. Al-Mansûr sent an expedition against him commanded by the freedman Wâdjdja; an encounter took place on the banks of Wâdjdja Râdâr and the Andalusian army was defeated. Al-Mansûr then organised another expedition and appointed as commander his own son 'Abî al-Malik al-Munafar. This time, Zîrî was defeated on two occasions in 387/997. He tried to take refuge in Fâs, but the residents denied him access to his capital, which 'Abî al-Malik entered shortly after. Zîrî was compelled to withdraw by way of the Sahara, after which he attempted to found a state in the central Maghrib, in the territory belonging to the kingdom of the Zîrî Eddâb b. al-Mansûr b. Bulûkîn. Thus in 388/998 he mounted an invasion of this part of the Maghrib. After the victory of the Sanhâdja army commanded by Hamâmâ b. Bulûkîn, Zîrî b. 'Atîyya took possession of Tâhart, Chellâ, Têdès and al-Maflâ. It is interesting to note that in these towns he ordered that prayers be offered for the Umayyad caliph Hishâm and his couple al-Mansûr and Hamâmâ; the latter set on his way to the town of Agulî, capital of the Sanhâdja, but he died in 391/1000-1, before taking this town.

On the death of Zîrî b. 'Atîyya, the Maghrawa of northern Morocco proclaimed his son al-Mu'izz chief of this branch of the confederation. This prince, who did not share his father's hostile attitude in regard to the hâdîb Ibn Abî 'Amir, had already, in 390/999-900, been established by the latter at Fâs in the role of Umayyad governor. Subsequently, the son of the hâdîb 'Abî al-Malik al-Munafar, who became after the death of al-Mansûr his successor at the court of Cordova, appointed al-Mu'izz, in 393/1002-3, to govern Fâs and the Maghrib al-Aksа. In 396/1006, al-Mu'izz received from Cordova letters of investiture for Fâs and for the whole of the Maghrib al-Aksà with the exception of the land of Siqilmása, the preserve of the Maghrawa dynasty of the Banû Khazâr who were, like the amîrs of Fâs, subject to the Umayyads of Spain. Al-Mu'izz died in 417/1025 or, according to another source, in 420/1029; during his reign, the kingdom of Fâs enjoyed a period of peace. His successor was his paternal cousin Hamâma b. al-Mu'izz b. 'Atîyya who had been appointed governor of Fâs by al-Mu'izz in 416/1025, before the death of this amîr. Hamâma was able to consolidate his power in regard to Spain. However, in 424/1030, a war broke out between this amîr and the rival dynasty of the Banû Ibran, who possessed a kingdom with its capital at Shalla (Sâhî) on the Atlantic coast of Morocco. The Ifranid prince Abu 'l-Kamâl Tamâm b. Zîrî marched against Fâs and captured this town. Hamâma retreated towards the east and reached the towns of Wâdjdja and Têdès in the eastern part of the kingdom of Fâs, where he stayed for five years. Having mustered powerful contingents, he advanced on Fâs in 425/1037-8. Abu 'l-Kamâl was forced to withdraw from Fâs and return to Shalla. Later, in 430/1038-9, Hamâma continued the anti-Ibrân policy of his predecessors by attacking the Hamâmâ b. al-Mu'izz b. 'Abî al-Malik, who came to meet him and secretly paid large sums of money to the Zanâta troops of Hamâma. The latter, becoming aware of this and fearing the defection of his troops, returned to Fâs, having declared his submission to the Hammûdid. He died in 431/1039-40 or 433/1041-2.
After his death, power passed to his son Dīnās. Having suppressed a revolt by one of his cousins, this prince subsequently devoted all his efforts to the embellishment of Fās, which was now becoming a large commercial city. He died in 452/1062, leaving the throne to his son al-Futūb. But the rights of al-Futūb were contested by his brother ʿAbdīs. The latter took control of part of the capital, while al-Futūb established himself in the other part. The two brothers engaged in a war which lasted three years, at the end of which ʿAbdīs was killed and al-Futūb was able to reign effectively in Fās. However, his was not a long reign. In fact, he was driven from Fās by a council of the Banū Khazrān b. Muhammad b. Muḥammad. After his departure, the Maghārawa chose one of his kinsmen to succeed him, Muʿānnasār (or Muʿānsār) b. Ḥanūmān b. Muḥammad b. al-Muʿīzī b. ʿĀṭīyya. He was proclaimed chief in 453/1063 and was soon obliged to wage war against the Almoravids, who were beginning to invade Morocco. Defeated by them in a major battle the same year, he took refuge with the Berber tribe of Ṣādiq, leaving Fās to fall into the hands of the warriors of ʿUṣūf b. Tāḥfīn. But some time later he returned, depositing the lieutenant installed by ʿUṣūf b. Tāḥfīn and regaining control of his capital. At the same time, Al-Muʿīzī, head of the Almoravid army, attacked Fās; in 450/1062-3, Muʿānsār attempted a sortie, but he did not return from the battlefield. The people of Fās then proclaimed as prince his son ʿAmārīn. But the capital was taken by ʿUṣūf b. Tāḥfīn two years later (462/1069-70), and the new sovereign was put to death by the Almoravid king, who also ordered the slaughter of more than three thousand Maghārawa, Banū Ṣafir, Ṣanāʾīa and Mīknāsā living in Fās. Those who escaped the massacre took refuge in Tiemen. Another group in Maghārawa from Fās fled to al-Dānnān, a town situated in northern Morocco, on the frontier of the land of Gḥomāra. But the Almoravid king laid siege to the place in 465/1072-3 for according to another source, in 471/1078-9. He captured the town and crushed the Maghārawa. Ab-Bakr mentions, in 1058, yet another group of northern Maghārawa living near the highway leading from Ṣeuta to Tétouan, on the fringe of territory belonging to the Berber tribe of the Mājjaksa. There they possessed a market which they called Sūk Banū Maǧrāwat (“Market of the Banū Maǧrāwat”). It is not known whether this group survived the conquest of Fās and al-Dānnān by the Almoravids. However, it is by no means impossible that this small tribe should have succeeded in crossing the Mouloga and returning to the Chaff, the ancient cradle of the Maghārawa.

3. Siǧīlmašā. At the instigation of the ḍāḥib of Córdova Ibn Abī ʿAmīr, a Maghārawa chief named Khazzūn b. Pūtūl b. Khazar embarked in 366/976-7 on the conquest of Siǧīlmašā, which for two centuries had been governed by amirs of the Mīknāsā family of the Banū Mūḏarr [q.v.]. This chief, who was one of the most influential members of the princely family of the Banū Khazar, proclaimed in Siǧīlmašā the sovereignty of the Umayyads of Spain and sent to Córdova the head of the last prince of the Mūḏarrīd dynasty. After this, Khazzūn received from al-Muṣṭaf the governorship of Siǧīlmašā which he retained until his death. He was then replaced by his son Wānūdīn. The latter endeavored to defend himself against the invasion by the Algerian San-ḥāqa of the Maǧrīb al-ʾAṣṣā. For a certain period of time he was thrown into disgrace by al-Muṣṭaf, whose son and minister al-Muẓaffar gave the government of Siǧīlmašā to Wānūdīn b. Ysālī, but later, in 369/982, his authority was confirmed by the Umayyads. At the time of the fall of the Umayyad caliphate in Spain, he declared himself independent, conquered the region of Darʿa (Darʿa in our maps) and in 407/166-7, took possession of Ṣafrū (Sefrou), which was one of the dependencies of Fās, and of the valley of the Wāḍī Malūyaa (Mouloga). Al-Muẓaffar b. Ysālī, sovereign of Fās and master of Ṣafrū (and perhaps also of the region of the Mouloga), under attack from Wānūdīn who conquered a large portion of his dominion, attempted not only to recapture these provinces but also to deprive Wānūdīn of his capital. This chief, however, soon managed to undertake an expedition with a powerful army, but was beaten by the troops of Siǧīlmašā and led back to Fās only the remnants of his force. His son and successor Mansūr was defeated, stripped of his dominions and killed by the Almoravids, who put to the sword all the Maghārawa who had taken refuge in the region (443/1053-4). Ten years later (in 453/1063), the sons of Wānūdīn and the remnants of the Maǧrāwa residing at Ṣafrū were dispersed in their turn. Finally, in 460/1070-1, the Almoravids seized by force the settlements of the region of the Mouloga. In this way, the domain of the Banū Khazar family of Siǧīlmašā was completely destroyed.

4. ʿĀṣhīdī. Another segment of the ancient confederation of the Maǧrāwa which entered Morocco ca. 971 founded a small kingdom at Agmāṭ on the plain of Marrākūṣī near the foothills of the High Atlas, in the period when the last princes of the family of Zīrī b. ʿĀṭīyya were the rulers of Fās. Nothing is known of the history of the Maǧrāwān dynasty which reigned at Agmāṭ, but it seems to have been just another branch of the great Maǧrāwa princely family of the Banū Khazar. The last of the Maǧrāwa amirs of Agmāṭ, named Lākūṭ, (Lākūṭ, Lāgūṭ) b. Ysālī b. ʿAšī, was killed by the Almoravids in 451/1060. He was apparently married to the wise and beautiful Zaynab bint Isbāfī of the Almoravid family Abū Bakr b. ʿUmar. The latter subsequently, in 456/1062, handed over Zaynab to his kinsman ʿUṣūf b. Tāḥfīn.

5. al-Sūs. After the arrival of the Maǧrāwa in the Maǧrīb al-ʾAṣṣā in ca. 971, an amīr of the family of the Banū Khazar, named Mākūṭī and, according to Ibn Hawkal, the brother of the amīr Abū Aḥālī Mākūṭī b. Khazar, set out, probably at the head of a group of Maǧrāwa, towards the south where he occupied territories in the province of al-Sūs. According to the list of Berber tribes compiled by the geographer Ibn Hawkal, he was present in this area in the period following 366/976-7. This prince is completely unknown to us. He may in fact be none other than Mākūṭī b. ʿĀṭīyya, brother of Ẓirī (sovereign of Fās), mentioned ca. 365/975-6 and residing, in this period, in the north of Morocco, as stated above.

Despite the crushing defeat inflicted on the kingdom of Fās, of Siǧīlmašā, of Agmāṭ and of al-Dānnān, the Almoravids did not succeed in exterminating all the branches of the Maǧrāwa in Morocco. In fact, the remnants of this confederation stayed in this country where they are mentioned again, in the 8th/14th century, by Ibn Ḥakīdīn. Among these remnants mention should be drawn to the Banū Warāʾ, a substantial branch of the Maǧrāwa. In this period, families belonging to this tribe were widely dispersed in Morocco, particularly in the environs of Fās and in the Sūs. According to Ibn
Khalidun, at the beginning of the 8th/14th century, the Marinid sultan Yusuf b. Ya'qub deputed to the territory of Chellif the chiefs and almost all the families of the Banu Warrā who resided in the region of Tās. Another Maghrāwī branch, the Banū Sindjas, also occupied in the 8th/14th century numerous places in Morocco.

B. Algeria. Tlemcen. According to Ibn Khalidun, the Maghrāwī sovereignty of Fās, al-Mu'izz b. Zirī, seized from the Sanhāja, i.e. from the Zirid king Baddīs b. al-Mu'azzam (358-909/958-1016), the town and province of Tlemcen, where he established as governor his kinsman Yāsif, son of the amīr Muhammad b. al-Khayr, who had previously (until ca. 375/985-6) headed the confederation of the Maghrāwī in the Magrib al-Asqā. Yāsif served Mu'izz b. Zirī faithfully and passed on to his descendants the government of Tlemcen and of all the surrounding country.

His successors lived in peace with the Sanhajja dynasty, masters of the central Magrib, which enabled them to consolidate their authority at Tlemcen, which became an independent state. This situation continued until the arrival in the central Magrib of the Hilālī tribes of Zughba and Aḥlībādi. In ca. 446/1034-5 the invaders turned their weapons against the Zanita tribes of the area and captured from them all the open country. The Hammādīs, who found themselves in this period, after many truces, in a state of war with the amīr Bakhṣī, a descendant of Ya'qub b. Muhammad b. al-Khayr, obtained the support of the Zughba. The war between Bakhṣī and the Zanita on the one hand and the Hammādīs and the Zughba on the other, lasted a long time. Bakhṣī put at the head of his army a vizier named Abū Su'da who belonged to the Zanita tribe of the Banū Iyāra. This general rallied beneath his flag all the Zanita tribes of the central Magrib, headed by the Maghrāwa and the Bānū Iyāra. The sources mention numerous battles which took place between the Hammādīs (and their allies, the Zughba and the Aḥlībādi) and the army of Bakhṣī. In one of these conflicts, Abū Su'da lost his life (450/1058-9). After the death of Bakhṣī, at a date unknown, the throne passed to his son Yūsuf b. Ya'qub, who found himself in this period, after many battles, only remnants of the Maghrāwī in the territory of Chelīf. He established himself among this people and was greeted with honour by the Banū Warsīfān, the Bānū Warrā, the Bānū Sa'id and other Maghrāwī tribes. These tribes, ever loyal to the family of the Banū Khazar, the ancient kings of the territory of Chelīf and of the central Magrib, were all eager to recognise in his person the rights of this dynasty. Yūsuf b. Ya'qub, descended from the Banū Khazar, the ancient princely family of the Banū Warrā, was known in the territory of Chelīf by the name of Banū Khazar and of Banū al-Mu'īz. In this war, which ended with the decisive defeat of the Maghrāwī and the Zanita, the Maghrāwī and Zanita chiefs were decimated. Among these chiefs, mention should be made of Abu 'l-Futtaḥ b. Habbās (or Hamnish), amīr of the Banū Sindjas and ruler of Lamdiya (Medea).

The history of the Maghrāwa of the region of Chelīf under the domination of the Almoravids is entirely unknown. They seem however to have suffered greatly at the hands of the Lāmīta. In fact, when 'Abd al-Samād, a Maghrāwa amīr who belonged to the Banū Khazar family and traced his origin from the Banū Khazar, a descendant of Ya'qūb b. Ya'qūb, the brother of 'Abd al-Ḳaḥṣar, arrived in the territory of Chelīf, he found there only remnants of the Maghrāwī. He established himself among this people and was greeted with honour by the Banū Warsīfān, the Banū Warrā and other Maghrāwī tribes. These tribes, ever loyal to the family of the Banū Khazar, the ancient kings of the territory of Chelīf and of the central Magrib, were all eager to recognise in his person the rights of this dynasty. 'Abd al-Samād allied himself through marriages to their leading families and left numerous children, who were known in the territory of Chelīf by the name of Banū Khazar and of Banū al-Mu'īz. In this period to the authority of the Hammādīs, and the Banū Sindjas, who had their own amīr, possessed the region of Medea, known as Lamdiya in the Arabic sources.

After the collapse of the dominions of Fās, of Sidjīnīs and of Asāfīmīs brought about by the Almoravids, a Maghrāwa prince named Mu'ansār b. Ḥammād, who claimed descent from Zirī b. Ya'qūb, fled from Yūsuf b. Tāḥṣīn at the head of a group of Maghrāwī and entered the territory of Chelīf, subject at this time to the Hamādī king al-Nāṣir (434/1043-61). It seems that the Maghrāwī tribes of this region recognised his authority, with the exception of the Banū Warsīfān who were unwilling to accept him and who remained loyal to the Hammādīs, governor based at Mīyāna. Mu'ansār b. Ḥammād attacked them and killed a number of their sheykhās (chieftains.) He also slew the Hammādī governor of Mīyāna. Al-Nāṣir was unable to come to the aid of the Banū Warsīfān on account of his struggles with the Hilīlī Arabs. So the Banū Warsīfān marched alone against Mu'ansār, killed him in battle and sent his head to al-Nāṣir. This battle seems to have been only one episode in a long war between the Maghrāwī invaders of Morocco, who were joined by numerous Maghrāwī and Zanita tribes, and the Hammādīs which took place ca. 460-70/1067-78.

The history of the Banū Sindjas and of other Maghrāwī tribes residing in the central Magrib in the 5th/11th century was closely connected with the political and military history of the empire of the Almohads, who became masters of the central Magrib in 547/1154 after a war against a coalition of Zanita tribes. Also members of this coalition were the Maghrāwī, in particular the tribe of the Banū Warsīfān (in ca. 539/1145). One of the descendants of 'Abd al-Samād, a certain Abū Nāṣr who was renowned for his piety, received from the Almohads, who treated him with great respect, the government of part of the territory of Chelīf and the command of the Maghrāwa in this region.
Such were the origins of a new Maghrawa state in the central Maghrib. The real founder of this state was Mandil b. 'Abd al-Rashid, grandson of Abu Násir who lived at around the end of the 6th/12th and beginning of the 7th/13th centuries. This prince conquered the neighbouring territories, including the region of Wånsahdr and the town of Landiya (Medea) along with the places dependent on them. The dynasty which he founded is known in the medieval Arabic sources as Awlid Mandil (q.v.). As for Mandil b. 'Abd al-Rashid himself, he took the field against Ibn Chânûya, but lost the battle and died in 622/1225, prisoner of this chief.

The successors of Mandil took possession of Miliana, of Téns, of Chercel, of Mitfija and a large part of the region of Wånsahdr, founding a quite substantial kingdom, much of which was subsequently taken from them by their neighbours, in particular by the Banu 'Atiya, chiefs of the Zanâta tribe of Tûfîn which inhabited the region of the high Chellih. In ca. 670-727, the Maghrawa of Chellih recognized the sovereignty of the dynasty of the Banû 'Abd al-Wâd of Tiemen. However, two centuries later the Banû 'Abd al-Wâd of Tiemen ('Abd al-Wâdids) were expelled from the land of the Maghrawa and compelled them to cede to him the town of Téns. Thus began the wars between the 'Abd al-Wâdids and the Maghrawa amirs which lasted a hundred years. One of the most important episodes of these wars was the expedition of the sultan of Tiemen Abu Zayyân (703-704/1303-4), who subdued the towns of this region. Nevertheless, the Maghrawa continued to be the formidable enemies of the Banû 'Abd al-Wâd. In fact, in 714-314-5, the Shaykh of the Maghrawa tribe of the Banû Bû Sa'îd raised, in the valley of Chellih, the standard of revolt against Abu Hammûr who had become sultan of Tiemen after the death of Abu Zayyân. However, he was forced to take flight. Living at about the same time was the amir Râghid b. Muljam, a renowned Maghrawa warrior who, after the conquest of his land by the Banû 'Abd al-Wâd, offered his services to the princes of Bougic. In 703-704, he reached the territory of Mitfija (Mitfija), where another celebrated Maghrawa warrior named Munîf b. Thâbit came to join him with his partisans. But the latter, decisively defeated, took refuge with his entire family in Spain, where he remained until the end of his life.

Later, at around the middle of the 8th/14th century, the Maghrawa of Chellih became once more a tribe of some importance. They were at this time subjects or allies of the sultans of Tiemen, but they sought at every opportunity to rid themselves of this dependence. In this period, their principal centre was the town of Tûnfrâs or Tûnfrâs. In ca. 750-754, a prince of the Awlad Mandil dynasty named 'All b. Râghid (possibly the son of the renowned Maghrawa amir Râghid b. Muhammad mentioned above), took possession of the territory of Chellih and subjugated Miliana, Téns, Chercel and Chermak. He ravaged the village of Médiâa. But the revival of the state of the Maghrawa did not last long. In fact they were attacked, in 751 or 752/1350-1, by the sultan Abu Thâbit of Tiemen, who subjugated the Maghrawa of Chellih and captured Madina, Brechik, Chercel, Miliana and Medea. The Maghrawa warriors took refuge in the fortress of Aïrân which dominated the towns of Téns.

In ca. 774/1370, after the death of 'Abî b. Râghid, the Maghrawa of Chellih proclaimed as chief his son Hamza, who was the last prince of the Maghrawa state of Chellih. His reign was of short duration. In 774/1372, the sultan of Tiemen sent powerful forces to subdue the Maghrawa. The latter were defeated, and the 'Abî al-Wâdids took control of the town of Tinfrâs (Tûnfrâs) situated in the centre of their territory. Téns and Miliana also surrendered to the sultan of Tiemen. In the wake of this defeat, the Maghrawa of Chellih lost all their power and, to avoid the prospect of slavery, they emigrated from the region in large numbers. In 775/1372, the majority of this people took refuge in the district of Mitfija. However, it is quite possible that some of the Maghrawa of Chellih remained in their ancient homeland and that the noble and valiant inhabitants of the Maghrawa remained in their ancient homelands and that the noble and valiant inhabitants of the "Maghrawa Mountain" located near the village or mountains of Zab and Montagnac who are spoken of in 1525 by Looe Alexandre belonging to the various segments of the Maghrawa.

3. Zâb and its environs. It has been observed above how the Maghrawa princes of the Banû Khazâr dynasty took advantage of the 'Alîid revolt of Maysar to subdue the Maghrawa. They then took advantage of the Almûjad governors of Kaysrân to extend their authority over all the nomadic Zanâta of the central Maghrib, of which Zâb formed a part. So it was that from this period onwards, different Berber tribes and clans belonging to the confederation of the Maghrawa began moving into this region. In 359/970-80 the powerful Maghrawa prince Muhammâd b. Khazâr appeared in Zâb, from which he energetically expelled the supporters of the Fatimids. In 373/983-4, a Maghrawa amir claiming descent from the family of the Banû Khazâr and named Sa'd b. Khazrân b. Fâjîd, descended from the Banû Khazar, took control of the towns of the region of Zâb. After the death of this amir in 381 or 382 (991-2), it was his son Fûlîîb b. Sa'd b. Khazrân who succeeded him in this role. In 389/999 this amir rebelled against the Zâbi prince Bâdis b. al-Manqûs (380-406/996-1016), but after defeat at the hands of the Sanhâjids, he took refuge in the mountains and subsequently, in 391/1002-3, made his way through the desert to Tripoli.

Among other Maghrawa individuals who were active in Zâb and the surrounding region mention should be made of three chiefs of the Banû Warzâmâr (Wazza'mar), a leading family of the Maghrawa, these being al-Manqûs al-Warzâmârî and his two sons 'Abî Allah and Masûd, who made war on Hamûnâb b. Bulûkûkî (405-406/1013-14), probably in the vicinity of the town of Tubnà in the region of Zâb. After the death of this amir in 381 or 382 (991-2), it was his son Fûlîîb b. Sa'd b. Khazrân who succeeded him in this role. In 389/999 this amir rebelled against the Zâbi prince Bâdis b. al-Manqûs (380-406/996-1016), but after defeat at the hands of the Sanhâjids, he took refuge in the mountains and subsequently, in 391/1002-3, made his way through the desert to Tripoli.

its name to a prince belonging to the family of the Banū Kharaz, possibly the ancient Maghrība king Muhammad b. Kharaz who reigned in the central Maghrib in the first half and around the middle of the 10th century. To the west of Bantiyus, al-Dakrīr notes the presence of the Maghrība in an expanse of desert three or four stages long, on the road leading from Oraa to the land of Kasfiyya (Bilād al-Djarīd). Maghrība are also to be found in this period to the south of Biskra. In fact, it is worth mentioning that within this area there were two others: Oued Boureg and Owed-Oualal on our maps, situated to the south of Biskra and probably inhabited by Berber Ibadī elements, was besieged in 450/1058-9 by the Maghrība chief named Abū Zamīkh al-Kharazī, clearly a member of the princely family of the Banū Kharazī. Later, in ca. 468/1075-6, the Maghrība, the Ghumart and other nomadic Zanāta tribes of the Zāb region allied themselves with the Hilālī Arab tribes and sacked the towns of the Zāb. The leader of these brigands was the Maghrība chief al-Munṣār b. Kaṣṣārīna, master of the Zanāta of Tripoli (of whom further mention will be made below), who made his base at Waghātnāt. The inhabitants of Zāb complained to the Hammadīd prince al-Nasir, who had his seat at al-Mansūr, for whom 'Arūs b. Sindāl, chief of Biskra, had laid a trap, was killed by the latter and his head sent to al-Nasir. It may be added that among the Maghrība tribes which inhabited Zāb and the neighbouring regions there were also the Banū Zandikī, the Rīgha and the Laghouatī. The first of these tribes occupied the territory currently known as the Ouled Nâil and the land extending as far as Djebel Amour and the mountain of Rīghīd. According to Ibn Khaldūn, the Singas resided, before the arrival of the Hilālī Arabs, in the jūrā of al-Mansūr at the head of an army. Al-Mansūr entered Waghātnāt and destroyed the town. Some time later, al-Munsīrī, for whom 'Arūs b. Sindi, chief of Biskra, had laid a trap, was killed by the latter and his head sent to al-Nāṣir.

It seems that the Maghrība established themselves in the Nafrawa in a quite ancient period. In any case, at which date the Almohads existed until 554-555. It may be added that among the Maghrība tribes which inhabited Zāb and the neighbouring regions there were also the Banū Zandikī, the Rīgha and the Laghouatī. The first of these tribes occupied the territory currently known as the Ouled Nâil and the land extending as far as Djebel Amour and the mountain of Rīghīd. 78-831. Muhammad b. Isbāb was an 'Abdī, as were the majority of the inhabitants of the district of Naṣrāwa. Princes descended from the Banū Khazār were still ruling the Naṣrāwa at the time of the Zirīd al-Muẓīz b. Bāḍīs (406/3, 1010/62).

It may be added that the Maghārawa chief Wārūr b. Sa‘īd, descended from the Banū Khaḍrī family, an offshoot of the Banū Khazār, was appointed governor of Naṣrāwa by the Zirīd prince Bāḍīs b. al-Mansūr (400/1009-10). After him, his brother Khaḍūrān obtained from Bāḍīs the government of Naṣrāwa (401/1010-11).

The Maghārawa and the Zanātā also resided, in the second half of the 10th-11th century, throughout the region of Kasiliyya. Ibn Khaldūn refers, in fact, to a raid of Hilāli Arab against these Berber groups. Probably those involved were the same Maghārawa who took part in a coalition of the Hilāli Arab tribes of Kiyāb, of Zaghva and of Sulayman which campaigned, in 457/1064-5, against the Hamaddīd sovereign al-Māsīr.

Among the Maghārawa tribes inhabiting I特斯拉iya, mention should also be made of the Banū Sinjūlāt, who distinguished themselves by the part that they played in the war of the Zanātā against the Zirīd and Hamaddīd Sāḥibādīya. In 514/1120-1 they blockaded Gafsa and ravaged the surrounding area. They also appeared in the Blād al-Djarād, where they were attacked by Muḥammad b. Abī ‘l-ʿArab, general of the Zirīd sovereignty.‘Abd b. Yāḥyā (509-15/1116-21). The Zirīd army expelled them from the Djarād and destroyed their power.

D. Tripolitania. An offshoot of the Maghārawa led by ʿamīr descended from the family of the Banū Khaḍrī, al-Muḥammad b. al-Muḥammad b. Sa‘īd b. al-Muṭarrīf, of Khazrān, established an independent government at Tripoli. The history of this state, which existed for almost a century and a half (391-542/1000-1145), is little known in spite of the information provided by Ibn Khaldūn, Ibn Sīdārī, al-Tifānī and other Arab authors. Nevertheless, some facts are available, in particular concerning the first century of the dominance of the Banū Khaḍrī.

It has been observed above that Fulfū b. Sa‘īd b. Khaḍrī, a Maghārawa ʿamīr descended from the family of the Banū Khaḍrī, was, like his father Sa‘īd b. Khaḍrī, a supporter of the Zirīd, lieutenants of which he was, in the person of Warrū b. Sa‘īd, the governor of the town of Tūnīs in the Zābīr on behalf of this Sāḥibādīya dynasty. In 390/1000-1 Fulfū b. Sa‘īd rebelled against the Zirīd prince Bāḍīs b. al-Mansūr. Defeated by Bāḍīs, he took refuge in the Sahara and subsequently marched on Tripoli, a province dependent on the Zīrīd. He took control of this land in 391/1000-1. Becoming master of the town and province of Tripoli, Fulfū b. Sa‘īd was constrained to fight a prolonged war against Bāḍīs b. al-Mansūr, and requiring military support he first of all recognized the authority of the Fāṭimid caliph al-Hākim whose aid was, however, ineffectual.

Therefore, he decided to approach the Unayyād of Spain, and in 395/1005-6 he sent a mission to the court of Cordova, whose sovereignty had always been, since the time of ‘Abd al-Rahmān III (320-50/932-61), allies and protectors of the Maghārawa and their kings, the Banū Khaḍrī. However, this approach led to no result, as Fulfū b. Sa‘īd died in 400/1009-10, before the return of his ambassadors from Cordova.

After the death of Fulfū, the Maghārawa and the other Zanātā tribes proclaimed as ʿamīr his brother Wārūr b. Sa‘īd. This chief was obliged, first of all, to recognize the authority of the Zīrīd Bāḍīs b. al-Mansūr, who marched on Tripoli and occupied the town, forcing the Zanātā and Maghārawa warriors to flee. Wārūr b. Sa‘īd was granted a general amnesty and appointment as governor of Naṣrāwa (400/1009-10). But in 401/1010-11 he once more repudiated the authority of Bāḍīs and inaugurated a lengthy war, during which the Zīrīd sovereignty over the Zanātā and Maghārawa of Tripoli was limited. However, they were unable to take control of the town of Tripoli which remained in the hands of Muhammad b. al-Hasan, the governor appointed by Bāḍīs b. al-Mansūr. Ultimately, in 404 or 405/1013-14, Wārūr b. Sa‘īd again offered his submission to the Zīrīd.

After the death of Wārūr b. Sa‘īd, the territory of Tripoli was divided into two parties, one supporting the succession of Khalīfa, son of Wārūr, and the other rallying round Khaḍūrān b. Sa‘īd, the latter's brother. It was Khalīfa who emerged victorious over his rival, having taken possession of the city. Khalīfa b. Sa‘īd made his way to Egypt, to the court of the Fāṭimid caliph, where the two sons Sa‘īd and al-Muntaṣir spent their youth. In this manner, Khalīfa b. Wārūr established his authority over all the Maghārawa and Zanātā of Tripolitania. This chief pledged loyalty to Bāḍīs b. al-Mansūr, but after the death of this sovereign and the accession of his son al-Muṭīz (400-454/1010-1106), he rebelled against the new Zīrīd sovereign. The Zīrīd governor of Naṣrāwa, Abd al-Ilḥām b. al-Hākim, ceded the town to Khalīfa, who thus restored the domination of the Banū Khaḍrī. Subsequently, in 417/1026, Khalīfa b. Wārūr made overtures to the Fāṭimid caliph al-Zāhir b. al-Hākim (414-97/1025-36) and obtained from him confirmation as governor of Tripoli. The same year, Khalīfa also sent a lavish gift to al-Muṭīz b. Bāḍīs. It is probable that Khalīfa died during the reign of al-Zāhir.

It was apparently in the lifetime of Khalīfa b. Wārūr that Sa‘īd b. Khalīfa and his brother al-Muntaṣir, sons of Khalīfa b. Sa‘īd, returned from Cairo and established themselves in the neighbourhood of Tripoli. At one point, it is not known when or how, Sa‘īd b. Khazrān succeeded in taking control of the town of Tripoli, but he was killed in 429/1037-8. After him, his kinsman Khalīfa b. Khalīfa seized Tripoli. But his residence in the town lasted only a year, until December 1038, when he was forced to leave Tripoli in secret to escape from al-Muntaṣir b. Khaḍūrān, who arrived at the head of a Zanātā army to secure the accession of his brother Sa‘īd b. Khazrān. This chief, proclaimed ʿamīr of the Maghārawa and Zanātā of Tripolitania, governed the town and province of Tripoli for a very long period. It was during his reign, between the years 430 and 440/1040-50, that a lengthy war took place between the Zanātā and Maghārawa of Tripoli on the one side and the Zīrīd Bāḍīs b. al-Mansūr on the other; the latter attacked them at the head of a Sāḥibādīya army. The Maghārawa and Zanātā routed the first Sāḥibādīya expedition, and repulsed the second, but were defeated by the third and were compelled to conclude a peace treaty with al-Muṭīz. According to Ibn Khaldūn, al-Muntaṣir again recognized the authority of al-Muṭīz b. Bāḍīs in 443/1052-7, during the invasion of the Banū Ḥāfil. In fact, he came to the aid of Bāḍīs at the head of a thousand Zanātā horsemen.
but was beaten by the Hiiil?ans and fled along with the entire Zirid army. Despite the occupation of the plains of Tripoli by the Hiiil?an Arab tribes, the capital of the province remained in the hands of al-Muntasir, who was still in residence there in ca. 468/1075-6. It was at about this date that he decided to lead the Arab tribes of the Banu 'Adl in an assault on the central Maghrib, which was at this time under the influence of the Zirid dynasty of the Banu Hammud. The forces of al-Muntasir occupied the towns of al-Masila and Asghir, and also the regions of Zab and Righ. Al-Muntasir established his headquarters in the small town of Waghlina, to which reference has been made above; in addition, he remained master of Tripoli. It has also been mentioned above that he was treacherously killed by the chief of Biskra, who recognised the authority of the Banu Hammud.

After his death, another member of the Banu Kha?run family, whose name is not mentioned in the sources, took control of Tripoli. The subsequent history of Tripoli under this dynasty is not known. It is known, however, that the last amir claiming descent from the Banu Kha?run was expelled from the town of Tripoli by King Roger II of Sicily, who claimed the title of amir after his death, another member of the Banu Kha?run family, whose name is not mentioned in the sources, took control of Tripoli. The subsequent history of Tripoli under this dynasty is not known.

As for the Maghrawa of Tripolitania, they subsequently took refuge in the Djabal Nafusa. They were still present in this area in the 8th/14th century, to which reference has been made above; in addition, they remained master of Tripoli. It has also been mentioned above that he was treacherously killed by the chief of Biskra, who recognised the authority of the Banu Hammud.

After his death, another member of the Banu Kha?run family, whose name is not mentioned in the sources, took control of Tripoli. The subsequent history of Tripoli under this dynasty is not known.

1183

[T. Lewicki]

I. GEOGRAPHY.

Morocco occupies the western part of Barbary; it corresponds to the Magrib al-Aṣṣā from the Arab geographers [see al-MAGHRIB]. Lying between 5° and 15° W. longitude (Greenwich) on the one hand and between 36° and 28° N. latitude on the other, it covers approximately an area of between 500,000 and 550,000 km². On the north it is bounded by the Mediterranean, on the west by the Atlantic and on the south by the Sahara. On the eastern side it stretches to the Tell and to the plateau of Oran. The boundary which separates it from Algeria is quite conventional and fixed definitely only on the northern side.

Although Morocco forms one with the northern part of Africa, it is chiefly oriented to the west. It is, on one might say, the Atlantic slope of Barbary; it is nevertheless a continental country. The coast does not lend itself to a maritime population; the Mediterranean coast is steep and inhospitable, the Atlantic coastline straight and lacking in natural shelters. The estuaries of the rivers are of very little value because of the sandbars which obstruct their entrances. The geological structure is somewhat complicated. Below the folds of the primary age, of which there still exists much eroded evidence covered by secondary deposits, have risen strata contemporary with the Alps. The actual relief which has resulted from these movements of the earth's surface and from these successive modifications consists of folded mountain chains, plateaux and plains. The chains are also in many places elongated along the line of the Atlas. The Rif is the continuation from the other side of the Straits of Gibraltar of the Bastion Cordiller [see Rif]. The Atlas [sou.] chain forms the backbone of Morocco. It breaks into the High Atlas oriented west-north-east, linked by the volcanic massif of Sirwa (3,300 m.) to the Anti-Atlas which lies more to the South, and also to the Middle Atlas running in a diagonal line from the south-west to the north-east, as far as the country of the outer foothills of the Rif, from which it is separated by the corridor of Taza. From these different chains stretch plateaux. Those of the Anti-Atlas constitute the great surface of the high plateaux of Algeria; those of the West gradually descend towards the Atlantic. Amongst the latter some are only the vestiges of the primary layer raised and eroded; others are composed of sedimentary deposits of varying origins.

In consequence of the oblique orientation of the Middle Atlas, which gradually draws away from the coast, the plains, which occupy in Morocco a more important place than in the rest of Barbary, lie mainly on the Atlantic side. They are composed of two series, the one stretching diagonally from the mouth of the Tensift to that of the Muluya (the sub-Atlantic plains, the plain of Sebou, the corridor of Taza, the plain of the lower Moulouya). The other stretches to the foot of the High Atlas (Hawz of Marrakush) and disappears in the heart of the Middle Atlas.

Climate. The climate of Morocco has been defined as "an Atlantic variety of the Mediterranean climate" (Gentil). This however must not be taken to apply to the whole of the country; the different regions differ as much in regard to temperature as in the distribution of rain. On the Atlantic coast the climate is relatively mild in winter and cool in summer (Tangier: 23°-24°; Agadir: 14°-22°); only small differences are recorded between the coldest month and the warmest. In the interior on the other hand, the seasonal variations and even the daily ones increase the farther one goes inland. They become excessive in character in eastern Morocco where the climate is distinctly continental. The rainfall is equally lacking in uniformity. Brought by the west and south-west winds, the rains are abundant in the autumn, the winter and the beginning of spring but they are very rare during the summer. The Atlantic coast has everywhere a copious rainfall although the quantity which falls decreases as one goes from north to south (Tanger: 32 inches; Casablanca: 26 inches). It also enjoys the benefit of an atmosphere which is saturated with moisture even in summer. The interior is not so well served. The rains diminish in quantity from west to east. The mountain masses always form an exception. They condense the moisture in the form of rain and even snow which, although it is by no means perpetual, nevertheless covers the high summits of the Atlas mountains until the beginning of the
summer. Eastern Morocco on the other hand, isolated by the barrier of the Middle Atlas, is not subject to oceanic influences and only receives, except in the immediate neighbourhood of the Mediterranean, rare and irregular downfalls of rain.

The flora reveals in striking fashion these variations of climate. Forests of evergreen oak, of oak and of cedar clothe the peaks of the High and the Middle Atlas and of the Rif. The cork tree is found in extensive forests in the massifs of the Zaāâ‘ir and Zayān and as far as the region of the Atlantic (forest of the Ma‘mūra). The thuya and the arganier [see ARGAN] are already more disseminated. Poplars, willows, alms and tamarisks form a fringe of verdure along the wādis. The olive tree is met almost everywhere in its wild state. But, as the rainfall decreases, the forest gives place to scrub where the jujube tree and the mastic abound, then to prairie and steppes. The prairie, which hardly goes beyond the limits of the maritime plain, is the home of plants which are used for fodder and of bulbous plants. The steppe is the home of shrubs and bushes (artemisia, drin, alfà) which are adapted to a dry soil and to extreme variations in temperature. The steppes cover a part of the interior plains of western Morocco and practically the whole of eastern Morocco, where they extend to the neighbourhood of the Mediterranean. As regards the desert, it is devoid of vegetation in the hamadas [q.e.], although the oases form spots of verdure in the midst of the general desolation.

Hydrography. The structure of the country and the relative abundance of rainfall affect the hydrography. Morocco is much richer in running streams and in subterranean waters than any other country in Northern Africa. Wādis (wetels) are here more numerous; their courses are longer and their volume larger. A number of them even deserve the name of rivers. The waters flow in three different directions: towards the Atlantic, towards the Mediterranean and towards the basin of the Sahara. The Atlantic rivers are in all respects the most important. They can be divided into three groups: those of the north (Loukos and Sebou), those of the centre (Bū Ragrag and Umm al-Rabī‘), and those of the south (Tensift and Sous). The Rif maintains the districts of the Gharb; the Sebou, those of the Middle Atlas, the Zarhūn, and the southern slope of the Rif. On emerging from the mountains it takes numerous turns and windings across the alluvial plain and reaches the ocean after a course of 300 miles. Although subject to considerable variation in volume, according to the season, it never dries up completely. It is even navigable in its lower course [see AL-MARĀDIYYÀ]. The Bū Ragrag and the Umm al-Rabī‘ run for a part of their course through the central plateau, the Moroccan "Meseta". The irregularity of their courses makes them useless for navigation. The Tensift, to the north of the High Atlas, the Wāḍī Sās to the south, which are much less in volume approach more nearly to the classic type of wādh of northern Africa. The watercourses of the Sahara (Wāḍī Gīr, Wāḍī Zīz, Wāḍī Dar‘a) diminish in volume as they go farther away from the mountains and end by disappearing in the sand. The Dar‘a [q.e.] alone reaches the Atlantic, but it only flows intermittently in its lower course. As for the Mediterranean rivers, they are only torrents with violent and rapid foods. The Monouya (Maliwiyya) alone forms an exception. It collects water from the slopes of the Middle Atlas but only reaches the sea in much diminished volume on account of the loss it suffers in crossing the steppes.

Although the common characteristics of all the countries of Barbary are found in Morocco, the greater or less differences in relief, the differences in climate, the peculiarities of vegetation bring in their train a diversity more or less marked of the districts of the Strait of Gibraltar and regions less rugged in character which to the south-east and the west form the transition into the adjoining countries. The mountains, split into deep ravines by the courses of the wādis, for the most part only leave between their last escarpment and the sea-shore a narrow strip, or a few bays enclosed by the rocky promontories. A few cuttings which run across the ranges afford communication between the two watersheds. The Rif, therefore, must seem to be a world very little susceptible to influences from without. Arab influence has scarcely grazed it. The population has always vigorously opposed the political and economic penetration of the suzerains as well as the attempts of Europeans to settle themselves there. Crowded into a limited territory, since the highest parts of the mountains are useless, the people of the Rif find their chief means of subsistence in the cultivation of vegetables and fruits. A number of them gain from temporary emigration an addition to their resources. They are not nomads but inhabitable villages perched on the slopes. Towns are represented only by Qshfāwā (Chechaouen) and Wazzān (Ouezzane), religious and commercial centres, situated the one on the northern side and the other on the southern side of the Djebāla. Towards the south-east, plains interspersed with mountain masses extend as far as the Moullouya. The lack of rain gives to these plains (Salān, Garet) the aspect of steppes more fitted to a pastoral life than to agriculture and a settled life. Towards the west the lowlying coastland, still a very narrow border at the strait of Gibraltar, increases gradually from the north to the south between the Atlantic coast and the last slopes of the Djebāla. This district commonly called the Gharb is a corridor. It still keeps in this respect its historical significance, but its economic value is diminished by the stagnation of its waters in the hollows in the flat bottoms of the valleys, and by the insecurity resulting from the proximity of the warlike tribes of the high mountains. A few townships have however succeeded in establishing themselves, either at the crossing of roads such as al-Kaṣr al-Rabī‘i [q.e.] or in proximity to the coast like Ceuta, Tangier and Larache [see the articles SABTA, TANZILA and AL-SARĀTH].

The valley of the Sebou. The valley of the Sebou lies between the Rif, the Middle Atlas, the Moroccan Meseta and the Atlantic. The situation of the region, the abundance and variety of its natural resources makes it of exceptional value. The Sebou links up the whole of it. Through its tributary the Innawan, the valley of which leads
to the pass of Taza, it makes communication with the rest of Barbary easy. The mountain masses there (Zarhûn, Zâlâgî, mountains of Gerwân) offer no insuperable obstacles to communication. The high plains of Sâ’tis and Makûnt are contrasted with the lower plains of the Sjârdà and the alluvial plains of the lower course of the Sebou. The influence of the Atlantic is felt far into the interior and combines with the numerous streams that flow into the Sebou and its tributaries and the subterranean waters to promote the development of all forms of vegetation. Forests cover the higher slopes of the mountains; fruit-trees flourish on the sunny slopes and cereals on the high plains; the morgias, temporary marshes produced by the Sebou in its lower course, are used for grazing until they are sufficiently dry to be of use to agriculture. This combination of circumstances, so auspicious for human habitation, has made the valley of the Sebou a centre of intensive settlement. The most diverse ethnic elements have settled together and mixed there. All types of habitation are found here, as well as all degrees of attachment to the soil from a nomadic to settled town life. Human activities are displayed in the most varied forms (grazing, agriculture, arboriculture, commerce, industry). The country villages, douars of huts in the plains, villages of houses of clay in the mountains, are numerous, the towns are flourishing. Mawlay Idris I, the sacred city of Morocco, Sebrou on the borders of the plain of Sâ’tis and the high limestone plateau, lives by trading with the people of the mountains and the industry of its weavers and makers of silks. Fès and Makûnt are among the great cities of Morocco.

The first of these towns has remained to this day the political, religious, intellectual and economic centre of Morocco. It has resisted all the usual causes of decline. From all time the ownership of the high plains of the Sebou has been bitterly contested. Their possession has been the condition for the establishment and survival of the dynasties which have succeeded one another in Morocco. Their political significance and role in history correspond very exactly to their geographical position and economic value.

Central Morocco. Between the valley of the Sebou, the country of the Atlas and the Atlantic, covering about a quarter of habitable Morocco, lies the region called by the geologists the Moroccan Meseta. It includes districts of very different character, the only feature uniting them being the possession of a common substratum, the Hercynian peneplain covered almost everywhere by sedimentary horizontal formations. Differences of structure and of climate distinguish clearly the various parts: the Atlantic plain, the plateaux of the centre, and the interior plain of the Haoua. The maritime plain lies along the Ocean from Rabat to Mogador [see al-Suwâwra]. Very narrow at its northern and southern ends, it broadens near the centre (Dukklàa, Shâwîyya) to a width of 30 miles. To the rains and the contact of the ocean, the plateaux are well suited as the abundance of running streams and subterranean waters, the natural fertility of the soil further adds to the conditions for prosperity. The ûfs or black lands which run in an unbroken line behind the coast from the Bi Râkrag to Tensift are admirably suited for the growth of cereals. The rural population, almost everywhere settled, is therefore considerable. The land of the Dukklàa has 40 people to the square kilometre, a density very much greater than that of the other districts of Morocco. The towns of the coast, Salé, Rabat, Casablanca, al-Djakîldà, Azamînyûr, Safi, Mogador [al-Magîhrîb], benefit by the richness of the hinterland. The exploitation of agricultural produce has at all times been a branch of commerce, and has been much developed since the settlement of Europeans there. While facility for communications and the continental relations with the valley of the Sebou opened the plain to Arab influences, the ports of the coast maintained contact with abroad and permitted the infiltration of European influences.

The interior is much more broken. The ground rises gradually up to a height of 2,000-3,300 feet. The predominant formation is plateaux terminating on the north in the very old massifs of the Za‘âdîr and Zayân, which are really mountains in character, in the south in the equally old but less elevated massif of the Râhîmûn. These plateaux deeply cut into by the course of the Uman Râbî’ overcome the west side the low-lying coastlands from the top of cliffs, and slope gently to the seacoast, on the eastern side the plain of Tadla. This is a depression, over 20 miles in length, running to the north into the heart of the Middle Atlas where it terminates in a cul de sac, while it broadens greatly in its southern part. A low pass enables communication to be made between the Tadla and the Hawz of Marràkîs, a basin shut in by the High Atlas in the south, the Middle Atlas in the east, the Djiblât in the north and the hills of the Shîyâmûn in the west. The economic value of this inner region is very unequal. On the mountains of the north, the rains and streams support forests and the local inhabitants, especially Marrikusb have been enabled to rise to a considerable degree of prosperity. The plateaux of the centre covered with a surface of limestone have great stretches of bare rock and cultivation is difficult. The Tadla is no better favoured except in the zone adjoining the Atlas, watered by torrents descending from the mountains. The plain of the Hawz would also suffer disastrously from drought, if human industry had not averted this danger. An ingenious system of irrigation [see Kântî] has transformed the country round Marràkîs into a vast palmyra grove and resulted in a particularly dense population. Comparatively large towns (Antîmûn, Dammât [s.e.] and Tameshûbût) and especially Marràkîs, have been enabled to rise and prosper. A mere division between this prosperous Saharan, and the high lying plains of the Sebou, the plateaux of the centre and the mountains of the north which come down to within a short distance of the shore, interpose a barrier which the attitude of its inhabitants makes still more difficult to cross. The Zayân, the Za‘âdîr, the Zemrâm, over whom the authority of the makhîrsen has never been very securely exercised, have more than once cut direct communication between Fès and Marràkîs. These two cities have been at different periods the capitals of distinct and even hostile kingdoms.

The region of the Atlas. In spite of the marked differences between the different elements of the country, and since the region is peculiarly suited to the general characteristics of its own. Between Atlantic Morocco on the one hand and Saharan Morocco on the other, the Atlas lies as an almost continuous barrier. Only the few transverse fractures in the Middle Atlas permit passage between the basin of the Sebou and the Saharan oases, while in the High Atlas valleys running right into the heart of the massif give access to passes opening on the valleys of Sous and the Dar’s. Moister and colder, the
Middle Atlas is covered with forests which are denser and more extensive than those of the High Atlas. Both however are great watersheds. From the Middle Atlas come the great rivers of the Atlantic slope (Sebou, G.Pe, Umm Rabli, Wadî 'l-Ahib), from the High Atlas the Tazaouit and the Tensift. The lands of the Atlas are nevertheless poor. The high mountains offer little to support mankind. Human activities are found mainly in the zones of contact between the mountains and the plains (i.e.) of the Middle Atlas and in some specially favoured valleys of the High Atlas. Except in the Middle Atlas, the valleys where the moisture results from the exodus in the bad season of the inhabitants who lead a pastoral life, and on the plateaux of the High Atlas on the Atlantic side (Hâba, Shiyûdòna) the inhabitants of which are mainly engaged in cattle-rearing, the natives are settled. They live in villages perched on the slopes and terraces between wadis or scattered along the valleys. There is nothing approaching a town in size. These regions, defended by the nature of the country, have almost completely escaped outside influence: they are still almost exclusively the domain of Berber tribes (Berber in the Middle Atlas, Shbih in the High Atlas). The customs and institutions of these tribes have survived to a greater extent here than in any other region of North Africa. In particular, their political organisation was most rudimentary: municipal republics administered by a guanîn in the Middle Atlas, feudal lordships ruled in patriarchal and despotic fashion by a few powerful families in the High Atlas. The people of these regions have also always opposed vigorously the central power; the authority of the mekhsen (gov.) over the Berbers of the High Atlas has never been exerted except through the local chiefs. As to the tribes of the Middle Atlas, they have for long retained an almost complete independence.

Easter North Morocco. Eastern Morocco may be described as the continuation of the central Maghrib, of which it has the distinctive characteristics. In it, as in Ouarâ, we have a têl zone and a zone rising by successive stages up to 6,000 feet. The upper valley of the Moulouya separates them from the Middle Atlas. The monotony of these vast spaces is only broken by the outcrops of gars, flat beds of rocks cut up by erosion and by the depressions of the chotts (see Ksar). Beaten by the winds, exposed to the rigours of an extreme climate, these lands are only fit for the pastoral life led by the nomads who raise sheep. The valley of the Moulouya is no better favoured, except in the vicinity of the Atlas, where villages surrounded by vineyards with a settled population are found along the tributaries of the river. As to the Tell, hills of no very great height (the most important being that of the Beni Snassèn which does not exceed 5,000 feet) divide it up into compartments occupied by plains (plains of the Awïld Maqûr, on the coast, of the Tifrit, of the Angâd which in the south reaches the cliffs in which the high plateaux end). The dryness of the climate frequently gives these plains a steppe-like character; only the western part of the plain of the Angâd with a fertile and well-watered soil lends itself to cultivation. The nomads come here to procure pasture. But this region owes its importance less to its natural resources than to its situation on the natural route between Atlantic Morocco and the rest of Barbary. Oujea (see Wadda), which commands the passage, has thus been enabled to escape various causes of decay that have threatened it. A border district, eastern Morocco has always been a disputed region, a „march“ for which the lords of Tlemcen and Fès have contended. The authority of the latter was never solidly enough established here to impose itself on the settled inhabitants of the mountains and on the nomads of the plateaux and plains.

The Moroccan Sahara. The Moroccan Sahara is the northwestern corner of the Sahara. There we find the general characteristics of this desert region (see Sâhara). Only the parts adjoining the Atlantic and the threshold of the mountains offer favourable conditions for the growth of palms (namândas), but in between the Atlas and the Anti-Atlas, the rivers and the irrigation canals enable shrubs to grow. The Darâ, Ziz and Ghr are in their upper courses fringed by a thin border of cultivated land, pastureage, vineyards, and in their middle course assure the growth of palmgroves of which the best known, if not the most prosperous, is that of the Tafilalt (gov.). The richness—only relative it is true—of these oases is in contrast with the desolation of the rocky plateaux (hamândas) which form the greater part of the Moroccan Sahara. These natural conditions determine the mode of life of the inhabitants who lead a nomadic life and drive their flocks up and down the plateaux; others are permanently settled on the Sous, in the high valleys and in the oases. Sâs contains numerous villages and even towns (Agadir, Tinmit, Tarudan); the oases have a settled population in the ksar. Those of Tafilalt, Tamargut, Bô Dûib and Figg carry on a certain amount of commerce between Atlantic Morocco and the Sahara. But this very circumstance has prevented them escaping as completely as the lands of the Atlas from the political and intellectual influence of Western Morocco, especially Tafilalt where considerable groups of Arab ghurâf (see giurâf) have long established in the midst of Berber populations. But, although the present dynasty actually came from Tafilalt, the people of this region have frequently escaped Shari' authority.

II. HISTORY.

Morocco before Islam. Morocco, like the other parts of North Africa, has probably been inhabited from a very remote period. We know, however, nothing definite about its earliest inhabitants. The traces which they have left, weapons and tools of chipped flint, pottery, rock-paintings, some of which represent animals of the quaternary period, now extinct, megalithic monuments identical with those found all round the Mediterranean basin, give us no information in this respect. At most, we may suppose that the primitive population consisted of emigrants from southern Europe, the Sahara and perhaps from Egypt. The fusion of these diverse elements gave birth to a race, the members of which, frequently different in type and physical features, were united by a community of language. The ancient writers called them Libyans and Moors. They were the ancestors of the present Berbers [g.v.]

The first historical fact known, and that only imperfectly, is the appearance in the 12th century A.D. of the Phoenicians on the Moroccan coast. The sailors of Tyre and Sidon built factories there, where they exchanged goods of eastern origin for local products (cattle, wool, hides) and slaves. But Phoenician influence was exercised mainly through the intermediary of Carthage when it in turn had become the metropolis of a great maritime empire. The Carthaginians rebuilt the ruined factories and added new ones. In the middle of the 5th century, Hanno in the course of his celebrated “Periphus” established on the Atlantic coast seven coloniae of which one was at the mouth of the Sebou. Rusaddir (Melilla), Septem (Ceuta), Tingis (Tanger), Lixus (Larache), Sala (Salé) were the principal Carthaginian establishments. It does not seem, however, that Carthage sought to extend her power into the interior. She was content no doubt to conclude treaties with the native chiefs and to recruit mercenaries from the country. Morocco remained independent, but the tribes who inhabited it were not organised into states, except perhaps in the east, where ancient writers mention in the period of the Punic Wars the existence of a kingdom of Mauretania of Marcus, extending along both banks of the Moulouya.

The destruction of the Carthaginian empire hardly altered this state of affairs. For two centuries Rome administered only the “Province of Africa” directly and left the other regions of Barbary in the hands of native chiefs under a more or less severe protectorate. Northern Morocco shared the fate of Mauretania down to the annexation of this kingdom in 42 A.D. The region to the east of the Moulouya formed part of Caesarea Mauretania. The lands stretching from the Moulouya to the ocean formed Mauretania Tingitana, an imperial province governed by a procurator. When the empire was re-organised by Diocletian, it was attached to Spain.

Roman Morocco never covered more than a small portion of the modern Morocco. On the Atlantic coast, it barely extended beyond the mouth of the Dû Ragra, and in the interior to the massif of the Zañhalû. The plateaux and sub-Atlantic plains and the mountains of the Rif, Middle and High Atlas escaped the authority of Rome. It was the same with the Sahara. The expedition of Suetonius Paulinus, who in 43 A.D. advanced as far as the Wādī Gīr, remained an isolated incident.

To defend herself against the rebellions of her own subjects and to protect the country from Berber inroads, Rome had to keep in Tingitana an army of 10,000 men, to build strategic roads and to establish fortified posts on the sides of the triangle: Sala, Zarhûn, Tingis. With the exception of Volubilis [see Maâlîâv dâbîl], the importance of which has been revealed by its ruins, and which was undoubtedly a centre of influence of Roman culture on the people of the interior as well as a military base, the towns were all on the coast. They were Lixus and Tingis, raised to the rank of coloniae, and Ceuta. They owed their prosperity mainly to trade with Spain, to which were exported oil and wheat, the two main products of the country. On the whole, however, Rome’s influence on Morocco was superficial and has left but little trace.

Without any real firm hold on the country, weakened by native risings and by the quarrels between the Donatists and the orthodox, Roman rule was to collapse suddenly at the beginning of the 5th century. Germanic invaders, the Vandals, came from Spain and in 429 A.D. conquered without opposition Tingitana which they gave back a few years later to the Romans. Soon afterwards the western empire disappeared and the natives seized the opportunity to become independent. The Byzantines, who in the 6th century destroyed the Vandal kingdom, were content to re-occupy the two strongholds of Ceuta and Tangier. The rest of Morocco was in the hands of the Berbers. The latter were divided into a large number of tribes, of whom the principal were the Ghurân [g.v.] on the Mediterranean coast, the Barghâwâta [g.v.] on the Atlantic coast between the strait of Gibraltar and the mouth of the Sebou, the Mûknûs, in the central district, the Mâsmdâ [g.v.], on the western slope of the High Atlas and on the coast from the Sebou to the Sûs; the Hâskhûn between the Sûs and the Darâ a; the Lâsât and Lamûns [g.v.] on the left bank of the Darâ a. Those Berbers were all of Šânâja descent, some professed Christianity or Judaism, but the majority still followed the old nature worship. The Arab conquest brought them a new religion: Islam.

The Introduction of Islam. The Arabs appeared in the extreme Magribi at the end of
The rebellion was both religious and political in character. With the same readiness with which they had converted Islam, the Berbers adopted the Kharaj doctrine of the east, teachings which also appealed to their egalitarian tendencies and to their spirit of independence. The army sent from Syria to establish order was destroyed on the banks of the Sebou in 122/742 and the extreme Maghrib was lost at one stroke to the caliph and to orthodoxy. Berber principalities were organised in the Rif; in the west, the Barghawata recognised the authority of a certain Safi, founder of a rival religion to Islam, who had composed a Koran, that is a sacred book, in Berber. None of these little states was strong enough to impose its authority on the others and to collect all the Berber tribes under one rule.

It looked for a time as if the Idrisid dynasty [g.v.] were to play this part. Idris I and his successor Idris II, actually enforced their authority over the greater part of the tribes of northern Morocco and successful expeditions extended their kingdom from the shores of the Mediterranean to the High Atlas and from the Atlantic to beyond Tlemcen. Ardent champions of Islam, they imposed their religion on those peoples who did not yet practise it or who had abandoned it after once adopting it. The conversion of the extreme Maghrib to Islam is their work much more than that of the Arab conquerors, equally vigilant defenders of orthodoxy, in spite of their Alid origin, they fought the Kharajis with the same vigour but did not, however, succeed in completely extirpating the heresy. It is not without good reason that legend has transformed these rude warriors into saints, the one Idris I, patron saint of Morocco, the other Idris II, the patron saint of the city of Fas [g.v.]. The building of this city was to play this part. Idris I and his successors undertook an expedition which carried him as far as the shores of the Atlantic Ocean. This raid, however, if it ever took place, was too transitory to have any permanent results. But at the beginning of the following century, Yusuf b. Najar [g.e.], who had just completed the conquest of Ifriqiya and took Tangier, installed a governor there and set himself to conquer and convert the local people. He succeeded without much trouble. Attracted by the hopes of gain, the Berbers adopted Islam and enrolled themselves in the armies which were invading Spain. They were not long, however, in rising against the Arabs. Dissatisfied with the share allotted them of lands taken from the Christians in the Peninsula, and exasperated by the exactions of the governors of Tangier, they took up arms in 222/740 on the call of the porter Maysam [e.c.].

None of these little states was strong enough to impose its authority on the others and to collect all the Berber tribes under one rule.
to one another to last long united. The Almohad caliphs were powerless to restrain the separatist tendencies which revealed themselves on all sides. In the first half of the 9th/13th century the Almohad empire broke up. Ifrikiya and the central Maghrib recovered their independence; local dynasties set up in Tunis (Hafsids) and Tlemcen ('Abd al-Wâdîde). The extreme Maghrib ended by slipping away from the descendants of 'Abd al-Mu'tamin, who were replaced by the Malfiids [q.v.].

The Marinids. Berbers of Zanûta stock, driven by the Hilfî Arabs on to the plateaux of Oran and into the central valley of the Moulouya, the Banû Marâfî had at first entered the service of the Almohads, then turned against them, and the Marinids of the dynasty began to decline. By repeated razzias they made themselves masters of almost all northern Morocco. After the death of the caliph al-Sâ'id, who had been able to arrest their progress for a time, their leader Abû Yahyâ (641-56/1243-58) seized Fâs, Meknès, Rabat and Sijilmâsâ. The capture of Marrákush (568/1170) by Abû Yusuf, successor of Yahyâ, marked the final triumph of the Marinids. Heirs of the Almohads, the first Marinids endeavoured to reconstitute the empire of their predecessors. In Spain, they enforced their authority on the Muslims of Andalusia. In Africa, they endeavoured to take the central Maghrib from the Hafsids and the Wâdî. They were successful when Tlemcen, besieged seven times in sixty years, finally fell into the hands of Sultan Abû 'l-Hasan (748/1347). Ten years later, the same ruler took Bougie, Constantine and Tunis, but his hold on these was very insecure. At the end of barely a year, Abû 'l-Hasan, defeated by the Arabs, found himself forced to abandon Ifrikya, the Hafsids returned to Tunis and the 'Abd al-Wâdîde to Tlemcen, while the sultan's own son Abû 'l-Mâlik rose against him in Morocco. Attaining to power, Abû 'l-Mâlik renewed his father's efforts. He re-occupied Tlemcen and Tunis, it is true, but could not retain them (921/1516). The Hafsids and 'Abd al-Wâdîde recovered their kingdoms almost once.

Separatist tendencies thus triumphed and on this occasion in a most definite fashion. The extremes Maghrib, the history of which had hitherto been so often that of Barbary, began to live its own life. The Marinid kingdom, while its boundaries in the east were still vague and changing, already corresponded roughly to modern Morocco and the Marinids may be regarded as the first strictly Moroccan rulers. Lacking the religious prestige of their predecessors, they endeavoured to secure the moral authority which they lacked by taking as their patron saints the apostles of Islam in the Maghrib. The cult of Murâd and of the sultans, which in the 9th/14th and particularly the 10th/15th century assumed an importance which it has retained to the present day. No less characteristic is the development of intellectual life and the arts. The Hispanic-Moorish civilisation never flourished more brilliantly in Morocco than in the Marinid period. The rulers attracted to their court the poets, men of letters and lawyers of the Iberian Peninsula and of the Maghrib. The university of al-Karaîwîyn at Fâs attracted students from all the lands of the western Muslim world. Fâs, which the Marinids, abandoning Marrákush and Rabat, the capitals of their predecessors, chose as their royal residence, was given splendid buildings by them, palaces, mosques and madrasas. It was at the same time a commercial city in which African and Spanish merchants mixed with Christian traders.

This brilliant exterior, however, was quite deceptive. Marinid Morocco was never able to organise itself on a solid basis. The central power was very weak and did not succeed in imposing its authority everywhere. The accession of each sultan was an occasion for outbreaks. The pretenders who arose always found supporters readily, either among the Arabs or the Berbers. Powerless in the interior, the sultans were no more fortunate in their enterprises against their neighbours of the central Maghrib or against the kings of Granada. Their prestige and their authority could not survive these checks. The Marinid period in the strict sense disappeared from the scene in 850/1445, after the assassination of the sultan by an Idrlsid sharîf. The Banû Wattâs, descended from a collateral branch, the chief of whom seized the power in 873/1470, had themselves a wretched existence. Their kingdom broke up into a large number of independent little groups, principalities at Fâs and Marrákush, Berber republics in the Atlas, Marabout fiefs in the Rif, the Qü abrasive and in the Darâs and Sás. The sultans were quite powerless to prevent this decomposition.

The Christian offensive and the revival of Islam. Of all the causes which combined to enfeeble and discredit these rulers, the principal was undoubtedly their subjection to the offensive of the Christians against the Maghrib. In 818/1415 the Portuguese took Ceuta, in 860/1455 al-Ḳar al-Sâghir, in 875/1470 Tangier. They thus secured themselves a base of operations in the north while by the occupation of Asta and Ansâ (Casablanca) they secured a footing on the Atlantic coast. In the early years of the 16th century, they built fortified posts at Santa Cruz (Agadir) and Mazagan and took by force of arms Saffi [see Sâfî] and Azâmûr [q.v.]. Holding all places of importance except Larache [see al-Ḳaraksh] they brought under their protectorate all the lands near the coast (Shâwîya, âbâs, Dijâlîa), reduced the local people to pay them tribute and to hand over to them strategic points up to the environs of Marrákush. Their expeditions had no other aim than plunder, no other result than to exasperate the inhabitants who saw their towns destroyed, their donars burned, their women and children massacred or sold as slaves.

Menaced in the west by the Portuguese, Morocco was threatened in the east by the Spaniards also. The latter completed the reconquista by the taking of Granada (1492). Thus free to go further afield, and still fired with the religious enthusiasm of Ximenes, they too went over to fight the Muslims on African soil. The conquest of Al-Qâdisiyya al-Kabîr (1507) marked the beginning of the establishment of a Spanish protectorate over the kingdom of Tlemcen constituted a serious danger to the Muslims of Morocco.

The threat from the Christians produced an awakening of religious sentiment. This renaissance of Islam in the 9th/13th and 16th centuries, the results of which are still to be felt at the present day, is beyond question the great event in the history of Morocco since the Idrïsid period. The way for it had, moreover, been prepared by the Sufi teachings imported from the east and by the development of the brotherhoods [see Tariqâ] in which the adepts of these doctrines were organised. It also found a favourable soil owing to the persistence of maraboutism among the Berbers. The ascendency
which the religious leaders exercised, the wealth they accumulated in their siiyayn, made them independent of the sultan. They thus became temporal leaders also, all the more readily as the sovereigns could not fulfill their office of defenders of Islam owing to lack of energy and also of means. The activity of these religious leaders was always of a local nature; it was only effectively exercised within a limited area and did not extend over the country generally. The religious solidarity thus established, the kind of common conscience thus created, did not avert a check to the political decline until the time when the Sa'dian ghuzz took direction of the movement and exploited it for their own benefit.

The Sharifian dynasties. a. The Sa'dians [q.v.]. The Sa'dian ghuzz benefited by the prestige which the religious awakening had restored to the descendants of Fatima, the daughter of the Prophet. Coming from Arabia at the end of the 8th/14th century and settling in the valley of the Wadi Der'a, while another branch of the family settled at Tafillalt (Hasanl or 'Alid ghuzz), they were not long in acquiring a considerable influence over the tribes of the south. Thus they were naturally relied on for support in the south. They were exposed to the attacks of the Portuguese. To the same period also belongs the organisation of the Marhizan siiyayn, led by Muhammad al-Mahdh. The disintegration of the dynasty died in 1070/1660. assassinated by the Sa'dians very soon found this out. The tendencies to disruption which had been held in check by the energy of al-Mansur broke out again on his death. The dispute for the throne set his sons against one another. One of them, 'Ali, ended by triumphing over his rivals but could not prevent the break-up of the empire. Laarache was occupied by the Spaniards, Fas cast off Sharifian authority.

b. The Hasanl ghuzz. The disintegration of Morocco was arrested by the coming of the Hasanl ghuzz. The latter had taken advantage of the disorder to assert their authority in the Tafillalt, then by expeditions, which partook of the nature of brigandage as much as of warfare, they had conquered eastern Morocco. One of them, Mawlay al-Kashid (1076-1082/1664-73) was more successful. He took Fas, disposed of Qaylan, an adventurer who had established himself securely in the ghuzz, destroyed the ashayn of Dila', reconquered Marrakush, thus rebuilding as it were piece by piece the Sharifian empire. Installed by force of arms, the new dynasty recognised the necessity of securing the moral prestige which their origin could not give them. They therefore sought to attract to their side the Sharifian families. They heaped favours on the ghuzz of Fas, whose patronage was a guarantee even for the rulers.

The work begun by Mawlay al-Rashid was continued and brought to a successful conclusion by his successor Ismail (1082-1139/1672-1727). During the first fifteen years of his reign, he did not cease to wage war on the rivals who disputed the districts of Marrakush and the Sis with him. While fighting his enemies, he was engaged in building up an army which would work his will. To the ghuzzan formed by the Shraiga and Udaya, he added a body of black slaves, the 'Abid al-Bagharti (Bwakher), the property of the sultan; their children were specially trained for military service. The number of effective troops in this corps by the end of the reign numbered 150,000.
The real masters of the situation were the *AbId also remained in a perpetual turmoil. Under MawlAy Morocco remained a poor country and did not open of commerce with Denmark, Sweden, England, and inaugurated a mercantile policy, concluded treaties central power was mainly due to a lack of financial rebel Berbers back to their allegiance, and by the emergence much weakened from it. Inheriting the energy and pleased. One of them, MawlAy 'Abd Allah, was proclaimed and deposed six times. He succeeded, however, in restoring it. Inheriting the energy and the authority of the Sharifs wars. The remedy, however, was not much better importances whom gradually diminished with the failure, and the lower course of the Moulouya continued to be the boundary of the Sharkiilan empire. In spite of his lack of success here, MawlAy Ismā'īl is nevertheless the great figure of the Hasanani dynasty, the model the Moroccan sultans have set themselves to the present day. Morocco, however, remained what it was before, i.e. an aggregation of different groups, the cohesion of which depended on the personal energy of the sovereign, who squeezed his subjects to the utmost to get the money necessary for the building of his capital Meknès, the palaces of which were built by the forced labour of the local peasantry and by slaves.

On the death of Mawlāy Ismā'īl, a reaction set in. For thirty years his sons fought with one another. The real masters of the situation were the *Abīl al-Buγhārī, who made and unmade sultans as they pleased. One of them, Mawlāy 'Abd Allāh, was proclaimed and deposed six times. He succeeded, however, in triumphing over his competitors by playing the Berbers off against the *Abīl, the importance of whom gradually diminished with the wars. The remedy, however, was not much better than the disease. This period was for Morocco one of misery and ruin. The authority of the Sharifs emerged much weakened from it. Mawlāy Muhammad (1179-1230/1767-92) succeeded, however, in restoring it. Inheriting the energy and vigour of his grandfather Ismā'īl, he brought the rebel Berbers back to their allegiance, and by the taking of Mazagan in 1183/1769 destroyed the last trace of Portuguese power on the Atlantic coast. Convinced, on the other hand, that the weakness of the central power was mainly due to a lack of financial resources, he endeavoured to procure money by encouraging the development of foreign trade. He inaugurated a mercantile policy, concluded treaties of commerce with Denmark, Sweden, England, and France and endeavoured to attract foreign merchants to his kingdom by building the town of Mogador (see AL-TUWĀRA) in 1764. Heavy taxes however, severely impeded the progress of this policy. Morocco remained a poor country and did not open itself, as had been hoped, to European penetration. It also remained in a perpetual turmoil. Under Mawlāy Yazzīd (1206-1219) the country was once more handed over to anarchy. Mawlāy Sulaymān (1208-30/1794-1822), after at first being able to restore order, had to spend the last ten years of his reign in putting down the continual risings of the Berbers of the Middle Atlas; in the course of one of these expeditions he actually fell into the hands of the rebels. This rebelliousness caused the sultan much misgiving; he also wanted to prevent the infiltration of foreign and anti-Muslim influences which he believed would aggravate it. He forbade his subjects to leave the country and restricted to a minimum their intercourse with Christians. The diplomatic and consular agents were relegated, and access to the interior was made almost impossible for Europeans. His successors followed his example. Down to the end of the 19th century, Morocco was more rigorously closed than it had been in the time of the Marinids and Sa'dians and even in the early days of the Hasani Sharifs. In spite of this systematic isolation, the sultans had nevertheless to face the same difficulties as Mawlāy Sulaymān and had no more success than he in overcoming them. For half-a-century the domestic history of Morocco was nothing but a succession of rebellions which the sovereigns had great difficulty in suppressing. The regions remote from the centre, Rif, Tafilelt, Figgī, eastern Morocco, escaped the authority of the makhzan. In the very heart of the country, the Berbers cut communications between Fās and Marrakush, forcing the sultans when they wanted to move from one capital to the other to make a great detour by Rabat. The empire broke up more and more. Mawlāy al-Hasan (1290-1341/1873-94) postponed for a few years the inevitable collapse. His reign resembled that of Mawlāy Ismā'īl. At the head of his army, the artillery of which had been reorganised by a French military mission, he was constantly in the field raiding the rebels and tearing down hashash. He re-established order in the region of Oujda, forced the people of the Sus to recognise his ūfīdī, reduced to obedience the Za'a'īr and Zayān, endeavoured to extend the makhzan territory by expeditions against the independent Berbers, endeavoured to develop his influence in the Saharan regions and to restore his authority in Tuwāt. But he died before completing his task and all had to be begun again. Morocco and the Christian powers. The situation was the more critical, in that the fate of Morocco could no longer be a matter of difference to the European powers. It increased the prosperity of some and aroused the cupidity of others. In spite of their desire for isolation, the Moroccans had not been able to break every link with Europe. They had also to take account of the proximity of Spain, established for three centuries in the "presidio" of the Mediterranean coast, and of the French who had replaced the Turks in Algeria. The conquest of the old Regency, destroying all the Sharifs' hopes of extension eastwards, had caused great irritation in Morocco. *Abd al-Kādir [etc.] found followers among the peoples of this country and support hardly disguised on the part of the makhzan. This hostile attitude resulted in the Franco-Moroccan war of 1859-60. The Sharkiilan army was crushed at the battle of Isly, the ports of Tangier and Mogador bombarded. The moderation of France alone enabled the makhzan to come fairly well out of this unfortunate escapade. Henceforth, the relations between France and Morocco remained peaceful, although the impotence of the Moroccan government to guarantee security on its borders forced France to military demonstrations like the Ben 'Usdan.
affirmed the three principles of the sovereignty of
the sultan, the territorial integrity and the economic
freedom of Morocco. It did not, however, settle the
Morocco question. The two international bodies
which it decided to set up, the police for the ports
and the state bank, both capable of being of great
service, could not take the place of the general re¬
forms necessary for the salvation of the empire.
Disorders continued, acts of hostility against Euro¬
peans in Morocco itself and acts of brigandage on the
frontiers increased in number. Not being able to
obtain satisfaction from this subject, the French
Government ordered the occupation of Oujda and Casablanca in 1907. The country was then pacified around these two centres and order
restored in eastern Morocco and in the Shaliya
to the great benefit of the natives themselves. The
Spaniards in their turn for similar reasons inter¬
vened in 1908 in the adjoining region of Melilla
and after a severe campaign in 1909 occupied
Salw& and a number of strategic points.
During this period, war broke out between 'Abd
al-'Aziz and his brother Mawlyy al-Hafiz,
proclaimed sultan at Marrakusk and then at Fas.
Supported by the anti-French party, the pre¬
ident of the Council was victorious. All the states of
France and Spain, recognised him, after he had promised
to respect the agreement of Algeciras, the inter¬
national treaties and all the engagements entered
into by his predecessors. France and Spain an¬
ounced their intention of not prolonging their
occupation of Shariah territory. The Franco-
Moroccan agreements of 4 March, 1912 and the
Hispano-Moroccan one of 19 November of the same
year, stipulated that the occupation should cease as
soon as the mahkam should have a force sufficient
to guarantee the security of life and property and
peace with its frontiers. This settlement seemed
all the more desirable as there had been accidental
friction between France and Germany which had
only been smoothed over with great difficulty, the
most serious being the affaire of the deserters from
Casablanca in September 1908. A disquieting state
of tension remained between these two powers,
although France had endeavoured to give satisfaction
to Germany in signifying, by the agreement of
8 February, 1909, her willingness not to impede the
agricultural rights of the nationals. The Spanish
Government decided to set up, the police for the ports
and the state bank, both capable of being of great
service, could not take the place of the general re¬
forms necessary for the salvation of the empire.

most serious being the affaire of the deserters from
Casablanca in September 1908. A disquieting state
of tension remained between these two powers,
although France had endeavoured to give satisfaction
to Germany in signifying, by the agreement of
8 February, 1909, her willingness not to impede the
economic freedom nor hinder the development of
German interests.
The aggravation of the situation in the interior hastened the denouement. The sultan's rule was
more effective than that of his predecessors; the
infections of the Moroccon agents in the spring of
1917 provoked a rising of the Arab and Berber
tribes in the region of Fars. Besieged in his capital and
on the point of succumbing, the sultan ap¬
pealed to the French. They decided to send an
expeditionary force to the help of the sultan, but
ordered its commander to avoid any injury to the
independence of the sultan and any occupation of
new territory. Vigorously commanded by General
Monter, the military operations had the desired
effect. Fars was relieved on 21 May, and after
certain police operations necessary to secure the
peace of the district, the expeditionary force re¬
turned to the Casablanca. While the danger was thus
baffled from the interior, unexpected complica¬
tions resulted. Spain, taking advantage of the
case to take possession of the sphere of influ¬
ence reserved for her by the agreement of 1904,
established herself in Larache and al-Kasr. Germany
feeling the moment was decisive, claimed compen¬
sation in her turn and in July 1911 sent a warship to

campaign (1859) and the Wadi Gir expedition (1870).
Spain in turn being unable to obtain satisfaction
from the attacks directed against her garrisons,
decided also to resort to arms. The campaign of
1859-60, ended by the victory of O'Donnell,
revealed the military weakness of Morocco. The treaty of Tetuwan (1860) granted to Spain, along
with some trifling territorial aggrandisement, an
indemnity of 100,000,000 reals. To pay this debt,
the Sharifian government had to raise a loan in
London on the security of the Moroccan custom¬
houses and to accept the control of European com¬
misjoners. For the first time, foreigners intervened
in the domestic administration of the empire. The
breach thus made was continually enlarged. The
exercise of the right of protection, the erection
of a lighthouse on Cape Spartel, served as a pre¬
text for diplomatic negotiations and for the exten¬
sion of international control. European ambitions
were not dissimulated. In order to protect itself
against them, the mahkam tried to play one off
against the other and confined itself to granting, as
it did at the conference of Madrid (1880), con¬
cessions of an insignificant nature. Mawlyy al-Hasan excelled as this difficult game and the sultan
Bâ Hamâd [q.v. in Suppl.], who directed affairs during the early years of the reign of 'Abd al-Atlas, Mawlyy
al-Hasan's successor, displayed no less skill. Morocco was thus the object of a very keen struggle for
influence. England wanted to maintain her economic
preponderance along with the control of the Strait; France wanted to ensure the security of her
Algerian possessions and of the roads leading to
the Saharan oases occupied in 1901-2; Spain ap¬
pealed to her "historic rights"; Germany lastly
was preparing to seize the opportunity to acquire
openings for her commerce and emigrants.

The Moroccan crisis and the establishment of the French protectorate. Such a position could not last. The impossibilities of Sultan 'Abd
al-'Aziz precipitated the crisis. The whims of the sovereign and his inordinate desire for
European innovations displeased the stricter Mus¬
lins. The modifications in the fiscal policy made
by the tarîth [q.v.] disturbed the people already
taxed to the utmost. Rebellion broke out every¬
where. A pretender, the râbiid Bû Hamîra [q.v.], rose in the region of Taza and routed an army sent against
him. It was in vain that France by the agreements
of 1901 and 1902 endeavoured to organise the
activities of the mahkam against the rebels and
to postpone the inevitable catastrophe. On the
failure of this effort, France decided to arrange
France and England to settle the Moroccan
question and prevent the dismemberment of the
empire. In return for recognition of the protectorate
de facto exercised by England in Egypt and the
granting to Spain of a sphere of influence in
northern Morocco, these two powers recognised
the right of France to act as her interests best
demanded. France hastened to propose to the
sultan a plan for reforming the Moroccan administra¬
tion. The intervention of Germany prevented its
realisation. On 19 August, 1903, the Emperor William
II landed at Tangier and in a sensational speech
posed as the defender of the independence of the
sovereign and his immoderate desire for
European innovations displeased the stricter Mus¬
lins. The modifications in the fiscal policy made

tion. The intervention of Germany prevented its
realisation. On 19 August, 1903, the Emperor William
II landed at Tangier and in a sensational speech
posed as the defender of the independence of the
sovereign and his immoderate desire for
Agadir. This demonstration provoked the greatest alarm in France and in Europe generally. In the end, however, a peaceful settlement was reached. After four months of difficult negotiations, the agreement of 4 November 1911 put an end to the dispute. Germany abandoned all political claims to Morocco and admitted with certain reservations, chiefly of an economic nature, the protectorate of Spain in the north of the country. The French were forced to abandon a portion of the territory which they had occupied. Crossing the Spanish zone, they entered the valley of the Wargha and threatened Fes. The resistance of the posts stationed along the frontier gave reinforcements time to reach the scene of hostilities. Checkered in the autumn, the Rifian advance was definitely crushed in the spring of 1916 thanks to the combined action of French and Spanish. The reduction of the last pockets of resistance in the mountains and the southern regions was completed in 1919.

The administrative reorganisation kept pace with the pacification. The old machinery was retained but submitted to a control which guaranteed the local population against abuse of their power and excesses by the agents of the mahkhan. Technical services were created to give the country the works necessary for its economic life.

Thus, within the space of some 40 years, Morocco, which was still a mediaeval country, became a modern kingdom equipped with a quite extensive highway network, electrified railways and deep water ports. The remarkable results achieved in all sectors were facilitated by the influx of European immigrants and capital. Approximately 350,000 Europeans in the French zone and about 100,000 in the Spanish zone participated actively in the economic life of the country and contributed in particular to the prosperity of agriculture, while the towns enjoyed rapid development.

At the same time that the pacification of the country was completed, young people educated in metropolitan universities as well as in the modern establishments founded in Morocco itself, began to agitate; the Berber dahir (see ABOU'DEA, 51) of 16 May 1912 gave the signal for opposition to French policy and desire for independence. During the Spanish Civil War, Moroccan troops served under the victorious General Franco; as a result, the inhabitants of the northern zone were able to benefit from a more liberal régime. Subsequent events during the Second World War, and in particular the defeat and occupation of France in 1940, had no very serious immediate effect, although they induced the nationalists to pursue their activities with greater vigour, not without encouragement from the Allies; in other respects, the increasingly overt manifestation of national sentiment in the Arabic-speaking countries brought latent aspirations to overt manifestation of national sentiment in the French zone, and the coming of age of the independent reform party in the open. 1944 saw the establishment of the Istiklal party, to which the sultan Muhammad V, who had occupied the throne since 1927, showed himself far from hostile; on 10 April 1947, he made a speech at Tangier which disturbed the French authorities. The nomination of General Juin as Resident-General and the reforms immediately effected failed to restore stability; in 1953 France decided to depose the sultan, sending him to exile in Madagascar and replacing him with the Prince Sidi Abdel Aziz. The resistance of the posts stationed along the frontier gave reinforcements time to reach the scene of hostilities. Checkered in the autumn, the Rifian advance was definitely crushed in the spring of 1916 thanks to the combined action of French and Spanish. The reduction of the last pockets of resistance in the mountains and the southern regions was completed in 1919.

At the same time that the pacification of the country was completed, young people educated in metropolitan universities as well as in the modern establishments founded in Morocco itself, began to agitate; the Berber dahir (see ABOU'DEA, 51) of 16 May 1912 gave the signal for opposition to French policy and desire for independence. During the Spanish Civil War, Moroccan troops served under the victorious General Franco; as a result, the inhabitants of the northern zone were able to benefit from a more liberal régime. Subsequent events during the Second World War, and in particular the defeat and occupation of France in 1940, had no very serious immediate effect, although they induced the nationalists to pursue their activities with greater vigour, not without encouragement from the Allies; in other respects, the increasingly overt manifestation of national sentiment in the Arabic-speaking countries brought latent aspirations to overt manifestation of national sentiment in the French zone, and the coming of age of the independent reform party in the open. 1944 saw the establishment of the Istiklal party, to which the sultan Muhammad V, who had occupied the throne since 1927, showed himself far from hostile; on 10 April 1947, he made a speech at Tangier which disturbed the French authorities. The nomination of General Juin as Resident-General and the reforms immediately effected failed to restore stability; in 1953 France decided to depose the sultan, sending him to exile in Madagascar and replacing him with the Prince Sidi Abdel Aziz. The resistance of the posts stationed along the frontier gave reinforcements time to reach the scene of hostilities. Checkered in the autumn, the Rifian advance was definitely crushed in the spring of 1916 thanks to the combined action of French and Spanish. The reduction of the last pockets of resistance in the mountains and the southern regions was completed in 1919.

The administrative reorganisation kept pace with the pacification. The old machinery was retained but submitted to a control which guaranteed the local population against abuse of their power and excesses by the agents of the mahkhan. Technical services were created to give the country the works necessary for its economic life.

Thus, within the space of some 40 years, Morocco, which was still a mediaeval country, became a modern kingdom equipped with a quite extensive highway network, electrified railways and deep water ports. The remarkable results achieved in all sectors were facilitated by the influx of European immigrants and capital. Approximately 350,000 Europeans in the French zone and about 100,000 in the Spanish zone participated actively in the economic life of the country and contributed in particular to the prosperity of agriculture, while the towns enjoyed rapid development.

At the same time that the pacification of the country was completed, young people educated in metropolitan universities as well as in the modern establishments founded in Morocco itself, began to agitate; the Berber dahir (see ABOU'DEA, 51) of 16 May 1912 gave the signal for opposition to French policy and desire for independence. During the Spanish Civil War, Moroccan troops served under the victorious General Franco; as a result, the inhabitants of the northern zone were able to benefit from a more liberal régime. The reduction of the last pockets of resistance in the mountains and the southern regions was completed in 1919.

The administrative reorganisation kept pace with the pacification. The old machinery was retained but submitted to a control which guaranteed the local population against abuse of their power and excesses by the agents of the mahkhan. Technical services were created to give the country the works necessary for its economic life.
French and Spanish officials, before appealing to new allies for support. The "Army of liberation" was absorbed into the Forces Armées Royales (FAR), and the French and Spanish troops withdrew in 1961, while the American airbases were evacuated.

One of the first concerns of the sultan (who took the title of king in 1957) was to appoint a consultative Assembly, supervised in 1960 by a constitutional Council charged with preparing a Constitution; the latter, which instituted a parliamentary monarchy, was approved by referendum on 7 December 1960 (see overleaf, viii). During the same period, the Parti Démocratique de la Indépendance (PDI), recently founded, became quite active, but in 1959 a number of its members, together with some independents, joined the Union Nationale des Forces Populaires (UNFP), closely linked to the Union Marocaine du Travail (UMT) and the product of a schism within the Istiqlal provoked by the syndicalist Mehti Ben Barka.

The first Moroccan government, led by a non-political colonel, was composed of members of the Istiqlal and the PDI, but after November 1959 the latter withdrew and a democratically elected Istiqlal cabinet appointed. In 1960, the king took upon himself the functions of prime minister, with the assistance of his son, prince Mawlay Hassan, who was to succeed him after his death in the following year. In the legislative elections held in 1962 after the promulgation of the Constitution, the Istiqlal and the PDI, now in opposition, obtained respectively 41 and 28 seats, as many between them as the number gained by the Front pour la Défense des Institutions Constitutionnelles (FIDC) which had recently been established. On 16 July of the same year, several leaders of the UNFP were arrested for "serious infringement of the law" and for being the founders of a "subversive movement". The charges of conspiracy laid against some hundred individuals were not pressed, but since the two parties boycotted the next elections, the Government won a decisive majority in the regional councils and Chamber of Deputies.

Also in 1962, an armed conflict broke out between Morocco and Algeria on account of a frontier post which the latter had seized. Between 1962 and 1967, relations with France were compromised by the abduction and disappearance in Paris of the leader of the UNFP, Mehti Ben Barka. These events led the French authorities to institute proceedings against Moroccan secret agents and specifically against the Minister of the Interior, General Oufkir, who was sentenced in his absence. The name of this officer was mentioned again in connection with two unsuccessful attempts on the King's life, one of which had been detailed to escort it; one person was killed and two wounded, but the pilot of the Boeing succeeded in landing his plane at the airport of Rabat-Salé, where renewed strafing caused a further 8 deaths and injured 50. The officer responsible for the attack ejected from his fighter, but was arrested and implicated General Oufkir, who met his death the following night.

The failure of these successive attempts on his life only enhanced the prestige of the Sovereign, who was nevertheless confronted by a new danger. In fact, after the independence granted by Spain to Rio de Oro, a section of the population of the Western Sahara refused to withdraw from territory claimed by Morocco and formed the Polisario Front. Since then, from its bases in Algeria, this organisation has continually harassed Moroccan troops immobilised in the south, behind a "wall" which they have been obliged to construct to defend themselves from attacks by an enemy equipped by various nations with the most modern arms and equipment. The expenses incurred as a result of this interminable and violent war have been a considerable burden on the finances of Morocco, whose economy is also suffering as a result of the world-wide economic crisis.

passed the 20 millions mark (20,419,555), of whom 57.3% were rural dwellers. This population is very unevenly distributed and its density varies with geographical conditions. The most thickly populated part is that of the plains of western Morocco between the massif of the Jbala in the north and the Great Atlas in the south: Ghorb, Shawiya, Tadla, Dukkala and ‘Abda. The density of the population also varies with the fertility of the soil. The population of this region is estimated at two-fifths of the total. The mountainous regions, Jbala, Rif, Middle Atlas are not thickly populated, as we might have expected from the comparatively dense population of Kabylia. As to the Sahara zone, outside the belts of oases in the W’dt Gfr, the W’dt Ziz and the W’dt Dar’a (Dra), it is very sparsely inhabited.

8. Elements of the population. The population of Morocco consists for the most part of Berbers and Arabs, the former being the older element and the latter invaders. As to the Berbers, who do not seem to be a homogeneous race and whose origin is obscure, no attempt has been made to the Arabs, they are in a minority, but it is often difficult to attribute an exact ethnic origin to certain tribes or confederations, so much have the Arabs and Berbers become mixed since the Muslim conquest, and intermingled either by peaceful or warlike methods. It will be more prudent and will give a more accurate result if we distinguish in Morocco between those who speak Arabic and those who speak Berber (see below VII. LANGUAGES). The former live entirely in the plains, while with the exception of the massif of the Jbala, the inhabitants of the mountains speak Berber.

1. Berbers. Three main groups may be distinguished among the Berbers of Morocco: in the north the Hilis and the Beni Znazen; in the centre the Znaga (Sanhadja) and the Braber (Barib), who form the population of the Middle Atlas; the third group is that of the Shih (see Shilluh) who occupy the western part of the High Atlas and of the Anti-Atlas, as well the plain of Sfez. In addition to these main groups, we may mention the Jbala, arabised Berbers, to the north-west of Fas, and the Haratin (plur. of the Arabic haratân [g. u.]), who form the basis of the settled population of the zone of the Saharan oases.

2. Arabs. The early invasions at the time of the Muslim conquest do not seem to have appreciably modified the ethnology of the country. Up to the 7th or 8th century, the country districts of Morocco were almost completely Berber; it was the great Almohad ruler ‘Abd al-Mu’min [q.v.] who was the first to introduce into Morocco Hilili Arab tribes hitherto settled in the Central Maghrib or in Irlkia; these importations, continued by the successors of this prince and by the Marinid dynasty, soon drove the Berber element into the mountains or absorbed and arabised it. Evidence of such assimilation is still found in the fact that tribes with clearly Arab names contain sections whose names show their Berber origin. These Arab tribes, who are all settled in the plain, may be divided into two main ethnic groups: the Beni Hilili and the Magli [g. m.]. The latter occupies almost exclusively the valley of the Upper Moulaya as well as the lands south of the Atlas. The Beni Hilili occupy the sub-Atlantic plains and the steppes of Eastern Morocco.

3. Jews. There were formerly about 200,000 Jews in Morocco, mainly living in the towns. There were...
also a considerable number among the tribes of the Great Atlas. They also formed the principal element in the population of the two little towns of Dubdi and Damne. The origin of the earliest elements in this Jewish population is obscure: it is difficult to ascertain whether they were Jews who had migrated from Palestine or were judaized Berbers. The modern element is made up of Jews who fled from Spain to Morocco in the 16th century. The former call themselves *Djawis* (Palaestinians) and are called *forasteros* (foreigners) by the Spanish immigrant Jews, who, after they had settled in the towns of the coast and rapidly became Europeanized. Since independence, large numbers of them have emigrated, mainly to Israel.

1. Miscellaneous elements. The blacks, of whom there are considerable numbers in Morocco, do not however form a distinct group there. In the north we find many, who are almost all of slave origin. The predilection of the townsmen of Morocco for black concubines, noted for their slave origin. The predilection of the townsmen especially in Morocco, where we find many semi-nomads, who move only short distances, both in the country, and finally we may note that frequently the towns have purchased women for their harems in Constantinople.

IV. Social and Economic Life

a. Country. The population of Morocco, although for the most part rural, nevertheless has a larger proportion of settled people, of fixed habitat and living not only in tents but also in houses. The latter are rarely found isolated in the country, but on the contrary are grouped into villages of more or less importance and more or less near one another, according to the density of the population. As to the semi-nomads, we find them, outside the Middle Atlas, in the great plains of the Ghrib, in the north, the Rhamma and the Shyadma, and in the south, where a pastoral life has not yet completely disappeared before a more settled state of society.

Nevertheless, Morocco is, of the three countries of Barbary, that which has in its rural population the largest proportion of settled people, of fixed habitat and living not only in tents but also in houses. The latter are rarely found isolated in the country, but on the contrary are grouped into villages of more or less importance and more or less near one another, according to the density of the population.

The type of dwelling varies with the district. In the mountains we find houses built of unbaked bricks or stone with a gabled, thatched, pitched or a flat roof. In the plains, the tent predominates, more or less fixed to the spot, and with it we find more and more the hut of branches with a conical roof called *muawda*. In the Saharan oases, the population occupies a walled area of *hayr* (e.g., *hayr* from the class *hayr*); these conglomérations sometimes possess the elements of town-life. The villages are called *dour* (*muawda*) in the plains, and *ajdar* in the mountains. In some hill regions we find survivals of cave-dwelling. The country is divided into nomadic and settled; this division does not at all coincide with that into Arabs and Berbers; there are still nomadic Berbers, while certain Arab tribes are becoming settled on the lands which they cultivate.

It has been shown that the nomadic or settled life of the country-people in North Africa does not depend, as was long thought, on ethnic factors, but is entirely conditioned by geographical considerations. It is the rule for dwellers in the mountains to be settled while the people of the desert steppes, forced to move about in search of pasture for their flocks, are nomads. There are however tribes scattered between these two extremes and especially in Morocco, where we find many semi-nomads, who move only short distances, principally on the borders of the various mountains of the centre and south. But generally nomadism is the outcome of pastoral migration and its geographical area is in direct relation to the rainfall and therefore to the nature of the vegetation.

It is in eastern Morocco, in the steppes which lie to the east of the Moulouya, and to the south of the Great Atlas, towards the Sahara, that we find the principal groups of nomads in Morocco. In eastern Morocco, we may mention among the large tribes which lead a nomadic life the confederation of the Beni Gil, between Berguerat and Figg; on the other side of the Atlas, the Ayit Seddrat, the Ayit Djaflbi, the Iden-an-Bilal, the Ayit-Mribet; lastly to the south of the Dar’s (Dra) delta we have the Black Chami and the Awadh Dilm. As to the semi-nomads, we find them, outside the Middle Atlas, in the great plains of the Ghrib, in the north, the Rhamma and the Shyadma, and in the south, where a pastoral life has not yet completely disappeared before a more settled state of society.

Nevertheless, Morocco is, of the three countries of Barbary, that which has in its rural population the largest proportion of settled people, of fixed habitat and living not only in tents but also in houses. The latter are rarely found isolated in the country, but on the contrary are grouped into villages of more or less importance and more or less near one another, according to the density of the population.
the Mediterranean coast, Ceuta, completely europeanised for several centuries, on the Atlantic coast Arzila (Asila), Casablanca, which owes its origin to the little port of Anfa, Azemmûr, Agadir. In the interior, al-’Askar al-Kabîr, Taza, Tarudant. Several ancient towns have now disappeared, e.g. Nakor and Bâdis on the Mediterranean. To the south of Massanag, the two Ghomâr and Tanmâhali to the south of Marrakesh and several others, descriptions of which have been given by the geographers like al-Bakîrî, al-Idrîsî and Leo Africanus.

As a rule, the Moroccan town is grouped round a citadel or kasba (pop. kasba) which is the seat of authority. Under the protection of the citadel lies the mellâk or Jewish quarter [see mallaçî]. All around spreads the town proper or m'dina with its great mosque, markets and baysarya (g. e.). It is surrounded by a rampart (sur) beyond which there are usually the suburbs more or less rural in character. The town itself is divided into quarters (baoua) with streets (sâmâa), alleys (darb) and squares (sirt).

V. Economic Life. The country people, whether settled or nomadic, who no longer form more than 70% of the population of Morocco, live on the land, either by agriculture or stock-raising, most often combining the two. Those in the highlands grow cereals (wheat, barley), certain leguminosae (broad beans, chick-peas, vetches) and fruits. They also exploit their forests in a very primitive fashion (chuyas, cedars). The people of the plains devote themselves mainly to cereals and the rearing of cattle, sheep, camels, horses and asses. In the oases of the south, the population cultivates date-palms and understands the art of irrigating the land.

The rural industries are very primitive. They are limited to supplying the necessary implements of agriculture, and weaving wool into the material for garments, tents and carpets. The Berbers of Sus show a certain aptitude at metal-working (arms and jewels). The Sûs no longer export the cane-sugar and copper, which formed considerable articles of trade under the Sâvîânis.

Each tribe has a certain number of markets (sâb) which are held in the open country and bear the name of the day on which they are held. It is in the sâb that the peasant sells his produce and the products of carpet-weaving and embroidery brought by the merchants from the towns. Cereals are preserved in siloes (masjmuâ [g.m.]); in the Great Atlas and to the south of it we find fortified store-houses, which belong to the community and are called agadir [g. e.].

It is in the towns that we find industrial activity concentrated. Each trade, which originally formed a gild (kendi) is grouped in one street which bears its name. In it the articles are made and sold. The stocks are kept in the fondus (Ar. fonda) which correspond to the khan and matkala of the east. Some products, like grain, oil, coal, wool, are sold in special places called nabba. The monopolies of exporting (séba) corn and hides established by the sultan in the last century have been abolished. Several European products have become of the first necessity in Morocco and form the subjects of an important traffic: cotton goods, tea and sugar and candles. For the history of the weights, measures and coins in use in Morocco before the establishment of the protectorate, see the works by Massigmon and Michaux-Bellaire quoted in the Bibliography. The very vivid picture drawn by Leo Africanus of the commercial and industrial activity of Fes in the Middle Ages is still very valuable.

The Jews, who devoted themselves specially to certain trades that flourish in larger centres (goldsmiths, embroiderers), played an important part as brokers. The citizens of Fes, who had a large number of converted Jews among their number, had almost a monopoly of the import trade of Morocco, especially from England, and for this reason had little colonies in the sea-ports.

The Berbers of the Sûs like to settle in the towns as grocers (bakkâl) and having made their fortunes return to the country. Since the war, a large number of them have migrated to France as artisans and labourers and they settle in groups, according to their original tribes, in the suburbs of certain large industrial towns.

V. Political Organisation.

It is only at rare intervals and for short periods that Morocco has been entirely under the authority of the sultan: whence the distinction between the territory subject to the government (bilkâl al-mâhzen) and the territory unsubdued (bilkâl al-siba). As a rule, the makûzen territory included the towns, valleys and plains. The mountains, on the other hand, remained more or less independent, according to the degree of power possessed by the sovereign [see maghzen].

Outside the towns the population is grouped into tribes (kahila). Several are sometimes grouped together under a common name, without however being a cosederation in the strict sense of the word; in this case, as a rule, in the north, the Hîha, the Dukkâla, the Shâwiyya in the south. The tribe is subdivided into sections (rubî, khams, fâdhâ) which are subdivided into sub-sections comprising a certain number of villages of tents or houses.

The tribes who own the sultan’s sway are governed by a bêkaî appointed by the makhsan. His duty is to allot and levy the taxes, to raise contingents of soldiers and keep good order. He has under his command a shaykh for each section under whom are the makhdûms of the sub-sections.

For the distinction between makhsan, shaykh (vulg. bid) and makhzen tribes, see MAKHIZAN.

In the towns not subject to the makhsan, political activity was confined to the djamaâs (g. n.), i.e. an assembly of men able to bear arms. The djamaâs (jamea) dealt with all the business of the tribe, civil, criminal, financial and political. It administered justice following local custom (Arabic urj, Berber isiñf). It elected a shaykh (Berber anmâı) who was only an agent to carry out its decisions. Alongside of the djamaâs of the tribe, there were djamaâs of the sections and sub-sections but their powers were limited.

In the towns, the makhsan was represented by a governor whose official title was bêkaî, but in certain large towns he was often called bêkaî. The title of ‘îmâm was the same as that of the jamaâ of Fas, a governor of the Ouda. The bêkaî of the town, generally speaking, had the same powers as the bêkaî of the tribe and acted as judge in case of any violation of the law. He had an assistant or khâibî. Alongside of him, the makhîsî supervised the corporations, fixed their average prices and looked after public morals.

The bêkaî had under his orders the makhdûms of the quarters and his police (makhânsiyâ) carrying out his instructions. Among the officials sent by the
to each town may also be mentioned the mudā' in or inspector of endowments (hubūsā), the trustee of vacant inheritances (mabīl al-ghuraba, popularly bāš-mābārī = abu 'l-mawārī), the collector of local taxes and market-dues (amīn-al-mustafa'd). Lastly in the harbour and frontier towns, the customs were collected by officials called umanā (ṣg. amīn).

Justice [see MAMAKA. 5. i] is administered by the khālid or by the kādi, as the case may be. The latter deals with questions of personal law; official religion on cases are drawn up by the hubūs. In technical cases he appeals to experts: master-masons, agriculturists, veterinary surgeons (marūdā zu-nādar: urbā b-turke, jālīkh, bāyārī).

Landed property takes a number of different forms. In the first place, there are the state-domains; they were either managed directly by the mahzās (crown-lands) or they could be allotted to zīgh-tribes in return for the military service for which they could be liable; others of these lands might be granted in temporary or definite ownership to private individuals by imperial edict (ma'ars or tawfīqā).

The hubūs lands are urban or rural. In the towns, they not infrequently cover half the area. They are let out under special conditions which give the tenants special privileges, waṣīlah and gūz (class. Ar. ḍīṣṣā). In the country, the hubūs lands consist mainly of fields and orchards. In all cases, the revenue from these lands is set aside for the maintenance of buildings of a religious character or of public utility (mosques, colleges, schools, fountains) and for the payment of the officials attached to these establishments.

In Morocco, there are vast tracts of land which are not the property of any one individual, either as a result of the insecurity prevailing or of the sparsity of the population. These lands belong undivided to the whole tribe; they are called common lands (bādi al-jamā').

Lastly, lands which have come to belong to private individuals (mulāk) by inheritance or purchase have their character confirmed by a certificate of ownership (mulkisyya).

The old Muslim imposts (ṣahīl and uṣūr) have been merged into a single tax, the lātrih [p.v.]. In addition to this tax, from which the state draws the essential part of its revenues, we may mention the duties levied at the gates of towns and in the markets (maṣα', unpopular with the people and not countenanced by religion, and the urban tax on buildings (ṣariha). In addition to these, the main taxes, there was the kādūs or present offered to the sultan on the occasion of the three great Muslim festivals. The ġīṣā or poll-tax paid by non-Muslims and the nāṣīrā or payment for exemption from military service by certain Arab tribes have been abolished.

VI. RELIGIOUS LIFE

a. The Berbers before Islam. For lack of documents, it is difficult to get an accurate idea of the religious beliefs and practices of the Berbers of Morocco before their conversion to Islam, and it is only from the survival of animistic cults which can still be observed in the country that we can guess what the primitive religion was. The figures on two carved stones found in Morocco seem to be evidence of the existence of a solar worship. On animistic practices surviving in modern Islam in Morocco, see below.

b. Conversion to Islam. At the time of their invasion, the Arabs found that in the districts around the towns the people were more or less under the influence of Jewish and Christian teachings; but there is little doubt that they did not practise these religions in their true form. It will be more correct to think of them as professing Judaism or Christianity rather than as real Jews or Christians. It seems evident that these influences had prepared the Berber population around the mountains to adopt the new monotheistic religion, which the invaders imposed upon them. The two earliest invasions, that of 'Ukba b. Nāfi' ca. 50/570 and that of Māsā b. Nusayr in 92/711, could result only in a very partial and superficial Islamisation, for very few Arab elements remained in the country. Islam, a town religion, was for long confined to larger centres. The Berbers generally became converted in the hope of escaping the exactions of the conquerors; but when the latter wanted to treat them simply as tributaries, they did not hesitate to apostatise, on several different occasions, if mai believe the Arab historians. One thing is certain, that while remaining Muslims, they were not long in trying to counteract the authority of the caliphs of Bagdad by adopting the most orthodox doctrine of the Khāridjīs [p.v.; see also šūrā'yā]. The Berbers of Morocco went even further when new local religions arose among them more or less based on Islam, with their own prophets and Khurāns. After the attempt at rebellion by the Berber of Tangier, Maysara [p.v.], which was quickly suppressed, the Barghawātā [p.v.] recognised as their prophet one of their number, Sālih b. Tarīl, who gave them a religion and a Khurān in the Berber language. This religion, the progress of which was opposed by the early Moroccan dynasties, seems only to have been finally exterminated by the Almohad rulers of the 12th/13th century. This Barghawāta movement was the most lasting; we also note that which was created by Hā-Mīn (d. 915/928-29 [p.v.]) among the Chādirā, near Tetouan.

In spite of these reactions, Islam, having become the official religion of increasingly powerful dynasties, gradually gained ground and penetrated slowly into the Berber mountains, but it is only from the death of 'Abd al-Mu'min, who destroyed the religion of the Barghawātā and put an end to the rule of the anthropomorphist (mudjassimān) Almoravids, that we can date the complete unification of Islam in Morocco. Till then, Islam had had in Morocco champions who were soldiers rather than theologians, and who after forcing the people to adopt Islam at the point of the sword, were little fitted to instruct them in it. It required a Berber of the Great Atlas, Ibn Tūmārt [p.v.], a theologian who had been educated in the east, to come back to his country and to secure the devoted support of a mass of followers in order to found the movement, which was political as well as religious, of the Almohads or "preachers of ta'bi'id" [p.v.].

If the Almohad reformation was only temporary in Morocco, it was nevertheless strong enough while it lasted to obliterate in the country all trace of shī'ism or heresy and to establish thoroughly in it the school of Mālik b. Anas [p.v.] which it still follows.

c. Evolution of Moroccan Islam. From the time of the fall of the Almohad dynasty, Moroccan Islam rapidly acquired features of its own. Islam, defeated in Spain, was gradually driven out of it, then attacked in Morocco itself by the
Before the Marinids, Islam had required the constant assistance of the temporal power to maintain itself and advance. From the time of this dynasty, sprung from a Berber nomad tribe, the roles are inverted; it is now the sovereigns who utilise Islam to increase their own power, and try to monopolise it by creating official colleges for religious instruction (madrasas); the first of these (Madrassa al-Saffahia) was founded in 697/1280 by the sultan Abu Yusuf at Fès, the capital of the dynasty, which made it the great centre of Muslim culture in Western Barbary.

The immediate successors of the Marinids, the Banū Wattas, established in the same town the cult of their founder Idris II. The mausoleum in which he is said to be buried was henceforth an object of great veneration. He is the earliest in date and the most important of the innumerable canonised Muslims who are the objects of a regular cult in Morocco, even on the part of the religious leaders of the aristocracy. When the cult of Idris was established, his descendants—more or less authentic—claimed the title of sharif and soon played a preponderating part in Moroccan society, as a political and moral influence. The power of the Idrisid sharifs was soon reinforced by that of other sharifs descended from 'Ali through al-Hasan and this is the origin of the two great groups of sharifs in Morocco, the Idrisids and the 'Alids. To the latter belong the two Sharifian dynasties, the Sayyids and the Filis, the latter still in power. From the moment of their accession to the throne, the influence of the sharifs on the destinies of the country, even by more or less mystic mania [tahdid, khadij], sometimes even by more or less mystic mania (mujaddid, khalif); the others, after their deaths, have been distinguished by miracles, apparitions etc. The warrior saint, however, between Fès and Tangier, are very devoted to Islam, show great piety, and Kūr'ānic studies are very much in favour with them; it is from them that are recruited large numbers of schoolmasters who practice their calling in the plains (see SHARIF). It is also practically only among the hillmen of the north and south that we find a mosque in every village.

In spite of the great distance which they have to traverse, the Moroccans like to accomplish the canonical pilgrimage. A considerable number settle in the east (there are Moroccan colonies in Alexandria and Cairo); the importance of these colonies had even induced the sultan 'Abd al-Aslāz to appoint a Moroccan consul, amīn al-Maghrib, for Egypt.

In addition to the two canonical festivals of Islam ('id al-Adha and 'id al-Fitr), the Moroccans celebrate the festival of the birth of the Prophet (maslīd, class. maslīd, g.n.) and that of 'Ashūrā (10th Muharram). The maslīd, established in Morocco by the Marinids, has become a kind of national festival, since the accession to power of sovereigns claiming descent from the Prophet; this festival in Morocco almost surpasses in importance the two canonical feasts.

The peculiarities just mentioned would not be sufficient to give Moroccan Islam a special character, nor was its religious brotherhoods, if the latter were confined to the practices of religion or extollation of the faith and to satisfying the need for an elevated mysticism among their adherents, religious brotherhoods. All these brotherhoods have this feature in common: that their founder has become a famous saint (mū'īl).

The cult of saints is highly developed in Morocco and undoubtedly was so before the introduction of Islam, which found itself obliged to tolerate it. There are however very different categories of saints, from the venerated patron saint of a capital or of a district to the local holy man whose name is forgotten, between whom comes the sayyid whose tomb is marked by a wābba (g.n.) (chapel surrounded by a dome), more or less elaborate. The more humble saints are recognised by the circular wall (bawṭ) which surrounds their tombs.

These venerated individuals, male and female, have attained sanctity by very different ways. Some in their lifetime, by their learning, devotion, asceticism, miraculous powers (barka), sometimes even by more or less mystic mania (mujaddid, g.n.); the others, after their deaths, have been distinguished by miracles, apparitions etc. The warrior in the holy war (jihād, ribāt), slain fighting against the infidel is frequently beatified—hence his name of murābī (pop. marābī)—French and English
But the early significance of this term was frequently lost sight of and the term *marabout* came to be generally applied to saints, who never took part in a *qiyam* in their lifetime. *Marabout* thus came into general use as a synonym of the other words used for saint in Morocco: *sawfi*, *sasyid*, *sidi*. But it is not the only one applied to the descendants of a saint, who possess the *banska* of their ancestor. Among the Berbers, the saint is called *agurram*. The names of great saints have *mawlay* prefixed, the others the title *sidi*, while women saints of Berber origin are called *lilla*.

The saint to whom sanctuaries are most frequently dedicated—modest though they are (makhmam, *Mawla*)—was not a native of the country but the famous patron saint of Baghdad, *Abd al-Kadir al-Djilani* (q.v.), popularly called al-Jilali, who undoubtedly never visited Morocco. But the saint whose cult is surrounded with the greatest splendour is the famous *Mawlay Idriss*, founder and patron saint of Fas. Among the other great Moroccan saints may be mentioned: *Mawlay 'Abd al-Salam Ibn Masihab*, patron of the *Jbile*; *Mawlay Abu Salham*, in the Ghizar; *Mawlay Abu T-Ehitha* al-Khammar (Mawlay Bishshah), in the north of Fas; *Sidi Muhammad b. 'Isa*, patron of Meknes and founder of the brotherhood of the *Tawla*; *Mawlay Abu Shu'ayb* (Besh'ib), at Azemmour; *Mawlay Abu Ya' zuza* (Edza'aza), in the Tadla; *Sidi Abu T-Abbas* al-Sayyid (Sidi Bel-'Abbas), born at Cotta, patron of the *Sidi Bel-Abbés* who, for the most have been or will be the subjects of articles, and others less famous, are the subjects of a hagiographical literature which will be dealt with in the article *Makhmam*.

Devotion to individuals canonised in their lifetime or after their death is not confined to Musims. The Jews have also their saints, relatively as numerous as the Muslim saints. Some of the Jewish saints have acquired a reputation so great that even Muslims reverence their tombs: e.g. those of the Rabbi 'Amir in Ashan, near Wassan and of Rabbi Ben Zakkai at Saïf. On the other hand, the great number of Jews of Morocco show a special reverence for certain of the great Muslim saints of the country.

The area, surrounding the tomb of each of the principal saints is sacred (*kemr*) and hence regarded as an inviolable asylum; among the best known are the *kemr* of *Mawlay Idriss* in Fas and that of *Mawlay 'Abd al-Salam* B. Masihab in the mountains of the north-west. These pieces of ground are the exclusive property of the families who are descended or claim to be descended from the saint. They are exempt from state taxes; more than that, they are centres of orthodoxy and give life and vigour to Islam in the country. Some are centres of mysticism and they are always centres of religious instruction. This explains the enviable position occupied in Moroccan society by any group of descendants of a famous saint, or of marabouts. If their ancestor had, in addition to the virtues for which he was canonised, the honour to be a descendant of the Prophet, they are at the same time *sorfia*, which further increases their material privileges. The descendants of a saint who was not a *shari`i* try to claim this origin for him by inventing more or less fictitious genealogies who in turn distribute the revenues. These do not come entirely from the *sorfia*. The *sorfia* often owns lands, sometimes extensive, which are let out and the profits shared with the tenants. They are called *faskh* and the tenants are called *fashah*. These farms, sometimes acquired by purchase, often come from bequests or donations (*kudif*) from pious private individuals.

We can thus see how certain famous and wealthy *sorfia* may exert a moral and political influence in the country round them, independent of their religious influence. The latter is however also very important: the great Moroccan *sorfia* are centres of orthodoxy and give life and vigour to Islam in the country. Some are centres of mysticism and they are always centres of religious instruction. This explains the enviable position occupied in Moroccan society by any group of descendants of a famous saint, or of marabouts. If their ancestor had, in addition to the virtues for which he was canonised, the honour to be a descendant of the Prophet, they are at the same time *sorfia*, which further increases their material privileges. The descendants of a saint who was not a *shari`i* try to claim this origin for him by inventing more or less fictitious genealogies who in turn distribute the revenues. These do not come entirely from the *sorfia*. The *sorfia* often owns lands, sometimes extensive, which are let out and the profits shared with the tenants. They are called *faskh* and the tenants are called *fashah*. These farms, sometimes acquired by purchase, often come from bequests or donations (*kudif*) from pious private individuals.

But it is the only one applied to the descendants of a saint, who possess the *banska* of their ancestor. Among the Berbers, the saint is called *agurram*. The names of great saints have *mawlay* prefixed, the others the title *sidi*, while women saints of Berber origin are called *lilla*.

The saint to whom sanctuaries are most frequently dedicated—modest though they are (makhmam, *Mawla*)—was not a native of the country but the famous patron saint of Bagdad, *Abd al-Kadir al-Djilani* (q.v.), popularly called al-Jilali, who undoubtedly never visited Morocco. But the saint whose cult is surrounded with the greatest splendour is the famous *Mawlay Idriss*, founder and patron saint of Fas. Among the other great Moroccan saints may be mentioned: *Mawlay 'Abd al-Salam Ibn Masihab*, patron of the *Jbile*; *Mawlay Abu Salham*, in the Ghizar; *Mawlay Abu T-Ehitha* al-Khammar (Mawlay Bishshah), in the north of Fas; *Sidi Muhammad b. 'Isa*, patron of Meknes and founder of the brotherhood of the *Tawla*; *Mawlay Abu Shu'ayb* (Besh'ib), at Azemmour; *Mawlay Abu Ya' zuza* (Edza'aza), in the Tadla; *Sidi Abu T-Abbas* al-Sayyid (Sidi Bel-'Abbas), born at Cotta, patron of the *Sidi Bel-Abbés* who, for the most have been or will be the subjects of articles, and others less famous, are the subjects of a hagiographical literature which will be dealt with in the article *Makhmam*.

Devotion to individuals canonised in their lifetime or after their death is not confined to Muslims. The Jews have also their saints, relatively as numerous as the Muslim saints. Some of the Jewish saints have acquired a reputation so great that even Muslims reverence their tombs: e.g. those of the Rabbi 'Amir in Ashan, near Wassan and of Rabbi Ben Zakkai at Saïf. On the other hand, the great number of Jews of Morocco show a special reverence for certain of the great Muslim saints of the country.

The area, surrounding the tomb of each of the principal saints is sacred (*kemr*) and hence regarded as an inviolable asylum; among the best known are the *kemr* of *Mawlay Idriss* in Fas and that of *Mawlay 'Abd al-Salam* B. Masihab in the mountains of the north-west. These pieces of ground are the exclusive property of the families who are descended or claim to be descended from the saint. They are exempt from state taxes; more than that, they are centres of orthodoxy and give life and vigour to Islam in the country. Some are centres of mysticism and they are always centres of religious instruction. This explains the enviable position occupied in Moroccan society by any group of descendants of a famous saint, or of marabouts. If their ancestor had, in addition to the virtues for which he was canonised, the honour to be a descendant of the Prophet, they are at the same time *sorfia*, which further increases their material privileges. The descendants of a saint who was not a *shari`i* try to claim this origin for him by inventing more or less fictitious genealogies who in turn distribute the revenues. These do not come entirely from the *sorfia*. The *sorfia* often owns lands, sometimes extensive, which are let out and the profits shared with the tenants. They are called *faskh* and the tenants are called *fashah*. These farms, sometimes acquired by purchase, often come from bequests or donations (*kudif*) from pious private individuals.

We can thus see how certain famous and wealthy *sorfia* may exert a moral and political influence in the country round them, independent of their religious influence. The latter is however also very important: the great Moroccan *sorfia* are centres of orthodoxy and give life and vigour to Islam in the country. Some are centres of mysticism and they are always centres of religious instruction. This explains the enviable position occupied in Moroccan society by any group of descendants of a famous saint, or of marabouts. If their ancestor had, in addition to the virtues for which he was canonised, the honour to be a descendant of the Prophet, they are at the same time *sorfia*, which further increases their material privileges. The descendants of a saint who was not a *shari`i* try to claim this origin for him by inventing more or less fictitious genealogies who in turn distribute the revenues. These do not come entirely from the *sorfia*. The *sorfia* often owns lands, sometimes extensive, which are let out and the profits shared with the tenants. They are called *faskh* and the tenants are called *fashah*. These farms, sometimes acquired by purchase, often come from bequests or donations (*kudif*) from pious private individuals.
It is hardly possible to separate from these animistic cults that of Mawly Ya'kib in Morocco, who always has a kubba beside thermal springs, whose curative virtues are recognised.

Survivals of paganism in every case completely foreign to orthodox Islam may be found everywhere in Morocco; they are hardly distinguishable from what one finds in other parts of Barbary. The rites which accompany birth and the ceremonies connected with it (giving of the name and circumcision), marriage and death are now well known. They constitute practices quite foreign to the prescriptions of the Sunna, but they are not regarded by those who follow them as in any way heterodox.

It is especially in the life of the country people that we see most clearly traces of pre-Islamic practices. Many of them are strangely like agrarian rites, especially practised by the lower classes of society, and are regarded as supernatural powers, who have to be overcome harm done. In spite of the many sacred formulae of Islam, which are found in the celebration of these two kinds of rites, one gets a strong impression of paganism from them: they undoubtedly remain practically what they were before the introduction of Islam into Morocco.

 Speakers; he retains this figure in the 1954 edn. (250).

while the towns and lowlands are more and more mentioned later, the highlands of Morocco alone by the Arab tribes that their language spread there. Essentially urban culture, was spoken mainly in the towns while the country people continued to talk of the Banu Hilal and of the Sularm (6th/12th centuries. But until the arrival in Morocco Muslim conquest, then in the 6th/12th at the coming of the Banu Hilal and the Sulaym. Down to the coming of the latter, who were brought to Morocco by the Almohad ruler Ya'qub al-Mansur, Arabic scenes to which went to begin almost exclusively in the large towns of the north, where it was used by a considerable Arab population who enjoyed a double prestige, religious and political. It was the language of religion and law. From the towns, Arabic spread among the people of the surrounding country, and al-Idrisi (Description de l'Afrique et de l'Espagne, text 79, ir. 90) already notes that in the 6th/12th century the Berber tribes of the southern highlands of Fas (Banu Ysid, Pandalawa, Bahlil, Zargara, Magassa, Shaiyat and Saliqun) spoke Arabic.

It is this linguistic influence exerted by the towns on the country around them that explains the arabisation of the mountainous country of the Jbala (plur. of jbel, 'highlander') while the rest of the Moroccan highlands remained Berber speaking. The land of the Jbala, in the wide sense, stretches in the form of a crescent from Tangier to Taza. It was surrounded by a sorden of towns: Nakdr, Bades, Tighzas, Tetsouan, Ceuta, al-Kar al-Saghir, Tanger, Azilal, al-Karg al-Kubir, Aqsa, Agjen, Banu Tawudh, Wallil, Fas, and Taza, which were the only ports or markets available for the tribes of the region; besides, the massif itself was traversed by the most important commercial routes of Northern Morocco: the roads from Fas to Tangier, to Ceuta, to Bades, to Nakdr and to Ghasa; it was therefore natural that being subject to the direct and indirect influences of the towns, the highlands of Jbala should be the first region of Morocco to be arabicised. The process was further favoured by several other factors: 1. the existence in the mountains of numerous large villages, almost towns, which became secondary centres of Kur'anic culture; 2. the settlement almost everywhere in the 4th/10th century among the Jbala of Idrisi qatira who, driven from Fas by Mughlami and Abyd, 'Aliya al-Milka, founded independent principalities in the mountains, which became centres of Muslim urban culture; 3. the tribes of the Jbala furnished a considerable part of the contingents which went to wage the holy war in Spain and returned home after being more or less arabised by contact with the great Muslim towns of Andalusia; 4. lastly, the rebellions and civil wars which so frequently disturbed Muslim Spain, the emigrations or expulsions caused by the progress of the Christian reconquest, brought to Africa, from the 'rising of the suburb' at Cordova (in 927/818) down to the 10th/16th century, an important element which settled in the region of the Jbala either in the towns around the mountains or in the villages of the highlands (resettlement of T tetouan, foundation of Shafishawan) bringing there, along with the Arabic language, the prestige of their cultural, intellectual and material superiority.

This rapid sketch of the spread of the Arabic language in Morocco explains why, after studying the question, three categories of Arabic dialects have been distinguished:

a. Urban dialects; b. highland dialects; c. Bedouin dialects; and we may add: d. the Jewish dialects.

a. Urban dialects. In Morocco not all the town dialects are "urban dialects". There are towns like Casablanca, al-Diracta, Safi and al-Suwara (and to a certain degree Meknes and Marrakech) the
people of which is entirely or for the most part of rural origin and where the absence of an old nucleus of town-dwellers has not enabled them to become urbanised. The Moroccans however distinguish quite clearly such places from towns with a really urban culture, more or less influenced by Andalusian culture. The principal towns with urban dialects are Fás, Rabat-Sale, Tetouan, Taza, al-Kasr al-Kabir; Tangier, Wazzán and Shâshâwân also have urban dialects but these are much contaminated by the surrounding highland dialects. Meknès and Marrakesh have been influenced by the Bedouin elements introduced by the maghrebi groups into the dialects of these two old capitals. It is interesting to note the ease of Azemmûr where the old town (Azemmûr al-Haçar) has an urban dialect, while the new town, which has in more recent years grown up beside it around the sanctuary of Mawliy Abî Êhu<ayb (al-Bû Shâshâb), uses a Berber dialect. The urban dialects of Morocco form one group with those of the western part of the Central Maghrib, notably with those of Tlemcen, Nedroma and Algiers. Their phonetic characteristics are the loss of the interdentals of the classical language, the affective pronunciation (t) of ât, the frequent attenuation of kâf to hamza. In Fás, b, m, k, g and dâf assimilate the lam of the article and are treated as "sun letters"; the simple dâf is pronounced like the French j (= Persian j), but when it is geminated, it gives jî in Fás and dî in Tangier. The râ is often pronounced very close to the French uvular r.

As peculiarities of the dialect of Fás, we may note the contraction kebbâ "she has written it" for kirîbî + û, and the use of an invariant relative di representing the old dialectal dâl. Tangier and Tetouan have a proposition m. "to" which is used before nouns (a-dâ-dâr "to the house") but not before suffixed pronouns. To translate "of", Marrakesh uses t; the dialect of this town uses certain Berber adverbs: agkâ because", belï "only".

All the urban dialects use the characteristic prefa of the present indicative: ka- in the north, car- in the south. Fás uses one almost as much as the other.

b. Highland dialects. These are at least as well known as those of the towns. In 1920 G. S. Coli published notes on that of the Taï and the Brênes in the north of Taza; in 1922, E. Lévi-Provençal published texts, prefaced by a grammatical sketch, of the dialects of the middle valley of the Wargha; since then, Coli had an opportunity of studying those of the Bni Htemar (near Tetouan), of the Mestasa (near Bidis) and of the Qhâzâwa (near Shâshâwân).

The highland dialects are of course more differentiated than the urban dialects. The tribes which use them belong to two political clans probably originally of different racial origin: the Ghumâra, the old inhabitants, and the Sânghârâ, the invaders. In the present state of our knowledge it does not seem possible to make the dialects coincide with political or racial boundaries; but we can nevertheless recognise two main groups of highland dialects:

1. The northern dialects, extending from the Straits of Gibraltar to the south of Shâshâwân and embracing in the east the confederation of the Ghumâra; s. the southern dialects, from Wazzán to Taza, used by two great classes of tribes: first, the Sânghârâ tribes of the valley of the Wargha: Sânghârâ of the Central Wargha, Sânghârâ of the Sun and of the Shade, of Môbâb and of Gheddo; secondly, the Butr tribes, more or less closely related to the Zanâta and occupying the lands north of the region of Taza: Mârâsa, Brânès, Taâl, Mâdrâwa and Meknâsa. It seems to be a historical fact that these Zanâta and Sânghârâ peoples only settled in their present habitats long after the first Arab conquest; the Sânghârâ of the Central Wargha certainly now occupy lands which before the Almoravid period were peopled by the Ghumâra. We should therefore regard these southern highland dialects as younger than those of the northern group.

The slight differences noted between the two groups may then be due to two main causes: 1. an evolution of the neighbouring urban dialects which would have taken place during the period between the arabisation of the Ghumâra and that of the Sânghârâ-Zanâta; 2. the non-identity of the Berber subsrata.

To the two main groups: Ghumâra and Sânghârâ-Zanâta, we may perhaps add two little islands in the south: the highlanders of the region of Sefrû to the south of Fás (Ihâfîl, Bâi Yâghna etc.), and the Ghîyâta to the south of Taza; they probably constitute the last vestiges of a continuous Arabic-speaking bloc which stretched to the south of the Fás-Taza corridor, the existence of which in the 6th/7th century we know from al-Ibîl.

Phonetically, the Moroccan highland dialects are characterized by the profound changes undergone by the Arabic consonantal system as a result of the spirantisation of the dental and post-palatal occlusives. We find the interdentals th and dh which do not represent the classical interdentals; thâtha and dâtha have given in these dialects t and ð respectively, which remain occlusive only at the beginning of the word or after a consonant or geminated; but after a vowel we have th and dh bânt "daughter", plur. bûnt; after a vowel also kâf is pronounced as a spirant like the ð of modern Greek. The representative of the group of the classical language is usually ð, sometimes hardened to ð, but among the Ghumâra we have dh (= emphatic dâl). The sound ð is fairly common. The short vowels are commoner than in the towns; many of the short vowels i and u of the classical language are preserved; this is how we find a considerable number of imperfects îrî rîrî and a few irî rîrî.

As to morphology, the fam. personal suffixes -a (< -â) and pl. âm (< -âm) are characteristic; they are the complement of the series begun by the masc. -w, -o (< -wu). Among the northern Jbala we find the use of a suffix -â marking the plural. It seems really to be a borrowing from Latin. The dual, reserved for names of parts of the body which occur in pairs and for names of various measurements (of weight, length, volume and time) is in -dâm: shâbrâyn "two months", yiddâh "his hands". The relative, pronoun and adjective, is d. The classical construct state (îdâfà) is very rare and is only found in a few stereotyped phrases; linguistically replaced by analytical constructions in which the preposition d "of" is used, expressing possession as well as the material of a thing. Almost everywhere the preludes of the 2nd pers. com. and of the 3rd pers. fem. of the imperfect are -a- (not â-); dhokh "he wrote, the writes". The passive participle of hollow verbs is often of the type mešjâfî: mešjâfî "sold", mešjûdə "filled up". Finally, we may note a few
traces of a passive of the form ḫāl-yafālī: Ḫālī "to be taken". As evidence of conservatism, we may mention that in these dialects we have the word fā "mouth" which seems to have disappeared since old Arabic.

In spite of their divergencies, which are due mainly to pronunciation and to the local use of words and phrases corresponding to two very distinct forms of culture, the urban dialects and the highland dialects cannot be either historically or linguistically separated. The fundamental disparity is that which exists between the urban and highland group and the Bedouin group. It is the townspeople who have taught the highlanders to speak Arabic, but the urban dialects are used by individuals whose intellectual activity is greater, have evolved more rapidly. They are also more sensitive to external influence, literary and political. These facts, added to the predominance of Berber blood in the highlands, suffice to explain why the dialects of the Jbala still seem coarse and quaint. On the other hand, the towns have been frequently repopulated, wholly or in part by people from the neighbouring hills. All this explains the family resemblance which the linguistic finds between the dialects of the towns and those of the hills; perhaps the latter, being more conservative, are also the more interesting for the history of the language. W. Marçais regards them as valuable representatives of the Arabic spoken in the country district of the Maghrib before the coming of the Banū Hilāl and the Sulaym (cf. W. Marçais, Teses about the Tabrouna, i, preface, p. XXVIII).

The principal features which are common to the urban-highland group and which distinguish it from the Bedouin group are the following:—

loss of the classical interdentals;

pronunciation of Ḫāf as h or kama (and not g as among the Bedouins);

tendency to the syllabic grouping R² * R^1 when R^3 is not a laryngal nor a sonant;

rarity of the construct state;

suffix of the 3rd pers. masc. sing. in -u, -e (and not -āb, as among the Bedouins);

relative rarity of the addition of personal suffixes, but regular use of the analytical phrase with dāl: dād-dār dāl-l, "my house";

diminutives of R² * R^1 * R^2 or R² * R^1 * R^3 becomes R² * R^1 * iyām, "little dog";

diminutives of adjectives of the types R² * R^1 * R^2 (< class.: ʾafal) and R² * R^1 * R^2 becomes R² * R^1 * b√, "a little red"; b√, "a little large";

plural of the adjectives R² * R^1 * R^3 (< class.: ʾafal) becomes R² * R^1 * R^3, ʾtābāl, "black" (plur.);

reduction of the finals of the words in the plural, adjectives used by individuals whose intellectual activity is greater, have evolved more rapidly. They are also more sensitive to external influence, literary and political. These facts, added to the predominance of Berber blood in the highlands, suffice to explain why the dialects of the Jbala still seem coarse and quaint. On the other hand, the towns have been frequently repopulated, wholly or in part by people from the neighbouring hills. All this explains the family resemblance which the linguistic finds between the dialects of the towns and those of the hills; perhaps the latter, being more conservative, are also the more interesting for the history of the language. W. Marçais regards them as valuable representatives of the Arabic spoken in the country district of the Maghrib before the coming of the Banū Hilāl and the Sulaym (cf. W. Marçais, Teses about the Tabrouna, i, preface, p. XXVIII).

The personal suffix of the 3rd pers. masc. is -āb. The dialectal preposition translating "of" is -yāb, "the (little) place", lewfiดาว, "the entail".

The retention of the accent on the first syllable causes "projected" syllabic forms: ṣālīnh, "he writes", plur. ṣālīnbn; ṣāleṭir, "Moroccan", ṣāleṭir, "musket", ṣāleṭir, "my cow".

The personal suffix of the 3rd pers. masc. is -āb. The dialectal preposition translating "of" is -yāb, "the (little) place", lewfiดาว, "the entail". It does not seem that the Bedouin dialects know the use of the verbal prefix indicating the indicative present. In the plural personal forms of the defective verb, there is a reduction of the diphthong: ḥa-yābīn, from the verb ḥāl "to try"; ṣāʾ-yaḥm, from the verb ṣāʾ "to forget".

We may also note the use of a preposition ʾāb, "to", ʾāb-āb, "he told us".

From the point of view of vocabulary, some words are characteristic of Bedouin dialects: ʾāb-ʾāb, "to wish", ṣawā, "yesterday", ṣafākah, ṣafākh, "now", from the classical ṣafā-khilāfāk, d. Jewish dialects. The Jews who emigrated from Spain have as a rule retained the use of an archaic Spanish; many have also learned Arabic for business reasons. Alongside of the Spanish Jews, we have in the Berber highlands and in the towns of the interior Moroccan Jews of unknown origin whom the former called forasīrīs (Span. "foreigners"); according to the district, they speak Berber or Arabic (see JUDIO-ARABIC AND JUDIO-BERBER).
Relations of the linguistic groups of Morocco to one another. Morocco appears to the philologist a wonderful field for the study of the influence of the substratum on an imported language, since the language of the substratum, i.e. Arabic, is still alive alongside of the Arabic and quite well known. The results of the examination are very meagre: the phenomena actually ascribable to the action of the substratum alone are infinitesimal; this may, however, be due to the fact that Arabic, a Semitic language, and Berber, a proto-Semitic language, are not sufficiently differentiated.

From the phonetic point of view, there is hardly any sound change found in the highland dialects of the arabised Berbers, for which a corresponding change cannot be found in the dialectal phenomena of old Arabic; only, perhaps their tendency to spirantisation should be connected with the identical tendency observed in the northern Berber dialects found in the confines of the Jbila country.

If we consider the morphology, we see that in the highland dialects the verb has lost feminine forms of the plural of the old Arabic, which still survive in some Bedouin dialects and are still found in Berber. A Berber origin has been sought for the use of the verbal prefix indicating the present of the indicative; but similar prefixes are found in Egypt and in Syria where there are very different substrata.

Certainly, Berber has the scheme tu—t which forms nouns indicating trades (ta-hamni-y, "trade of a mason") and names of abstract qualities (ta-brimti-y, "roguey"); it is however curious to note that in modern Berber, this scheme has not this significance; it is used to form the feminine and secondarily the diminutive.

In the syntax of the highland dialects, we find indisputable traces of Berber influence; plural treatment of singulars applied to liquids (water, urine), phrases translated or stereotyped, e.g. ha in Kaddar "Kaddar's brother", with retention of the Berber particle indicating belonging to, -in.

But it is in the vocabulary that the Berber substratum makes its influence most felt. Whether surviving in the highland dialects or borrowed in the Bedouin dialects, many of the terms relating to country life are Berber (names of plants, animals, rocks, agricultural implements and tools); they have often remained in Arabic the Berber prefix a-, which, still felt to have its original value, makes them unfit to take the Arabic article also; alongside of the singular in a-, we usually have a Berber plural in a- in. In Tanjier the naye of the mosque is called a-blad; at Rabat two words imported from Europe have a Berber form: a-bihf, "the sultan's boat" and a-tay, "tea".

Some Berber words have survived in the administrative language of the makhzen: a-ulq, "a wall of cloth surrounding the sultan's camp"; a-bqal, "a pasture reserved for the sultan's animals"; a-ülq, "lash to punish the guilty"; mawwe, "syndic (našīfe) of the Shārsīs".

The Bedouin dialects naturally contain much fewer Berber elements than the urban dialects and still less than the highland dialects; their rustic vocabulary nevertheless made numerous borrowings from the technical vocabulary of the previous Berber tillers of the plains. Within the Arabic area, the highland and urban dialects have borrowed from them a certain number of terms relating to the rural activities of the Bedouins; they are as a rule revealed by the pronunciation of bāf as f. The Bedouin dialects in their turn borrow from the towns their words relating to a more advanced culture; but, for economic, political and, to a certain extent, aesthetic reasons, they give more than they borrow.

In addition to the Berber and Arabic elements, the Moroccan vocabulary contains a fairly important number of "European" borrowings. The song of the vocabulary of a higher culture and relates to the flora (in cultivation or its products), to agriculture, to food and dress, to furniture and housing, sometimes even to parts of the body. There are Greek or Latin borrowings of the oldest period, Romance or Spanish for later periods; but neither their meaning nor their phonetic treatment enables us always to be able to date accurately the time of their introduction and their origin. All these "European" loans are naturally found in large numbers in Northern Morocco, which has been more subject to Mediterranean influences, through refugees from Spain, which have been left as far as the northern part of the Middle Atlas. The Bedouin dialects have escaped these influences (cf. Simonet, Dictionnaire arabesque y latines usadas entre los Mosarabes, Madrid 1888; Schuchardt, Die romanisirehen Lehnworte in Berberischen, Vienna 1918; G. S. Colin, Etymologies magribines, in Hesp/rts viii, 1927). It is also found in many eastern dialects; but it is curious that it has become general in the Maghrib in spite of the profound differences which separate them, the highland and Bedouin dialects of Morocco (and of the Maghrib) agree in one essential and characteristic morphological feature: the forms sing. a—, plur. a—a, in the first persons of the imperfect.

Now this fact is attested in the 6th/7th century for Almoravid Spain and Norman Sicily, i.e. in languages from which Hiliâb influence is clearly excluded; it is also found in Maltese; it must then be admitted that the two groups of dialects have independently brought about this innovation, which seems to have remained exceptional in the dialects of the east. The two groups agree also in the loss of short vowels in open syllables; this phonetic peculiarity is also found in many eastern dialects; but it is curious that it has become general in the Maghrib while the dialects of Spain and Egypt do not have it.

It is in the Documents intdits d'histoire almoravide that we find the first information about Moroccan Arabic (use of bāf, "in order that", mata, "of", first persons of the aorist in a— (a-f), but we have to wait till D. de Torres to find two phrases transcribed (cf. French tr. Paris 1636, 241, 323, 339). Mouette, who was captured at sea by the Moors in 1670 and was for a long time a prisoner, has left us a Dictionnaire arabe-esquisque in French and Moroccan, in transcription (cf. Relation de la Captivité Par 1683, 350-60). The first grammatical notes were collected by Hést (cf. Efterretninger ... 1779, ch. 8, p. 202-210), who has also given us a Berber-Danish-Moroccan Arabic vocabulary (op. cit., 128-33). It is to Fr. de Dombay that we owe the first monograph on Moroccan dialects, which is also the first serious contribution to the study of Arabic dialects; the dialect which he deals with is that of
Tangier: (Grammatica linguae mauro-arabicae, Vienna 1800). Since then, there have been a number of studies: for works before 1911 see the bibliography given by W. Marçais in his Textes arabo de Tangiers, 207-25; for later works, see the bibliography in Textes arabes de Rabat by L. Brunot and the Bibliographes marocaines given periodically in Hespéris.

2. Literature of the Arabic dialects. Like all popular literatures, the literature of the Arabic dialects of Morocco is essentially poetical. The only texts in prose are those which have been collected recently by European students of dialects.

In the Arabic poetry of Morocco two periods must be distinguished: the first extending down to the beginning of the Sa'dian dynasty; the first known texts are those which Ibn Khaldûn gives at the end of his Muhadditha among the specimens of the poetry of the towns. To these we may add a mass of poems composed in honour of the Prophet (Mawlid al-Nabî) and collected in numerous collections existing in manuscript. From this group cannot be separated the poems which accompany classical Moroccan music, "Andalusian" music, many of which must have been composed in Morocco; these were collected and classified by al-Hî'ârin, a musician of Spanish origin who had settled in Tetuan. All these early poems belonging to the first period are written in the Spanish Arabic dialect, which after the great success of the Cordovan Ibn Khânâm (6th/12th century) became the classical language of the new poetic genre called nasîl [lit.], which had this in common with the muraqshah [lit.], that, while employing like it new metres, its prosody was based on the quantity of the syllables, but it differed from the muraqshah in that it was written in the Spanish dialect and not in the classical language.

The main characteristics of the poetry of the Moroccan dialects of the first period are attention to the quantity of each syllable and the use of the Spanish dialect.

The second period, on the other hand, is distinguished by a system of prosody founded exclusively on the number of syllables in each verse and by the use of a special language called nathîm [see mawlid].

Alongside of this men's poetry, there are the songs of the women (songs of women working at the mill, songs of gleaners, songs of family fits), the children's songs which are often strangely conservative, epicranes and proverbs; see S. Bismar, Notes d'ethnographie et de linguistique nord-africaines, Paris 1924 (songs of women and children); L. Brunot, Proverbes et dictons arabes de Rabat, in Hespéris 1928 (with Moroccan bibliography of the subject).

III. Other Languages. A sketch of the languages of Morocco which only took account of Berber and Arabic dialects would be incomplete, for three other elements of secondary importance have to be considered:

a. Classical Arabic, the official language, is used only in writing, for sermons, lectures and conferences; it is never the language of conversation except on the radio and television. But, thanks to these two methods of communication and to the fact that religious studies which are considerably developed in the towns (especially Fas) and also among the Jbâla (Kur'ânic studies and especially kîndî'â), many words of classical Arabic have been introduced into the popular dialect. The phonetic peculiarity to notice in borrowed classical words is the retention of the short vowels as a result of the process of elongation, e.g. classical dâdîr, plur. dâdîr, "decree of the sultan," borrowed by the popular dialect in the form dâdir, whence a dialect plural dâdir. Several Kur'ânic expressions or phrases of enosics hence passed into everyday language as adverbs: biham [lit. "slowly", lit. "in commenting on", wa-ham [lit. "perhaps"]

b. Spanish was the only language spoken by many of the Muslims of Spain, who in the 9th/10th century and especially in the 11th/12th took refuge in Morocco, mainly at Tetuan and Rabat-Sâle. Moncté, who was taken a prisoner to Morocco in 1670, says that Spanish was as common there as Arabic; his remarks is probably true only of the towns already mentioned. The descendants of those emigrants from Spain later learned Arabic and forgot Spanish, under the influence of Islamic culture. Not having been subject to the latter influence, the Jews of Spanish origin still speak an archaic Spanish, sprinkled with Arabic terms moulded to the flexions of Latin morphology.

c. In the palace of the sultan, many black servants of both sexes still spoke Sudanese dialects, but these seem to have had no influence on the Arabic dialects of Morocco.

No trace has so far been found of the existence in Morocco of secret languages; one could hardly put in this category the argots of certain guilds (butchers) nor those of the students, the originality of which consists simply in transposing certain letters of each word of the ordinary language and in the addition of certain prearranged syllables. One should not, finally, omit to mention that the use of Spanish and, above all, French, which spread during the protectorate, remains as widely spread— if not more so—since independence, and is not without an appreciable effect of dialect formation.

(G. S. Celet)

VIII. INTELLECTUAL LIFE.

More especially since the end of the Middle Ages, Morocco has occupied a place by itself, often important, in the history of civilisation. From the point of view of intellectual life, it was for long under the tutelage, more or less marked, of neighbouring countries, and it was only from the time it became an independent state that it began to show independence in this respect also. The great activity at the centres of learning in Arab Spain down to the end of the 7th/12th century had undoubtedly an influence in Morocco, but it was after the return of the Iberian Peninsula to Christianity, that, owing to the migration of refugees from Spain to Morocco, where there happened to be ruling princes anxious to further Islamic studies, it was able to preserve the last and only centres of study in the Muslim west. In any case, in spite of the relatively large number of scholarly works which has produced in various branches of "îmâs, this country is far from having inherited in the eyes of the rest of Islam the reputation and intellectual prestige, which Spain enjoyed when it was a Muslim country. However, it may be said that the towns of Morocco have always held in recent centuries a large proportion of men of letters, much attached to their traditional culture. Lastly, it may be noted that this culture, to the end of the 19th century at least, never allowed the slightest place for modern sciences, the study of which, if it has gradually become more or less established in the Muslim East, has hardly interested the West.
The characteristic feature of this culture, which is essentially founded on religion, is that it has remained unchanged. In this country, where tradition strictly regulated all acts of public and private life, it is not surprising that the intellectual ideal has always remained the same. It has already been remarked that, until recent times, this Moroccan fakih, whether he were magistrate, teacher, or official of the Sharifian government, possessed the same stock of knowledge as a fakih of the periods of the Marinids or Sa'dians. The same instruction had been given him and by the same methods. He received first of all an elementary education in the Karim school (see Kuttab). He learned the Qur'an by heart, often completely, and some of the elements of grammar. Next he became a student (zâdil), and the fa'il al-din, which he studied, was governed by no rules or programmes other than the traditional ones. He first of all studied the "mother-words" (ummalât), compendia made to be memorised readily, on theology and grammar (usually the Mushāqūdi altâmirîn of Ibn ʿAbî and the Adîjarumâyyîn). It was only then that he entered upon a more thorough study of more advanced texts, usually commentaries (shahrb) or glosses (bağhyâns) on works (main) of established reputation and exclusively Islamic in character. The whole trend of his studies was toward a better knowledge of theology and law.

The result was that in most cases in Morocco men of learning were almost entirely jurists and that they differentiated between purely Islamic sciences (ʿulûm) and profane learning (funûn), with some contempt for the latter. One understands also why the part played by Morocco in Arabic literature is primarily in the domain of subjects directly connected with the Qur'an and the Sunna, theology, law and usul.

The centres of learning have varied with periods and historical circumstances. The early ones seem to have been the points nearest to Spain, Ceuta and Tangier. The foundation of Fâs and the building in this city of the great Mosque of the Karawâns (Dâr al-Karawiyîn [r.s]) facilitated the establishment of a centre of culture in the interior. A little later, Marrâkûsh, the capital of the Almoravids and of the Almohads, became by desire of its rulers the centre of attraction for Maghribi character. The whole trend of his studies was toward Morocco. But it is from the Marinid dynasty, who saw in the development of educational centres in Morocco a means to make themselves popular in the country and to acquire prestige in the eyes of the Muslim world, that the rise of Fâs as an intellectual centre dates: it was the metropolis of learning in the country from the 8th/14th century. Not only did the Marinid princes make it the political capital but by the foundation of a series of colleges or madrasas around the Dâr al-Karawiyîn and mosques of New Fâs, they were able to attract to this city a host of students from all parts of the country and to give it the renown for learning, which it still jealously claims to-day. In the Marinid period, madrasas were also multiplied outside Fâs: Meknès, Salé and Marrâkûsh had their own, which shows that regular education was given in these towns.

In addition to the part played by the madrasas, there was the activity of the zâwiyas, directly connected with the development of maraboutism and Sharism in the country in the period when the Spaniards and Portuguese were trying to establish themselves in Morocco in the 10th/16th century. The zâwiyas, religious centres, headquarters of the djâbûd, naturally became centres of teaching. At the time when Fâs could only with difficulty keep its character as the principal centre of learning in the country, the zâwiyas, in which teaching was carried on, became more and more numerous. E.g. the Zawiyat al-Dînî (q.v. in Suppl.) in the Middle Atlas, the Zawiyat of Tamart in the land of Dârâ and the Zawiyat of Wazzân (q.v.) in the north. The most famous scholars were frequently either heads of brotherhoods or sharifs, who taught in the motherhouse of their order.

We do not intend here to give a detailed sketch of the Arabic literature of Morocco, but will be content with a few general indications and names distinguishing where possible, between Islamic and profane sciences.

It was not till the Muslim West adopted the Mâlikite rite that Morocco began to produce work in the domain of ʿilm in close accord, as already mentioned, with the school of Spain. In this period of intellectual dependence, the relations between the two countries were down to the 7th/13th century considered a sojourn in Cordova, Murcia or Valencia necessary to finish their course. The East did not yet seem to exert the attraction that it did later. At this period, besides, the islamisation and arabisation of the Berber masses was still too recent. Only a few names may be mentioned for this early period, Darrâs b. Ismâ'îl, of whom much that is recorded is legendary, the famous reformer Ibn Tûmârt (q.v.), creator of the Almohad movement and author of several risâlas or 'akhsâs on his teaching; the ùdâr ʿIyâd (476-544/1081-1149 [q.v.]), author of numerous works on Muslim learning, of which the most famous are the Kûfî al-Shîrûdî and the Maghribi al-wasâl with a collection of biographies of learned Mâlikîs, entitled al-Madârîsh.

During the modern period, on the other hand, the number of learned Moroccans becomes more and more considerable. The best known are for hîrûd: Ibn Barî (8th/14th century); Ibn Fâhâshîh (9th/15th century); the scholar of Meknès Ibn Ghusîl (d. 919/1513); 'Abd al-Rahîm b. al-Khâlî (d. 1086/1673); 'Abd al-Rahîm b. Idris Mandjûr (d. 1175/1766); Muhammad b. 'Abd al-Salâm al-Fâsî (d. 1214/1809); Muhammad b. Ahmad al-Sârâqî (d. 1086/1676-7); Sûkkây al-Šâsîn (d. 936/1529); Ridwân al-Dînârî (d. 991/1582); Muhammad b. Kasim al-Šâsîr (d. 1012/1604-5); Idris al-Ifrîkî (d. 1228/1815); for jûk: Abu ʿIbān al-Shâchâyîrî, commentator of the Madârîsh; al-Šâzîlî (q.v.) and Ahmad Zârîk (9th/15th century) commentators of the Risâla of Ibn Abî Zayd al-Karawânsî; al-Wânsîrî (d. 925/1518); Mandîrî (d. 993/1585) [q.v.]; Ibn ʿAbî (d. 1040/1630); Mayârîa (d. 1072/1661); Ibn Maškûrî (d. 807/1404-5); Ibn Zakî (d. 892/1486) [q.v. in Suppl.]. Their works have for the most part been recorded and will be found detailed either in Brockelmann or in Bencheneb's work on the individuals mentioned in the Ighubar of 'Abd al-Kâdir al-Fâsî. Only a small number have found a place in eastern libraries; but on the other hand, they all form the foundations of the collections of manuscripts formed and preserved in the imperial palaces and mosques of Morocco.
claim any great originality and purely literary
figures are rare. Poetry, as a rule—when it is not
didactic (urfij) is religious or mystic. At the
courts, there were always a few literary men
maintained by the princes, who were the panegyrists,
often very extravagantly, of their patrons. For
most of the courts, especially from the 8th/14th century, that we find the few historians who
have given us original chronicles or compilations.

Their works, planned on a singularly curious con-
ception of history, have nevertheless the merit
of giving us the only detailed information about the
political history of the country in the period of the
author or immediately preceding it. Those
which date from the Middle Ages are, however, much
the best. The kind of work not only did not im-
prove later, but became simply dry chronicles, in
which events are related in a brief and colourless
fashion.

The early historians of Morocco—besides the
Berber genealogists about whom we do not
know very much—are contemporaries of the Almo-
zdavid dynasty. A little later, the Almoravids find
a person in the company of the Ma'had Ibn Tumart, al-Baydhaq (q.v.), to whom we owe a
scholar of Marrakush, to whom we owe a
history of North Africa and Spain, the Baydhaq
al-mughribi, that of Ibn: Abu Zafar, author of a
didactic (urdujusa) dictionary of the celebrities of the
country in the period of the author or immediately preceding it. Those
which date from the Middle Ages are, however, much
the best. The kind of work not only did not im-
prove later, but became simply dry chronicles, in

and educated there, he migrated to Khartoum, near Kassala, in the service of his spiritual director, the Maghribi master, Baba Isak. In 770/1367, Baba Isak died, and Ahmad set out on an extended pilgrimage, visiting Arabia, Iraq, and Iran before returning to Dihli, where he lived the rest of his life. The work of this governmental change that the Banu 'I-Maghribi family experienced in the course of two succeeding centuries (the 14th and 15th centuries) the influential functions of kafir, kdtib or intendant (munabbir) at several princely courts throughout the Middle East, in Baghdad, Aleppo, Cairo, Mawil, and other places are mentioned in the work of his life, the grandfather al-Husayn b. 'All was to succeed by his two sons, while real power of government was entrusted to his Nubiau slave qabir. When the last remnants of the ransom had been handed over, the Byzantine authorities gave permission for him to return to his home country. However, soon after his arrival in Aleppo— or, according to some other sources, even before his return—Ahmad was killed by the Byzantine authorities, who had been requested to release a number of Muslim prisoners of war. Also comprised in this act of redemption (fiid) was the deliverance of a second security, a very valuable piece of armour studded with jewels, a hadassa of Sayf al-Dawla himself. This affair of the fiid occurred in 354/965 and is an indication of the importance attached to al-Husayn b. 'Ali as a political personality.

could boast of some successes in their intrigues, of the Sword and Pen), the Christian MansGr b. 'Abdun. Although initially the Banu *-Magljribi were to change again, this 'Abdun. Although initially the Banu 'l-Magliribl came to be entrusted with a position of influence while his son Abu *-Kasim al-Maglribi (see 4- below) 1 possibly as a consequence of the sudden death of al-Hakira in 386/996. It is perhaps in this period of Abu 'l-Hasan's life that the Syrian poet Abu 'l-ALSAI al-Ma'asrī [g.v.] addressed to him a hasīda, part of which has survived till our time. In this fragment (Shurā b Saht al-sand, Cairo 1947, ili, 158-96, rhyme bismirr) the poet explicitly mentions the Persian descent of his mansūdh, together with other praiseworthy qualities, e.g. his description of Abu 'l-Hasan as one who, instead of silver, only wishes to grant gold to his favourites—at the same time scattering pearls of material origin, accompanying his much more excellent pearls of spiritual wisdom. Notwithstanding the wisdom ascribed to him, Abu 'l-Hasan failed to realise his political aims in Syria, and was recalled to Egypt. There he appears to have escaped the immediate effect of the Fātimid caliph's wrath, possibly as a consequence of the sudden death of al- Fāzīz and the accession to the throne of his successor al-Hākim [g.v.] in 386/996. Once more in Egypt, Abu 'l-Hasan again succeeded in securing for himself a position of some importance, while his son Abu 'l-Kasim al-Maghirī (see 4, below) came to be entrusted with a position of influence in the Diwān al-Sanadīd. Soon, however, the fortunes of the Banu 'l-Maghirī were to change again, this time because of their increasing involvement in a number of intrigues, which culminated in the execution en bloc of the members of the Banu 'l-Maghirī, the representative of the fourth generation of this family (for details about the intrigues, see Ibn al-Kalānī, Dīwā'ī al-Fārīd Dimashqī, 61-2). 4 Abu 'l-Kāsim al-Hasan b. 'All, "al- wāzir al-Maghirī", also called by another surname "al-Kāmil Abu 'l-Waṣāṣatānī", was born in Abu 'l-Hadīja b. Maydān. Maydān, al-Adīm, Bugāya, fol. 14a-b, whose information should be preferred to al-Makrīzī, Ḳāhiī, ii, 158, where instead of Aleppo, Egypt is mentioned as his original home. Having escaped from the massacre in Egypt, Abu 'l-Kāsim at first sought refuge with the Banu 'l-Djarribh (see 394.2.Kāmil), leaders of a clan of Bedouins who exercised some political influence in Palestine more or less independent of al-Hākim's authority. At his request, the chief of this clan, Ḳaṣān b. al-Muṣarriq b. Daḡfar, granted him protection or idār (q.v.), upon which the grateful fugitive composed and recited a fairly long Ḳaṭla, which can be found in Ibn al-Kalānī, Dīwā'ī, 92-3. Once in Palestine, Abu 'l-Kāsim approached the Bedouins against the Fātimid caliph, against whom he evidently felt an unquenchable thirst for revenge. At first, his policy proved successful, for even a quite important town like Rāma, which was under Egyptian jurisdiction, had to undergo a siege and subsequent invasion, looting and massacre—all this, as it appears, at the instigation and advice of Abu 'l-Kāsim. Not yet satisfied, he also planned and executed the erection of a counter-imamate to that of the Fātimids. A Meeqaṭa gaft, al-Hānim, son of Qaṭṭār, who could from his family pedigree claim a descent at least as authentic as that of the Fātimids, Aftīd, was, claimed for himself, asṣīr al-muṣarriq, the honorific title al-Raḥib b. Bīlāh, all this accompanied by the approval and acclamations of Abu 'l-Kāsim and his Djarribid protectors. This rebellion was financed by gold and silver taken from the Kaṭha, melted down, and coined into dinār and dirāms, known as "Kaṭbiyya" ones. However well-planned, the action of Abu 'l-Kāsim failed to achieve any result; the counter-imamate proved unstable on account of the readiness of its Bedouin supporters to accept extensive bribes from al-Hākim. Just in time, Abu 'l-Kāsim was able to leave his former allies and to escape to Irāk and ʿAbbāsīd jurisdiction. In connection with Abu 'l-Kāsim's stay in Irāk, we find in Ibn al-ʻAdīm, Bugāya, fol. 15b, a rather curious report about the suspicion fastened on him by reason of his name "al-Maghirī". The ʿAbbāsīd caliph al-Kādir b. Bīlāh wrongly assumed from this pro-Fātimid inclination, the Egyptians being indicated in the east by the term Magharīth. From Wāsit, where Abu 'l-Kāsim had to remain as long as this suspicion circulated, he sent to al-Kādir a ṭuṣkā, in which the original meaning of the name "al-Maghirī" was duly explained, as derived from the Diwān al-Maghirī, a Baghdādī governmental department. Thus having purged his name and political intentions, he was allowed to reside at Baghdād, and was able to begin a completely new career of statesmanship at different princely courts in the Muslim East. After his stay in Baghdād, he is reported to have held several offices, at first in Mawṣil under the ʿUsayyīd prince Kūra Ḵabīb al-Malekī, then at Mayyāfārīgī under the Marwānī prince Naṣr al-Dawla b. Aḥmad. Thereafter, having returned via
Mawil, he held for a short while the office of wazir in Baghdad in the caliph's service. But because of his involvement in pro-Ali riots in Kufa, he incurred al-Kādi's displeasure, and had to retrace his steps, again seeking refuge at the court of his former protector the Marwânid Nâṣr al-Dâwla.

Finally, at Mayyâshârîn, he died in 468/1027, but before his death his ever-scheming mind had already planned that his mortal remains should be carried 10 Mashhad Allûr Kâfû, without unduly attracting the attention of his opponents, for burial near the holy shrine. To this end, he is reported to have sent letters containing the request that the body of a beloved female slave of his might pass in coffin through the intervening territories; only after the funeral were the real nature of the coffin's contents known.

From among the wazir's works, the following may be mentioned here:

(1) A compilation (known only in manuscript) of Ibn al-Sîkit's work, Isâhî al-masokhî.

(2) al-'Anas bi-lim al-asâd (also in ms.), containing many names for Arab tribes, which by their mutual resemblance or their unusual construction might easily cause misunderstanding or confusion.

(4) Kitâb fi l-tasîina, ed. Sâmî al-Dâhâmîn, Damascus 1498, is a short manual for an unmaned ruler, giving him advice how to attain the ideal form of government. In doing this he should at first understand how to organise his own way of living; and secondly how to behave towards the higher classes of society in his empire, and which qualifications are to be required in order for his subjects to perform certain functions in the ruler's service, for example the ones of chancellor (kitâb), chamberlain (hâdîq [q.s.]), tax-collector-in-chief, etc. Thirdly, the ruler should know how to restrain the masses, in view of their inclination to revolt. In conclusion, the author quotes an injunction given by Abû Bakr to Yazid b. Abî Sufyân, when the latter was sent with an army to Syria (cf. Ibn al-Azhîr, sub numa 13 H., where a variant text is given). Although the author of the Kitâb fi l-tasîina never discloses the identity of the prince to whom the work was dedicated, it may be surmised that the Marwânid ruler of Mayyâshârîn, Nâṣr al-Dâwla Ahmad, who on several occasions had shown himself to be a loyal advisor to Abu al-Kâstim b. Abî Sufyân, is meant.

Contemporary judgments upon the wazîr are known to us from two sources. A negative appreciation is found in the work of 'Ali b. Masûr b. Tâlib Dawkhâla 'Ibn al-Kâdî' who, for a long time, until shortly before 409/1010, had been a tutor employed for the education of the sons of the Banu 'I-maghrîbî. Abu 'I-Kâstîm had been one of his pupils, but after the massacre of the family, "'Ali b. Masûr detached himself from it and composed this hûzîd [q.s.] full of abuse and strong criticism against Abu 'I-Kâstim. In this poem, he accuses the wazîr of inter alia having been the indirect instigator of his family's ruin through his own intrigues (see for details, Yebוצר, Usâbâh, v. 424-7)."

Later on, Abu 'I-'Alî al-Ma'ârî Fitzgerald appears to have criticised this hûzîd poem. At any rate, 'Ali b. Masûr felt himself obliged to remove the unfavourable impression made, and this among other things (see also al-Ma'ârî) was the aim of a letter which he addressed to al-Ma'ârî. This letter and al-Ma'ârî's reaction to it are now available in the annotated edition of 'Abâb 'Abd al-Rahmânîn, Risâlât al-Ghâfîfân wa-al-ma'âhid (Risâlât Ibn al-Kâstim mibâhid jahânîm) (Cairo 1963 and later editions). Al-Ma'ârî's answer to Ibn al-Kâstim's criticism of the wazîr is found in the Risâlât al-Ghâfîfân, and is characterised by an inclination to gloss over any possible false steps made by the wazîr. In particular, Abu 'I-Kâstim's intrigues in Egypt are ascribed to his youthful ambition and lack of experience, and their terrible result as being the ultimate effect of crushing Fate (R. al-Ghâfîfân, 5.4).

Finally, a dirge (masârîya) composed by the poet, not only due to the occurrence of the wazîr's death has survived, having been included in the poet's second collection the Lusum mai la yâsdâm (ed. 'Abd Zâd, Cairo 1872-5, ii, 434; ed. Bombay 1386/1967, 3-46). In one verse of this poem, the poet seems to acknowledge that a certain measure of criticism against the wazîr's way of life could be justified, cf. 1. 7: "If the two angels who accompanied you did write down some small sin, how many an excellent characteristic contrasting this can be found, always wiping it out!" Elsewhere in the same poem, the Ma'ârî makes mention of the wazîr's precious library which survived its owner. Two centuries later, we find Ibn Shaddâd (d. 685/1285 [q.s.]) reports its continued existence in his topographical work al-'Adâb al-khâfi'râ fi al-dinar ummâr, al-Shām wa l-Dârâ (apud Kitâb fi l-tasîina, 390), with the following words: "In Mayyâshârîn there was extant this library which up till the present time is known as "al-Maghrîbî's Library"."

leadership of the lived autonomous Kurdish Republic under the...

...of 79/695 to 83/702. Arabs had settled in this district by the 3rd/9th century the taxes of Mah al-Basra were reckoned at a maximum of 4,800,000 dirhams. In 326/939-50 Mah al-Basra was assigned as a mint to al-Mutawakkil; he endowed al-Mutawakkil with the sons of 'Idris b. 'Uzayr al-Dinhar, who owned the town of Abi al-Muslin, lived in Mah al-Asra. In the 3rd/9th and 4th/10th centuries Mah al-Asra is described as a fertile, lush, well-watered district producing dhurra, saffron, and fruit, with the best black clay for seal impressions, buildings of clay and two mosques.

...of al-Kufa and Nihawand to Mah al-Basra...
areas. Mahābād's streets were paved, city water and fighting improved, an irrigation project began near the city and a modern road connecting Mahābād with Rīdī'īyya and Sanandaj was completed.

In 1974 a truce between Mullā Muṣṭaṭa Barzānī and the 'Irāqī government ended in renewed fighting. This time the Kurds received strong backing from Iran, and Mahābād became the unofficial rest area behind the front. Its streets were filled with Harzāni's Peng Me'a fighters driving captured 'Irāqī vehicles, and the bazaar resounded to stories of free-spending Kurdish fighters. As the fighting intensified, Kurdish non-combatants from 'Irāq increasingly sought refuge in camps in the Mahābād area.

The 1975 Algiers Agreement put a sudden end to the Kurdish war, and over 100,000 new refugees fled to join the 30-40,000 already in Iran (about 28,000 of these were in the area around Mahābād). Mullā Muṣṭāfa, his family and many of his tribesmen settled near Mahābād. By the end of 1975, most of the refugees had returned to 'Irāq and the remainder (about 30,000) had been forced to leave the Kurdish areas of the Trans-Iranian area. For the merchants and farmers the country was abandoned, and Mahābād was moved to Tehran, and eventually went to the United States where he died in 1975.

Calm returned to Mahābād until the beginning of the Iranian revolution in 1978. Initially, the city united to seek the ousting of the Shah. This unity, however, was quickly followed by strife between Kürds demanding greater autonomy and revolutionary guards supporting Khomaini (Khūnayni). The most bitter fighting occurred in Sanandaj, but Mahābād again became the seat of the nationalist Kurdish movement. The city was captured by government forces in 1979, but was returned to Kurdish control as part of a negotiated truce. The area remained chaotic with various groups manoeuvring for power, including the sons of Mullā Muṣṭāfa, Ḥādī and Maṣṣūd, and the 1980 Iranian 'Irāqī war was added to the complexities as some Iranian troops were moved out to join the fighting in the south.

(W. Eagleton and R. Neumann)

MAHĀBĀT KHĀN, military leader in Mughal India. Zamāna Beg (later known as Mahābāt Khān) was the son of Ḥaṣṣayyur Beg Kābulī, a Rāṣṭhāni Sayyid, who migrated from Shaṭrūţ to Kābul during the reign of Akbar and settled there. Zamāna Beg entered the service of Akbar's son Salīm as an aṭābār (cavalry trooper) and rose to the rank of 500. After Diḥāṅgīr's accession (October 1605) he was promoted to the rank of 2,000 and given the title of Mahābāt Khān, becoming a trusted confidante of that Emperor. He led a rather unsuccessful campaign against Mīndwār (1608), but rose nevertheless to the rank of 4,000/5,000 by 1610. In 1615 he was awarded dā Ḃāṣṭa sīḥ rank and was posted to the Deccan. Apparently unable to get on with Shāh Diḥāṅ, he was transferred and made governor of Kābul. When Shāh Diḥāṅ rebelled in 1622, Mahābāt Khān was called upon by Diḥāṅgīr and the Empress Nūr Diḥāṅ to command the imperial troops. He was awarded the highest possible rank for a noble, viz. 7,000/8,000. He pursued Shāh Diḥāṅ to the Deccan, with a force under the titular command of Prince Pārvīz, and then marched across the empire to eastern India in order to expel Shāh Diḥāṅ from that region. He then returned with Pārvīz to the Deccan. Although his enhanced power and prestige aroused much jealousy at the court, he was now appointed to Benga. Provoked by certain demands for accounts and by the humiliation of his son-in-law, he suddenly carried out a coup (March 1626), capturing the person of Empire Diḥāṅgīr, who now appointed him wāzzī. His power, however, came to an end within three months. He fled and was on the run when Diḥāṅgīr died (1627).

Mahābāt Khān in the meantime made his peace with Shāh Diḥāṅ, who after his accession (January 1628) appointed Mahābāt Khān governor of Aḏīrār and then in the same year sent him to the Deccan as vicere. In 1629 he was appointed governor of Diḥīlī, and in 1632 again vicere of the Deccan. Mahābāt Khān won a signal success when he captured Daulatābād in 1633, but lost much prestige when he failed before Pārentā last year, being censured and recalled. He died in 1646 and was buried in Diḥīlī at the Kadamāgīr of Shāh Mardān.

Mahābāt Khān considered himself an opponent of both the dominant Iranī and Tūrānī factions in the Mughal nobility; his troops consisted in a large part of Rāsidūtpats. Though lacking a religious education, he was said to be skilled in astrology and astronomy, and to have embraced Shīːmī in his old age. His eldest son Amān Allāh Ḥusaynī (Ḵān Zamīn) was also his trusted confidante; his son, Lahrāsp, rose to occupy high office under both Shāh Diḥāṅ and Awrangzīb, enjoying the title of Mahābāt Khān II.

(M. Atar Alī)

MAHALL (Ar. lit. "place of aligning, settling, abode"), in the context of Islamic India, widely used in the sense of "palace pavilion" or "hall", and more particularly of private apartments in the palace, the mahāl-sād—hence also a queen or consort. It seems not to have achieved the same currency in Iran. Here it appears as equivalent to Hindī mandir, mandar or manda, sometimes reclaiming these in areas under strong Muslim influence such as Rajāstān. Much palace terminology is Persian, though specialised Hindī terms like ḡaṭār for a hall with three adjacent bays or doors, and ḡhātra or for one with twelve (3 each side) are applied to Muslim buildings, the latter figuratively as "summer house". Consideration of their architectural development entails a review of the palace layout in which they were set.

1. Diḥīlī Sultanate. Though none of the Mamlūk palaces have survived, Ibn Baṭṭūta [9.] has left a description of the Kūḥ-i Lāl [1] in Kīfāt Rāy Pīlīrā (see nts.) as used by Sultan Pīlīlāl al-Dīn Kāhilī (689-91/1290-91), comprising two great audience courtyards (māshirār) in sequence, with a closed building at the rear. In the first was an immense vestibule (dākhāz), and both were overlooked by a double range of (900+20) tall columns of large blocks of white granite in the sultan set to watch games (Rīāl, iii, 271). He writes of Muhammad b. Tughūk's new palace (see ca. 1335-41), the Dār Sārā at Diḥāṅ-gān-pān, in similar terms, noting the platforms (or cells ? 1333-41), the Dar Sarfl at a Jahan-panih, in

-i, Bibl. Ind., Calcutta
Ustân, with painted timber columns supporting a finely-carved roof. Each gate had provision for musikans to signal the arrival of dignitaries, and the third was controlled by clerks who registered entry (ibid., ii, 217-21). Its use of magâvar for both courts and the hall is ambiguous, but he later shows that the audience was covered by a great tent (bârga for P. bârga) at festivals; at the Khâkkh-La'î both courts could be covered by canopies (payâyân; ibid., iii, 232, 233, 273). These successively more private areas, with formal guard posts in the first court, were to be essential features of Mughal palaces two centuries later, as were raised pavilions and tentage. Of Ghiyât al-Dîn Tughluk’s palace at Tughluâkâbâd we learn that its tiles (bîrmda) were gilded so as to shine in the sun (ibid., iii, 214). Reference to the hall flanking his tomb shows that masonry could be extensive, with sculpted chakhâkhâ sâves above the lintels, sturdy piers, and cross-bracket capitals reproducing earlier Hindu ones in timber. Firuz Shâh’s description shows pictures and portraits to have decorated walls and doors. The remains of the palace of Firuz Shâh (525-54/1513-88) in his Mâtât (see Dîhil, and J. A. Page’s account, in Memoir ASI, iii, Delhi 1937) confirm the description by Shams-i Sirâtî Aftâf (Ta’rikh-i Firuz-shâhî, lium iv, madekadda 4). The Mabâll-i Shâhâ-i Gîlân was used for receiving dignitaries, the Mabâll-i Châdîji-yi Câbn for court officials, and the Mabâll-i Bârî-î Amm for public audience. The sitting of this fort along the Dîmann [g.v.] allowed the private apartments and the tâmâna to benefit from the cooler microclimate, the reflection and the view over the water. Its character can be inferred from the severe, utilitarian style typical of the reign, as seen at the Kâbîr-i Kâhás [see Dîhil, 2] with plain, battered towers flanking colonnades of double squared piers, vaulted cells, multiple brackets, and a roof line relieved by pyramidal hooded roofs on projecting dîharâkh balconies, or an occasional dome. It was whitewashed for royal visits, presumably on stucco, and decorated with garden scenes (ibid., iv, 5, and v, 2). The royal establishment extended to 36 bâhâkhane handling its material needs.

The publication followed an international convention, for an axial recession of courts was used both in the Mongol palace at Khân Bâllik (Peking) and in the dominant Muslim models at Baghdât (1425-72) and Sâmârâ (ca. 211/82-85) [g.v.]. The latter had conspicuous âtâkah and culminated in a domed throne chamber, both notably absent in Hindustân, where they were replaced by trebled columned halls derived from a long local tradition, through hypostyle palaces such as Cîlîa (8th-century A.D., ASI, xxi [1885], 9 ff. and pl. v.) or the open verandah of the Kâtâbâ Mabâll at Ranoz (ca. 1000 A.D., ASI, li [1872], 303 ff.), which already show the characteristic squared columns, cross-bracket capitals, lattices (dîhil), merlons, and the eaves pent designed to shade the interior and throw off monsoon water. Muslim buildings were to combine these elements with the use of arches and vaults (the first cross vault is found at Tughluâkâbâd) and articulate such halls into an ensemble. The elimination of the dîhil as audience hall, perhaps under Firuz Shâh, facilitated the integration, though it was still used in camp. The mahâll as a setting for elaborate court ceremony (Ibn Ba’tüfîa, iii, 212-42) was distinct at this time from the khâkkh, a less formal pavilion, and the sârây, or villa of a mâtât or shâhâkî.

ii. Dâkhân. At Bîdâr [g.v.] the palace buildings enclosed in the south of the Fort represent the in-

fusion of a largely Tughluâkîd inheritance with direct Iranian influence in a gamut of formal structures that later evoked parallels in the North. Some of the Bahmanî [g.v.] buildings are now disguised by Barîî Shâhî [g.v.] secretions, but most are attributed to Ahmad Shâh Wâl (839/1439 for nine years). They are of stone, faced with stucco and tilework, with finely carved jambs and archivolts of hornblende; traces of timber columns show they were once painted and gilded, on square hornblende bases. The ruined court identified as the Diwân-i Amm (Hall of Public Audience) is nearly square, the southern three-quarters paved for privileged access, with entry from east and west, and a hall placed centrally to the south seven bays wide by three deep, the middle bay being wider; this has a range of private rooms along the rear, and access to raised dîharâkh facing the yard, probably for ministerial interview, at each end. The court was colonnaded, with an octagonal pool, fountains, and cascade; the upper storey of the hall opened through rhythmically spaced arches filled with terracotta dîhil work. Tilework on the dôdôs was mainly blue, with polychrome floral designs of Timûrid character, as at Gâzur Gâh (828/1425) on square units (see Kâtâbâ) (cf. G. Yazdani, Bîdâr, Oxford 1947, 62-6 and pl. xxxii-xxx). An intermediate court, or pîrdâkh, immediately to the north, with a multi-domed annexe, leads west into a third, inscribed as the Kaâfî-i Sulân, perhaps a hall of private audience, now known as the Taqîtâb Mabâll after the turquoise throne really housed in the public hall (ibid., 6, and 66-77, pls. xxxi-xxxii). Here too a loggia faced north across the yard above long steps, only three bays wide by two deep, but with wider spans at 5.01 m/16′. The broad central bay led to a magnificient octagonal royal hall, once domed 30.30 m/100′ above the floor, on the caliphal model. Painted in vermilion and gold, it had Hindu niches, and fine tiling, some in relief, and a little in mosaic, framed by the massive arches. A varied but symmetrical complex of rooms around the court includes a mûftid [g.v.] opening through three bays on the west and another octagonal pavilion of it behind an elaborate pîrdâkh. The royal hall opens westward to a private court with a tank, alcoves, a tîhîna hall (bedroom?) and an elaborate hâmâmî [g.v.] on two levels. Most of the spaces are linked axially, and long rooms are flanked by service spaces or contrasting, smaller rooms; the surfaces are carefully articulated with recesses.

An east-west axis links these to another series of courtyards, the main halls invariably facing northwards. The largest, the La’î Bâgh, runs north and south, with baths to the north, the Dîmani Mâqâîdî along the west, and the three storries of the Tarkegh Mabâll in the south, notable for panels of carved stucco (ibid., 57-9, pls. xix-xl) and multiple niches. In the Gagan Mabâll, two courts are set side-by-side, and the halls are partially em-
bodded in the masonry of the ramparts, with ranges of plastered vaults (ibid., 50-2, pl. xxii). In a cluster of small but exquisite rooms rebuilt by All Barîî (949-87/1542-79) as the Rangîn Mabâll, a loggia of three bays by two is prolonged by two enclosed bays at each end, and the roof is still upheld by squared timber pillars with tiered capitals in Hindu style, and deep brackets with pendant Hindu bosses at each step, but with arabesques carved on the sides and an early cusped arch where they meet. On the central axis, an arch of black stone inlaid with mother-of-pearl leads through a square
The walls of its T-shaped mass are emphasised by the use of long flights of steps to enhance the massing. A local and successful element is the pavilions ranged in between, and their symmetry about a central entry. Water is tanked at three levels, twice in square pools with graciously curved stepped verges. More typically Muslim are the extensive use of pointed arches; the central one spanning the full width of the istbâra, 90'9"/18.5 m, provides a dramatic setting for the king in state, while at the ends, the same height, effectively limit the composition. The GonBadh in Assi, NIS xxvii [1916], pl. xviii-xix, Ibrahim I's Sînî Shah Bârsa (sic) is by contrast serious, but superbly accomplished. The Ku''k Mahall at Fatehâbâd near Canderi, identified as the seven-storied palace built ca. 849/1445 by Mahmud, has comparable transverse arches spanning two hall galleries which cross at right angles, dividing the square plan into four equal halls that open onto the galleries through three tiers of arcades, rather than the outside: a device for procuring shade and cooler air.

The Ku''k Mahall (sic) in the palace of Cihil Sutun built at Djuwârî (ibid., pl. lxix-x). This in turn was developed in Mahârâ (op. cit., pl. xxxvii [1916], pi. xvi-xvii). 4

The Gagan Maballat Bîsâpur (post-889/i484), the Sîd Manzil, in steps on a platform 122 m down a causeway between two lakes, presents beautiful sites. The Dji'ahaz Mahall, extending 70-3. A similar but larger hall, "Gada Scab's Shop", attributed to Sikandar Lodî at Sikandra (945) to 1495) and in its proportions, and an evident delight in building. Arches appear in a secondary role, as infilling in the bârdarîs, while the spandrils were once fretted. Open bâ‘adars of 16 cm and 24 inches and a hemispherical dome over each bay also rely on systems of lintels. At Câmpânpur (op. cit., 1910-n), Mahmûd built another palace of seven stories (post-889/i484), the Sît Manzil, in steps on the edge of a cliff; only the lower level remains.

v. The emergence of other forms may be glimpsed in the palace of Chîl Sutun built at Djuwârî (ibid. for illustration) by Firuz Shah's governor, where the square building surrounded by a verandah rises to a terrace carrying a large châna whose massive vault has gently curving hips. A bârdarî attributed to Sikandar Lodî at Sikandra (ibid.) may form the basis of the tomb of Marmam al-Zamânî [d. 1949/1632]: square in plan, it is ventilated by four corridors crossing at right angles to form nine blocks of rooms, with a central entrance on each face, and a flat roof over cross vaults, domes, and barrel vaults.

vi. Mughal. Buildings from Humâyûn's reign...
MAHALL

(937-47/1330-40) are described by K̲h̲ān Bahā' al-Dīn (K̲h̲ān-i Humāyūnī, ed. M. Hidayat Hosain, Calcutta 1940, Bibl. Ind. no. 200, 62-3, 68, 78) as a series of innovations, mostly incorporating astrological symbolism and a preoccupation with polygonal forms no doubt related to the Timūrid tradition. A portable timber palace in three stories, the K̲h̲ān-i Rauwān, used at Āgra and Gwalīyar in 940/1533, was hexagonal and well equipped with various different colour each side. He constructed a palace inside the Lodi fort at Āgra (q.v.) and a Daulāt-Khānā-yi Tīlūn on the bank of the Dīnāmūr, built around a central octagonal reception hall with a sunken tank, flooded at will, and a central platform (cf. Gulbādan Bāgh, *The history of Humāyūn*, ed. and tr. A. Beveridge, London 1902, text 314, tr. 118-24).

A smaller octagon adjoined the north, with alcoves, and the Dīnāmūr the west, facing the khībā (q.v.), with a garden to the east. Above these were further three rooms (badīh-khānā) the Khānā-yi Daulāt containing the ninetenth Cingūrī panoply, the Akbar- nal I, and the Pīhāgāt, a pavilion and private audience hall. There was also a forecourt, pāhāgāt, where a throne could be set. Remarkably, internal stairs assumed no architectural importance until the end of the 18th century.

The one remaining building from the citadel of Purānā Kīlā, (see DHI. 2) begun by Humāyūn but finished by Shēr Shāh, is perhaps in the same tradition, as a two-storeyed octagon of sandstone crowned by a kiosk, about 18 m tall, the Shēr Mandāla. The space inside rises as one volume, painted with coloured designs, punctuated by a gallery. It was used as a library and observatory.

A smaller octagon in line with this building may be found in Bābur's comment (915/1528) on the Palace of Mān Singh (1480-1516) at Gwalīyar (q.v.) Fort, that it was wonderful, but "solidly subdivided and without regularity" compared to Timūrid models (Bābar-nāma, ed. A. Beveridge, London and Leiden 1905, 340 ff.). Such over-compactness and lack of axial development were to be corrected.

*vi. Akbar (932-1014/1516-1605 q.v.)* initiated a prolific programme of palace building when he was twenty-two. The camp, in which the court spent much time (see MANT) can be taken as an idealised palace plan, to be modified according to the site, but not achieved in solid form until the reign of Shah Jahān.

As described by Abu 'l-Fadl (Al'i Akbar, 1, 482, 16-18), the royal precinct was a rectangle accessible from the eastern end, where a great forecourt, flanked by stables and a records office (dāfār-khānā), led up to a rectangle roped off for the court of public audience (dāfār-khānā-yi ẓāmnā); beyond this was a private audience hall (dāfār-khānā-yi khaṣṣ) within its own enclosed court, and then another court (maqām) where the Emperor received his closest courtiers in the evening. Still further east, beyond a small guard court, lay the women's quarters (hāṣbān-i ṣabāb) with private dwellings, a hall, and a two-storied wooden oratory from which he received the august visitors. The main road then lay on one axis, with a drum house (nakṣar-khānā) facing on the approach. Both camp and palace were set for a strict routine of ceremony and administration observed daily (see Ẓīn, I, nos. 72-4; Ibn Hāsan, *The central structure of the Mughal empire*, Oxford 1936, 65 ff.; Sir J. Sarkar, *Mughal administration*, Calcutta 1935, 19-21).

Akbar's first palace at Āgra (q.v.), the hunting lodge at Nagar ācyn near Kāhramāl, was started in 1564. From 972/1564-5 to 980/1572-3 Āgra Fort was rebuilt as Akbarbad, in red sandstone in place of the crumbling Lodi brickwork; the massive ashlar was to characterise future Mughal work (see Bayzūnī, ii, 4). In this case, the optimum position along the eastern parapet overlooking the Dīnāmūr and the main approach from the Dihīf Gate in the west allowed the favoured axis, modified by extension of more than 500 buildings of masonry, after the beautiful designs of Bengālī and Gitjarat (17th tr. ii, by H. S. Jarrett, Calcutta 1891, 185), and in 1569 Pelsaert confirms that it was built over like a city with streets and shops, princely buildings and residences, with māhalls for the ladies (ed. W. H. Moreland and P. Geyi as *Jahangir's India*, repub. Delhi 1972, 24) leaving little room.

This aesthetic eclecticism, consistent with the policy of sulh-i khalq ("universal toleration") must have profited from an influx of craftsmen from both regions, then disrupted, and from Gwalīyar, reappear in 985/1578. The synthesis is evident in the two buildings, known as the Dīnāmūr Mahāl and the Akbarī Mahāl (such names have since disappeared) remaining from Akbar's private apartments, which seem to have extended to the Mughānsu Barī corner in a symmetrical group. Pelsaert (loc. cit.) mentions the mahāl of the Queen Mother, three others, and a Bangālī Mahāl, with which one of these may be identified; if so, it was built before 977/1569 (see R. Freude Tucker, in *ASIAR* [1907-8], 82, but cf. Sir J. Marshall in *ASIAR* [1902-3], 62, and Nur Bāghā in *ASIAR* [1902-3], 169-71).

The trabeated "Akbarī Mahāl" ran in two stories round a square courtyard with flat roofs; a hall was set at the centre of three sides with an axial entry on the west, the roof having a small pavilion, uniquely of marble. This closed format is repeated in the "Dīnāmūr Mahāl" where many features of scale, construction and decoration show derivation from Gwalīyar, though the vigorous Hindu style is blended with Islamic arches on the upper floor, and lightened by tāhirs and latticed balustrades; the interior is remarkable for dramatic brackets supporting the ceiling. The buildings east of this court are in a markedly more Iranian style, dominated by four-centred arches and alcoves, with slender columns to the portico; this elegance, and that of the entrance façade, resembles work of the early 1560s at Dihī (the formal grouping of iwanās around a waterside terrace was reiterated at Māndī around the Nīl-kanh shrine dated 985/1574-5). On the Shāh Burdī was a small pavilion, uniquely of marble.

Work on the Fort at Lāhāw (q.v.), in burnt brick, is recorded in 972/1566, and Akbar's hall of public audience (daulāt-khānā-yi ẓāmnā) was in use by 986/1577, with an open rectangular courtyard of 114 bays, as confirmed in a plan of the Sikhs period. Its raised dīhābāhā, from which the King held audience, survives as a projection from a former pavilion (computed in the plan of R. Froude Tucker in *ASIAR* [1907-8], 82, as "Shāh Burdī-nāma") in the Royal Library, Windsor, set in Āgra, showing a very similar arrangement; see B. Gray (ed.), *The arts of India*, Oxford 1951, fig. 127). The courtyard subsequently built by Dīnāmūr immediately north of this, probably for private audience, completed this axial scheme up to the river Rāwī; the private apartments were to extend from there westward.

The most extensive palace remaining from Akbar's
The purpose of several buildings is uncertain, and expanded in a pavilion of five bays broken forward.

Nearby, the oldest royal building, the Rang records office courtyard to the south (Rizvi and dikardkhd-yi darshtut in the rear overlooking the axis muhdi catwalks: an embodiment of the central roof strutted as at Agra. The “Dlw&n-i radjah in front. The garden, centred on a square tank with fountains, introduces another element of the classical palace plan. This court was probably the private audience hall, then known as the shahjahan in the fort founded in 978/1570-3, only a bârdar, the “Zanana Palace”, has survived. A peristyle of double columns surrounds a central hall, and the terraced roof is set off by latticed kiosks.

At Allahâbâd [q.v.], in the fort founded in 971/1563-4 initiates a pastiche resumed in the main buildings; its stonework is carved in imitation of a framed hut with cabled angle shafts, perhaps as used in camp. The Dîwân-khâna-yi 91 Ammi, placed at the north of the ridge has a trabeate colonade of 11 bays with a domed ceiling. The roof is a decorative wheel, and the royal râghukîh is expanded in a pavilion of five bays broken forward into the court on a podium, with a hipped roof and roof(dfut. Its surprisingly modest scale is typical of the whole palace, where imaginative massing and exquisite carving achieve delight rather than grandeur. The organisation of the remainder of the palace, now weakened by the absence of the courtyard walls, must have been informal, with frequent lack of symmetry, overlapping masses, and half-closed spaces, and an intextness on individual buildings which suggest that the architects as well as the craftsmen worked in a Hindu tradition (cf. Kunthâ Râhâ’s palace at Citâvari, taken in 979/1568).

This court of unusual character may be symmetrical, and its fanciful names are best used for reference alone. The “Ankh MifawlI” is a pavilion form. A low podium carries a rectangular hall, perhaps contemporary (cf. Agra). The “Dlw&n-khâna-yi Amri, placed at the north of the fort, is based on a square tank with fountains, introduces another element of the classical palace plan. This court was probably the private audience hall, then known as the shahjahan in the fort founded in 978/1571, and it seems that most of the work, all in red sandstone, was finished within a year. The trabeation allowed the prefabricated panelled technique essential to such rapid erection, and the stone was, as claimed, “wrought with the ease of turning wood” in traditional Indian techniques apparently derived from Bayân not far away (fieldwork by M. Shokoohy, 1981). The site on a ridge running northeast and southwest requires a layout in a series of steps to the south, culminating in a great mosque at the western (i.e. ibid.) end near the house, Khâfakh, and madris of Shaikh Saifîn Chishtî. Nearby, the oldest royal building, the Rang Malhu (976/1568-9) is traditional in its introverted courtyard plan, with colonnades in two storeys, but the fusion of Islamic and Hindu detail is experimental.

The saint’s own house, khâtiakih, of the whole palace, where imaginative massing and exquisite carving achieve delight rather than grandeur. The organisation of the remainder of the palace, now weakened by the absence of the courtyard walls, must have been informal, with frequent lack of symmetry, overlapping masses, and half-closed spaces, and an intextness on individual buildings which suggest that the architects as well as the craftsmen worked in a Hindu tradition (cf. at a Láhawr. The latter was approached from the Dihill Gate down the Míná Bázár with its rows of shops and square láhár sābā, and entered from the north on the cross axis by the Akbari Darwāzā. The Āmar Singh Gate to the south was primarily for access to the private apartments, like the Hāthī Pōl at Láhawr.

Shāhidjahān adjusted this layout. In his first year (1037/1628), he had ordered halls of forty columns (Máil satsan) at Āgra, Láhawr and Būrhānpūr (q.v.) to protect his nobles at public audience instead of the tents used previously. As that at Būrhānpūr is ruined, and that at Láhawr only roughly reconstructed, the hall (twān) at Āgra, renamed the Dawlāt-khánā-yi Khāṣṣ u ʿAmm, is the remaining prototype for his court buildings, which thenceforward follow its format as an arched, hypostyle loggia, rectangular in plan and set on a podium, with a flat roof, Chālidja, and Chaṭris at the corners. The work, in red sandstone dressed with polished marble stucco, and with details picked out in gold, is strikingly different from its forerunners. It retains such features as doubled peripheral columns, quadrupled at the corners, and doudecagonal shahs-e-khán, large piers; these are flanked by the first of the genre (internal work above the dado is Sikh work). The royal bed-chamber (khāṣṣ wādān) lay behind a range of shallow rooms facing the Būrdj (Fīḍqāddī-nūma, i, 223-5).

Eastward of this group, along the river front, are three further courts: one opening to the entrance yard, Dōwāt-i dāvūrī and the Hāthī Pōl, one marked Khilwat-khánā on the Sikh map (not Khilwat as cited by Vogel) which may have been harem quarters, with baths, a small mosque, and a small marble bāngāl on the parapet dated 1055/1645, and one with ranges grouped around a dār bāgh including the Chōfī Bāngāl believed to be one of the buildings for Kālbāgī and Khilwat-khánā (see viii. above) ordered in 1043/1634 (Ammātī Sālī, cited by Nur Baksh, op. cit., 1902, 223-4). Dāshānhīr’s court ends the row, thus reversing the Āgra plan. At Adjmār, the five white marble pavilions along the margin of the Āna Sāgar lake (1047/1632) show the idea of the waterside terrace at its most perfect, as the climax of the Dawlāt Bāgh; the new style is at its most precise, though the column groupings recall Fathpur Sīkri. The prominent Hindu brackets are found too in the black marble pavilion carried out by Zafar Khān at Shālamār (formerly Fadż-baksh) in Kashmir in 1039/1630 (see Bustān).

The Lāl Kītā at Dihill (q.v. for plan and details), being founded de novo in 1048/1638, allowed free development of a riverside palace within the walled format of a rectangle set along the Djamnā to the east. The main approach axis from the Láhawr Gates in the west passes through a long, vaulted bazaar street with an open octagonal court, of Iranian pattern, to a great square guard court, with a tank at its centre and a nawāt-bāghāna over a triple gate at the far side. This led to the still larger courtyard, a rectangle set athwart this axis, and surrounded by arcades (Fudās) of separate cells for the umāma, serving the Dawlāt-bāgh-yi Khāṣṣ u ʿAmm opposite. Neither court is extant. The north and south sides of the guard court received the transverse axis of an open arcade, with a canal, running from the southern Dihill Gate. Beyond the audience hall, the main axis ended in a third court in front of the Imtiyāz Mahāll (Rang Mahāll) on a riverside terrace, the first of a line of harem buildings extending south along the cross axis of the Nahr-i Bihāsh canal, once fronting garden courts that
provided privacy and accommodation. To the north, however, a group of administrative buildings was inserted on the terrace, offset to the left of the main axis, behind their own courts, an arrangement probably intended to combine the advantages of the microclimate with easier access for the emperor to both halls.

The new building types are elaborated. The public audience hall in red sandstone, once plastered, still has the nominal forty columns, but the detail is more florid; a raised ḡabarāb recess under a round arch has a (later?) lawīlla of marble advanced forwards. The Ḥimyār Māhāl has three aisles of intersecting cusped arches on cruciform piers; the canal runs down the centre between vaulted rooms at the corners, which form visual stops. In the Shāh Māhāl (now Dīvān-i Khān), also pierced, the canal is marked by the insertion of narrower and lower bays in the end elevations of the hall and its matching persistyle; the peacock throne was once housed here. The Khān Māhāl (dated 1578-80), comprising private apartments (Khān-bāgh) linked to the Muḥammān Būrjī, faces each of these with a corresponding elevation. The later Mughal style is represented in the Shāh Būrjī pavilion, with baluster columns, depressed arches, and an upward arch of the bābālī over the centre bay (see plan in Rostot, op. cit, pl. 60).

Further elaboration of these elements can be seen in the Rāgpūt work at Amārūb under the direct influence of Agra and Dīhlī, and in the Dīsīt palaces of Dīg (ca. 1725) near Bāharatpūr. The transition to the frivolities of later Mughal palaces is marked by the Kudsiyya Bāgh at Dīhlī, built for the mother of Āḥmad Shīh (1616-7/1748-54), of which fragments remain (cf. a print by T. Daniell, Oriental scenery, London 1795, i, 3). It was built rapidly from brick and plaster, with applied stucco ornament; the river elevation is in two storeys of arched, blind below, and with balustraded openings on to her apartments above. Octagonal towers at each corner are fully latticed above, with oriel set on lotus calyces, and the façade by balustered openings on to a metathesis of bangāl caves; these and other features form the vocabulary of subsequent domestic architecture at Lakhnāw (s.v.). The tradition was to continue with greater vigour in the gradual accretions of Rāgpūt palaces, and in Sīhī buildings, until the present century.

MAHALL (a.), a noun of place from the verb halla, which means notably "to unite (a kaot, luggage, etc."); and by extension, "to make a halt", whence the meaning of "a place where one makes a halt, where one settles (for a longer or shorter time)". This term constitutes the first element of names of towns or villages: in Egypt, where a hundred places were designated by an expression formed from Mahalla followed by an adjective or a proper noun; al-Mahalla al-Kubra ("the great city of al-Mahalla al-Kubra") appears quite early, since it was attested under the name of Pirahmān, war commander. This change in the meaning may be due to the changes in the territories within the empire, and to the need for a more compact expression. The term "mahalla" is also used to designate a movable camp, especially in Turkish (mahall, a metathesis of malldh, a place of assembly, of Persian and Urdu). Dozy (s.v. Mahalla), and by extension, "to make a halt", whence the meaning of "a place where one makes a halt, where one settles (for a longer or shorter time)". This term constitutes the first element of names of towns or villages: in Egypt, where a hundred places were designated by an expression formed from Mahalla followed by an adjective or a proper noun; al-Mahalla al-Kubra ("the great city of al-Mahalla al-Kubra") appears quite early, since it was attested under the name of Pirahmān, war commander. generally received with marks of honour by the subject tribes who, moreover, hated to see it strike camp, for it was they who had to provision the troops on campaign.

The mahalla constituted an instrument of government. It performed in effect a triple function: to consolidate the authority of the sovereign over the provinces, to ensure the levying of taxes and to suppress rebellions or the insubordination of local chiefs. In the ordinary way, it performed a simple route march, but the collection of taxes sometimes proved difficult and necessitated more than a simple demonstration of force; when the launching of a mahalla had been provoked by the agitation of a tribe, it was settled on its territory, from which it put pressure on the population; finally, when serious troubles broke out, real war operations had to be mounted against the rebels, as for example in 1864 (see Kh. Chater, Insurrection et répression dans la Tunisie du XIXe siècle: la Mahalla de Zarrouk au Sahel (1864), Tunis 1978).

In Morocco, the mahallas performed almost the same functions as in Tunisia, with this difference, however, that a good part of the territory totally escaped the authority of the sultan, who was furthermore constrained in organizing one since, from Fez or Meknès, he used to make his way to his southern capital, Marrakesh, via Rabat. In a general fashion, the Moroccan mahalla comprised elements of the three corps of the regular army (see DAVY), to which were added some contingents designated by the name of barha (baraka) and supplied by tribes subject to the sultan. The latter formed the vanguard (or the rearguard where an attack on the rear was repulsed) and explored the terrain, spreading out over a wide area; then came the regular troops charged with protecting the sovereign (who rode under a parasol) and his entourage, who preceded the standards and musicians.

At its resting place the camp contained in its centre the tents of the Sultan, his wives and eunuchs, surrounded by a linen screen, which, in Tunisia, bore the Berber name afnag (transcribed as afnag [arj] [p.9]). Outside this enclosure were placed the ministers, secretaries, musicians, around whom the troops formed a square; within this apparatus, wandering merchants established a market, where all kinds of articles and foodstuffs were to be found, for provisioning was not ensured by regular supervision; it was the tribes who had to supply what was called the mūna (muna), i.e. the provisioning, and it was not uncommon for this to be insufficient, in spite of the sacrifices of the populations subject to this obligation, which often reduced them to misery. Nevertheless, some of them preferred to remain dissonant, at the risk of possibly seeing a mahalla settle on their territory and help itself to their flocks and cereal resources without pity.

Most of the Europeans who visited Morocco before the Protectorate had occasion to describe a mahalla, in particular the one mounted to suppress the rebellion of BO Qura [p.9], but the richest source with reference to this is the work of Dr. L. Arnaud, Au temps des "Mahallas", IHEM, Notes et Documents, fasc. no. xii, Cadablanca 1932.

**Bibliography:** given in the text. (Ch. Pellat)

**Al-Mahalla Al-Kubra** or Mahalla Kasr is the modern name of an important town in the Delta of the Nile at some distance to the west of the Damietta arm, north-east of Tańa. It lies on the Turf-al Mi'āb canal, a branch of the Bahr Shābīn. In view of the large number of Egyptian geographical names compounded with Mahalla (see these listed in Muhammad Ramzl, al-Kūmāt al-jishārsī fi 'ilābīd al-Misriyya, Cairo 1953-68, i, 404-9), the identification of the town with the names mentioned by earlier Arabic writers is a matter of some difficulty. Maspero and Wiet identify it with the Copetic Tishier (Amdlin, La geographie de l'Egypte a l'époque copte, Paris 1893, 262), but this identification is rendered doubtful by the fact that al-Mahalla is a purely Arabic name (and it also remains to be proved that it is a rendering of the Copetic name just mentioned), and because the work of Abū Shāhīn on the Christian buildings of Egypt makes no mention of this town. The earliest author who knew a town called al-Mahalla or al-Mahalla al-Kabīra is al-Muqaddasī (55, 194, 196, 200); he tells us that it was a town of al-Rūf built in two parts, one called Sandāf (or Sandaf), but the statement that the town was situated on the river by Alexandria (200) seems to be an error. Al-Bakrī seems to know the same town under the name Mahalla Māfīrūn (Khit al-Mahalla wa 'l-mamatīk Brit. Libr., mi. 1416, Description de L'Afrique, 158, calls the town simply al-Mahalla and knows a coastal city called after it. Yākūt's statements are confirmed, for he speaks of two places of that name, Dakhāl and of another Mahalla Shāhīyūn (iv, 428), both of which seem to refer to the same place. Mahallā Shāhīyūn in Yākūt—which he also calls Mahalla al-Kabīra—forms one town with Sandaf and on the other hand he says that Mahalla Dakhāl between al-Kāhira and Dīnāyūt is the largest of the Mahallas that he knows (cf. also Abu 'l-Fida', ii, 160), while the geographer al-Dimīshkī (234) knows Mahalla Dakhāl as the capital of the kūff of Dakhālū; Ibn Dūrūn (v, 82) says that the governorship of this town was regarded as "the little vizierate" (al-witīzara al-tashārī). Under the Mamlūk sultan Barquš's administrative organization at the end of the 14th/15th century, al-Mahalla al-Kubrā became the centre of the wilaya of the town under an amir tahlikāna (900 H. Hahn, Ägypten nach den mamlūkischen Lehensregistern. 11. Das Delft, Wiesbaden 1982, 311, 519).

The name Mahalla Shāhīyūn is again found in al-Makrīzī (ed. Wiet, iii, 297); it is clear from these writers that the town was an important commercial centre from the 4th/10th century onwards. It does not seem however to have played any considerable part in history, although All Pasha Mubārāk quotes some events that took place there, from al-Makrīzī and al-Dabari. In Egypt in the 19th century, the town had to give way to Tańa, which became the capital of the munīf of al-Qāhirat, while al-Mahalla became the capital of a smaller administrative area; All Mubārāk estimates its inhabitants at 50,000, while the 1914 Baedeker gives it only 35,500. It is present at a centre of the cotton trade; raw cotton is there cleaned in the factories. Of the many individuals who bore the name al-Mahalli, the most celebrated is Djallāl al-Dīn al-Mahalli [p.9], who was born here.

**Makallati, Ḡārā Khan, Bāyyid Ḡurban All Shāh, last of the Niṣārī Ismā'īlī imāms**
to reside in Iran and the first of them to bear the title of Aghā (less commonly but more correctly, Aghā Khan). Born in 1229/1814 in the village of Rahat near Maballati in central Iran, he succeeded to the imamate in 1233/1817 when his father, Sāhib Khān Allāh, was murdered in Yazd. Faith 'All Shah, the kādjar ruler, amply compensated the young imām. His lands at Maballati were extended by royal decree, he was given a daughter of Faith 'All Shah in marriage, and he was made governor of Kūn, despite his extreme youth. With this appointment came the title Aghā Khan, subsequently used as a hereditary title by the Nizārī Ismā‘īlī imāms.

Aghā Khan Maballati led an apparently loyal and tranquil existence until the death of Faith 'All Shah in 1230/1814, and the favour with which the court regarded him was confirmed when the new ruler, Muhammad Shah, appointed him governor of Kirmān. But when, in 1254/1836, an attempt was made to replace Maballati with Piruz Mirzā, a Kādjar prince, he forcibly resisted his dismissal and embarked on a career of rebellion that ended with his fleeing to India by way of Afghanistan. Despite initial success, Aghā Khan Maballati was soon obliged to withdraw to the citadel at Bām, where he surrendered after a siege lasting fourteen months. There followed eight months of captivity in Kirmān and a period of retreat at the shrine of Shah 'Abd al-'Azm before he was able to plead for mercy at the court. He was pardoned on condition that he retire to Maballāt. This he did, but in the space of two years he gathered there an army of Ismā‘īlīs and non-Ismā‘īl mercenaries that enabled him to resume his rebellion. Claiming that he wished to go to Bandar 'Abbas in order to embark for the Hijāz, Aghā Khan Maballāt left Maballāt in Kādrāb 1256/September 1840, striking out with his force south-east across the desert to Yazd and Kirmān. Again he won a number of preliminary engagements, but in 1258/1842 he was decisively worsted in a large battle outside Kirmān and soon after he crossed into Afghanistan.

Aghā Khan Maballātī’s motives for rebelling against the Iranian central government are unclear. They may have been connected in part with rivalries surrounding the Nīnmatallāh Shīr order. Despite the paradox involved in an Isra‘īlī going to the court to displace Zayn al-Abī asking for his pardon and safe return to Iran, Agha Khan Maballati took up residence in Bombay, where he acquired extensive properties and began to accumulate a vast fortune. In this undertaking he was significantly aided by a ruling, handed down by the Bombay High Court in 1850, that placed all the community property of the Nizārī Ismā‘īlīs in the name of their imām and under his absolute control. Maballati died in April 1863, and was buried in a lavish shrine at Hasanabad in the Mazandaran area of Bombay. He was succeeded by the eldest of his four sons, Agha 'All Shah, Agha Khan II.

MABALLI is the commonly used Ottoman administrative paragraph for a ward or quarter of a town. As listed in the Ottoman registers (see DAIKARTI-‘KHAN), the maballes are of various kinds. Characteristically, the Ottoman maballe consisted of a religious community grouped around its mosque (or church or synagogue) and headed by its religious chief. In addition to its place of worship, the maballe normally had its own market, school and water fountain, these normally being supported by pious endowments. In many provincial towns, the maballe also had its own outer wall with a limited number of controlled points of access. Often the maballe had its own militia and some form of internal police. At times government central authority, rivalries and even armed clashes between maballes were not uncommon. The strong sense of corporate identity of the maballe is also indicated in a number of other ways, as for example in processions and ceremonies, with music, torches and flags. These were frequently linked with the Sāhib brotherhood (see TANESA) with which the inhabitants of the maballe were associated.

Often the maballe bear ethnic or denominational names, e.g. of Kurds, Turks, Mozajis, Christians, Jews; where Christians and Jews are numerous, they may
be subdivided by communities, e.g. Orthodox, Copts, Armenians, or, in the case of Spanish Jews, by their cities or provinces of origin. While many quarters are inhabited by homogeneous ethnic, religious, or, sometimes, occupational groups, this is not always so, and the registers list many quarters in which different elements live side-by-side. The quarters inhabited by Sunni Muslims are normally designated by some topographical name, often that of the main mosque of the quarter. The listing of the adult male inhabitants of the quarter often begins with the Imam and other religious functionaries, and ends with an indication of the numbers of religious and other tax-exempt (e.g. blind, mad or maimed) persons. In many dealings with authority, the Imam of the mosque, or his equivalent, was the representative head of the mahalla. In some documents, the mahalla appears to be headed by a Shaykh, responsible to and appointed by the Ottoman authorities, possibly on the recommendation of the inhabitants of the quarter. In 1242/1826 a new system was introduced, with the election of a mukhtar (q.v.) as headman for urban districts as well as villages.

1. Theological debates (musnâdarî), where the Mu'meess were pre-eminent, not only in their combat with other sects and religions, but also in their internal discourse, commented on by the Sophists and by Greek philosophers in general. They made use of dialectic as a very efficacious instrument of analysis, a means of distinguishing absolute truth from relative truths.  
2. Secular debates (mu'mâdarî, mu'âdarî) on a broad range of subjects coming to the fore in a new civilisation loaded with contrasting elements, particularly the conflict between the Shu'âbîs and the believers in the supremacy of the Arabs, among whom al-Dâhî (see Gérès, *op. lâd.*) is a distinguished example. The antagonists were numerous. Some of them exploited every opportunity for debate, even on trivial questions, a fact which led al-Dâhî (K. al-Baywânî, i, 11-25, vii, 7-8) to
describe them as ʻasāb al-bhāṣīmāt, declaring that he had no involvement with them.

This state of affairs inevitably had the effect of throwing doubt on the real worth of every idea and every concept, especially in a milieu where rationalism and Greek influence were the dominating forces. This fact was to influence ideas and literature, both in form and in content, most of all among the rationalists and in the case of Al-Dībājī especially.

In his writings, this author shows an expert knowledge of the milieu, in all its aspects and contradictory tendencies. The characteristics of the milieu become associated with ideas borrowed from Greek philosophy, and it is these which must have led Al-Dībājī to the concept which enable him to reply both to dualists and to determinist Muslims and which was to be one of the fundamentals of his doctrine: the relativity of good and evil in this world and the necessity of their co-existence for the optimum benefit (al-ziyāh) of creation and especially for intelligent life.

The desire to illustrate and popularise his relativist conception of good and evil induces him to prepare, on the basis of the controversies of his time, a fairly long literary text where there is discussion of the merits and faults of the cock and the dog (mūṭažila al-dīth wa-māṣīlah, wa-māṣīlah al-khalīf al-masāwīn). This is presented to the reader in the form of a debate between two highly distinguished Mūṭaẓīlīs. One of them (al-Naṣṣām [q.v.]) favours and defends the cock (sāḥib al-dīth), while the other (Maḥṣūd [q.v.]) favours and defends the dog (sāḥib al-khalīf); both are vehemently criticised by a certain accuser (ṣawāqī) who also censures the two animals and enumerates their vices.

It is not difficult to prove that this innovative debate is the invention of Al-Dībājī himself, seeking out the merits and faults of the cock and the dog and simultaneously prompting the replies made to the accuser (see Gérès, op. cit., 34). He offers this controversy to the reader in a very amusing and attractive literary form. He is the first to present the opportunity of reading, in a book of adab, a text of reasonable length commenting on the māṣīlah and the mawṣūl of the subject under discussion. Al-Dībājī does not confine himself to talking of the cock and the dog: he exposes the merits and faults of many other objects known in his time, such as the pig, the monkey, the eunuch and fire (Haṣa-wān, iv, 30, 1, 160-77, iv, 35, v, 5; Gérès, 445-534).

With the aid of these examples he aims to convince his readers that everything is relative and all is important, and each creation has its place. It is in this sense that the K. al-Hayāmīn is to be understood, as it deals with various despicable elements of creation, the wisdom that they contain and their importance for the optimum state of the world. Similarly, in his book and his letters he deals with different social groups, stressing the important and indispensable role that each plays and concluding that each social group has its place (Haṣa-wān, i, 43-4, 204-10; Al-Maṣāwīn wa l-maṣāwīn, in Rasdī al-Dībājī, ed. Hārūn, Cairo 1964, i, 117; cf. Gérès, 44-54). This realisation comes to be applied in the Dībājīan ethical, which in its principles is reminiscent of the Aristotelian ethical (see Gérès, 54-7).

The composition of literary texts containing praise and censure of the same object is therefore not, in the case of Al-Dībājī, a worthless and insignificant game which seeks only to prove the verbal abilities of a skilful advocate. However, this will not be understood without a detailed study of the corpus of Al-Dībājī's work, especially the K. al-Ḥayāmīn, the readers of which seem to have been attracted or shocked and even scandalised by the form and content of these texts. Al-Dībājī immediately acquired a renown which finds expression as much in the very violent attacks of certain later writers ( Ibn ʿUtayba, Taḥwīl maṣūlahi al-ḥadīth, Fr. tr. G. Lecomte, Damascus 1962, 73) as in the imitation of his method, although his imitators failed to understand the philosophical and theological significance implicit in the form and content of his work.

According to the periods in which works adopting the characteristic structure of certain writings of Al-Dībājī were composed, the content and the form vary subject to the influence of the contemporary milieu and accentuated by dominant trends.

One of these writers who seems to be the most attracted by the Dībājīan method is Ibrahim b. Muhammad al-Bayhākī (3rd-4th/9th-10th century), author of a sizable book of adab entitled Al-Maṣāwīn wa l-maṣāwīn (ed. Schwally, Giessen 1902; ed. Abu ʿAfra Ibrahim, Cairo 1941). Al-Bayhākī is unknown to the ancient Arab biographers, all that can be added to the material contained in the article Al-Bayhākī in EDP, is that he was a moderate Shīʿī (Zaydi) and that he ascended the social scale to the point where he was a muqaddim or companion of kings. Ibn al-Rūmī, who allows him this distinction, composed numerous satires (hidjāf) against him (see Gérès, 74-9; Ibn al-Rūmī, Dustūn, ed. M. Sh. Salim, Beirut n.d., ii, 28-9, ed. M. Kaylān, Cairo 1942, 204-6, poem no. 233; R. Guest, Life and works of Ibn Er-Rūmī, London 1944, 29, 133; S. Boustaïa, Ibn al-Rūmī, sa vie et son œuvre, Beirut 1967, index).

The subjects discussed in the K. al-Maṣāwīn wa l-maṣāwīn and the ideas it reveals are virtually identical to those of Ibn ʿUtayba in the "Uyuṣ al-ḥadīth, with the exception of the politico-religious tendencies which are to be perceived in the first part (see Gérès, 50-3). The factor which makes this book unique and different from other works of
adab is the precise method with which the writer deals with his subjects and his technique of revealing to the reader his own feelings towards them (ībīd., 79-89). Each chapter (ḥāl) is divided into two opposing sections: mahāsin of . . . māsadwi of . . . The contrast concerns either one single object possessing both merits and faults (e.g. mahāsin al-jabr/māsadwi al-ğibr: poverty; see the K. al-Mahāsin wa l-Masūdāv, 99-107, 170-8, 207-30, 304-73, 386-92, 464-9, 595-609, 609-12, 619-22; cf. Gērēs, 87-90, 9), or, as is more common, two objects of which one is positive, praiseworthy and full of merit, the other negative, reprehensible and full of fault (mahāsin al-ruṣul/ māsadwi al-ghādir, Mahāsin al-Mulk/ māsadwi al-masālih; see K. al-Mahāsin wa l-Masūdāv, 1225). This opposition of the two sections is a function of the anonymous terms mahāsin and māsadwi and of the subjects under discussion, which gives the impression that this is an example of the Diḥbīzian procedure of praising and censuring every thing.

This false interpretation of the mahāsin/māsadwi contrast is not new. It appears in as early a work as the pseudo-Dījāhz’s al-Mahāsin wa l-adḍād (ed. G. van Vloten, Leiden 1898, German tr. O. Rescher, II. Über guten und schlechten Seiten der Dinge, Stuttgart 1922, i. Das K. al-Mahāsin wa l-Masūdāv, Constantinople 1928). The Arabic text has been reprinted in Cairo in 1924, 1925-7, and in Beirut in 1969. This author, who seems to have been well-acquainted with Dījāhz, is the first to imitate al-Bayhakī, going so far as to reproduce a substantial part of his work. In fact, the first part of al-Mahāsin wa l-adḍād is found in al-Bayhakī’s work, but in a more complete, exact and correct form (see introd. by van Vloten, pp. ix-x, xiv; cf. Gērēs, 102-10, 112-15). The anonymous author reproduces none of the chapters dealing with politico-religious subjects which reflect the tendencies of al-Bayhakī. The modifications which he introduces into the plagiarised chapters and passages show that he has not properly understood the method followed by this author and that he has been seduced by the Diḥbīzian procedure of bestowing praise and censuring.

Significantly, he has substituted for māsadwi the term ḍiddāhu (its opposite). Thus for him the opposition is: mahāsin of . . . ḍiddāhu. This means that he systematically contrasts the sub-chapters mahāsin of . . . with their opposites, without allowing the reader to deduce whether he will find under the title ḍiddāhu censure of the same subject praised under the heading mahāsin (good/bad sides of the subject) or a subject antithetical to that which has been praised (praise of the good and of the proper/censure of the bad and of the improper). Thus in the example mahāsin al-wujūd/ ḍiddāhu (70-6), it is difficult to decide whether it is praise of the existence of something or censure of its non-existence, of “praise of fidelity” or of “praise of fidelity/censure of infidelity”; a confusion which arises from the ambiguity of the pronoun hu in ḍiddāhu. Furthermore, there is the fact that the book is attributed to al-Dījāhz, with the object of creating in the reader the impression that he is confronted by the Diḥbīzian method, consisting of praising and censuring every notion, and that there is nothing here but a simple literary game. This, it seems, is the anonymous author’s conception of this method.

This is why care should be taken to avoid attributing to him the same intentions and the same motives as those of al-Bayhakī. The things that interest him, besides the method of contrasting, are entertaining subjects and literary texts. The desire to distract and to entertain is even more evident in...
the second part of his book, which is borrowed not from al-Bayhakī but from other sources (see introd. by van Vloten, pp. xiii-xiv; Géries, 116-18). Here, with the exception of the last two chapters which deal with Persian feasts and with gifts, the subject most prominently discussed is that of women: women famous for various reasons, their beauty, examples of romantic intrigues, their fidelity and their infidelity, their wiles and their relationships with men, etc.

Nevertheless, the author applies the contrasting method in only five of the twenty-one subjects tackled in this part of the book, and he confines himself, in the others, to presenting the mahāsin (which here signifies the fine examples or beauties) of the subjects under discussion.

Curiously, he uses the method of contrasting in three cases to present that which to him appears good and praiseworthy in opposition to that which seems evil and culpable: fidelity/infidelity of women, reasonable jealousy/excessive jealousy, copulation/impotence. Furthermore, he uses the terms mahāsin/maṣāfī to reveal, in the title, his judgments and feelings regarding the subjects in question. He does the same in the two other cases, whose titles give the impression that he is conforming to the method which consists of attacking and defending every notion: mahāsin/maṣāfī makh al-nisāʾ (intrigues of women) and mahāsin/maṣāfī l-dabib (scurrilous approach of a man seeking to seduce a woman: 263-72, 148-50). In the first case, intrigues performed for a reputable purpose are commended with the term mahāsin (good intrigues), and those of which the objective is vicious and reprehensible are deplored (wicked intrigues). It is not impossible that the author intended, in this way, to expose the ambivalent attitude of adab and of the Muslim ethic towards intrigue. However, the terms mahāsin/maṣāfī cannot here be translated by praise and blame. In the second case, a short tale of a success (l-dabib is classed under the heading of mahāsin; on the other hand, attempts which end in failure are classified as maṣāfī). Thus favourable/critical judgment depends on the result of the adventure and not on the conduct itself; in other words, there is no place here for praise and censure of the dabib.

These two connotations of opposition characterise the majority of the chapters of al-Bayhakī. Thus the anonymous author has brought no innovation to the contrasting method itself; he has however varied the range of themes tackled, placing the accent on amusing, piquant and even erotic subjects, which brings his book closer to the genre of al-Djahīz, whose overall title is also that of the majority of its chapters, and the fact that it bears the name of al-Djahīz, serve to reinforce the impression that one is faced with the method of praising and censuring every notion, and this element has enhanced the renown acquired by it within this genre.

This reputation seems to have been very widespread in the 4th/10th and 5th/11th centuries, as is expressed through the attribution to al-Djahīz of a letter (ed. Pellat, in Machriq [1958] 70-8; cf. Géries, 120-5) bearing the title FI dhāmm al-ṣulām wa-maṣāfī ("Censure and praise of the sciences"). Its author systematically applies the original Djahīzian method; one by one he censures and praises various sciences and professions with the aid of phrases of wajz (description and evaluation) in rhymed prose which he has drawn from books of adab, including those of al-Djahīz. Analysis of the letter shows that this author is seduced by the effects of style and form involved in the method and not by its philosophical and theological connotations, an attitude thoroughly typical of his age.

The same pre-occupation comes to light soon after in the work of one of the most prolific of 5th/11th century authors, al-Thaḥlīlī. Living in a period where Arab culture was shaped by rhymed prose and by systematic pursuit of form and virtuosity, and in a milieu whose sole concern was with the invention of harmonious forms and formulas for the expression of every thought, he found that the Djahīzian method was the best formula for supplying the needs of the kāfīb (scribe and functionary) and the adīth ("gentleman") of his age in their professional lives and in their encounters: stereotyped expressions finely-composed in prose and poetry, bearing on the main subjects of adab and expressing the two contrary views which people might take towards them or, more accurately, which adab had already taken towards them.

To this effect, al-Thaḥlīlī, in his two identical books al-Thaḥlīlī, there is thus only one used here), tackles each of the eighty subjects that are discussed in a chapter divided into two: madāh . . . ḥafrān . . . (in the first part he offers elegant quotations in praise of the subject, and in the second he gives those which censure it (for example: madāh/ḥafrān al-adīth; reason; of al-Ghang, fortune, etc., 160-8; cf. Géries, 122, 126-39).

This fundamental pre-occupation of the author excludes the anecdotes and lengthy narrations which characterise al-Bayhakī’s book and that of pseudo-Djahīz. For al-Thaḥlīlī, passing praise and censure on every subject is a proof of virtuosity and the witness to a great talent (hašāqa), as well as evidence of a profound knowledge of the Arabic literary heritage (18). It is for this reason that he compiles several books following this method, in which he repeats himself, to such an extent that in two of them he even reproduces the same themes and the same quotations, while giving to each of them a different title. Furthermore, he dedicates them to two different persons, adding, in the introduction to each, the pretense that in this book he has invented material that is original and totally unprecedented (21; cf. Géries, 132-5).

In addition, he reproduces a large proportion of the materials presented in these books in a third which he entitles al-Tashāf wa-l-taḥbīb (ms. İstanbul, Raghīb Pasha 1473, Fāyūd ʿAllāh 2133, edition of the text in preparation), and in which the opposition is presented in a new form: he praises that which is generally regarded as bad and passes censure on that which is generally regarded as good, apparently seeking, once again, to present a book which may appear new and unique in its genre.

In these three books of al-Thaḥlīlī, there is nothing to confirm the view that the author was acquainted with the work of al-Bayhakī or of pseudo-Djahīz. On the other hand, it is the direct or indirect influence of the Djahīzian corpus that seems to be acting upon him, compelling him to follow the method which involves praising and censuring every notion (see Géries, 158-61).
The almost-immaculate coat of these beautiful, desert-dwelling addax antelopes is applied to rock crystal (brillat), with its first set of tusk-like horns and female are hardly distinguishable, but they do differ slightly in height and in horn thickness; mahāt and the other names are used without gender distinction, as are the poetical descriptions of them like ʿaynā, (pl. ʿīn) "with big, black eyes" and ḫawwāl, "with a flat muzzle". The desert folk are very acute in their observations, and they use a more precise vocabulary to describe the animals at different stages of their development.

The calf at birth is baḥaṣi or barṭḥaṣ, but if it is completely white, maʿrī is used. As it grows and up to the time of its weaning (Ṣuđam), it is called faṣrā, faṣrāh and faṣrāh. A male (bull) calf has the name ṣ-src-ḥrah frah, and the adult male ṣ-ḥrāh; in the rutting season, its restless and skittish manner is aptly described as ṣādī ḫīlī "lively" and ṣaḥīr ṭawwār, "pawing the ground". The old bull, ḵ ḡab, is often found living alone.

The oryx. In the semi-desert areas of Africa, Syria and Arabia, several species of oryx are found. Even some of the rare white oryx (Oryx algazali algazali) have survived on the northern edges of the Sahara, where it is called waḥāb in Chad, waḥāb-ṣūrīgīyya (pl. ʿāy) in Mauretania (in the Egyptian Sudan, it is called ābū ʿārāb, and in Tūmāhāl of AlAggar, tammāsīt-ṣūrīgīyya, pl. tammānī, ṣārīmī, ṣūrīmī, and pl. ×ī̂ mítīmu). The last specimen in Tunisia was killed south of Douz in 1966, but in ancient times it was said to be common in southern Morocco, the high Algerian plains and southern Tunisia. From murals in ancient Egyptian tombs, there is evidence that it was domesticated under the Pharaohs and used as a draught animal. Fliny says ... oryxum appellati Aegyptii, which, considering how Latin was pronounced then, suggests that the name should be compared with Moorish ʿirīgīyya.

In the Middle Ages, the animal was known in the Sahara by the name of lamī, and its skin was used to make the famous shields [see LAM]. Now that the oryx has completely disappeared from the Sahara, this has been caused in fairly recent times by the increasing number and better quality of firearms in the area, and also by the ploughing-up of the desert by incessant motorised traffic. The oryx is, after all, a big, heavy creature, short-winded and not very fierce; it used to be that a good mehari camel was all that was needed to catch it quickly. Saharan travellers in the last century found great herds of oryx which they, said, could be numbered in hundreds, but that now seems an age ago.

There are two other species in Africa, with darker coats and also black stripes, the oryx gazella in the south-west and oryx leucoryx (possibly derived from baydār, "white") oryx which includes the oryx beisa beisa of Abyssinia, o.b. galareum of Mozambique, o.b. amniemtis and o.b. callosis in the southeast and Kilimanjaro. None of these brightly-marked antelopes are, however, found in Arabic-speaking countries. There has always been a distinct species in Arabia, the oryx leucoryx (formerly beatiris) known as the sabre-horned or Arabian oryx, which is found as far as the borders of Syria and ʿIrāq, and which was the first species to be called al-maḥāt by the Arabs. Their tapering black horns are ringed, and curve back majestically like those of their African cousins. They are usually more than a metre long and are perfectly parallel, so that when...
seen from the side the animal seems to have just one horn. That is why the oryx was thought, wrongly, to have connections with the unicorn, but that mythical animal is in fact to be connected with the rhinoceros [see KARKADDAN].

Probably no other desert wild animal, except the onager (binbars al-wa'ahah), has been described more than the sabre-horned antelope by the pre-Islamic poets and their later imitators. The animal was not used as a principal theme in their kasidah, but as a background image of the hard desert life and the difficulties in it that the poet would have experienced himself. There are long descriptions of hunting for the oryx and of its death (fardah), which, incidentally, show how abundant it must have been. The poet, wishing to emphasize the high moral qualities of the huntsman, by a literary device transfers these qualities to the brave, hunted animal. The scene itself is conventional, but it reflects an idyllic picture of violent hunting in all its details. Sometimes the poet mounts a horse, and then the oryx is soon caught, after a terrifying chase in which as often as not three salukis participate, and is brought down at the point of a lance. Experiences of the horse like this are common in oryx poems. Zuhayr b. Abi Sulma, 'Alkama al-Fabi and a number of others described such events in their tragedy hunt. On other occasions, he will mount a she-camel, and then the story of the chase ends differently, for the oryx becomes the symbol of this matchless she-camel and it triumphs over all its adversaries by its speed and endurance; it will stop only to rip open a dog or two with its terrifying horns. Such poems are accordingly panegyrics, and al-Dhahib has carefully discussed this mechanical literary device in archaic poetry in his Hayawan, ii, 20, where he says, "when the poem is a lamentation or exhortation, it is usual for poets to let the dogs kill the oryx, but in panegyrics, where the camel is said to be an oryx with certain special qualities, it is the dogs that are killed. That is not to say that such events are poetic fabrications, for oryx bulls have often killed or injured dogs, but it usually happens that the hunted animal is the victim in the end, the dogs emerge safe and well and their master has found his quarry."

A more romantic picture is sometimes drawn to show the effect of the four seasons of the life of the oryx, each with its own particular difficulties, struggles and hardships. Such pictures represent the challenges the pre-Islamic Bedouin faced in their daily life, whether they were real or not. The bull, for example, is shown as wandering far in search of a mate and as confronting many rivals in tests of behaviour, but the addax seems generally better adapted to his environment than the oryx. It is more resistant to thirst for, like the camel, it carries a special sac containing an aqueous, slightly acidulous liquid in its belly, and this has been the salvation of many a waterless hunter (Pliny refers to it in Nat. Hist., x, 47); moreover, its wide, spongy hoof is well adapted to its environment. The main distinction between the addax and the oryx is the absence of any brownish-red markings on the neck and breast. Other distinguishing marks are its brown forehead, its white tear-pit, its reddish nose and its noticeably long horns (qaqas, qaqat). These are straight with a slight backward slope and a two-and-a-half turn spiral; they are fully annulated. Both antelopes enjoy the same habitat and display the same behaviour, but the addax seems generally better adapted to its environment than the oryx. It is more resistant to thirst for, like the camel, it carries a special sac containing an aqueous, slightly acidulous liquid in its belly, and this has been the salvation of many a waterless hunter (Pliny refers to it in Nat. Hist., x, 47); moreover, its wide, spongy hoof is a great help when it comes to long, sustained journeys across the dunes.

In the Yemen during the Himyaritic period, the ibex (capra ibex) and the oryx were game animals which were hunted in accordance with ancient cultic rites. Archaeologists have excavated many bas-reliefs on which they are depicted (see in the Hist. the important works here of M. Höfler, R. B. Sergeant and J. Ryckmans). Before the dawn of Islam, in the north-erly regions of the peninsula the oryx had a special position as a sacrificial beast (sifruh) in the ritual, idolatrous offerings performed by the Arabs in the month of general truce, Rabia; the oryx was included with domestic cattle in the list of raghbiysiat (Hayawan, vi, 517).

There were still about a thousand oryx in Arabia in 1950, but nine years later only about a hundred were left, in the remote regions of the "Empty Quarter" (al-Rouh al-halifat) to the north-west of Aden. Seventy of these were destroyed by motorised safaris with automatic weapons in 1960-1. Faced with such a serious situation, the World Wild Life Fund organised a rescue mission under Major L. R. Grimwood in 1962 and three animals were captured. To these were added one offered by the Kuwaiti ruler and four from King Ibn Sa'ud. These eight survivors formed the nucleus of a breed set up in a desert park, but apart from these animals, the white oryx, locally the wadiyaha or abi rula, can be considered an extinct species in Arabia and the Near East. Some of the animals have introduced as a substitute in some areas the oryx-gazelle, which is native to Africa.

2. The addax. In North Africa, mahat also denotes the addax (Addax nasomaculatus), a cousin of the oryx. This animal is extremely rare, and is found in a narrow strip of land in the Sahara, from Mauretania to the western edge of the Nile. At the beginning of this century, it could also be found in Palestine and Arabia, and it is recorded in ancient Syria and Mesopotamia. The main distinction between the addax and the oryx is the absence of any brownish-red markings on the neck and breast. Other distinguishing marks are its brown forehead, its white tear-pit, its reddish nose and its noticeably long horns (qaqas, qaqat). These are straight with a slight backward slope and a two-and-a-half turn spiral; they are fully annulated. Both antelopes enjoy the same habitat and display the same behaviour, but the addax seems generally better adapted to its environment than the oryx. It is more resistant to thirst for, like the camel, it carries a special sac containing an aqueous, slightly acidulous liquid in its belly, and this has been the salvation of many a waterless hunter (Pliny refers to it in Nat. Hist., x, 47); moreover, its wide, spongy hoof is a great help when it comes to long, sustained journeys across the dunes.

Two vernacular Arab names for the animal are in use, mahat and qar al-wa'ahah, and perhaps echoes of an earlier African term, taken into Latin by Pliny as addax, are to be found in its Sudanese and Upper Egyptian names 'akhabis, bi 'akbas, bi 'adad; the origin and meaning of these names is still uncertain. The Touareg call it amellzialamelliat, pl. imellziałimellłat (from the verb "to be white"), and thus draw attention to the whiteness of its coat. They regard the addax as a choice game animal, and hunt it as soon as the herds mass together in the spring. Observers in the last century said that there could be as many as 300 animals in such gatherings (see O. Nachtigal, Sahara und Sudan, Berlin.
1870-89, i, 551). Ibn Battûta, travelling five centuries earlier in the spring of 753/1352 from Tâsârah to ḳâṭârah (Wâlatâ), was amazed at the abundance of the herds and by their evident fearlessness of man. He noted that the people of the region hunted the addax with dogs and shot them down with arrows. He added that they were very fond of the stomach liquid, and that they used to slice their thumb from their victims. For his own part, he did not find the meat enjoyable, saying that it was dry and tasteless (Rûmûn, ii, 190). Because it was relatively slow-footed, it was easy to capture, and the antelope offered the hunter not just venison as his prize but also leather and the stomach liquid. This liquid was said to possess many virtues, and it commanded a high price in the markets in large centres as far away as Tunis. There was also the attraction of extracting bexors [see nâlân] known locally as bid el-makhlûk ‘antelope’s eggs’, from the viscerœ. These biliary secretions occur very frequently in the digestive systems of ruminants, and the preparation was greatly valued in the medieval pharmacopoeia for its supposed qualities as an antidote and a aphrodisiac. Jewish pharmacists and druggists of the cities of the Maghrîb went about collecting them eagerly from the nomads and then sold them speculatively to sultans and persons of high rank. The addax skin was, by contrast, much less valuable than that of the oryx; it was used only for shoe making and saddlery. Of course, the trick was not unknown of substituting addax-leather for oryx-leather for making the famous impenetrable shields mentioned above.

Before firearms and motor-cars arrived, the addax was pursued with dogs, and it was also caught in traps (the spiked-wheel trap and the crossbow trap). The Tibbu of Tenere would encircle a herd and then sell them speculatively to sultans and persons of high rank. The addax skin was, by contrast, much less valuable than that of the oryx; it was used only for shoe making and saddlery. Of course, the trick was not unknown of substituting addax-leather for oryx-leather for making the famous impenetrable shields mentioned above.

**MAHÔB B. AL-RAHIL AL-'ABDĪ, ABU SUPYAN, Ibnîdī theologian and historian, originally from the Arabic tribe of the Banā' Ābd al-Kays, who lived in the 2nd/9th century and who is cited in the *Kitab Tabakht al-mashdiyih* of al-Dardî (d. 670/1272 [q.v.]) amongst the scholars of the fourth *tabâqa* or class. His family came originally from *Ihrīk* [his grandfather al-Mâlî al-'Abdī was one of the close friends of the head of the *Bidâ* community in *Busra*, the famous Ābd al-'Ubayda Muslims b. Ābd Karîma al-Tamîmi [see al-Ibrâîıyî], and he first lived in *Urān*. Then he settled in *Busra*, where he became a pupil of Ābd al-'Ubayda. After the death of al-Râbi' b. Habîb al-Busran, head of the *Bidâ* community in *Busra* after Ābd al-'Ubayda, spiritual supremacy in the *Bidâ* world passed to Ābd Suyūtî Mahbûb b. al-Rahîl. In effect, he acted as arbiter over the schism of Khilāf al-ālîn in the *Maghrib* [see al-Γalâ'/asyv] during the reign of the Kustamînīnīn Imam *Abd al-Wahhâb b. 'Abd al-Râhîm b. Rustam, and wrote a *risâla* (or *kâf*) to the *Bidâ* chief *Abd Allâh b. Vâhîy al-Kindi, called *Tâlî* al-Hâkh (d. 129/747), who set up in South Africa the first *Ibrâî* imâmate and who occupied *Mecca* and *Medina*. Mahbûb b. al-Rahîl became especially known as a historian, and it is to him that we owe the greater part of the traditions about the oldest *Ibrâî* shâ'âbīs. His historical work, mentioned in al-Bârâdî's catalogue (9th/15th century) under the title of Kitâb Ābd Sujûn, served as al-Dârîjî's basis for the putting-together of the first four classes of his *K. Tabâkh al-mashdiyih*, where he is cited several times.

**MAHÂDâWS, a sectarian group in Indian Islam, the followers of Sayyid Muhammad Mahdî (827/1421-1450) of *Djâwânpur* [q.v.], near *Bheers*, who declared that he was the promised Mahdî [q.v.] and by his preaching gained a number of adherents in Ahmadâbâd [q.v.] and other parts of Gugjârat. He was compelled to leave India, however, and died at *Pârîh* in what is now western Afghanistan, where he was buried. His followers credited him with the power of working miracles, raising the dead, healing the blind and the dumb, etc. For a time, they were allowed to profess their faith without official harassment; but in the reign of *Muzaffar II, Sultan of Gugjârat* (917/1511-26) they were persecuted, and many of them put to death. The Mughal prince *Arângzîb* [q.v.] also moved against them when in 1055/1645 he became governor of Ahmadâbâd. In consequence of these persecutions, most Mahdâwis began to practise the *tahiyya* [q.v.] and other parts of the orthodox Muslims. Their exact number, therefore, remains today uncertain. They are found in small groups in some parts of Gugjârat, in *Bombay*, in the *Deccan*, in Uttar Pradesh and also in *Sind*, where they are known as *Zikris* [see *Zikri*s in *Suppl.*]. **MAHDIYYA**

Origin and early development during the Umayyad age. The term mahdi as such does not occur in the Qur'an; but the name is clearly derived from the Arabic root ـلاـ which commonly used in it in the meaning of divine guidance. As an honorific epithet without messianic significance, the term was employed from the beginning of Islam (references gathered by Goldziher, *Variaungen*, 257). Hassan b. Thabit thus described it in the Prophet's hadith to Abirr b. Abraham. Sulayman b. 'Abdul-referred to as al-Husayn, after his martyrdom, as "Mahdi son of the Mahdi," and al-Farazdaq called al-Wahl in a panegyric the sixth of six caliphs of 'Abd Shams from 'Uthman who were khdw mahdiyyin (Dīwān al-Farazdaq, ed. al-Sūfī, Cairo 1936, 88). During the Second Civil War, after the death of Mu'awiya, the term came first to be used for an expected ruler who would restore Islam to its original perfection. 'Abd Allāh b. al-Zubayr claimed the caliphate as such a restorer. Though he does not seem to have been given the epithet al-Mahdi, his career substantially shaped the later image of the expected Mahdi. In Kūfā, al-Hartūnī (d. 99/716) and Mu'ādh b. 'Amr (d. 544) and of his son al-Walid II as a Mahdi (khdw), the Mahdi thus applied it to the Prophet, and Djarir to Sulayman b. Surad referred to al-l-Qusayn, but he refused to engage himself in the Mahdiyya. As an honorific epithet without messianic significance, the term was facilitated by the fact that 'Umar II was descended through his mother from 'Umar I who, together with his son 'Abd Allāh, enjoyed the highest religious authority among conservative Medinan scholars. Statements attributed to 'Umar I and 'Abd Allāh b. ʿUmar were circulated to the effect that the former had predicted the advent of a descendant of his who would fill the earth with justice. These statements reflect an earlier expectation that a descendant of ʿUmar I through male lineage would become the restorer of justice, but they were now applied to the Umayyads (Ibn Sa'd, v, 243). Sa'id b. al-Musayyib (d. 93 or 94/712-13) was alleged to have identified ʿUmar II as the Mahdi, while the latter was still in Medina but before his reign. A particular effort was made to counter Kifān claims that the Mahdi would be an Alid. Thus Muḥammad b. al-Ḥanafiyah was reported in Medina to have said that if there was to be a Mahdi he would belong to the ʿAbd Shams. Muḥammad b. l-Bākīr, the imām of the Imāmites, was quoted as stating during the caliphate of ʿUmar II: "The Prophet belongs to us, and the Mahdi belongs to the Banū ʿAbd Shams. We do not know him to be anyone but ʿUmar b. Abd al-Azīz" (Ibn Sa'd, v, 245).

In Mecca, on the other hand, ʿUmar b. Kaysan (d. 106/724-5), a respected muḥaddith traditionist residing in the Yemen, was quoted expressing himself more reservedly that ʿUmar II was rightly guided but not the Mahdi (khdw). Statements attributed to ʿUmar II of the type "khdw khdw" were made to counter ʿAbd al-Qādir b. ʿAbda b. Abī Maʿābad Nafīlī (d. 104/722-3), a particular effort was made to counter Kifān claims that the Mahdi would be an Alid. Thus Muḥammad b. al-Ḥanafiyah was reported in Medina to have said that if there was to be a Mahdi he would belong to the ʿAbd Shams. Muḥammad b. l-Bākīr, the imām of the Imāmites, was quoted as stating during the caliphate of ʿUmar II: "The Prophet belongs to us, and the Mahdi belongs to the Banū ʿAbd Shams. We do not know him to be anyone but ʿUmar b. Abd al-Azīz" (Ibn Sa'd, v, 245).

In Mecca, on the other hand, ʿUmar b. Kaysan (d. 106/724-5), a respected muḥaddith traditionist residing in the Yemen, was quoted expressing himself more reservedly that ʿUmar II was rightly guided but not the Mahdi (khdw). Statements attributed to ʿUmar II of the type "khdw khdw" were made to counter ʿAbd al-Qādir b. ʿAbda b. Abī Maʿābad Nafīlī (d. 104/722-3), a particular effort was made to counter Kifān claims that the Mahdi would be an Alid. Thus Muḥammad b. al-Ḥanafiyah was reported in Medina to have said that if there was to be a Mahdi he would belong to the ʿAbd Shams. Muḥammad b. l-Bākīr, the imām of the Imāmites, was quoted as stating during the caliphate of ʿUmar II: "The Prophet belongs to us, and the Mahdi belongs to the Banū ʿAbd Shams. We do not know him to be anyone but ʿUmar b. Abd al-Azīz" (Ibn Sa'd, v, 245).

In Mecca, on the other hand, ʿUmar b. Kaysan (d. 106/724-5), a respected muḥaddith traditionist residing in the Yemen, was quoted expressing himself more reservedly that ʿUmar II was rightly guided but not the Mahdi (khdw). Statements attributed to ʿUmar II of the type "khdw khdw" were made to counter ʿAbd al-Qādir b. ʿAbda b. Abī Maʿābad Nafīlī (d. 104/722-3), a particular effort was made to counter Kifān claims that the Mahdi would be an Alid. Thus Muḥammad b. al-Ḥanafiyah was reported in Medina to have said that if there was to be a Mahdi he would belong to the ʿAbd Shams. Muḥammad b. l-Bākīr, the imām of the Imāmites, was quoted as stating during the caliphate of ʿUmar II: "The Prophet belongs to us, and the Mahdi belongs to the Banū ʿAbd Shams. We do not know him to be anyone but ʿUmar b. Abd al-Azīz" (Ibn Sa'd, v, 245).
II. His contemporary and rival in the religious leadership in Basra, Muhammad b. Sira (d. 110/728) maintained that there would be a Mahdi of the Muslim community (faisum) and that he, after descending from heaven, would pray behind him. He further affirmed that the Mahdi would be more excellent than Abu Bakr and `Umar and would equal a prophet in rank. According to another report, he held that the Kafari was identical with the Mahdi. Khatada (d. 117 or 118/735-6), prominent disciple of al-Hasan, spread the following hadith of the Prophet: "There will arise a difference after the death of a caliph, and a man of the people of Medina will go forth fleeing to Mecca. Then some of the people of Mecca will come to him and make him rise in revolt against his will, and they will pledge allegiance to him between the run and the mahdi. An expedition will be sent against him from Syria but will be swallowed up (yukfasaf bi-hith) in the desert between Mecca and Medina. When the people see this, the righteous (abdil) of Syria and the groups of horsemen (sadib) of `Irak will come to him and swear allegiance to him. Thereafter a man of Kuraish will arise whose maternal uncles are of Kalb. He will send an expedition against them but they will defeat them. This will be the expedition of Kalb, and disappointment will be for those who will not witness the booty of Kalb. He will then divide the wealth and act among them according to the sunna of their Prophet. Islam will become firmly established (yuhi bi-ghayrahi). He will remain seven (var. nine) years and then die, and the Muslims will pray over him." This hadith, whose first part is patterned upon the revolt of `Abd Allah b. al-Zubayr, may conceivably go back to `Abd Allah b. al-Harith b. Nawfal b. al-Harith b. `Abd al-Muttalib, who appears in its isnad and claimed to have heard it from Umme Salama, widow of the Prophet. `Abd Allah b. al-Harith, called "Babba", was chosen by the people of Basra as their governor in 646/684 after the death of the caliph Yazid and the flight of his governor Ubayy Allah b. Ziyad. But he held aloof from all the violent events in Basra at this time (cf. Ch. Pellat, Le milieu basrien et la formation du Hadith, Paris 1953, 268-9): hence it is in fact unlikely that he was responsible for this hadith, which aimed at stirring up support for the cause of Ibn al-Zubayr. There is also a variant of it, including the addition of the Sufyanite, whose "maternal uncles were of Kalb" and who would send an army of Kalb against Ibn al-Zubayr, reflects the expectations at the time which were not fulfilled by history. The element of the swallowing up of a swarming army, based on Kur'anic warnings (aknd ad-dild), was incorporated from slightly earlier hadith spread by `Abd Allah b. al-Zubayr himself and by two prominent supporters of his, `Abd Allah b. Safwan and al-Harith b. `Abd Rab' al-Mahzumah, as war propaganda during the campaign of Yazid's army against Medina and Mecca (see Muslim, Suhk, K. al-fitan, bab al-khab). Though it does not mention the Mahdi, the hadith of Khatada was later generally taken to refer to him, while his Syrian rival became the prototype of the Sufyanite [gu], the traditional opponent of the Mahdi. Much of later tradition about the career of the Mahdi and of this Sufyanite is an elaboration of the various elements of this hadith.

In the late Umayyad age, Matar b. `Abd Allah b. `Abd al-Muttalib (d. 125/742), a Khurarsanid resident in Basra and senior disciple of Khatada, rejected the view that `Umar II was the Mahdi, stating that the Mahdi would do something `Umar II had not done: be would refuse to accept money returned to the treasury by someone who, after requesting it, found that he had no need of it. Matar also transmitted traditions attributed to Ka'b al-Ajahbari to the effect that the Mahdi was named so because he would be guided (yyahd) to find copies of the original text of the Torah and the Gospel concealed in Antioch. The same Ka'b tradition seems to have been known also in Kufa at this time, where "Abd Allah b. Bishr al-Khahifani is reported to have transmitted it in the following form: "The Mahdi will send (an army) to fight the Rumi, will be given the knowledge (fahd) of ten, and will bring forth the Ark of the Divine Presence (fahd al-sakina) from a cave in Antioch in which are the Torah which God sent down to Moses and the Gospel which he sent down to Jesus, and he will rule among the People of the Torah according to their Torah and among the People of the Gospel according to their Gospel."
The following hadith was circulated in late Umayyad Basra on the authority of Abu Sa'id al-Khuladi: "The Prophet said: There will be in my community the Mahdi, if for a short time, seven (years), otherwise nine. My community will then enjoy prosperity as they have never enjoyed. The earth will bring forth its fruit for them and will not hoard anything away from them. Money will at that time be in heaps, and whenever a man will get up and say 'O Mahdi, give me', he will say 'Take'." This hadith, which identifies the Mahdi with the generous ruler predicted earlier, was spread, with variants, by Zayd al-`Amri but may in substance go back to his authority, the Basran Abu 'l-Siddiq al-Najdi (d. 128/746-7). Another variant of it was transmitted by Suhaym b. `Abd al-Salami, a Basran contemporary of Zayd al-`Amri. Of late Umayyad Basran origin is also the topos that the Mahdi would have an aquiline nose and a bald forehead (ahm Kiid). Kufan tradition insisted that the Mahdi would be one of the Ahi al-Bayt of the Prophet or a descendant of `Ali. `Asim b. Bahdala (d. 127 or 128/744-5), the famous Kufan Qur'ani reader, disseminated the following hadith with a Kufan isnad going back to `Abd Allah b. Mas'ud: "The Prophet said: The world will not pass until a man of my family (ahi bayt) will rule the Arabs whose name will coincide with my name (yussal tamuk sum)." The claim that this hadith was originally transmitted by the Prophet was no doubt made in the time of al-Mughira's rebellion in favour of Mu`awiyah b. al-Husayniyya, who is reported, when addressed as the Mahdi, to have referred to his privilege of bearing the name and hansiya of the Prophet (Ibn Sa'd, v. 68). The hadith of `Asim thus probably goes back to `Asim's authority, Zurr b. `Abdlay, who was known for his pro-`Ali sentiment. By the time of the revolt of Zayd b. `Ali in Kufa in 129/748, the thesis of the identity of names was evidently already well-established there, since his supporters did not try to identify him with the Mahdi but with the Mansur (al-Tabar, i, 1676), a messianic figure originating in Yemenite beliefs. In Kufa it was also spread the following hadith related by `Alahim son of Muhammad b. al-Husayniyya, under authority of his father on the authority of `Ali: "The Prophet said, 'The Mahdi will be from us, the Ahi al-Bayt. God will give him success in a single night (yuhi bi-ghayrahi)." The descent of the Mahdi from the Prophet was also affirmed in the hadith: "The Messenger of God said, 'Even if only a single day of the earth were left, God would send a man from us who will fill it with justice as it had been filled with oppression." Though the hadith was widely spread
Among the traditionists only by the Kufan Fitr b. Khalifa (d. 153/770), it may well go back to the Companion Abu 'l-Tufayl 'Amir b. Waqih (d. eq. 100/718-19), known for his support of 'Ali and his Shi'a sympathies, who claimed to have heard it from 'Ali. The theme of the generous ruler was taken up in Kufa by Atyiya b. Sa'd b. Dunada al-Kaysi (d. 111/730 or 127/744-5), considered a Shi'a, who passed it on to the author of Abu Sa'id al-Khudri: 'The Prophet said, 'A man will come forth from my family after an interval of time (finda 'nhad' min al-saman) and the appearance of civil wars (jisa) whose lib erality will be in throwing about (hatsayu) [money]. He will be called al-Saffah (= the generous')."

The early 'Abbasid age until the time of the canonical collections of hadith. The 'Abbasid revolutionary movement aroused and was supported by messianic expectations and the hope for a restorer of religion and justice from among the Ali b. abi. The first 'Abbasid caliph gav himself the Kufan messianic name al-Saffah in his inaugural sermon in Kufa with an open ca mi ml. He was addressed as the Mahdi of the Hashimis by the poet: Sadi (Algani, iv. 93). The second 'Abbasid caliph, Abi Dja'far, was also called the Mahdi by his court poet, Abi Dullama. During his reign, the 'Abbasid claim to the Mahdi ship faced a severe challenge in the rising of the Hasanid Muhammad b. 'Abdi Allah, who, having long been announced by the propaganda of his supporters as the expected Mahdi, appeared in Medina in accordance with the hadith predictions. After the suppression of his revolt, the caliph adopted the messianic name al-Mansur and gave his son and crown prince Muhammad the same name. Abu Sa'id al-Khudri, a companion, related the following story: He was asked, 'Is the Mahdi of the Hashimis?' He answered: 'Yes.' He was then addressed as the Mahdi of the Hashimis by the poet: Sadi (Algani, iv. 93). The second 'Abbasid caliph, Abi Dja'far, was also called the Mahdi by his court poet, Abi Dullama. During his reign, the 'Abbasid claim to the Mahdi ship faced a severe challenge in the rising of the Hasanid Muhammad b. will come forth a man who will be called by the name of your Prophet. He will resemble him in character but will not resemble him in shape. He will fill the earth with justice as it was filled with injustice”.

The Mahdi was, however, identified as a descendant of al-Husayn in a tradition attributed to ‘Abd Allah b. Amr b. al-‘As and spread at this time by ‘Abd Allah b. Lahfa (d. 155/772) in Egypt: “A man of the offspring of al-Husayn will come forth from the second rising, after the Abbásid revolt, in Kufa, his defeats at the hands of Sufyān, and for Rayy to prepare the way for the Mahdi. The descendant of al-Husayn in a tradition attributed to ‘Abd Allah is reflected in predictions, hadith opposition into a tradition of the Prophet, providing a solid basis for the popular belief in the Mahdi.

Later developments. Traditions about the Mahdi were gathered also in the post-classical collections of hadith like those of al-Tabarānī, al-Ḥakim al-Naysabūrī, and al-Bayḥakī. The eschatological rôle of the Mahdi became generally more pronounced. The view that the Mahdi would rule the Muslim community at the time of the descent of Jesus was commonly accepted doctrine now that he was identified with the leader of the prayer of the Muslims mentioned anonymously in earlier traditions. A new dimension in the career of the Mahdi appeared in the K. al-Tadrijina of Abū ’Abd Allah al-‘Uṣaybā‘ī (d. 671/1272) who quoted some traditions according to which he would first appear in Medina, then preach in the mosque of Seville, receive the oaths of allegiance from the Muslims mentioned anonymously in earlier traditions. Ibn Khaldun, however, describes the view that the Mahdi would rule the Muslim community and that Jesus would pray behind him. Some of the acts which, according to earlier traditions, Jesus was to perform after his descent were now ascribed to the Mahdi, who would also aid him in the killing of the Darjālī (g.v.). The Mahdi was more and more associated, too, with the great Muslim conquests predicted in malākūm traditions for the final time of the world, especially those of Constantinople and Rome (Rūmiyya), and was described as the ruler of the whole world. These tendencies are apparent in the traditions quoted by Abū Na‘wā‘yn al-Iṣfahānī (d. 438/1045), who composed at least three different collections of hadith on the Mahdi.

These tendencies are apparent in the traditions quoted by Abū Na‘wā‘yn al-Iṣfahānī (d. 438/1045), who composed at least three different collections of hadith on the Mahdi.

Despite the rapid spread of traditions about the coming of the Mahdi, opposition to the belief in him as expressed earlier by al-Ḥasan al-Bāṣrī did not entirely disappear among the hadith scholars. The Yemenite Muhammad b. Khalid al-Janadī claded this hadith about Medina, which he considered as containing a hadith about the Mahdi, the Prophet, providing it with an isnad through al-Ḥasan al-Baṣrī to the Companion Anas, Matters will only grow in hardship, the world will only increase in backward movement, and the people in greed. The Hour will rise only on the worst of people. There will be no Mahdi but ‘Isā b. Maryam’. The hadith was given added prestige by the fact that al-Shafi‘ī (d. 204/820) transmitted it from al-Janadī. Included by Ibn Mādhūn in his Sunna, it was later interpreted by supporters of the belief in the Mahdi as meaning that no-one spoke in the cradle (maḥdī) except Jesus or that the Mahdi would rule only in accordance with the instructions of Jesus since only the latter, as a prophet, was infaillible (maṣṭūm). Many hadith experts, among them al-Nasā‘ī, and Ibn Kayyim al-Jawziyya, rejected it as inauthentic. Lingering doubts concerning the Mahdi may partly account for the absence of any traditions about him in the Sahihs of al-Bukhari and Muslim. The Mahdi traditions contained in the canonical Sunni hadith collections of Al-Dawūd, al-Tirmidhī, Ibn Mādhūn, and al-Nasā‘ī as well as the Mustadrīk of Ibn Hanbal were, however, numerous enough to provide a solid basis for the popular belief in the Mahdi.

The Mahdi was, however, identified as a descendant of al-Husayn in a tradition attributed to ‘Abd Allah b. Amr b. al-‘As and spread at this time by ‘Abd Allah b. Lahfa (d. 155/772) in Egypt: “A man of the offspring of al-Husayn will come forth from the second rising, after the Abbásid revolt, in Kufa, his defeats at the hands of Sufyān, and for Rayy to prepare the way for the Mahdi. The Mahdi or hidden caliph would appear in Mecca. He further reports that this mahdi was a descendant of Ali and would appear in the Maghrib. He predicted the advent of the Mahdi at the fortress (ribat) of Massa and travelled there in the hope of meeting him and pleading allegiance to him. At the beginning of the 18th century, a man pretending to be the Mahdi had gained some support there, but had been killed by the chiefs of the Ma'sudids. Belief that the Mahdi would arise in Morocco remained widespread until modern times.

Eastern and Egyptian tradition largely ignored this development. Treatises dealing specifically with the Mahdi, assembling large numbers of traditions from the earlier collections, were produced by late traditionalists like 'Umar b. 'Abd al-Malik and 'Umar ibn al-Hasan. Al-Taftazani (d. 990/1580) argued in his commentary on the Mahdi that he would be a descendant of the Umayyads and would emerge in the Maghrib. Similar beliefs arose around the 11th century, with others identifying the Mahdi with a second caliph, 'Abd al-Razzaq al-Barazanji, who was identified as the Mahdi but failed to appear. The pattern was already set in regard to Abu Jannal, who was identified as the Mahdi and considered all Muslims to be his followers. This development was already set in regard to Abu Jannal, who was identified as the Mahdi and considered all Muslims to be his followers.

A Sufi doctrine on the Mahdi had been expounded by Ibn al-Arabi. He described the expected Mahdi, a descendant of the Seal of the Saints (az-Zakir), as the one who would appear in Mecca. He further reported that this mahdi was a descendant of Ali and would appear in the Maghrib. He predicted the advent of the Mahdi at the fortress (ribat) of Massa and travelled there in the hope of meeting him and pleading allegiance to him. At the beginning of the 18th century, a man pretending to be the Mahdi had gained some support there, but had been killed by the chiefs of the Ma'sudids. Doctrine on the ghayba of the Mahdi was greatly developed after the death of the seventh Imam Mūsā al-Kāẓim (183/799) among the Wafqīs [q.v.], who considered himself the last Imam and expected his return as the Mahdi. While most of them believed that he had not died and was alive hiding, others held that he had died and would rise from death. They relied on statements attributed to Imām Dīja’far to the effect that the Mahdi was called the Kā’īm because he would rise (yakṣūn) after having died. A book on the ghayba was written by one of the founders of the Wafqī in Kūfah, al-Ḥasan b. ‘Abī Hanza al-Ṣaḥḥāl. Other books on the ghayba are known to have been written by the Kūfīs Wafqīs ‘Abī ‘Abbās b. Dīja’far (d. 210/824), ‘Abī al-Ma’mūn al-Arāḍī, ‘Abī al-Ḥasan al-Tātīrī (d. 261/876-7), and al-Ḥasan b. Muhammad b. ʿAllī b. Ṣama’ā (d. 263/876-7). A Wafqī was perhaps also ‘Abdallāh b. Sallūh al-ʿAmārī (Kūfah, first half of the 3rd/9th century), author of a K. al-Ghayba. Books on the ghayba were, however, in the same period also composed by some Imām scholars who believed in the continuation of the imamate after Mūsā, like al-Abābā al-Qāshirī (d. 219 or 220/834-5) and the Kūfī Fathī b. al-Ḥasan b. Fadhālī.

The doctrine of the ghayba was thus well-documented by traditions of the Imāms before the occulation of the Twelfth Imām whom the majority of the Imāmiyya came to consider as the Mahdi after the death of the eleventh, al-Ḥasan b. ‘Abī al-‘Askārī, in 260/874. Such earlier traditions could now be used and adapted to support the doctrine of the Mahdi’ship of the Twelfth Imām. Of Wafqī origin was, for instance, the tradition that the Mahdi, Muhammad al-Bāṣkhr, and transmitted by al-Ḥasan b. ‘Abī Hanza and now applied to the Twelfth Imām: “In the Lord’s Order (tābi‘ khāṭīb al-amn) there will be a precedent (ṣu‘ma) from Moses, a precedent from Jesus, a precedent from Joseph, and a precedent from Muhammad. As for the precedent from Moses, he will be afraid and watchful (ḥṣīf yataṣāfkbū); as for Jesus, it will be said about him what was said about Jesus; as for Joseph, imprisonment and concealment (al-sīḌīn wa-l-ghayba); as for Muhammad, his rising with the sword, following his conduct and explaining his traditions...” The tradition clearly refers to the imprisonment of Mūsā al-Kāẓim and to the falsification of the masūd. He had been killed by his enemies. Also of Wafqī origin were traditions attributed to Imām Dīja’far about the two occultations (ghaybatān) of the Mahdi like the following: “The Master of this Order will have two occultations. One will be longer so that it will even be said, ‘He has died’; and some will say, ‘He has been killed’. No one but a few of his followers will remain loyal to him. None of his sons nor anyone else will have knowledge of his place except the client in charge of his affairs”. The two absences referred to the two arrests of Imām Mūsā who had been briefly imprisoned under the caliph al-Mahdī before his final imprisonment by Hārūn al-Rashīd from which he did not return. Such traditions were now interpreted as referring to the Lasser and the Greater ghayba [q.v.] of the Twelfth Imām. Dīya’r Shīfī’s doctrine on the Mahdi and his occulations was based on traditions attributed to the Imāms, was authoritative elaborated by Muhammad b. ‘Abdallāh al-Nuṣairī (middle of the 4th/10th century) in his K. al-Ghayba, by Ibn Bābūyā (d. 381/992) in his Ismā‘īl al-dīn, and by Shaykh al-Ṭūsī (d. 460/1068) in his K. al-Ghayba.

Imāmi traditions about the career of the Mahdi after his advent largely reflect Sunnī traditions. He will be the lord of the sword and rule the world. Jesus will pray behind him after his descent from heaven. This did not raise a theological problem as in Sunnīsm, since the Mahdi, like all other Imams, according to prevailing Imāmi doctrine, exerts all prophetic attributes. The Mahdi’s rule is thus described in various ways. Specifically Shi‘ism is the expectation that the Mahdi will force all Muslims to accept the Shī‘ī belief. Imam Dīja’far is quoted as stating: “When the Kā’īm of us rises, he will offer the faith to every opponent (i.e. of ‘All, nīṣāb). Either he will enter in it truly, or he will cut his neck or force him to pay the ḥizyāt as the non-Muslims (aḥl al-ḥumma) pay it now. He will gird himself with a travel bag and expel them from the towns to the countryside (sa‘ādūt)”. The Kā’īm will also enforce the law as laid down by the Imāms, and accordingly prevent Muslims from repudiating their wives except by the fikhr al-sunnah. The Mahdi thus was expected to restore the ghayba of Islam integrally, and this has always been orthodox Imāmi doctrine. More radical doctrine was propagated by the Karāmīs [see KĀRAMĪ], who held that the Mahdi would abrogate the ghayba and bring a new message. According to al-Nawbahjī (Fī ṭabār al-ṣa‘īda, ed. H. Ritter, Istanbul 1931, 62), they interpreted a statement ascribed to Imām Dīja’far, “If our Kā’īm were to rise you would learn the Kū‘ān anew”, in that sense. Similar ideas appear to be expressed in another statement ascribed to Imam Dīja’far, “When our Kā’īm rises, he will bring a different order than what was before (dja‘far bishu‘am ghayri ‘Nadhi kā‘īm)”. Countering Sunnī criticism, Imāmi apologists endeavored to prove that the description of the Mahdi contained in Sunnī hadīthas applied to the Twelfth Imām and that the longevity of the Mahdi implied in the doctrine of the ghayba was not unreasonable in view of revealed data about Khūḍar, Jesus, and the Dajjal, and secular reports about long-lived men (muṣālimmārūs). Such apologetics gained considerable momentum in the middle of the 7th/13th century when several Sunnī scholars supported the Imāmi belief that the Twelfth Imām was the Expected Mahdi. In 648/1250-1 the Syrian Shī‘ī traditionist Muhammad b. Yūsuf al-Gandī al-Kawālijī, later (658/1260) murdered in Damascus for cooperation with the Moscoil conquerors, and the Syrian traditionist K. al-Bayyān al-bidā‘ah fi ākūb ‘alā mā‘mad al-sunnah, in which he proved the Mahdi’ship of the Twelfth Imām relying solely on Sunnī traditions. In 659/1261 Kamāl al-Dīn Mūsā al-Ṣa‘īdī (d. 716/1316) wrote his Taflīh kā‘īm al-wa‘ūd bi-dīya’r bī–ghayba ‘al-ṣa‘īda assembling reports from Sunnī sources about the virtues of ‘All and his descendants, especially the Twelfth Imām. In 667/1270 the Imāmi al-Kawālijī, screen master of the Twelve Imāms and answered Sunnī objections to the belief that the Twelfth Imām was the Mahdi. The Sibī‘ Ibn al-Dajwīzī, shortly before his death in 654/1256 in Damascus, wrote his Taflīh kā‘īm al-wa‘ūd bi-dīya’r bī–ghayba ‘al-ṣa‘īda assembling reports from Sunnī sources about the virtues of ‘All and his descendants, especially the Twelfth Imām, and at the end affirmed that the Twelfth Imām was the Lord of the Time, the Expected Kā’īm and Mahdi. In support, he quoted the following hadīth, terming it well-known (maṣāḥib), “The Messenger of God said, ‘At the end of time, a man of my descendants will come forth whose name is like my name and whose kūnay is like my kūnay. He will fill the earth with justice as it was filled with injustice. That is the Mahdi’”. He thus avoided one of the major Sunnī objections.
to the Mahdi's expected reappearance.

Muhammad b. al-Kassem, viz. that the hadith of 'Asim in its expanded form stipulated the identity of the father's name of the Mahdi with that of the prophet's father. Al-Ganjâl, on the other hand, quoted the testimony of al-Abûrî that this stipulation had been added to the hadith by the Kufan transmitter Zaidî (d. 160/677-8).

A problem arose also about the Sunni hadith, related by Ibn Hanbal and others, "The Prophet said, 'A community will not perish among whom I am the first, Jesus is the last, and the Mahdi is in the middle (fi wasatihik)'." This implied that Jesus would remain after the Mahdi and there would be no Imam before the end of the world, as against a cardinal Islamic dogma. Al-Ganjâl therefore interpreted the hadith as meaning that Jesus should be the last caller (kadî) inviting mankind to accept Islam but would not survive the Mahdi.

Testimony in support of the Mahdihip of the Twelfth Imam by Sunni authors, as also of later ones like the Malikî scholar Ibn al-Sabâbîn al-Isfâ'îfî al-Makî (d. 855/1452), a Maghrîbi resident in Mecca, and, more recently, the Hanafi Nahwîbîdî Shaykh Sulaymân b. Ibrahim al-Kundâzî al-Balqî (d. 1294/1877 in Istanbul), was regularly noted by Imamî apologist. The works of al-Ganjâl and Kamâl al-Dîn ibn Tahtâ were extensively quoted already by Ahmad b. 'Askâr ibn al-Ibrîhîm (d. 692/1293) in his Kitab al-qumma fi mafrifat *1-6. This view against the clear evidence of the traditions met the Mahdihip of the Twelfth Imam, which in turn won positive comment from Sunni sources. Further support for the Mahdihip of the Twelfth Imam came from Shi'î circles. Already Abu Bakr al-Bayhaqî (d. 458/1066) had noted that some Shi'î gnostics (aša'irî min abî bâli) agreed with the Imamî doctrine about the identity of the Mahdi and his gnostics. The Persian Kitâb al-durar al-din Ibrahim al-Hamâmî (late 7th/13th century) supported Imamî doctrine on the Mahdi in his Farâ'id al-simayn.

The Egyptian Sûfî al-Shârîn, while generally showing no sympathy for Shi'ism, affirmed in his al-va'lidî wa 'l-ja'fudî (written in 958/1551) that the Mahdi was a son of Imam al-Hussayn ibn Muhammad. Imam al-Tâbînî (491-511/1099-1120), who claimed to be the Expected Mahdi, his death was denied by his family and followers, known as the Husaynîyya, and his successors did not claim the title of Imam in expectation of his return. The sect of the Husaynîyya, opposed by the majority of the Zaydis, survived until the 8th/14th century. It is characteristic for the insignificance of Mahdi expectations among the Zaydis that the Sayyid Hamâmî (7th/13th century), representing Zaydi orthodoxy, could recognize al-Husayn b. al-Kasem as the Mahdi, who had appeared at the time predicted by the Prophet, while ensuring those of his supporters who raised his rank above that of the Zaydi Imam before him and refused to recognize him as the Mahdi (see W. Madelung, Der Imam al-Qasim ibn al-Husayn, Berlin 1965, 198-201).

On the death of al-Mansūr, on the Pilgrimage of 158/1 October 775, al-Mahdī, who was already in Baghdad, succeeded to the throne without opposition. Al-Mahdī's policies were in many ways a continuation of his father's, and like al-Mansūr he continued to rely on the Kūrāsānī army and members of the 'Abbasid family as the main supporters of the regime. He seems to have emphasised more strongly than his two predecessors the religious nature of his office and the role of the caliph as the champion of Islam. His regnal title of al-Mahdī, a title previously adopted by 'Alī and by 'Abbasids, was an indication of this. He also showed his concern for religion by the enlargement of mosques, at Mecca and Basra and the Askūs in Jerusalem, by improving the water supply on the Pilgrimage route from 'Irāq to the Hijāz and by organising expeditions against the Byzantines. The concern for the ḥadīth and the dhīḥād was part of a policy to establish the caliph as leader of the Muslim community as a whole. He also sought to maintain the purity of the religion by vigorous suppression of the šiddāt, dualist or gnostic heretics, some of whom were executed. He attempted to heal the rift which had developed in the family of the Prophet between the 'Abbasids and the 'Alids and which had led to the rebellion of Muhammad "the Pure Soul" in 145/762. He invited members of the 'Abbasid family to court and granted them pensions, as well as trying to reconcile their traditional supporters among the people of Medina by recruiting a guard of Ansārī and by the distribution of largesse. In the main, this policy seems to have been successful and there were no large-scale 'Alīd disturbances during the reign.

Al-Mahdī's main adviser in his relations with the 'Alīd was the marāṣī Yākūb b. Dāwūd, who had made contacts with members of the family in prison and who in 160/777 placed his services at the disposal of the caliph. Yākūb succeeded in reconciling with the caliph some prominent 'Alīd dissidents, and in doing so acquired enormous power, supervising almost the entire administration and most government appointments. He failed, however, to win over the most active and militant 'Alīd, 'Īsā b. Zayd, who continued in hiding as a focus for opposition and this failure, coupled with resentment felt by many others at court against his influence, led to his fall and imprisonment in 166/782-3.

The power attained by Yākūb points to the general increase in power of the bureaucracy and the secretaries (khitābī, sing. khīṭābī [q.v.]) during the reign of al-Mahdī. Until this time, the khīṭatī had acted as individual secretaries to rulers but now, under the leadership of the Barmakīs (see al-Barmākī) family, they came to form an important pressure group at court. From 161/777-8, Yākūb b. Khālid al-Barmakī became tutor and adviser to the young prince Hārūn, later the caliph al-Mahdī, thus becoming one of the most influential figures at court. The rise of the khīṭatī at this time provoked a reaction among the leaders of the Kūrāsānī army, who felt that their position was being threatened, and the caliph was warned that he was in danger of losing the support of his army by his great-uncle 'Abd al-Samād b. 'All. The tension between the bureaucrats and the military which originated at this time was to be a continuing feature of 'Abbasid politics.

Al-Mahdī's reign was in the main a period of peace and prosperity. There were disturbances in Kūrāsān, notably the prolonged rebellion of al-Muḥammad b. 'Abd Allāh b. Mūsā, between about 159/775-6 and 163/780,
which was only suppressed by considerable military effort. Elsewhere, Muslim armies expanded the influence of the caliphate; on the eastern frontiers of Khorasan, Farghana [g.r.] was attacked, and al-Ya'qubī gives a somewhat fanciful list of eastern monarchs who are said to have acknowledged the caliph's authority, including the Kings of Tibet and China. There was also a joint anti-carthaginian expedition against the unbelievers in Sind. As usual, however, the main military effort was concentrated on the Byzantine front. In 632/179-80 the Byzantines destroyed the Muslim outpost of al-Rahmah [g.r.], and the caliph responded by sending his son Hārūn on two expeditions in 635/178 and 636/179, which raided the empire without making any lasting territorial gains.

Al-Mahdī designated as his heirs two of his sons by his favourite wife al-Khayzur &n, Musa, who took the title of al-Maḥdī, and Hārūn, who took the title of al-Rasjid. Both these were given responsibility in their father's lifetime, Musa in Bagdad, where he developed close links with the Khurāsān soldiery, and Hārūn in Syria and the Byzantine frontier regions. The arrangement was that Musa should succeed and be followed by his brother Hārūn, but there were indications that the caliph, persuaded by al-Khayzur &n, was about to change these dispositions at the time of his death. Nothing had been done, however, when he died on 22 Muharram 106/4 August 785 at Masābaḥīn, probably as the result of a hunting accident.

AL-MAHDI [See IRN TOMB; AL-MARDĪYA]

AL-MAHDI, MUHAMMAD B. HISHĀM B. 'ĀBD AL-DIYĀRĪ B. 'ĀBD AL-RAHMĀN AL-NAṢIR, ABū E-WALID, ELEVENTH UMAYYAD CALIPH OF SPAIN. He held power on two occasions, first as successor to Hishām II al-Mu'ayyad [g.r.], and again in Sulaymān b. Hakam al-Mustā'īs [g.r.] place in the period of general rebellion which at the end of the 9th/10th century immediately preceded the establishment throughout Muslim Spain of petty independent rulers, the Mulāk al-Tamīnī [g.r.].

The third of the 'Amīrid ḥādisīs, 'Abd al-Rahmān b. al-Mansūr, surnamed Sanchol, from the moment he succeeded his brother 'Abd al-Malik al-Muẓaffar, abandoned himself to all sorts of excesses and was able to take advantage of the weakness of the titular caliph, Hishām II al-Mu'ayyad, to get himself designated heir-apparent. This decision at once aroused the indignation of various members of the caliph's family, thus excluded from the throne; they arranged that one of their number, Muhammad b. Hishām b. 'Abd al-Diyyār, a great-grandson of 'Abd al-Rahmān III al-Naṣir, who had many followers among the nobles of Cordova, should head a rebellion. Advantage was taken of an expedition, which 'Abd al-Rahmān Sanchol was to lead in person against the Christians of Géliea, to raise the standard of rebellion. On 15 Dūlāmād 399/17 February 1909, Muhammad b. Hishām attacked the palace of Cordova, where the caliph Hishām was with a small number of followers who had remained faithful to him. He captured the palace and at once took steps to make Hishām sign his abdication and had himself proclaimed caliph. The whole population of Cordova was in arms and plundered the 'Amīrid town of al-Madina al-Zāhira [g.r.]. All the treasure accumulated there, including a vast sum in money, was seized and brought to the new caliph who, to destroy 'Amīrid power for ever, demolished completely and set fire to the town which the great ḥādisī of al-Muṣtāfa, had built only a few years before. At the same time, Muhammad b. Hishām, who had adopted the honorary ḥādisī of al-Mahdī, took steps to meet the counter-attack expected from 'Abd al-Rahmān Sanchol. Warned of what had happened in Cordova and of the destruction of al-Madina al-Zāhira, the ḥādisī, full of anxiety, pitched his camp at Calatrava (Kal'at Rabī' [g.r.]) and endeavoured to secure the fidelity of his troops, who were mainly Berbers. He was soon forced to witness their defection and went to Cordova in the hope of finding new partisans there. But on the way back he was captured by emissaries of al-Mahdī in a monastery of the Sierra Morena and executed at the end of Dūlāmād 399/7 March 1909. His body was encased in Cordova.

Muhammad al-Mahdī, once the power was in his hands, soon alienated the principal Berber chief of his army as well as his relatives of the Umayyad house. A rebellion against him was planned by his adversaries. The Berbers put at their head an Umayyad pretender, Hishām b. Sulaymān b. al-Naṣir, whom they proclaimed caliph with the title al-Rahim, and had siege to Cordova. Al-Mahdī made a sortie, routed them and the pretender was killed. The Berbers then chose a new Umayyad prince, Sulaymān b. al-Hakam, and at the same time appealed for assistance to Sancho García and his Castilian subjects. In spite of all the efforts of al-Mahdī, the blockade of Cordova became more and more strict. He then tried to put on the throne the caliph Hishām II b. al-Mu'ta'īd whom he had himself deposed and then given out as dead, but this was in vain. On 16 Rabī' I 400/2 November 1009 the palace of the caliph was in the hands of the besiegers. Al-Mahdī's only hope was to hide himself. The pretender of the Berbers, Sulaymān, received the oath of allegiance to Cordova and assumed the honorific title of al-Mustā'īn bīlāh.

In the following month, al-Mahdī was able to leave Cordova secretly and seek refuge in Toledo, where he was received by the inhabitants. He then sought and obtained an alliance with the Christians (Umaydī) who marched with him on Cordova in Shawwāl 400/May-June 1910. The town was taken and the second reign of al-Mahdī began with a bloody persecution of all the Berbers in Cordova. To avenge the wrongs of their fellow-countrymen in the capital, the Berbers in the army of Sulaymān al-Mustā'īn returned to besiege this city. At al-Mahdī, betrayed by his retainers, was slain during the siege
in the palace in Cordova by some 9Amirid slaves on 8 Dhu 'l-Hijja 400/25 July 1013. His first reign had lasted nine months, the second last two.

MAHDI 'ALI KHÂN, the most outstanding vizier of the later Nawâibs of Awadh.

He started his career from the early reign of Nawâib Sa'd al-Dîn Khân (1798-1814) as a thâkkâ-dàr (an officer of one of the revenue districts) of Bâhla Mu'âsmâddî and then of Fâyâbâbî. His administration made the Bâhla under its control exceedingly prosperous. He himself became fabulously rich and was made a minister. Early in the reign of Sa'd al-Dîn Khân's successor Ghâzî al-Dîn Hayyâr (1815-27), Mahdi 'All lost his position because of his resentments at the interference of the Awadh Resident Colonel Baillie with the Awadh administration. Much of his property was seized and he was imprisoned. After his release from prison, he moved to the British territory at Fathpur in 1824 and began to live in a grand style. After the death of Ghâzî al-Dîn Hayyâr in October 1827, his son Nasr al-Dîn Hayyâr appointed Mahdi 'All as his mîdîr (chief minister). The Governor-General Lord William Bentinck was highly impressed by Mahdi 'All's administrative abilities and supported his schemes. Mahdi 'All reduced the salaries of undeserving favourites of the court, slashed the stipend of the ladies of the palace and even curtailed the stipend of the ladies of the palace and even curtailed the expenses of the King. After four years of strong rule, Mahdi 'All had to face a threat from the ruler of the Yemen, al-Malik al-Mas'ud Yâsuf. In 1830-31 he was behaving arrogantly towards the Queen Mother and was appointed in his place. The reforms introduced by Mahdi 'All were speedily reversed and the prosperity of the kingdom declined. Mahdi 'All retired to Farrukhâbâd and died in obscurity.

Abd Allah b. al-Hasan al-Dawurdl, with
from his mule which had been frightened by a bird,
when thrown 'l-Hakk Yahya. After the death of the
Imam, was the son and second successor of al-Hadid bi-

In 646/1248 Ahmad proclaimed himself imam in the fortress of Thula, north-west of San'a, with the support of the Banu Hamza Zaydi, his father's family, and with the possible connivance of the Rasulids. The rise of the Rasulid ied-holder of San'a, the sultan's nephew, Asad al-Din Muhammad b. al-Hasan, whose loyalty to his family was at best only lukewarm.

Abd Allah Ahmad b. Yahya as imam. 'Abd Allah al-Dawurdl thereupon had 'All, the son of al-Nasir, proclaimed imam, and al-Mahdi Ahmad and those supporting him left for Bayt Baws where they were immediately besieged by the rival imams, w. 'All. For the remainder of that year and until 794/1392 the two claimants to the Zaydi imamate fought for supremacy. Al-Mahdi Ahmad was caught in Mabar, south of San'a, by forces of his rival, 'All, and languished in prison until 801/1399, a period of over seven years. In that year he was freed with the help of his jailers. He lived on, however, until 840/1437, when he died near Hajiya of the plague. Ironically, enough, his erstwhile rival the Imam 'Ali died in San'a of the plague in the same year.

The choice of Ibn al-Murtada as Imam was a mistake, inasmuch as he lacked the necessary military and administrative ability. On the other hand, he had another qualification in perfection. As a result of a careful education and a thirst for learning from his youth upwards, he wrote a great deal, dogmatic, legal and systematic; he was also a poet and worked at grammar and logic. The kindness of his warders, who supplied him with ink and paper, enabled him to compose the law book al-Makk fi al-Imam al-Mahdi, on which he wrote a commentary. His most valuable work is still his theological and legal encyclopedia, al-Babur al-tahdhib (Berlin ms. 4901) in which he wrote a commentary. Although not the work of an original scholar, it is a rich and well-arranged compilation, which deserves attention, for it is a rich and well-arranged compilation, which deserves attention, for its parts for the part of the introduction which compares the various religions, as the distinctions between them are seen from quite a different point of view to that of al-Ash'ari or al-Shahrastani.

About 80 years after al-Mahdi Ahmad b. Yahya, from 922/1516 onwards, the Turks had begun to occupy Yaman and to hold it with varying fortunes (see Kuth al-Din al-Maliki, al-Barb al-yumani fi l-Fath al-Uthmani, in S. de Sacy, in Notices et extraits, iv, 417-504, and A. Rutgers, Historia Jemenii sub Hanao Pascua, Leiden 1838). In his struggle with them al-Mansur bi'llAh al-Kasim b. Muhammad, a descendant of the Al-Hadid in the seventeenth generation, was able in 934/1528 to restore the present Imamate in San'a (see A. S. Tritton, The rise of the Imams of Sana, Oxford 1925). Of his sons, Muhammad al-Mu'ayyad succeeded him. Even in his reign, but still more after his death in 1054/1644, when his successor Isma'il, another son of al-Kasim, was making his way with difficulty against his many brothers and nephews, one of al-Kasim's grandsons began to come to the front, afterwards the Imam

2. al-Mahdi li-Din Allâh Ahmad b. al-Hasan b. al-Kasim. His father was not Imám, but distinguished himself in the wars against the Turks and was also a scholar. In 108/1675 Ahmad appeared in the hills of Wusay, in 1015/1604 he was in Mecca with many members of his family on the pilgrimage. Just at the accession of Isma'il, he set out with another cousin against San'a. At first he came to terms with the Imam, but then fought in different places for his own hand, e.g. at Thula and again in the Dhijal Wusay. In 1076/1665 he won Hadramawt for Isma'il, to which the Zaydi had been permitted by the disputes for the throne. When in 1087/1675

The choice of Ibn al-Murtada as Imam was a mistake, inasmuch as he lacked the necessary military and administrative ability. On the other hand, he had another qualification in perfection. As a result of a careful education and a thirst for learning from his youth upwards, he wrote a great deal, dogmatic, legal and systematic; he was also a poet and worked at grammar and logic. The kindness of his warders, who supplied him with ink and paper, enabled him to compose the law book al-Makka fi al-Imam al-Mahdi, on which he wrote a commentary. His most valuable work is still his theological and legal encyclopedia, al-Babur al-tahdhib (Berlin ms. 4901) in which he wrote a commentary. Although not the work of an original scholar, it is a rich and well-arranged compilation, which deserves attention, for it is a rich and well-arranged compilation, which deserves attention, for its parts for the part of the introduction which compares the various religions, as the distinctions between them are seen from quite a different point of view to that of al-Ash'ari or al-Shahrastani.
on the death of Imam al-Mahdi, he himself assumed the imamate, a nephew, al-Kasim b. Muhammad al-Mu'tayyad, proclaimed himself imam and was recognized particularly in the remote territory in the south towards Tihama. A Zayyid assembly of leading Sharifs and 'ulama' met, at which Ahmad was with some difficulty recognized as the legitimate imam. Although this did not mean that he enjoyed the authority of a sovereign, since his rivals and the other amirs remained as independent as before, yet peace and security reigned in the country. But Ahmad b. al-Husayn died soon afterwards in 1021/1612 in al-Qhirka near Shibam, which had been built by the first Turkish conqueror Hasan Pasha, possibly from a bullet wound, sustained in action against a recalcitrant tribe. A notable feature of his comparatively uneventful imamate was his banishment of the Jews from San'a, the raising of their synagogue and the building of the Djalà mosque on its site (1050-1/1640-1). After the short and weak reign of his son Mu'tawakkil Muhammad (to 1067/1656), family feuds broke out again. Among the later imams of this 'Alid dynasty another Ahmad b. al-Husayn (al-Kaddab, to 1191/1779) again bore the official title of al-Mahdi ibn 'Abd Allah. 

AL-MAHDI 'UBAYD ALLAH, the first "manifested" (fiqah) Imam 'Imam and the first caliph of the Fatimid dynasty in Ifriqiya; while the historicity of this fact is conclusively established, there is doubt as to the Fatimid origin of 'Ubayd Allah and subsequently as to the authenticity of his imamate in the Imamite line. It would be pointless however, before giving an account of his activity as a sovereign, to digress upon the thorny subject of the nassat of the first Fatimid monarch, to which the author of the present article has, moreover, elsewhere devoted substantial consideration (see Dibii). This study will be confined therefore to exposing the essential features as a means of bringing to light the political and social conditions in which the Imamite da'wah developed in the Orient even before the imamate fell to 'Ubayd Allah, then in the Magrib, on the eve of the foundation of the Fatimid caliphate.

The question is whether 'Ubayd Allah—'Abd Allah according to the Imamites, who reject the diminutive form of his name on which Sunni and Kharijite authors agree—possessed an Imamite ancestry through a family relationship with 'Ubayd Allah, the seventh hidden Imam, or whether he was quite simply the great-grandson of the da'i Maymun al-Kaddab [see 'Abd Allah b. Maymun]. The documentation currently available is insufficient to provide a conclusive answer. It may nevertheless be asserted definitively that it was the seventh Imam, 'Abd Allah, who first laid the foundations of the Imamite movement, then his son Muhammad b. Isma'il who elaborated the doctrine and organised the preaching (da'wah) with the valuable assistance of the da'i Maymun al-Kaddab. It could be concluded that this da'wah in favour of the 'Alid descendants of the Husaynid branch was thus initiated in the period of secrecy (zahr), that is, at the beginning of the second half of the 2nd/9th century, and continued until the end of the 3rd/10th century, to be concluded finally with the "manifestation" (zahir) of the Imam al-Mahdi.

No sure light can be thrown upon the order of events in the succession in which the imamate was transmitted during this long period of secrecy and how the imamate effectively passed from the line of Isma'il to that of the family of al-Kaddab, because of the variety of contradictory and impasioned opinions which our Sunni and Kharijite sources have reproduced with the obvious zeal of their authors. Among the Imami authors themselves, profound disagreements have survived, depending on whether the sources consulted are works of doctrine intended for public consumption (zahir) or esoteric texts reserved for the initiates (dibii).

However, whether al-Mahdi be an authentic 'Alid or a descendant of al-Kaddab, it is appropriate to stress the importance of his role in the considerable development of the da'wah at the moment that he was obliged to make it public, beginning from his home in Salamiyya and promulgating it across Persia, Lower Mesopotamia, Syria, Bahrann, Yemen, Egypt and even the distant Magrib.

Nourished by the political and social unrest fomented among the Nabataeans, Aramaeans and Zandj masses in the East, Copts in Egypt and Berbers in Ifriqiya; strengthened, at the time of the decline of the 'Abbasid empire, as a result of the spectacular development of the Karmatian or Carmathian movement which enticed the same revolutionary ideal of political reform and egalitarian justice; perfectly organized and covering the various "constitutions" of the Islamic world (hidjari), the Imamite preaching ultimately entered, just at the time that al-Mahdi acceded to the imamate in 282/896, a decisive phase, that of its Magribi diversion.

Two decisive events influenced this movement of the da'wah in the direction of the Magrib: the Karmatian dissidence in the East and the successes of the apostleship of the da'i 'Abu 'Abd Allah in Lesser Kabylia in the West. As for the schism between the Karmatian movement and the centre of the da'wah, it took place at the same time that the imamate fell to al-Mahdi, whose authority the new Karmatian chief, Zikrauwa, refused to recognize. It was thus to fend off the formidable threat posed to Salamiyya that al-Mahdi resigned himself to fleeing this town and setting out towards the far Magrib at about the end of summer 290/902.

In fact, the apostleship undertaken on behalf of the Imam by the da'i 'Abu 'Abd Allah in this country, among the Kutama Berbers of Lesser Kabylia,
developed into an open insurrection against the Umayyad kingdom of the Aghlabids. Al-Mahdi made his way to Sidi-Mahaa, in the furthest Maghrib, there to await the final victory of Abu 'Abd Allah and his Kutama partisans. His stay in this town was to last for months. It is said that Abu 'Abd Allah, having conquered on his behalf the kingdom of the Aghlabids, arrived there only to present him with power and to escort him to Ifriqiya, where he took possession of the throne at Rakka'da on Thursday 20 Rabii' II 297/6 January 910.

On his accession, the first Fatimid sovereign was 36 or 37 years old, having been born at Askar in 259 or 260/873 or 874. Islamic and Sunni authors agree in attributing to him qualities of tenacity and prudent wisdom which proved to be of great benefit to him in the course of various vicissitudes between the time of his flight from Sahl al-Mihriyya and his triumphal entry into Rakka'da.

Al-Mahdi was officially proclaimed caliph on the day following his arrival, Friday 21 Rabii' II 297/7 January 910. The edicts of enthronement and proclamation emphasised the restoration of the umama in the line of descent of the Prophet and of his heir (waqt), through his daughter Fatiha, and the recovery of the caliphate usurped by the Unayyads and the 'Abbāsids.

Immediately upon his enthronement, al-Mahdi took in hand the responsibilities of state, letting it be known that he intended to exercise personally the power gained on his behalf by Abu 'Abd Allah. He thus eclipsed the prestige of the latter, his brother Abu l-Abbas and certain Kutama chieftains who, offended, were not slow to foment a conspiracy against him. But, assisted in his role as sovereign by Arab dignitaries who rallied to his cause, having earlier served the Aghlabid amirs, al-Mahdi did not hesitate to rid himself of the dā'at Abu 'Abd Allah, who was executed along with his brothers and their Kutama accomplices.

With the same determination, al-Mahdi set about consolidating his authority through energetic suppression of the internal agitation provoked by the elimination of Abu 'Abd Allah. He quelled in rapid succession an attempted insurrection at al-Kā здоровья, a riot at al-Kayrawan, a rebellion in Tripoli, a revolt by the clan of the Maawātī in the land of the Kutama and an uprising in Sicily. Having thus pacified his territories, taken firm control of his Arab and Berber subjects and contained the threat of Kutātī tribes (especially the Zanata hostile to his regime, he rapidly set about establishing on the foundations of the former Aghlabid kingdom a stable and powerful state which he was careful to endow, at an early stage, with a new capital, al-Mahdiyya (p.4). Built as a fortress, this coastal site was designed to ensure the security of the sovereign and to serve as an instrument for his policy of prestige and hegemony. For, in order to bring to a successful conclusion his twofold function of Imām and caliph, the first Fatimid monarch was obliged at once to conduct outside his frontiers a tireless campaign on three fronts simultaneously: against his two Muslim rivals, the western Maghrib, and the Christian enemy, the Emperor of Byzantium, in Sicily and Calabria.

In view of the fact that the proclamation of the Fatimid caliphate imposed on him the obligation to overthrow both the Unayyads and 'Abbāsids "usurpers", al-Mahdi no doubt at first contemplated invading Muslim Spain, where the power of his Cor-
of twenty galleys, the Fatimid officer Mas'ud b. Ghilib al-Walid took possession of the fortress of St. Agatha and made prisoners of its inhabitants.

Two years later, the chamberlain Dja'far b. 'Ubayd, known as 'Surfih', led the third raid, with Palermo as his starting-point. He captured Bruntalia and Orta and returned to al-Mahdiyya with vast riches. The resounding success of this campaign had the effect of inducing Byzantium to conclude a treaty. But the annual tribute agreed for Calabria was slow to reach al-Mahdiyya, and hostilities resumed in 315/927. Continuing until 328/930 under the command of the slave Sahir, the Fatimid incursions proceeded victoriously against Tarento, Salerno, Naples and Termoli. Eventually the tribute was paid, hostilities were suspended and the treaty remained in force until the death of al-Mahdi. Preoccupied by Bulgarian imperialism, Byzantium allowed the Fatimid sovereign to subjugate Apulia and Calabria and to reinforce the supremacy of Islam in Sicily.

Al-Mahdi died in al-Mahdiyya on 15 Rabii I 329/2 March 934. On the eve of his death, he could congratulate himself on having successfully performed his double task as Imam and as first Fatimid caliph. Under his aged, the da'wa emerged from its secular period of "secrecy" (tair), and flowered rapidly in the East and in the Maghrib. He had the skill and energy to conduct moderate but firm policies within his provinces, and to wage tireless war to expand his power. The diwan, Muhammad b. Saba', 

Thus, under his rule, the Fatimid empire embarked successfully on the first phase of its long history.

(F. DACHRAOU)

**MAHDIDS,** a dynasty of Zabid in the Yemen claiming descent from the pre-Islamic Tubabids of Yemen.

1. History. The family took its name from the father of its first leader, 'All b. Mahdi, who died in 354/965. 'All was brought up with a strong traditional Islamic education by his father in Tihama. Though much given to quiet meditation, 'All also acquired a reputation for eloquence. He travelled from all corners of the Islamic world. The famous historian-poet, 'Umara, is our earliest source for the Mahdids period. He tells us that he was much attracted by 'All's early teachings and visited him personally every month (Kay, Yemen, 92). During the period 351-6/1156-57, 'All preached openly in Tihama. So sympathetic to his words was the Nabiisid queen in Zabid, 'Ala'um, that he and his followers were exempted from the da'wa normally payable on land. In 358/1165, 'All felt called to attack the Mahdids town of al-Kadr, north of Zabid, but he and his supporters were driven off. They fled to the mountains where they remained until 354/1165. In that year 'Alam, the Nabidid queen in Zabid, against the advice of her adviser, allowed 'All and his supporters to return to Zabid. 'Alam died in 354/1165, an event which signalled the opening of a long, ruthless and extremely cruel campaign conducted by the Mahdids against Zabid and the surrounding area of Tihama from the mountains above. The town stood firm against appalling acts of terror. 'All was compelled in 359/1165 to journey to the court of the Zaruy'id rulers in Dhiba, Muhammad b. Saba'. 'Umara too was present at the meeting and tells us that 'All left empty-handed. The Zaruy'id refused to assist him against Zabid (Kay, Yemen, 94-5). 'All began to intrigue among the Nabidid amirs and in 351/1165 he engineered the murder of Suruf al-Farih, a key figure in the declining Nabidid house. Despite the brave resistance of its inhabitants, Zabid finally fell to 'All b. Mahdi in 354/1165. The latter had just only established himself in the town, however, when he died.

The events which followed the death of 'All are difficult to unravel and our sources differ in their accounts. He was succeeded either by two sons jointly, Mahdi b. 'All and Abd al-Nabl b. 'All, or by the former only. Whatever the truth of the matter, the Mahdids consolidated former Nabidid territory in Tihama, made peace with the Zaruy'id based in Aden and al-Dunlula, and raided other areas in the south, notably Labji and al-Djanad. Mahdi died in 359/1165. Abd al-Nabl assumed full control for the Mahdids house, and the plundering and looting began under his father, 'All, continued with renewed vigour. Not only the southern areas of Labdji and Abyan were attacked, but also raids were made north in Tihama into the territory of the Sulaymads. In such a raid Wuhd b. 'Ubayd, the sulaymad leader, was killed in 360/1165, an act which may well have helped to bring about the Ayyubid conquest of the Yemen nine years later by Tair Shih b. Ayyub, the brother of Saladin (Smith, Ayyubids and early Rasulids, ii, 32-3, 41-2, 46). Abd al-Nabl's thirst for territorial gain continued. Ta'izz and Ibb fell in 361/1165 and he moved on to besiege Aden in the same year. The siege dragged on until 368/1172, when the Zaruy'id ruler of Aden, Hatim b. 'All, arrived in San'a' to beg for assistance to raise the siege from a fellow Imam, the ruler of San'a', the Ayyubids, Abd al-Nabl b. Hatim of Hamdah. The latter agreed to help, and with strong tribal support, the Zaruyid-Hamdan alliance put the Mahdids to flight in 369/1173, thus releasing Aden.

Abd al-Nabl and his battered forces retired to Zabid. Soon afterwards Tair-Shih arrived in northern Tihama with his Ayyubid forces from Egypt. Joining up with the Sulaymids, who were eager to avenge the Mahdids killing of their leader, the Ayyubids swept southwards through Tihama, taking Zabid and arresting Abd al-Nabl and his brother Ahmad. Both were executed by strangulation by the Ayyubids in 371/1176, after what appears to have been a Mahdids attempt to regain control of Zabid.

2. Religious doctrines. 'Umara's account of Mahdids doctrine is perhaps an oversympathetic view which inevitably led to the charge that he was a Kharidji and thus punishable by death. Capital punishment was also prescribed for all those who opposed his teachings, as well as for wine drinking, singing and unlawful sexual intercourse.

Property was held in common and a communal pool of horses, military equipment etc. was maintained. All other sources took a less charitable view of 'Abd
al-Nabi’s political-religious leanings. He is painted as a man of great evil, plundering and looting in a mad attempt to spread the word. Rather than punish wine-drinkers, he was himself a drunkard, they paint him, and a womaniser into the bargain. Certainly, the Khādirī labeled stuck and 'Abd al-Nabi is depicted in Yemeni and non-Yemeni sources alike as a fanatic whose removal from power in the Yemen was of sufficient importance to Saladin in Egypt to bring about the Ayyūbīd conquest under his brother, Tūrūn-Shāh, in 568/1173. The causes of the Ayyūbīd conquest were of course numerous and complex (cf. Smith, op. cit., ii, 31-49), but it is not beyond the realms of possibility that the presence of this “evil Khādirī” in the Yemen did add weight to the argument in favour of bringing the Yemen under Ayyūbīd control.

Bibliography: The earliest source of Mahdī activities is ‘Umāra’s Tarīkh, found in H. C. Kay, Yaman, its early medieval history, London 1882, with English translation: a whole section of chapter 3 of the present writer’s The Ayyūbīds and early Rastīlīds in the Yemen, GMS, XXVI, London 1978, 50-62, with full references, is devoted to the Banū Mahdī, and the references to them in a section on the reasons for the Ayyūbīd conquest of the Yemen is given in the text above; other important sources, mainly still in ms. form, for the Mahdī period are as follows: al-Dānaḏīl, al-Sulṭān ‘al-walāa’ wa ‘l-μūd, Chester Beatty ms. 3110, i and ii; al-Khaṣrāḏī, al-Khāfiyya wa ‘l-Nā’m, Leiden ms. 609, and al-Mād al-Dalīl, British Library ms. Or. 4561; Ismā‘īl b. al-‘Abbās, al-Qābulat al-asl, Rylands ms. 253; ibn al-Dāyba’, Kurrat al-‘ayn fi asbāb al-Yaman al-maymūn, now published in 2 vols., ed. Māḥmud b. ‘Alī al-Akwa, Cairo 1977; the late Zaydi chronicle of Yabīy b. al-Hayṣayn, ‘Uṣūl as-samā‘īl, etc., ed. S. A. F. Ashour, Cairo 1968, 2 vols., is occasionally of value; the principal non-Yemeni sources which mention the removal of ‘Abd al-Nabi as being a cause of the Ayyūbīd conquest of the Yemen are Abū Shāma, Rauṣanayyin, I, 557; ibn al-Mu‘āwī, al-‘Iṣbaq, I, 238; ibn Khulīlī, tr. de Siana, 284, iv, 304; Makrīzī, Kātib, ii, 37. (G. R. SMITH.)

AL-MAḤDIYYA, formerly called al-MA‘MūRA, a town of Morocco, on the Atlantic coast at the mouth of the Wādī Saḥū (Sebou), built on a rocky promontory which dominates the valley of the river. Situated on the southern extremity of the plain of Chaḥr and 20 miles to the north-east of Salé (Salé), it enjoys a geographical position of the first importance. A port has been created here for ships of heavy tonnage, which cannot sail up the Wādī Saḥū and a landing force of 8,000 men occupied the town without a blow being struck. The Portuguese made themselves a strong base in al-Ma’mūra, built fortifications there, remains of which still exist, but they were only able to hold it for a short time. The Muslims drove the Christians out of al-Ma’mūra at the end of the same year, inflicting very heavy losses upon them.

Al-Ma’mūra re-enters history when at the end of the 10th/11th century it became a formidable nest of European pirates, who, under the leadership of an English captain, Mainwaring, practised piracy along the whole Atlantic coast and became a terror to the seafaring centres of Europe. This state of things was put an end to when Spain, which in 1620 had occupied the port of Larache (al-‘Arāqiq), a little farther north, made a landing at al-Ma’mūra in Rabī‘ 1022/August 1614, after negotiations with the Moroccan ruler, the Sa’dīd Mawlay Zaydān. The town was taken and the Spanish fleet withdrew, leaving a strong garrison of 1,500 men. The captured town was given the name of San Miguel de Ultramar.

The Spanish occupation of al-Ma’mūra was to last 67 years, during which it was several times fiercely attacked by the Muslims, particularly the “volunteers of the faith” (maḍākhīdāt), who mobilised to drive the Christians from the various points on the coast where they had established themselves under the active leadership of the chief al-‘Ayyāṣī of Salé. The principal attacks on San Miguel de Ultramar were delivered in 1628, 1650 and 1647. In 1628, the ‘Alawī sultan Mawlūd Ismā‘īl laid siege to the town and finally took it by storm. He then gave it the name of al-Maḥdiyya; the name of al-Ma’mūra only survived as that of the great forest of cork oaks which lies between Salé and the lower valley of the Wādī Saḥū.

It may be noted that, for a few years at an earlier date, the name al-Maḥdiyya had been born in Morocco by the little military station founded by the Almohad caliph ‘Abd al-Mu’tāmin on the site of the future Rībāt al-Fath (Rabat), on the south bank at the mouth of the Wādī Salā (the modern Wādī Bu-Regreg). Al-Maḥdiyya was occupied by French troops in 1917.

Fairly important remains survive at al-Maḥdiyya, dating from the brief Portuguese occupation, the Spanish occupation or from the time when it was definitely retaken by the Muslims. Around the citadel (kaša) runs a continuous rampart with a ditch. These defences are entered by two gates; one, very massive and with two Arabic inscriptions, dates from the 11th/12th century. The other, a simple postern, dating from the Spanish occupation, opens on the steep slope which runs down to the sea. Inside are the ruins of the Muslim governor’s palace of the 18th century. Between the foot of the citadel and the bank of the Wādī Saḥū for a length of 200 m.
and a breadth of about 40 m. might still be seen
buildings consisting of a series of square chambers
completely isolated from one another and each pro-
tected by a double wall. These were probably gran-
aries, which need not be earlier than the end of the
11th/12th century, and are not, as has been
suggested, of the Phoenician period.

(E. LEVY-PROVENCAL)

Al-Mahdiyya, a town in Tunisia which
owes its name to its founder 'Ubayd Allah al-Mahdī
(297-325/909-34 Lf 17); situated on the coast 200 km.
to the south of Tunis, it is the regional capital of
a province of which the population, 218,000
inhabitants at the time of the 1975 census, is estimated
to have reached 247,000. The population of the town,
numbering 12,000 inhabitants in 1905, has grown
steadily to 14,937 (1946 census), 18,494 (1956) and
21,288 (1966).

Foundation.
The creation of al-Mahdiyya by the Fatimids
responded to a need which had already made itself
felt since the end of the previous epoch, that of the
Aghlabids. The last years of this dynasty had in
distinctly left Kairouan (al-Kayrawān) for Tunis. When
prospecting along the coast beyond Tunis, which did
not attract his choice, in the search for the site
to be selected for the creation of his new capital,
the Isāmī Shī'ī Mahdī followed the same motiva-
tions, with the additional concern of security. A
post eventum prediction has him prophesying the in-
surrection of Abū Yūsuf al-Nukkārī (q.v.), the violent
thrust of which was broken only by the ramparts
of al-Mahdiyya, and thus gives a hagiographical
explanation of its foundation. In fact, besides
considerations of prestige and the constant concern
of founders of dynasties throughout Muslim history
to mark the new order through the creation of a new
capital, the preocupations of the Mahdī were more
immediate: to build defences, at a good distance and
in a secure place, against an eventual assault by
Sunnis implacably hostile to the Shi‘īs, a storm
whose epicentre could be nowhere other than
Kairouan. The Kādirī menace was at that time
less predictable.
The chosen site offered ideal security safeguards
for a dynasty possessing a powerful navy, this
being inherited from the Aghlabids. Built on a
spur projecting some 1,400 m. into the sea, and
approached by a road narrow as a shoal-ace
(al-Muqaddāsī, Aḥsan al-apāsīn, partial ed.-tr.
Ch. Pellat, Algiers 1950, 17), the town was impregnable
from the land, which explains the choice of
'Ubayd Allah who, after the failure of his at-
tempted invasions of Egypt, was obliged to secure
his bases, for an indefinite duration, in Ifrījīya.
Numerous written and archæological sources
indicate that ancient settlements, Punic and Roman,
preceded the Fatimid occupation of the region. Arabic
texts preserve the memory of Dju'mma, usually
identified with the ancient Gummi. But there is
nothing to suggest that the peninsula itself had
been "occupied by an urban settlement before the
4th/5th century" (A. Lézine, Mahdīa, Paris 1965,
17). 'Ubayd Allah thus chose to build, in 300/912-13
(1bn Qāhirī, Bayān, ed. Colin et Lévy-Provencal,
Leiden 1948, i, 169), on a virgin site and, the work
completed, he inaugurated his new capital on 8 Shu-
wa 325/February 287 (1bn 'Ishāqī, Bayān, i, 184; al-Kādirī al-Nūṣfīn, Iṣḥāqī, ed. W. al-Kādirī,
Bordeaux 1970, 375, ed. F. Dachrouti, Tunis 1975,
372-8).

A city of refuge, al-Mahdiyya was surrounded
by a defensive wall of unusual thickness (5.30 m.),
which followed the coast and of which a long section
to the north is still recognizable. A rampart 175 m.
in length barred the entrance to the isthmus, and
was preceded, at a distance of 40 m., by an outer
wall. Access to the town was gained by means of
an iron gate decorated with bronze lions, leading
through a domed vestibule 35 m. long by 5.70 m.
broad. Only this vestibule, known as al-Salāfī al-
Kādirī, is still today entirely upright. The new
capital comprised a palace for the Mahdī and another
for his son and successor al-Kādirī, administrative
buildings; subterranean storehouses for cereals,
 wells, cisterns, and one mosque which, eroded by the
sea and disfigured by extraneous constructions, fell
into ruin; recently—in the 1960s—it has been
completely restored to its original state under the
direction of A. Lézine. The town was also equipped
with an arsenal end, on the southern side, a fort-
tified and sheltered inland port, a port which, although
not necessarily a reconstructed ancient installation,
as might be supposed, was probably designed on the
model of a Carthaginian harbour.

History.
A royal town and a citadel, al-Mahdiyya was never
heavily populated, being limited by its narrow
intra-mural space. The bulk of the population
resided in the suburb of Zawīla, which was also
the commercial sector. Al-Fārā'im (322-34/934-48)
encircled this suburb with a ditch. In 332/943 there
broke out the revolt of the Nukkārī Mahdī Abū
Yūsuf, nicknamed the "Man on the Donkey." The
latter, having stormed Kairouan, laid siege to al-
Mahdiyya (Jumādā 3, 333—Saḥāf 334/January-
October 945), its ramparts saving the Fatimids
from a defeat which seemed certain. After the final
suppression of the revolt, Isāmī al-Manṣūrī (334/11
April 945-53) nevertheless abandoned the town, which
thus lost its capital status, and moved, towards
the end of Saḥāf 337/September 948, to his new
residence of al-Mansūrīya, built in the outskirts of
Kairouan "on the very site of his victory over the
Man on the Donkey." (F. Dachrouti, Le califat
futūḥi m al-Maghreb, Tunis 1981, 217).

Al-Mahdiyya regained its role as capital, for the
last time, as a result of the Hilian invasion which
forced the Zirids al-Mu'izz b. Badīs to take refuge
there (31 Shu'āb 34/25 October 1057). It became,
from this time onward, a capital under threat,
and danger also came from the sea. In 480/1087
"Pisans and Genoans conquered Mahdia and Zawila,
which they pillaged and burned" (H. R. Idrīs,
Zirīds, Paris 1962, i, 188). In 549/1153, the town
was attacked, unsuccessfully, by the Nūrusīs.
In 559/1153, it was subjected to a sea and land assault
by the Jannūsids. Finally, with the treaty of
559/1150-1, the Nūrusīs of Sicily imposed harsh
conditions on the town, a prelude to its seizure by
Roger II (2 Safar 543/26 June 1148), which marked
the end of the Zirid dynasty.

Blockaded, from 22 Radjīb 354/30 July 1159,
by sea and land by the fleet and army of ‘Abd al-Mu’tamin b. Ali, the Normans were forced to capitulate to Mu‘arram 555/21 January 1160, and al-Mahdiyya was ruled by an Emir-Hajib, Abd al-Karim al-Raghibi al-Khami—of the tribe of ‘Abd al-Mu’tamin—affiliated with himself with the Banu al-Dhahabiya, declared himself independent at the beginning of the caliphate of al-Nasir (555-610/1199-1243), and took the title of ‘Ali. In 622/1225, the town was recaptured, along with the whole of Ifriqiya, by the caliph, who restored its fortifications.

Under the reign of the Hafsid, during the years 658 and 668/1260 and 1287, numerous towns in the Sahel, including al-Mahdiyya, were sacked by the Admiral Roger of Lauria, acting on behalf of the Aragonese. Then, from 718 to 723 (1318-23), Abu Darra, a son of Ibn al-Libyani, ruled the town as an independent possession. In 792/1388-9, al-Mahdiyya was recaptured from the hands of a certain Ibn ‘Abd al-Ghaffar, who had taken possession of it, and in ca. 796/1390 its fortifications were again restored by the Hafsid minister Ibn Tafralji. In 1590, between 20 July and 20 September, it was sacked by a Genoese army and was occupied by the Genoese, conducted by the Genoese with support from French and English knights. The town resisted, but was obliged to pay tribute to have the siege raised.

At the end of the reign of the Hafsids, the town was the object of bitter contention between the Turks and the Spanish. The latter besieged it in 1599, then established a garrison there in 1539 after the capture of Tunis by Charles V. But Dragut took possession of it the following year. Temporarily driven from the town, he returned and remained in control until 8 September 1530, on which date the admiral Andrea Doria captured the place on behalf of Charles V, who destroyed the town’s defences in 1534 before abandoning it.

In 1651 there was an outbreak of plague in the city, and in 1740 it was deserted by its population. A population severely punished by Ibn ‘Abd al-Qadir for its loyalty to his uncle. In 1838, the Christian population of the city was judged sufficiently important to justify the creation of a parish. In 1876, an outbreak of cholera claimed many victims. In spite of its cautious stance during the uprising of 1864, incited by the doubling of the mepta tax, "Mahdia, a city without defences, was pillaged on 29 April by the neighbouring villagers." (J. Gaulle, "Les origines du protectorat français en Tunisie" (1862-1881), Paris 1959, 228), and was ruined, as was the whole of the Sahel, by the combined effects of the expedition of Zarukh and the ruined, as was the whole of the Sahel, by the combined effects of the expedition of Zarukh and the

The city has today overflowed its original isleum and is developing along two arterial axes: towards Sfax, and especially in the direction of Sousse. Its leading literary figures, dating from the early 18th to the end of the 19th century, are two poets, Abu ‘Amr ‘Abd Allah b. Muhammad al-Ta‘wishi, known by the name of Ibn ‘Umayr (d. 659/1260), and Ibn al-Siraj (d. 690/1291). Also worthy of mention, from the point of view of Sufism, is the shuykh (shaykh) al-Dahamni (d. 521/1124), a disciple of Abu ‘Abd al-Madhiyya (g.v.)

AL-MAHDIYYA, a movement in the Egyptian Sudan, launched in 1882 by Muhammad Ahmad b. ‘Abd Allah (Muhammad al-Mahdi) for the reform of Islam. It had from the outset a political and revolutionary character, being directed against the Turco-Egyptian régime (al-Turkîyya), which it overthrew, establishing a territorial state. Under the Mahdi’s successor, the Khalifa ‘Abd Allah (see ‘Abd Allah b. Muhammad al-Ta‘quni, and Kallab, iv), this developed essentially into a traditional Islamic monarchy until its existence was

period, a little further to the north-west, there is the first mention of the village of Hibba. Then from the 16th century onward, the character of the town was changed completely as a result of the ethnic element introduced by Turkish garrisons, with the additional influx, after 1609, of Moors driven out of Spain. Today, 65% of the urban population of al-Mahdiyya is composed of descendants of Kouloughlis (see Kouloughlis), representing, in this respect, the highest proportion in Tunisia, with perceptible effects on names and customs.

The two principal riches of al-Mahdiyya consist of olive-growing and fisheries. The cotton plantations, mentioned in the 18th and 19th centuries (Lucette Valensi, Fellahs tunisiens ..., Lille 1973, 219), have today disappeared. Industries associated with olive-growing and fisheries—the sardine industry in particular—have on the contrary undergone large-scale expansion, and activities such as oil-extraction, refining, soap manufacture and the canning of food, etc., are flourishing.

The city has today overflowed its original isleum and is developing along two arterial axes: towards Sfax, and especially in the direction of Sousse. Its leading literary figures, dating from the early 18th to the end of the 19th century, are two poets, Abu ‘Amr ‘Abd Allah b. Muhammad al-Ta‘wishi, known by the name of Ibn ‘Umayr (d. 659/1260), and Ibn al-Siraj (d. 690/1291). Also worthy of mention, from the point of view of Sufism, is the shuykh (shaykh) al-Dahamni (d. 521/1124), a disciple of Abu ‘Abd al-Madhiyya (g.v.).
terminated by the Anglo-Egyptian re-conquest (1898-9).

1. Mahdist Antecedents. Only one previous mahdist claimant seems to have originated in the Nilotic Sudan before the Turkiyya, a 17th-century Saff ascetic, Hamad al-Abnaâ' al-As Wad al-Turâbi. His claim was rejected by the Fungi (q.v.) king of Sinnâr, Badî I. He is represented as clashing with the tax-gatherers of Badî III (cf. S. Hillelson, *Sudan Arabic texts*, Cambridge 1935, 174-93). The immediate antecedents of the Sudanese Mahdiyya are to be found in a mood of eschatological expectation, which appears first in Egypt in the late 16th and 17th centuries, reflecting the popular consciousness that traditional Islamic society was threatened both by infidels from without and despoits within. Mahdist expectations were thus attached to 'Uqâdî Ghazi Hassan Pasha (q.v.) during his expedition against the Smithu of Ibrahim Bey (q.v.) and Murad Bey (Diabarî, *Aṣâṣib*, ii, 114), while an inscription against the French in 1799 was headed by a mahdist claimant of Maghrûbi origin (*Aṣâṣbih*, ii, 58). A revolt in Upper Egypt against Muhammad 'Ali Pasha in 1823-3 was led by another mahdist claimant ('Ali Mubârak, *al-Khatîb al-āṣâsîdâ, xiv, 76). A manifesto against the Sudanese Mahdi mentions a predecessor in Khartoum (*al-Khurjûn* [q.v.]). Ibrâhîm al-Sudânî, of whom nothing further is known (*Shu'ayr, Ta'yîr al-Sudân*, iii, 379), the name suggests a person of southern Sudanese origin. The Sudanese Mahdiyya was thus the latest and most successful of a cluster of mahdist movements which, while formally presenting themselves in religious terms, had markedly social and political aims.

2. The revolutionary situation in the Egyptian Sudan. During the sixty years preceding the outbreak of the Mahdiyya, profound changes had affected the traditional society and Islam of the Nilotic Sudan, culminating in a revolutionary situation. Muhammad 'Ali Pasha's conquests (1820-1) ended the independence of numerous sedentary and nomadic groups. His establishment of a centralized and autocratic administrative system with its unaccustomed fiscal burdens (undoubtedly aggravated by corruption and extortion) had a traumatic effect. Moreover, the demands of modernisation in Egypt meant that the officials in the Sudan were rarely of high quality or integrity. One group whose political and social status declined under the Turkiyya was that of the indigenous men of religion (sing. *faki* < *fakî*), who during the previous three centuries had fulfilled a range of functions as teachers of the Qur'ân and *şâfi*, Sufi leaders, arbitrators, and intercessors with the rulers. The establishment of an orthodox hierarchy of *'ulamâ*, serving in government mosques, and integrated into the judicial system, created a rival group of religious leaders. Although individual members of the old *faki* families took advantage of the greater opportunities to study at Al-Ahhar and enter the official hierarchy, there remained a fundamental incompatibility between the *fakîs* and the government-supported *'ulamâ*, whom the Mahdi was to designate *'ulamâ* al-*âsir*. Developments in the two decades preceding the Mahdiyya heightened the tension between the Turkiyya and the inhabitants of the Egyptian Sudan. The vigorous autocracy of Khedive Isma'îl (1869-79) (q.v.), the power of government felt once more after the comparative laxity which had begun in Muhammad 'Ali Pasha's last years and continued under his successors. The former sultanate of Dâr Fûr (q.v.) was annexed in 1874. Since the middle of the century, traders seeking ivory and slaves had thrust into unexplored regions far up the White Nile and the Bayr al-Ghazâl (q.v.), outside the Muslim and arabised northern Sudan, and completely beyond the control of the Turco-Egyptian officials. The slave-trade that was fed from these regions was a scandal to Europe. To bring the south and west under his administration, and thereby to suppress the slave-trade, was a principal aim of the khedive. The implementation of this policy would in any event have antagonised vested interests, particularly the diaspora of northern Sudanese, the Dânâkîl and Diîlâfîyîn (q.v.), who were involved in the slave-trade, and who ranged from petty dealers (*gâlûtab*) to merchant-princes such as al-Zubayr Râhma Maşîr, the master of the western Bayr al-Ghazâl and the conqueror of Dâr Fûr. The situation was rendered more critical by the khedive's recruitment of Europeans and Americans to carry out his plans; this employment of Christians in high office shocked the conservative piety of the Sudanese. Chief among these expatriates was the British officer Charles George Gordon (cf. Bernard M. Allen, *Gordon and the Sudan*, London 1921), who as governor of the Equatorial province (1873-5) and governor-general of the Sudan (1877-9) played a leading part in the attempts to establish khedivial administration in the south and to suppress the slave-trade. With their inadequate resources, Gordon and his colleagues attained only limited success. The deposition of Isma'îl (June 1879) was followed by Gordon's withdrawal, and the comparative feebility of their successors in Cairo and Khartoum facilitated the drift towards insurrection in the Sudanese provinces.

3. The early career of Muhammad al-Mahdi (1844-81). Muhammad Ahmad b. 'Abd Allâh was born in 1844 in the province of Dongolâ (q.v.). His father was a boat-builder, and when Muhammad Ahmad was a child the family moved to Karâfîf on the Nile, a few miles north of Khartoum, where there was an adequate supply of timber. After their father's death, Muhammad Ahmad's brothers followed his trade, but he himself underwent a traditional religious education within the Egyptian Sudan. He early showed a propensity towards asceticism and *şûfîs* and, in 1861, he attached himself to Shaykh Muhammad Sharîf Nûr al-Dî'im, the grandson of the founder of the Sammâniyya *tarika* in the Sudan. When his brothers moved for timber to Abâ Island in the White Nile, he accompanied them, and from 1870 made his headquarters there. His pious reputation gained him many followers, a development which was the probable cause of a breach with Shaykh Muhammad Sharîf, in consequence of which Muhammad Ahmad attached himself to a rival leader of the Sammâniyya, Shaykh al-Kurâşî wad al-Zayn (d. 1878). In 1882 he was joined by the man who was to become his most intimate disciple and his successor as head of the Mahdiite sect, 'Abd Allâh b. Muhammad (q.v.), who came from the Ta'âsbûsh Bâbbâr (q.v.), cattie-Arabs of Dâr Fûr. A mahdist expectation was abroad in the Egyptian Sudan, and was shared by Muhammad Ahmad himself. There was evidence of it in Kordofan (Kurdufan) (q.v.), which he visited about his time. 'Abd Allâh b. Muhammad had, some years previously, saluted al-Zubayr Râhma as *mahdi* —a role which the conqueror of Dâr Fûr declined. It is probable that 'Abd Allâh played a decisive part in the spiritual crisis of which the outcome was Muhammad Ahmad's claim to be the Expected
Mahdi. This was first secretly communicated to his disciples at Aba (March 1881), and then to other adherents during a second visit to Kordofan. The public announcement ( zawir) of the Mahdi took place on 29 June 1881. Letters were sent to various notables urging them to rally to him, and he announced his divine mission in a telegram to the governor-general.

While the Mahdiyya had in its origins many characteristics of a movement of social and political protest, these aspects were submerged in the founder's primary aim: the reform of Islam, encompassing both the cult and the society. Like previous reformers, notably Ibn `Abd al-Wahhab [q.v.], he envisaged the restoration of the primitive Islamic umma governed by the Qur'an and the Sunna. Unlike Ibn `Abd al-Wahhab, however, Muhammad Ahmad was deeply impressed by the emotional and imaginative quality of Shi‘ism. He saw his movement not merely as the revival of Islam, but as the recapitulation of the life and order of the primitive umma: a divinely ordained correspondence between Umar and Khadiji. He presented himself as appointed to the supreme succession (al-khilafa al-kubrd) as Successor of the Apostle of God (Khilafat Rasul Allah), while his leading disciples were the successors of the Rightly-guided Caliphs. Three of these were appointed soon after the Manifestation.

`Abd Allah b. Muhammad’s status was recognised in his title of Khilafat al-Siddiqi, i.e. the successor of Abu Bakr. An early follower, `Ali b. Muhammad HilU (`Ali had HilU), was appointed the successor of `Umar (Khilafat al-Farid), and the Mahdi’s young son-in-law, Muhammad Sharif b. Hamid, was his successor (Khilafat al-Mahdi). The appointment of successor of `Uthman was offered to the Mahdi, whose cooperation Muhammad Ahmad was anxious to obtain, but the offer, made in May 1883, was ignored. By another parallelism with the Prophet, the Mahdi styled his followers Ansar.

The official ʿadam endeavoured to confute the mahdiist claims of Muhammad Ahmad by stating the orthodox Sunni doctrine of the mahdi and demonstrating Muhammad Ahmad’s failure to conform to the criteria laid down in Ḥadith. He defended his position by reasserting his divine election, conveyed by the Prophet. At the same time, he emphasised where possible points of conformity with Ḥadith. Thus he adapted his name to Muhammad b. ʿAbd Allah, emphasising his descent from the Prophet, and changed the name of his renderers from Kordofan to Diīb al-Kadīr to Massa.

1. The Mahdi’s hizb and ghīṣḥ (1881–2). The authorities at first underestimated the Mahdi’s challenge, but when a small military expedition sent to arrest him was routed (August 1881), the matter was taken seriously. The Mahdi and his Ansar meanwhile made a withdrawal (the hizb) to Diīb al-Kadīr in the Nuba Mountains. The remoteness of this place rendered military operations by the government difficult (two expeditions were defeated in December 1881 and May 1882), while it formed an appropriate base for attacks on government positions in Kordofan. From southern Kordofan and Darfur the Mahdi could draw on a vast reserve of Bakkara tribesmen, whose propensity to raiding found a sanctified outlet in this warfare. Since the Mahdi regarded only those who accepted his mission as true Muslims, such fighting was designated ghīṣḥ [q.v.]. The government troops were, however, capable of prolonged resistance in fortified positions, and an attempt to storm the provincial capital El Obeid (al-Ubayyid) on 8 September 1882 was a failure. Henceforward the Mahdi relied upon siege-tactics, and the tribal forces were supplemented with a corps known as the ghiṣḥiya, largely recruited from captured government troops of southern Sudanese origin. They were provided with firearms, which the Mahdi was anxious to keep out of the hands of the undisabled tribal warriors.

The surrender of El Obeid (19 January 1883) gave the Mahdi an administrative centre, and Kordofan formed the nucleus of a territorial Mahdist state. In the meantime, khedivial control had been further weakened by the British occupation of Egypt (September 1882) and the reluctance of the British government to undertake commitments in the Sudan. An Egyptian expeditionary force was, however, organised with Col. William Hicks, a retired Indian Army officer, as chief of staff. Advancing through difficult country from the White Nile into Kordofan, it was annihilated by the Ansar at Shaykh Sir (5 November 1883). The Mahdi was now the master of the west. Darfur and Bahry al-Ghazal were surrendered by their European governors in December 1883 and April 1884 respectively. Meanwhile, Ummân Dikna (Osman Digna), from a mercantile family of Suakin (Sawakin) had been sent [May 1883] to raise the Bedja [q.v.] of the Red Sea hills, a mission in which he was largely successful through the support of an influential family, Shaykh al-Tahir al-Madridh, so that by the end of February 1884, only Suakin itself remained in Egyptian hands.

Khartoum and the riverain areas to the north were now threatened. At this juncture, Gordon was sent out by the British government, primarily to report on the military situation, but he was also appointed (at his own request) governor-general by the Khedive. Arriving at Khartoum (February 1884), he produced a succession of plans for the future of the Sudan while the Ansar closed in on the city. Ummân Dikna’s successes closed the route from the Red Sea to the Nile, while the fall of Berber [q.v.] to an army of Ansar (May 1884) cut the river line to Egypt. Military pressure on Khartoum itself was increasing, and between April and October 1884 the Mahdi brought up his main forces from El Obeid to Omdurman (Unm Durun), opposing the capital. Weakened by siege, the city fell on 25 January 1885, Gordon being killed in the fighting.

The fall of Khartoum marked for all practical purposes the end of the Mahdi’s ghīṣḥ. He was now the ruler of the chief provinces of the Egyptian Sudan from Dongola to Babr al-Ghazal, and from the Red Sea to Darfur. He ordered the evacuation of Khartoum, and made his own capital at Omdurman, where he died after a short illness (22 June 1885).

5. The rule of the Khilafat ʿAbd Allah (1885–98). The Mahdi’s death confronted the Ansar with two problems, one practical, the other ideological. First, who was to take the Mahdi’s place as ruler of the nascent state? Secondly, how was the Mahdi’s rule to be explained, since he had claimed a universal mission to restore Islam, but had achieved only a conquest within the boundaries of the Egyptian Sudan? The problem of the succession was in appearance quickly solved when a council of notables in the Mahdi’s house immediately after his death gave their allegiance (bays) to ʿAbd Allah b. Muhammad. Already in the critical period of political development following the fall of El Obeid, the Mahdi had conferred plenary powers on ʿAbd Allah,
so that he was henceforward the deputy of the Mahdi (khilafat al-Mahdi), although he did not use this title until after the Mahdi's death. He was, furthermore, the commander of the largest body of tribal warriors concentrated in Omdurman. His political and military pre-eminence was recognised in his election as the Mahdi's successor. This event suggested how the ideological problem arising from the Mahdi's death could be handled. A proclamation stressed the parallel between the succession of Abū Bakr as-Siddīq to the Prophet and that of Khilafat al-Siddīq to the Mahdi, and urged the Ansār to follow the example of the early Muslims, who had fought for their faith after the Prophet's death. There was other propaganda, much of it of a visionary or mystical nature, to legitimise 'Abd Allāh's succession.

His position was not, however, uncontested. Khilafat al-Kurds Muhammad Sharīf was the ostensible leader of the Aqṣāf (i.e., the kinsmen of the Mahdi), a group whose overweening pretensions the Mahdi himself had rejected in his last days. The Aqṣāf were the élite of the sedentaries from the northern riverain areas and their diaspora, known as aṣṣāf. This comparatively sophisticated group had little in common with the Bakkārīan tribal warriors, whose ascendancy was assured by the accession of the Khalifa. Within twelve months he had defeated a conspiracy hatched by the Aqṣāf in Omdurman and their kinsman Muhammad Khālid, the governor of Dār Fūr. The Khalifa's fellow-tribesmen or their clients replaced the Mahdi's appointees in the provincial governorships, with the exception of Uṯmān Dīnā, who was still in charge of the capital. The new appointees in the south were brought under the khedivial administration, were never integrated into the Mahdist state. Although (as mentioned above) Bahr al-Qusayr had fallen in 1884, its governor Karam Allāh Muhammad Kurkuṣūlī, a Dunkūkilī trader by origin, withdrew his troops in October 1885 to fight the Rizaykāt Bākṣāra and Dār Fūr. Thereafter, Bahr al-Qusayr drifted out of Mahdist control. The Equatorial province was even more remote from the centre of the Mahdiyya. Its governor since 1878 had been Emīn Pāsha (Edvard Schnitzler, of Silesian Jewish origin, and the last of Khedive Ismā'īl's expatriate officials), who in spite of mutiny and two Mahdist invasions (1885, 1888) held out until forcibly rescued by H. M. Stanley (1889). The second invading force, however, established a garrison at al-Raddīf, which maintained sporadic contact with Omdurman by steamer. The Mahdists held little more than the river line, and their position was challenged by former government troops, who had refused to be evacuated by Stanley, and who were led by Fadl al-Mawīlī Muhammad, an officer of southern Sudanese origin. Al-Raddīf became a place of banishment for political and other prisoners. The year 1889 marks the end of the militant phase of the Mahdiyya. The following period saw the stabilization of the Khalifa's autocracy within a territorial state limited for all practical purposes to the Muslim and arabised regions of the northern Sudan. A factor in the decline of militancy was the great famine of 1888-90, the effects of which were aggravated by the migration of the Ta'ā'isha to Omdurman. For the second time, the Khalifa's authority was challenged by a revolt of the Aqṣāf in Omdurman under the leadership of Muhammad Sharīf (November 1891). After some desultory firing and a few casualties, a formal reconciliation was effected by Khilafat al-Fārūq 'Ali b. Muhammad Hilā under terms advantageous to the Aqṣāf. The danger once past, the Khalifa proceeded to destroy his opponents piecemeal. Muhammad Sharīf himself was arrested in March 1892, and sentenced to imprisonment by a special tribunal. Thereafter the Khalifa's autocracy was unchallenged. His only intimates in matters of government were his half-brother Ya'qūb, who acted as his maiṣir (but without the title), and his son Uṯmān, who about this time received the honorific
of Shaykh al-Din, and was trained for the eventual succession. When the Khalifa thus strengthened his position internally, there was increasing European pressure on the frontiers of the Mahdist state. Sudan, which alone among the garrisons of the Red Sea area had not fallen to Uthman Dikna, formed the base for a campaign against the local A’nsar after the Anglo-Egyptian victory at Tokar. The operations, early in 1891, culminated in the capture of Uthman Dikna’s headquarters at Tokar (Tokar) in Feb. 1891. Although still a nuisance, he was no longer a threat to the Anglo-Egyptian forces in the vicinity. In the previous year Eritrea had been constituted an Italian colony. A Ma’asir raid into the territory was routed (December 1893), and in July 1894 the Italians with the prior agreement of the British government occupied Kasala [q.v.]. The loss of this important strategic position was even more serious than that of Tokar, but in spite of making a threatening demonstration in Omdurman, the Khalifa did not take the offensive. The Italian presence in Eritrea was equally threatening to Menelik II, who was committed by the death of John IV. In 1895 he sought to establish friendly relations with the Khalifa, but his overtures were repulsed. He repeated them in 1896 after his victory over the Italians at Adowa, and further embassies were received in Omdurman in 1897 and 1898, but no practical military or political co-operation resulted.

A more remote European danger appeared in the far south, when Belgian expeditions from the Congo Free State began to advance towards the Upper Nile and Babr al-Ghazal. In 1892 Faqil al-Mawali Muhammad and his followers entered the service of the Congo Free State, he himself being recognised as the governor of the Equatorial province. In the following year, a Mahdist force was sent to strengthen the garrison at al-Radjidjaf. Its commander, ‘Arabi Dafa‘ Allah defeated and killed Faqil al-Mawali (January 1894), and combated the Belgians with some success. His isolated position and precarious communications with Omdurman were, however, insuperable difficulties, and in February 1897 he lost al-Radjidjaf to a Belgian force.

By this time the final assault on the Mahdist state was developing. In March 1896 the British government authorised an advance by the Egyptian army into the Mahdist province of Dongola. While the pretext for the invasion was afforded by the Italian defeat at Adowa, the real reasons lie in British foreign policy and the international situation at the time (see G. N. Sanderson, England, Europe and the Upper Nile, 1882–1899, Edinburgh 1965). The Egyptian expeditionary force, commanded by Sir H. H. Kitchener, constructed a railway as it advanced up the Nile from Wadi Halfa. By the end of September 1896 the province was completely occupied. In the following year, Kitchener was authorised to make a further advance. A second railway was constructed across the Nubian desert, reaching the Nile at Abu Hamad, and was extended southwards as the Anglo-Egyptian annexed West Dongola. The Khalifa summoned Mahomed Ahmad with the bulk of his forces from the west to defend the approaches to Omdurman. He proved to be an irreproachable commander, lacking in all initiative. His base was al-Matamma [q.v.] in Djalali territory. Its inhabitants refused to evacuate their town, which Mahomed Ahmad took by force of arms—an incident which confirmed the hatred of aswad al-balad for the Ta’ifsha. Once established there, Mahomed Ahmad was reluctant to move northwards to confront the invaders, who were steadily advancing along the river-line. Abu Hamad fell in August 1897, and the important route-centre of Berber was evacuated in the same month. Mahomed Ahmad, faced with increasing desertions and shortage of supplies, was ultimately goaded to advance. His army (augmented by troops brought in by ‘Uthman Dikna) was overwhelmed on 8 April 1896 at the battle of the Atbara [q.v.], and he himself was taken prisoner. The Anglo-Egyptian advance continued, and the Mahdist state received its death-blow at the battle of Karrar, often called the battle of Omdurman (2 September 1898). Ya’qub died in the fighting, but the Khalifa escaped, and remained a fugitive for over a year. Finally, he was a handful of army was defeated by Sir Reginald Wingate in a skirmish (24 November 1899) at Umm Diwayikah on the White Nile, in which he was killed. ‘Uthman Shaykh al-Din was made prisoner, and died in the following year.
landownership. Undesirable customs regarded as repugnant to Islam were prohibited. The Mahdi's judicial functions were widely delegated to his officials, and one specifically judicial officer was appointed with the title badi’ al-rais. Ahmad ‘Ali, who held this post for twelve years (1882-94), had been a judge in Dar Fuir under the Turkiyya.

These military and administrative institutions developed further during the reign of the Khalifa. A detachment of the ‘alqidiyya, the regular corps first formed during the siege of El Obeid, was stationed in the Kama, i.e. Fort Omdurman of the Turkiyya. After the revolt of the Ajuria in 1891 the Khalifa felt the need of a reliable bodyguard. This was created by expanding a corps of orderlies, the mudizimiyaa. By 1895 it consisted of 5,000 or more troops under the general command of ‘Uthman Shaykh al-Din. A civil service, recruited chiefly from ‘awal al-balad and Copits, staffed the departments and treasuries of the capital and the provinces. Many of its members had occupied similar posts under the Turkiyya; some went on to serve the Condominium. Already in the Mahdi’s time a regular chancery procedure had been established, and the surviving archives of the Mahdiyya as a whole have been estimated at 50,000 pieces. The bulk of them are now in the Central Records Office in Khartoum (see P. M. Holt, The Mahdist archives and related documents, in Archives, v(8) [1962], 193-260).

Dispatches were sometimes exchanged almost daily between the ruler and his provincial governors. The provinces fell into two categories; an outer circle under military governors with their own fiscal and judicial establishments and garrison troops, and a core of metropolitan provinces, which fiscal areas rather than administrative units, and were tributary to the treasury in Omdurman.

The history of the office of amin bayt al-ni‘a illustrates both the institutional elaboration and the increasing autonomy of the Khalifa’s reign. Ahmad Sulayman, the first amin, was a partisan of the Ajuria, and was disgraced in April 1890. His successor, ‘Abd al-Rahman Muhammad al-Adlan, had been a merchant in El Obeid. His reluctance to extort grain for the soldiery during the great famine led to a clash with the Khalifa and his execution (February 1890). His successor, al-Nur Ibrahim al-Diroyawli, was another former merchant. Tenure of office became increasingly precarious: one commissioner was twice appointed and twice removed, and the last year of the reign saw three treasurers. At the same time special treasurers were established, of which the most important were the treasury of the mudizimiyaa and the Khalifa’s privy treasury. The sources of revenue had meanwhile changed. With the ending of the ‘alqidiyya, gladima sank into insignificance. Zakat continued to be levied and also for a poll-tax paid at the end of Ramadan. ‘Aid fi ‘ad was also paid as customs-dues, originally at the rate of 2½%, but al-Diroyawli imposed a further 10%, and this might indeed be taken at several points on the route. Fines were imposed on smoking and drinking, and the goods of other offenders were liable to confiscation. In addition, merchants and others might be required to pay “contributions” (tabirr al-imta‘) to the treasury. The minting of dollars at Omdurman continued, but the silver was increasingly debased. The minting of gold had ceased with the Mahdi’s pounds, which were soon driven out of circulation by Gresham’s Law.

The history of the judiciary is similar. Ahmad ‘Ali held office as ‘adil al-rais until May 1894, when he lost the Khalifa’s confidence, and was thrown into prison. His successor, al-Husayn Ibrahim had al-Zahrani’, had been trained at al-Azhar, but his overzealous adherence to the principles of the Shar’i led to a clash with Ya’qub. He was imprisoned and put to death, probably in the summer of 1895. The title of ‘adil al-rais seems to have died with him. Already in the time of Ahmad ‘Ali there was a deputy-judge (maqdi al-makrana), and the two seem usually to have acted in concert. By the end of the Khalifa’s reign, the chief judge had six deputies (muna‘ab), two of whom had special duties in connection with the mudizimiyaa. In addition, there were special courts in Omdurman for the market, the quay and the treasury. Both in the capital and the provinces, the judicial officers were dependent on the Khalifa and his governors, and were deferential to their wishes.

7. Subsequently developments. Although the Anglo-Egyptian reconquest overthrew the Mahdiyya, Mahdisim continued to be a powerful force, particularly in the west. The movement was virtually proscribed in the early years of the Condominium by Wingate, who was governor-general from 1899 to 1916. The surviving leaders were held in prison, the use of the Mahdi’s devotional manual (rādi‘) was forbidden, and several religious risings were suppressed. The revival of the Mahdiyya in a new form was the achievement of a posthumous son of the Mahdi, ‘Abd al-Rahman (1883-1959), whose considerable political talent found opportunity in changing political circumstances during and after the First World War. To many Anṣār he was a charismatic figure, regarded by some as al-Nabi ’Isa, and hence as having an eschatological role. To his westernised followers, he was rather a nationalist leader, the patron of the Umma Party, which was founded in 1945, and has continued to play a leading part in Sudanese politics. In one modern view, the Mahdi is seen as a mughaddat, and the Mahdiyya as a reformist but essentially orthodox movement.

The flow of emigration towards the New World originated in what was then known as Syria (the land currently comprising Lebanon, Syria and Palestine) at the end of the 19th century and the beginning of the 20th, attaining its highest point in North America in 1913; the tide began to ebb in the period following the First World War as a result of obstacles placed by the United States in the way of immigration, with the limitation of numbers of immigrants and with legislation on nationality, passed in 1924, which almost put an end to it, although a reflux of emigrants into Southern America continued.

The causes of the emigration were primarily economic. Among the Lebanese—who left their country in the greatest number—the inhabitants of the mountain region were deprived of agricultural land after the establishment of the regime of the mutasarrifiyah [see LUBNÁK], inaugurated in 1861 (and modified in 1864) in the wake of the intercommunal religious disturbances of 1860 and following intervention by the European states, and by France in particular. This regime accorded administrative autonomy to the mountain region, which possessed meagre financial resources, having first detached from it its fertile plains and sea ports. A section of the population was thus forced to leave the mountain region and to seek employment in Beirut and other Lebanese towns. This was the first phase; subsequently, some individuals left their homeland and made their way to Egypt and other African countries. When emigration to America became possible, some groups of Lebanese, insignificant in size, travelled there. After 1883 the scale of the movement accelerated, as the first emigrants elicited their compatriots with glowing reports of the financial opportunities that existed in America, while tourists, shipping companies and their agents added further encouragement, to such an extent that at the beginning of the 20th century a virtual epidemic had arisen and almost half the inhabitants of Lebanon left their country. The contagion spread to the cities of the interior (Homs, Damascus and Aleppo) and to the mountains occupied by the 'Alawites, whence it is estimated that a seventh of the population chose to become exiles. Some Palestinians had preceded the Lebanese, and others accompanied them. By the final phase of the movement, the total number of immigrants from Greater Syria who were settled in the United States and Canada exceeded half a million, attaining close to double this figure in the cities of Central and South America.

At the time, the movement was encouraged among the Christian population of Syria not only by economic factors—including the oppression of the peasants by their feudal lords, the monopoly over lands and goods exercised by the monastic communities, the oppressive burden of taxation, disastrous crop-failures, the slump in the natural silk market caused by the success of artificial Japanese silk sold cheaply and the diversion of international trade-routes following the excavation of the Suez Canal—but also on account of psychological factors aroused by a hated social and political situation; detestation of the foreign authority which governed them and always regarded them with suspicion, religious conflicts which culminated in the events of 1860, persistent sectarianism, corruption of an administration in which bribery was rife, the subjection of the faithful to religious leaders who collaborated with the French authorities in oppressing and robbing them, the suppression of public liberties, the alienation experienced by the entire population in the time of 'Abd al-Hamid, the posting of young Arabs to distant theatres of war, widespread ignorance and the rule of anarchy in all facets of existence.

On the other hand, there was talk of those advantages of emigration which constituted powerful incentives: the prospect of making a fortune, numerous opportunities for finding work, respect for public liberties, the acceptance by society of personal ambitions, the judgment of people by their actions and their abilities rather than on the basis of their origin and class, concern for the rights and dignity of all citizens without discrimination and the rule of order and of law.

The Syrians in general and the Lebanese in particular had been in contact with the West and its culture since Bonaparte's expedition to Egypt (1798-1801) and the creation of scientific institutions in this country in the time of Muhammad 'Alí [q.v.]. These contacts had been reinforced by the religious missions which began to arrive in Lebanon in the period when the son of the ruler of Egypt, Ibrahim Pasha [q.v.] was governor of Syria (1832-40), and which expanded their activities following the installation of the régime of the mutasarrifiyah (1861).
founding schools, cultural associations and charitable societies, importing presses, translating and publishing books. These contacts were also encouraged by the presence of tourists and members of the French expedition who stayed on in Lebanon for a full year after the events of 1860. These constant contacts with the West and the learning of the languages spoken there, in addition to the common religion which it shared with the majority of the future emigrants, reinforced their admiration for this part of the world and its principles, in particular those of the French Revolution and its well-known slogan, and strengthened their desire to migrate to it.

When these factors are considered in conjunction with the geographical position of Lebanon and Syria, facing the West from the opposite shore of the Mediterranean, and the hereditary zest for trade and travel characteristic of the Lebanese, descendants of the Phoenicians as they are, and also their eagerness to travel far in search of favourable opportunities, it is possible to understand the deep significance of this quasi-collective migration towards the New World and the dispersal of this race throughout the globe.

In the first instance, the emigrants were attracted to the United States; subsequently, they turned their attention towards the South, still virgin territory and offering greater employment opportunities than the North, on account of sparseness of population, the vast areas of agricultural land requiring manpower, emergent industry and the wide range of opportunities for commerce. Opportunities for emigration to South America were enhanced following the visits to Palestine and Lebanon undertaken in 1877 and 1887 by the Emperor of Brazil Dom Pedro II and the conclusion, in 1892, of an agreement between the Ottoman and Brazilian governments establishing the conditions of immigration. This emperor, who spoke Arabic, favoured the settlement of emigrants in his country as a means of contribution towards its prosperity and furthering the exploitation of agricultural land, and he promised them aid and assistance. Argentina offered similar attractions with its enormous tracts of land requiring cultivation and its untapped material resources. Waves of immigrants therefore made their way towards South America, to such an extent that their number amounted to 500,000 in Argentina alone, and Brazil accepted more than half a million. For their part, the Palestinians preferred the states of Central America or Chile and Mexico.

After disembarkation, these foreigners settled in the poorer quarters of the towns which they had chosen, usually because they had relatives there and attempted to make a living through street-trading and hawking. Those who succeeded (the minority), would open a small shop, and some found opportunities for expansion, in some cases even becoming industrialists or prosperous merchants [see DAVILA],

The people among whom they lived had little respect for them. They called them Turks, because they came from a land dependent on the Ottoman Turkish state, and in some instances they were treated in the same light as the Mongols, members of the yellow race; the immigrants themselves were aware of the need to correct the image which had formed in the minds of Americans.

Initially, they believed that their exile was temporary and would last no longer than the time needed to amass sufficient money to support themselves and their families at home; this same time-period, it was hoped, would see changes in living conditions in their own country. But once settled and accustomed to their new existence, seeing their businesses prosper and their children growing up in this new milieu, learning its language and becoming attached to it, they contemplated staying there permanently, in spite of the pain involved in the awareness of exile and in spite of the bitter nostalgia that they felt for their country and families.

Of these, there can be no doubt that it was in response to the need to communicate among themselves in their exile, and on the other hand to follow events occurring at home, that they were led to produce a number of minor Arabic newspapers; these began to appear with the arrival of the first waves of immigrants in the closing years of the 19th century, but in the South and the North of the continent.

It was in New York in 1892 that the first newspaper, Kawkab Alwadiba, appeared, followed by Al-Ya'ar (1894), Al-Ijmam (1897), Al-Hadd (1898) and Mir'al-Charb (1899). In Brazil, the oldest one, Al-Fayadh (1893), was followed by four others: Al-Rahif (1892), Al-Satdil (1898), Al-Mandif (1899) and Al-Siddi (1901).

Subsequently, the need was felt to form associations and literary societies to serve the interests of the immigrants, unite their energies and support their social institutions. Al-Djam'isyya al-sarayiya al-muttahsida came into existence in New York in 1907, and other associations followed. In Brazil, numerous clubs were founded, of which the most important was Al-Nadi Al-himsi, and literary societies subsequently came into being. But literary life prospered at an earlier stage in North America, for the following reasons: immigration there had a longer history, printing-presses had been established there at a relatively early date and writers of talent had been living there since the end of the previous century. Amin al-Ribani [see AL-MANDIF] arrived in New York in 1883, followed by Djibril Khalil Djibrin (q.e.) in 1895, the poet Nidir Haddad in 1897, then, at the beginning of the century, the two poets Nasib Sirgi and Ra'id Al Ayyub in 1905, Nidir's brother, the journalist 'Abd al-Masih Haddad in 1907, Mkhittar Nasirna (q.e.) and Iltiya Abi Madi (q.e. in Suppl.) in 1911. Printing-presses proliferated to such an extent that six were in existence by 1910, producing, besides newspapers, some remarkable literary reviews, such as Al-Fumun (1913) which was edited by Nasib Sirgi, and al-Sik (1913) edited by 'Abd al-Masih Haddad.

Amin al-Ribani began to write in newspapers at the end of the last century; his extremely vivid language had an alluring nature and displayed a marked penchant for innovation. He had published three of his books before Djibrin's first, Al-Musib, appeared in 1905. The concerns of his people, both in the mahdiar and in their homeland, pre-occupied him, and he set himself to preaching liberation in the widest sense of the term, political, social and intellectual, and to attacking in his articles and books (al-Mukhabita al-Ma'diya, al-Mahiti wa 3-l-kitab, Banakabi al-feur, Kifirini al-barin) inertia, bigotry and religious sectarianism. It is, moreover, entirely symptomatic that his first work published in the mahdiar is intitled Tu'ribi al-hawra al-ad nelisaniyya.

For his part, Djibrin began in 1903, while still residing in Boston (which he did not leave for New York until 1912) to publish his articles in the newspapers al-Muhdja (1903), al-Hadd and Mir'al-Charb. He appears to have been more forceful than al-
Rhâîî and more inclined to challenge traditions directly. Because he loved painting, imagery dominated his writing, and his education and experience endowed him with burning zeal and a penchant for idealism. His style reveals a poetic soul close to the sources of an Oriental mysticism inherited in the West by the various romantic movements. He put together in his first books ʿArāʾis al-murarāṭ (1906), al-Arīḏā al-mudamaṭirrā (1908), al-Rā şikā al mutakassira (1912) and Danūa wa-btisdnū (1913), his articles and novels which had been published in the newspapers of the mahdjar and in the two reviews al-Funun and al-Ṣābih.

Like al-Ribârist and Djibrîn, Nuʿaymâ also possessed a pronounced taste for innovation. He retained from his theological studies, undertaken in Russia between 1906 and 1911, a profound religiosity and, like Djibrîn, a tendency towards mysticism; he considered it necessary to go beyond the sensory organs in order to arrive at the reality of things, but he did not have the same ardour of feeling and he was sometimes more capable of effecting a synthesis. After theology, he turned to the study of law and literature at an American university. This training enabled him to improve his precision of expression and to attain a better equilibrium between the elements of the work of art; his knowledge of Russian literature also enhanced his aptitude for psychological analysis.

In this way, these men of talent, as well as the writers and poets who joined them later, were able to prove their literary abilities and, almost forty years after the arrival of the first waves of immigration in New York they found the means enabling them to found, after the end of the First World War, an association which had the object of "stimulating the literary spirit" and of establishing the norms of literary work. In 1920 they formed al-Rabiṣa al- khulamiyya, entrusting the presidency to the "doyen" Djibrîn and the post of secretary to the "counselor" Nuʿaymâ. Included among its members were the poets Nalīya Abū Mādî (1890-1957), Nasīb ʿArīda (1887-1949), Rashîd Ayyûb (1917-1943), Nuṭra Abū Mādî (1949) and a number of less prolific writers, of whom the best known was William Czetselli (1879-1950), treasurer of the Rabiṣa. They decided to make the review al-Sāṭib the pulpfit from which to address the public.

Literary reviews in Lebanon and South America soon began reprinting specimens of their work in verse and in prose, delighting in the strong innovatory tendency that they revealed, to such an extent that their reputation became wider and their influence on the literary life of the Arabs was accentuated.

But after the formation of the Rabiṣa, Diabān wrote nothing more in Arabic; except for a few articles, and he turned to the English language in which he composed eight books, of which The Prophet is considered the most significant work of his entire corpus. He gives his prophet the name Al-Mustafâ and, in a very engaging poetic style, puts into his mouth, in the manner of Nietzsche with Zarathustra, the outcome of his interpretation of existence and of man.

The other members of the Rabiṣa continued to write in Arabic. Mīḥālī Nuʿaymâ collected his articles of criticism and published them in a book intitled al-Ghirāṭ (1923); from this work it is possible to draw all the rules of criticism representing the most important characteristics of the writing of the Rabiṣa: to preach innovation, to uphold the truth, to relate literature to life and always to make it revolve around man and his vital problems. Nuʿaymâ is also the author of a series of short stories and articles which he subsequently inserted in his narrative collection, Kān mà kān (1937), in the Kitāb al-Murāsh (ca. 1935) and in the first part of his philosophical novel Muddāhīdīn al-ʿArāṣ (1949). Before the formation of the Rabiṣa, he had published his only dramatic work, al-ʿAbî wa-l-banîn (1927), in which he took the part of the younger generation and attempted to reconcile classical and dialectical forms in dialogue.

The majority of the members of the Rabiṣa wrote in verse and in prose, but it is the poets among them who still occupy the prominent place. Tiyyâ Abū Mâdî, whose collections of verse composed in the mahdjar were published before (vol. ii of his Diwān, 1929) and after the formation of the Rabiṣa (al-Qaḍāwîl, 1949) and of Tiyya ʿl-lawwâd (1941), and of Nuṭra Haddâd, whose single drīwânt is intitled ʿArâdî al-kabîr (1941), their poetry reveals the weight of nostalgia, anguish and love of mankind which essentially characterizes the literature of the mahdjar and the charm of style which marks its form.

However, the Rabiṣa did not monopolize the whole immigrant literary movement in North America, and there remained, outside it, renowned men of letters and journalists including Amin al-Ribârist, pioneer of the literature of the mahdjar, the poet Mâṣûd Samâba (1882-1926), whose poetry was powerful, versatile and rich in metre, the historian Philip Hitch (Hitti), who contributed, through his historical works composed in English, to making the Arabs, their history and their civilization known to the West, the journalist Naʿûm Mukarzâl, proprietor of al-Huşâ, his brother Sallûm who published numerous periodicals, and many other poets and writers.

The Rabiṣa lasted more than ten years (1920-31); with the death of its doyen Diabān (1931) and the return of Nuʿaymâ to his homeland (1932), it was dispersed, but other members continued their literary production for a certain length of time.

To give due credit to the Rabiṣa, it must be recalled that the literary press which made known to the world the best of the production of the mahdjar is owed to three of its members, al-Funun to Nasīb ʿArīda (1913), al-Ṣâbih to Abū Mâdî (1925) and al-Rabiṣa to Tiyyâ Abū Mâdî (1929) that, through the combined action of all its members, there came into being the first modern literary movement to present to readers of Arabic a kind of literary school, in spite of individual disagreements; that genres such as biography, the short story and the philosophical novel only became known in Arabic literature as a result of the artistic form that these writers gave to them; that one of its members, Abū Mâdî al-Haddâd, preserved in his original histories published under the title Hijâkāt al-mahdjar (1931), documents relating to the first phase of the immigration which contain precise and living details with which history is not normally concerned; that the effects of their reformist move-
ment on Arabic society are almost as important as its consequences in the literary domain, since they aimed to reconstruct the Arabic personality on new social foundations characterised essentially by love, a principle drawn from the Gospel; and that their activity in the cause of renewal gave firm support to a trend that came into existence in the Near East through the influence of the works of Mutrān, of the Apollo group and its disciples, and that the latter movement perhaps thereby gained a stronger voice, clearer views and greater homogeneity.

With the demise of the Rībiq, the centre of gravity of literary activity shifted towards Brazil, where the first association had been founded under the name Rūmāk al-Muṣarri (1900) by Na‘ūm Luhālī, but had ceased to exist long before the First World War when its founder returned to his homeland in 1908; its members then took to holding in their homes what could be described as literary salons. Subsequently, in 1933 Michel al-Ma‘īlī did see al-Ma‘īlī succeed in founding an association which took the name al-‘Uṣba al-andalūsīyya; this title was chosen by the members of the group because they were conscious of the fact that they lived among a people originally from the Iberian peninsula, in the south of which their Muslim Arab ancestors had been assimilated with the population, and they believed that they were rediscovering al-Andalus in this "New Andalusia". It seems to be an established fact that numerous Muslims of Spain, who had been forced to convert to Christianity after the end of their rule in 1492 and the decision of Philip III in 1609 to expel the Arabs and to try them before the courts of the Inquisition, took part in campaigns of exploration and conquest in the New World. The peoples of South America thus retain in their culture and their blood traces of the civilisation and the blood of the Arabs of al-Andalus; there are visible in their languages, appearance, customs and social traditions, which are familiar to Arab immigrants and encourage them to believe that here they can become attached to their roots.

The ‘Uṣba fulfilled its linguistic and literary mission with the aid of important societies founded by the immigrants, numerous schools established for teaching the Arabic language (for example, some fifteen thousand pupils were educated at the school of the Mu‘allim Wādī al-Ya‘sīrī), various social institutions sponsored by clubs which organised, for their support, festivals in the course of which members of the ‘Uṣba delivered speeches and recited their poetry, in addition to the festivals which took place on the occasion of various national ceremonies; it was also assisted by journals and reviews of which the most important were al-Shark, edited by Muṣāṣ Kurayyīm and al-Andalus al-dijadda, edited by Shukr Allāh al-Di‘ārī, which published the literary work of its members, sometimes also campaigning on behalf of opposing political opinions and thus supplying other motives for original creation to men of letters whether they belonged to the association or not.

At first, the latter had chosen as its platform al-Andalus al-dijadda which one of its members, Shukr Allāh al-Di‘ārī, published in Rio de Janeiro; two years after its foundation, in 1933, it established its own organ to which it gave its name, al-‘Uṣba, and of which the editor-in-chief was another of its members, Ḥābit Mas‘ūd. The ‘Uṣba and its review lasted until 1953, by which time it had been considerably enfeebled by death and by the return of the exiles to their homeland. With it, there came to an end the second literary movement of the mahdiar and the torch of mahdiar literature was extinguished; all that remains of it today are a few timid flames here and there on the American continent which still resist the assaults of time.

In North America, the mahdiar built up the prestige which it enjoys both there and in the Near East on prose rather than poetry, in spite of the influence exercised by the Mahdiyar of Di‘ārī, the Hams al-Ma‘īlī of Na‘ūyma and the poetical works of Ilyās ‘Abd Mādi and Na‘īm ‘Ardān, in turning the modern poetic movement towards the heart and the soul of man and in reforming the linguistic form and the music of verse, in spite also of the debt owed to the pioneers, al-Rihānī and Di‘ārī, for the development of the "poem in prose" which is highly regarded in certain Arab circles. In the domain of Arabic rhetoric, Di‘ārī created a kind of school of his own, with his style that was harmonious, warm and wrapped in a maze of symbols and colourful images, both pleasing and elusive to the senses. His prose and that of Na‘ūyma are applied, on the other hand, to major subjects concerning man, society and criticism, for which versification was inappropriate on account of the concentrated texture of Arabic verse; in addition, they tackled in prose the majority of literary genres. It is by means of this depth and this universality that their prose and with it, the Rībiq al-balānīyya and the works of the mahdiar as a whole, have acquired the prestige that they enjoy in modern Arabic literature.

In the case of the ‘Uṣba, it is prose which absolutely dominates the work of its members, under the influence of the inherited taste of the Arabs for poetry, in a milieu constantly looking back towards its Andalusian past. It is by means of this poetry that the activity of the mahdiar occupies a place in modern Arabic literature for which the credit belongs to the most prolific and gifted poets of the ‘Uṣba: al-Sha‘īr al-Karwāsī (Mu‘at al-Thā‘irī, born in 1887, emigrated to Brazil in 1913), Ilyās Farhāt (born in 1893, emigrated in 1910), Shukr al-Ma‘īlī (born in 1905, emigrated in 1926) and Shukr Allāh al-Di‘ārī (born in 1905, emigrated in 1926).

It may be noted, in general, that the poets and writers of South America were deeply attached to their literary and general intellectual heritage on account of the admiration that they felt for it; this is why they kept their eyes fixed upon it when seeking inspiration for their poetic works, while Di‘ārī and Na‘ūyma, in the North, allowed little interest in this heritage and Abū Mādi, ‘Ardā, and the other poets of the Rībiq ignored it completely, even if they read ancient works. Al-Rihānī appreciated the latter and translated some fragments into English, without, however, allowing himself to be bound by literary tradition. In addition, their works were dominated, in a general manner, by the originality and innovation which earned them their reputation and enabled them to exert their influence on modern Arabic literature. It seems in fact that these two tendencies were caused by the influence of the milieu; in the North, American society removed authors from their literary heritage, while those in the South were brought closer to it, as has been shown. This also accounts for the fact that the most eminent writers of the North have displayed linguistic weaknesses, amounting in some cases to misunderstanding of the rules of Arabic (see the article intitled Na‘īm al-daj‘ālī in al-Qādirī, while in the South there were poets (Ilyās Farhāt in
particular) who imitated the glories of the past and celebrated the Bedouin life, camels and tents; and even those who are distinguished by clarity and sensibility of expression (e.g. al-Shā'ir al-Karawi and Shafīq al-Maṣḥuf, have never lapsed into the use of excessively affected language, even though the nature of Lebanon and the poetry that emanates from its atmosphere have exerted their influence on their poetic images.

The difference between the North and South is revealed in the content as well as in the form. In North America, men of letters are for the most part interested in general human problems, both in their verse and their prose; they are broadly concerned with the destiny of man whose soul they wish to save from the oppression of material civilisation. Christianity and the ancient oriental religions, western romanticism, the works of which they have read in part and the writers of mystical tendency (Wake, Emerson, Whitman and Thoreau) have left their mark on their literature, while those of South America address themselves to national questions and their content - the works who could and stayed in their homeland, to such an extent that they commemorated some national festivals and honoured past and present rulers and writers of their country. But this did not prevent the poets of the South from writing historical dramas and excelling in long compositions, for example ʿAlā ʿbidī al-rīḥ by Fawzī al-Maṣḥuf, Shafīq by his brother Shafīq or Muʿallāb al-aṭ-ṭare by Niʿma Ḥārān.

In Buenos Aires, the poet George Shayda (1893-1958) attempted in 1949 to establish a new literary association, to which he gave the name al-Rabbī al-aḍābiyya, but it ceased to exist two years later. Literary production in Argentina has remained limited to the personal and prolific efforts of the poet and prose-writer Iyās ʿAqīl (1914-1981) who has been succeeded in this respect by his younger brother Zākī (emigrated to Argentina in 1958). The work of these two writers and that of George Shayda is dominated, like the literary output of all men of letters of the South, simultaneously by concern for the national problems of their country and by the desire to respect the purity, versatility and correctness of expression.

A few further remarks should be made concerning the effects still being exercised today by immigrants in South and Central America, but also in the North, to spread through the American continent awareness of numerous aspects of their general literary heritage, ancient as well as modern, with books such as Kamla wa-Ṭawāba, the Muḥaddaṣa of Ibn Ṣafīrīn, the Muʿallābīt, the Rihla of Ibn ʿAlī Bāṭṭuqa, the Laddīṣ al-Maṣʿūba and the Kīsāl al-ḥafūrīn of al-Maṣʿūba, and the Kīsāl al-Ḥanāfī of the Ḥanāfī, as well as certain works of Diārān, of Niʿma Ḥārān, of Abū Mālāḥ of al-Shāfīq al-Karawi, of Fawzī al-Maṣḥuf and of his brother Shafīq and of others. Philip Ḥittī has also edited Arabic texts (including the Kīsāl al-Ḥanāfī of Usāma b. Mūnṭaḵḥ, 1930) and has written in English his History of the Arabs (8th ed., 1963), History of Syria (2nd ed., 1957) and Lebanon in history (1957). Certain of his colleagues have applied themselves to making known the heritage of the Arabs, their customs, their legends and their stories, Arabs who emigrated to other states of the continent (Canada, Mexico, Venezuela, Chile and the republics of Central America) have left a large number of books and periodicals in Arabic and Spanish which also have the purpose of making known the Arabs and their culture; in addition, they translated English, Spanish and Portuguese texts and in this respect played an important role in the cultural exchanges necessary between peoples.

In a general fashion, the influence of the maḥdīyar on Arabic literary thinking remains alive today, since its poets and its writers are still read; most of all, they have influenced authors of romantic tendency, both in the Maqārib and in the Maḍāʾīn, Manṣūrī and ʿAbd al-Muṭṭafir, for this impetus of poetic thinking, represented in particular in al-Ǧīrūḥ by Niʿma Ḥārān, has contributed to the moulding of one of the most eminent modern critics, Muḥammad ʿAlī al-Naqī (1907-64) [w.v.]

It is now possible to summarise the common characteristics of the literature of the maḥdīyar in North and South America in the following fashion: dominance of the sentimental tendency of the authors on account of their expatriation and nostalgia for their native land; love of nature to the extent that it is made an object of worship, through the images of its beauty and serenity that they have brought with them and the consolation that they find therein in their distant exile; a penchant for reflection on the things of this world with poetic insight and lyricism in the manner of treating them.

With these specialties and with the individual and collective differences revealed by their works, the emigrants have conferred on some of them a world-wide renown (especially The Prophet by Diārān, which has been translated into more than fifty languages, and ʿAlā ʿbidī al-rīḥ by Fawzī al-Maṣḥuf) and a special place in modern Arabic literature. This particular and singular nature of their literary production is due to the particular and singular violence of their experience.

(ʿAbd al-Karīm al-Saṭṭar)

MAHIM, a port of India, with an island fort and two creeks forming a harbour, about 60 miles/90 km. north of Bombay. The large village of Kelve on the opposite bank of one creek is now incorporated with it in one municipality named Kelve-Mahim, which distinguishes it from the suburb of Mahim on Bombay island. The name is also spelt Mahim and, in Bahmian records, Mahldn. It was known to have been included in the possessions of the Dhiifi sultanate in the mid-8th/14th century, from which it passed to the Gujdarat sultanate, of which it became the southernmost port on the north Konkan coast. At the time of Gujdarat-BahmanI friction, in 833/1430, the BahmanI governor of Dawahtahd, Khafa Hasan, Malik al-Tadjหลb, occupied it, on receipt of a report that its Gujdaratl commander had died. At that time, the BahmanI northern maritime outpost was Tanha, but a counter-attack by the Gujdaratl was successful, thanks to the first recorded serious clash between DakhnI and Afrkl elements in the BahmanI armies, and not only was Mahim regained but ThaIa also taken.

In 896/1490 a BahmanI rebel amir, Bahadur Glianl, kotddI of Goa, engaged in piracy and predations on the north Konkan coast up to Cambay, sent a fleet of 200 raiding ships to attack Mahim, which caused the sultan Mahmud I of Gujdarat [70] to request the BahmanI sultan to put an end to KhaibdI's depredations (text of letter in Shd TabatabAb, Bkandh-I mahim, 147). [He was eventually defeated in 900/1494 by that Sultan-KuIl, who thereby received the title of Kuth al-Mulk and later became the first ruler of the Kuth-Shahi sultanate [70].]

In 920/1413 the Portuguese, negotiating with the Gujdarat sultan for permission to establish a base at Diu, were offered instead sites elsewhere, including Mahim (Alonso d'Albuquerque, Conmendarios, Eng. tr. W. de G. Birch, Hakluyt Soc. 1872-84, iv, 93-105); these they refused, but by 938/1532 Mahim was in their possession, and they were recorded as successfully defending it against the Mughals in 1021/1612. It eventually fell to Shivaji (see MarAthas) by 1068/1653, but in 1101/1690 Sidda Yakd Kot Khan, the Mughal (Habshi) admiral at Dindargera, engaged against the MarAthas, took Mahim among other coastal forts (J. Grant Duff, History of the Marathas, Bombay 1898, 274-6).

Bibliography: in addition to references given in the article, see the bibls. to Gujdarat and BahmanI.

MAHISUR, MAYSOR, conventional spelling Mysore, a former princely state of British India, now the core of a component state of the Indian Union called Karnataka, with its capital at Bengalore, and also the name of the town which was the dynastic capital of the state.

The native state was a landlocked one of South India, lying between lat. 12° 36' and 13° 32' N. and longs. 74° 38' and 78° 36' E. and with an area of 29,433 sq. miles. Its population in 1991 was 7,329,146, over 90% of this being Hindu; the Muslim minority was overwhelmingly Sunnd. Mysore city, the seat of the MahArAdja of Mysore, lies in lat. 12° 18' N. and long. 76° 39' E at an altitude of 2,493 feet. The principal language of the princely state and also of the present Karnataka was and is Kannarese or Kannda, spoken by approximately 95% of the population today, but Telugu, Tamil, Hindi and Marathi are also spoken on the fringes.

I. Geography and history. Geographically, the Mysore princely state boundaries comprised what is essentially an undulating table land, with rocky hills and ravines, and with the steep mountain barrier of the Western Ghats forming the western limits and the Nilgiri Hills the southern ones. Mulainadiri rises to 6,317 feet; the mountains are lushly forested, the timber being exploited commercially, and rainfall can be as high as 360 inches per annum at the crest of the Western Ghats. This heavily-wooded hill country of western Mysore has traditionally been known as the Mallad, whereas the more open country of valleys and plateas in the east, where rainfall may be as low as 20 inches per annum, is known as the Maydan or Bayalshlme. Drainage here is mainly eastwards to the Bay of Bengal, with the main river systems of the Kaveri or Cauvery in the south and the Kistna or Krishna in the north; none of these rivers or their tributaries is navigable within the boundaries of the princely state, but they have always been used, e.g. by the use of dams, for irrigation purposes and, in the present century, for hydro-electric power generation.

Popular etymology connects the name Mahisur with Skr. mahiśa- "buffalo" (lit. "beastful"); the "sour" in the present Karnataka was and is Kannarese or Kannda, the principal language of the princely state and also of the present Karnataka, being used by approximately 65% of the population today. But Telugu, Tamil, Hindi and Marathi are also spoken on the fringes.
of Bidjapür, of Golconda (the Kuth-Shahis [a.w.]), of Ahmadnagar (the Nizān-Shahis [a.w.]) and of Bijar (the Barī-Shahs [a.w.]) defeated Rama Rājā at the battle of Tālkot, leading to the sack of Vijayānagara itself. Nevertheless, his descendants established the Rāma Rājā dynasty in Mysore, and it was from one of them that English merchants in 1639 secured the grant of what became Fort St. George at Madras on the Coromandel coast in place of the earlier site at Masulipatam.

Mysore was now flourished under the waliyār feudatories, who gradually assumed de facto power, acquiring in 1640 Shrirangapatnam (Seringapatam). The power of the Muslims in Bidjapur was withstood, until in 1688-9 the Mughal Emperor Aḥmad 'All, Haydar's grandson, conquered the whole of the Deccan. A further major blow to Mysore was the rising prosperity to Mysore state, with expenditure on roads, metre gauge railways and irrigation, together with the first electric power station in the subcontinent at the Cauvery Falls. In 1947 Mysore acceded to the Indian Union, and the Maharājā Sri Jayachamaraja Wadiyar became the new Mysore State's first governor. With the administrative reorganisation of 1953 and 1956, under the pressure of South Indian demands for ethnic and linguistic administrative units, the State (as that comprising essentially Kannarese speakers) received additional territories in the west which gave it a coastline on the Arabian Sea and it acquired the name of Karnataka; the much-increased area is now 74,037 sq. miles; 1,75,757 km². The total population is 37,043,451 (1981 estimate), and the population of the state capital Bangalore is 1,549,747 and of Mysore city 355,682 (both 1971 census figures). The state is one of the most educationally advanced in the Union, with four universities and 31% of the population literate in 1971.

2. Monuments. The only significant building to survive from the Bidjapūr incursions, a mosque at Sante Bāndu (ca. 1547/1573) in Shimoga District, owes little to Adil Shāhī influence as it was built from the grant of a temple to Rangānāthē on the same site, with a groined roof and pointed arches. It is most remarkable for a stepped square tank surrounded by eight towers, with another at the arch, in the mixture of Hindu and Islamic forms characteristic of Vijayānagāra. The building is said to have been consecrated, and became known as a masdjid naqshī. The subsequent, but limited, development of Muslim architecture did not begin until the Mughal invasion of 1098/1687, when it can be traced from the Dīmāl Masgājī at the new administrative centre of Sirā and at Hirābidānur near Gauribidānur, and some tombs at both places. At the latter, where the mosque faces the Darastā of Niyamat Bī (properly the tomb of Husayn Shāhī) across a pool, the influence of Bidjapūr [a.w.] is evident in the careful modulation of the four-square tomb walls with panelled arches, the prominent guldāstās at the corners, the shape of their finals, and the dome set on a lotus-petal base, with a hemispherical profile above; the mosque dome too is bulbous in the other Bidjapūr fashion, though here given a different, turnip-like profile, and it has a tall minaret shaft engaged at each corner with lesser ones at the back. The merlons are articulated with smaller guldāstās at intervals, and the front wall by blind arches pierced by openings below. The combination of masgājī tank, and mausoleum is repeated at Kolar, where the mabbarā [a.w.] or cemetery houses twelve members of Haydar's [a.w.] family, but the building, with six internal pillars and a dome placed off-centre over Haydar's father, is of little interest.

Although the Sangin Dīmāl Masgājī at Taramandai-pet, Bangalore, follows the earlier pattern, with a prominent fretted parapet around the prayer-hall roof, and minarets at the front corners taller than these at the rear, these may not be original, as the roof was damaged in accident and restored in 1836. The substructure is attributed
to the Mughal period. The Masjid at the hill fort of Midigeshi has its strongly tapering minarets set on massive square towers at the front corners of the hall, with banded angles framing a well-proportioned, three-arched facade. The relatively tall upper works are again crowned with a fretted parapet. Such minarets, with domical finials, have become symbolic, like their 16th-century counterparts, rather than functional. The Masjid-e Fateh at Shrirangapattanam represents the culmination of this type, as built by Tipu Sultan [q.v.] (dated 1201/1786-7). The rectangular precinct wall, which houses an internal verandah, encloses a high terrace with a row of rooms at the front, and the prayer hall at the back. Though the flat roof of the hall is raised on multi-cusped arches, and the panelled wall outside is relieved by blind arches to match, its front is trabeated, with slender columns supporting a neat entablature. This runs between the squared bases of two immense minarets which rise in three octagonal stages, with elaborately pinnacled balconies, to prominent bulbous domes. The facades are set off by diagonal and vertical rows of small openings, and the domes are gadrooned. A small room to the west forms the mihrab. The unusual plan is due, again, to the re-use of a temple site. The interior carries five Kur'anic inscriptions.

Tombs of a square format surmounted by a dome are again found at Cannappattana. In that of Sayyid Ibrahim the small central cell is surrounded by a flat-roofed verandah on simple octagonal stone columns of Hindu derivation; the dome is only slightly bulbous, and its pointed profile is distinctly Iranian. The Salar Mas'ud Dargah at Tonnur is a more ambitious example of the same type, with a flat roof supported by four pillars, and a perimeter of six fluted and tapering ones each side, surmounted by a latticed parapet that almost conceals the dome. There were baluster-like minars at each corner of the terrace. The Mahbura of Ibrahim Khan Kila Durr at Kumbharpet in Bangalore, dating from Haydar Ali's rule, has a particularly squat bulbous dome on a square chamber, surrounded by merlons on fretted bases. Baluster columns with matching guldastas are engaged at each corner, and two smaller ones at mid-side. In the Mausoleum of Haydar Ali and Tipu at Shrirangapattanam, dated 1219/1782 (the year of Haydar's death), the two types of tomb are combined: the cubic mass of the walls rises through a verandah of black serpentine columns to more than twice its height, with a large bulbous dome above. Both the verandah and the central block have chahar-golus surmounted by slotted parapets and the usual panoply of bulbous guldastas; those below are skittered and those above carry a single range of seven blind cusped arches on each face. The dome, though rising from a boldly scooped lotus base, and crowned with a mahapada, is flatter than those at Bijdapur; even so, the tomb is clearly related to such buildings as the mausoleum of Shish Karim. The interior is decorated with the tiger-stripe mechnettes typical of Tipu, and there is a cunei in Persian inscribed on the west wall; the ebony doors inlaid with ivory are a restoration due to Lord Dalhousie.

Palaces. The Mughal Fort at Sira, with its palace and gardens (Khav Bagh) is said to have stimulated Haydar Ali, who was made sindahar of the province, to create his own retreats at Bangalore and Shrirangapattanam; little of it now remains. The Haydar-nama of 1784 confirms his interest in building, naming these in particular (ARASM [1930], ro1-2). The palace buildings, such as that below the Fort at Gitaldrug, were erected with tall timber columns; in most cases, this has unfortunately led to their destruction. That at Bangalore (built 192-1923/1778-9, survived until 1868) had four halls on the upper storey, each opening onto two balconies. Tipu Sultan held his darbars from a jhara-rookh looking down on his courtiers at ground level. The remaining part has fine tapering columns set on lotus bases. Paintings show that it had a lofty columned hall three bays by five open on one side, with balconies forming a mezzanine on the other, flanked by a solid, two-storied block of the same height either end; the flat roof rested on lines of cusped arches, with heavy brackets for the chahidjgd, and balusters above framing the varied tracery of the parapet. Tipu's principal palace at Shrirangapattanam, dismantled in 1807-9, was in the middle of the north side of the Fort. The main hall was also open on one side. His private apartments, guarded by four tigers chained in a narrow passage, were on one side of a square, the other three being storehouses full of goods. The Lal Bagh Palace, once at the eastern end of the island, has also vanished; drawings show it to have been of the same type, though the flanking blocks are columnated with seven narrow bays traversed by balconies, and the parapet is reduced to display a studious of guldastas.

The format seems to stem from the Baradar at Adimar via the Shish Mahall at Lakhaw [q.v.], and may be compared with the A'tkh Maball at Bijdapur [q.v.] (1900/1799), as well as 18th-century parallels in the Golap Bhawan at Dig, Bhuratpur. One fine example remains in the Daryâ Dawaiyat Mahall built by Tipu as a summer palace in the Dawlat Bâgh to the east of the Fort in 1198/1784. It is set on a substantial plinth, and the tapering wooden pillars with their prominently moulded bases and reeded shafts are used to form a verandah all round, with a deep chahidjâd and a fretted parapet in four tiers punctuated by small rounded finials. The three central arches, which though cusped are almost semicircular, open on to a tibba hall through a matching set on paired shafts. The two lateral bays on each side, which are wider, employ a rounded, shouldered arch to articulate the end peristyles, and the two-storied flanking blocks within them, here set back behind the verandah and opening onto the tibba through two ranges of cusped arcades, with a flat, diapered ceiling above. The facade to the river on the north, and that to the south, are identical, the building being square. There are three rooms on each side of the upper floor, and a central hall with projections. The whole interior is panelled with small blind arches and cartouches, richly painted and gilded, and is remarkable for a series of wall paintings depicting military successes and civil ceremonies, where individuals can be identified. Buchanan's description of the gardens at Bangalore (1800) shows that they followed the usual pattern of square plots, each allotted to a different plant, with five cypress trees at the sides bordering the walks. In those laid out by Tipu, the irrigation system of masonry channels was very prominent.

Bibliography. Scattered references can be found in the Annual reports of the Mysore Archaeological Department (ARMAD), continued as the Annual reports of the Archaeological survey of Mysore (ARASM) from 1927 to 1943, though unfortunately Muslim buildings receive much
less attention than Hindu ones, and information is cursory. The most useful are, for Shrirangapattanam, ARASM (1935), 51-65, with plates; for Tipu's palace and the Fort at Bangalore, ibid., 24-8; for Canapattana and its tombs, ibid., 21, For Hiribidaran, see ARMAD (1934-4), 20; for Kolay, ARASM (1930), 21-2; for Nandi, ARASM (1932), 57-63; for Sarca Benhad, ARASM (1939), 60-1; for Medigeti, ARASM (1938), 10-17; for Tonk, ARASM (1939), 57; and for Bangalore Fort, ARASM (1940). 54-7. The Museo gesilcct, Bangalore 1936, ed. Rao, ii/4, 357-9, provides a little extra material, but no illustrations. Early pictures of Bangalore and Shrirangapattanam can be found in L. James Hunter's paintings (1864-8) at the Government Museum, Bangalore, reproduced in M. Fazl Hasan, "Bangalore through the centuries," Bangalore 1970, in Charles Gold, Oriental drawings, London 1806, in Robert Home's Seleci views in Myors, London 1794, and his Description of Seringsapam, London 1796. Further descriptions can be found in Dr. Francis Beccham's A journey through the countries of Myors, Canasa and Malabar, London 1867 (repr. Hindi, 1952). The Data of Daudar Mahali is illustrated in O. Reuther, Indische Palastc und Wohnhäuser, Berlin 1925, pl. 164-5. See also Ziaur-din Desai, Mosques of India, New Delhi 1957, 71-2 and plate. (F.A. ANDREWS)

MAHITWA (L). "quiddity". On the construction of this technical term, al-Tahinawl provides interesting information. There are several explanations. One of them derives this word from the interrogative md haze? ("what is it?"). In this case, it is to be noted that the yd of the nihsa has been added, the wau suppressed and the d2 substliya termination given in order to change the word from the adjectival to the substantive form. Another explanation derives it from md, with the addition of the d3 of the nihsa and of the d3 marbilla. The original form would then be md?yyn; the hamza has subsequently been transformed into a h2 on account of the proximity of the articulation points. This md would therefore not be, as in the previous explanation, the interrogative particle (quid est?), but that which introduces the reply to the question pud?: "is that which..." In the same manner, hakfiya is the term for a response to the question how? ("how?"), and kamiyya is the response to the question ham? ("how much?").

The first explanation is appropriate in the context of the sense given by logicians to the word mahitya; it is that which replies to the question: what is this? It expresses the genus (gives), while the question ayeyy says what it is in relation to the species (defines). It is thus a case of yd firs. But in fact, the mahityya replies to two questions at once. In the Kibd al-irudid or Book of definitions, Ibn Sinâ writes with regard to the badd: "It is that which indicates the quiddity of a thing, this being the perfection of its existence in essence (hamal wadidid al-dhihi); it is composed of the genus and of the specific difference" (Arabic text, 11). This question will be encountered again with regard to the tmiya.

The second explanation accords better with the usage of theologians and metaphysicians. The mahityya is that through which a thing is what it is (md bth al-dhây' hawus hawas). This is the th2 y2 elven of Aristotle. In this sense, the term is synonymous with essence (dhâl (q.v.) and with reality (bâhiya, cf. Sîyás, Lihityiyd, i, 31). This reality, like quiddity and essence, is beyond the universal and the particular, the existent and the non-existent, meaning that it can express not only the genus but also the individual essence, not only that which exists in beings themselves (fi 'l-ayyîn), but that which does not exist thus, while existing in thought (fi 'l-bdd; cf. Shi'â, ibid., 32).

In the expression: "that through which a thing is what it is", the particle be (through) should be understood in the sense of causality (al-sababiyya): that, on account of which a thing is this thing (al-awm al-ahd bi-sababihi al-glayf 'dhâhik al-glâyf'). But this cause is not the active cause (al-fâsid), which is that through which a thing exists externally (fi 'l-âdâri), not that through which a thing is such a thing. It is thus a case of the internal cause which dictates that a thing is what it is. From this point of view, it follows that the action of the active cause (al-âhâs al-fâsid) is applied not to the quiddity in itself and as such, but to its relation to existence (wadâlî). This is the thesis of the Peripatetics and of those who say that it is not quiddity as such which is "placed in the being" (mafr'da); the active cause places it in the being and clothes it with the attribute of external existence (yâd'iyâ). In this important notion of mafr'da, cf. Fâhdr al-Dîn al-Râzi, al-Mabâthî b'lamgrâbîyya, i, 52. This is another case of the distinction between essence and existence which characterises the thought of Ibn Sinâ. For him, in fact, the active cause and the final cause are concerned with existence, while the material cause and the formal cause are concerned with essences. A thing may be an effect (ma'dâl) in relation to its quiddity and to its reality; it may be an effect in its existence. It is possible to express this through the example of the triangle: its reality depends on the area and on the line which is its side; area and line constitute it as a triangle and it has the reality of triangularity (bâhiyya al-mâbal'dahiyya), the area and the line being as its two material and formal causes. But from the point of view of its existence, it depends on yet another cause. This is neither a cause which constitutes its triangularity, nor a cause which is part of its definition; it is the efficient cause or the final cause which is the efficient cause of the causality of the efficient cause" (Isârâ, iii, 441-2). Of every thing which is such that existence does not enter into the comprehension of its essence (dhâl), it may be said that existence is not for it a constituent which enters into its quiddity" (ibid., 424).

But when it is said that quiddity is that through which a thing is what it is, it may be objected that there is another cause which is the active cause. This is its quiddity of such a kind that a line of causality can be represented between the two. But what is meant by this is, that the thing, to be what it is, needs nothing other than itself. Nevertheless, if this definition of quiddity is taken literally, there is the possibility of confusion between quiddity and accident, especially particular accident, since the risibîl (al-dâhik) is that through which man is risibîl, capable of laughter. But if this definition is understood in the sense of a thing which, to be what it is, needs nothing other than itself, it applies only to quiddity, since if man is capable of laughter, it is because he is reasonable, not the reverse. Thus quiddity expresses the essence as distinct from accidents, particular or otherwise. This is why, according to al-Tahinawl, philosophers begin their researches by distinguishing clearly between quiddity
and its accidents. Ibn Shāh writes on this subject (K. al-Najāt, 6-7): “The essential is that which constitutes quiddity from that to which it is attributed. But to define the essential (al-dhāt), it is not sufficient to say that it signifies that which is inseparable, since many inseparables are not essential. Neither is it sufficient to say that it signifies that which is inseparable in existence and which cannot be truly separated in the imagination (makhlūq), in such a way that if it were to be suppressed in the imagination, there would thereby be destroyed its object of attribution in existence. In fact, many inseparables are of this nature: for example, the fact that the sum of the three angles of a triangle is equal to two right-angles. This is an attribute of all triangles; it cannot be separated in existence, nor suppressed in the imagination. And yet, it is not essential. It is a consequence of the reality of the triangle, but it does not enter into its definition. The same applies to all concomitants (waṣṣāṣ), which are attached to a thing when its quiddity has been established. The essential is that which is such “that it is impossible to comprehend the essence of the object of attribution without having first comprehended that the specification of this belongs to it.” Such is the case for “man” and “animal”.

Ibn Shāh notes that the terms mahīyya, ḥābiṣa and ḍhāṭt may be taken as synonyms. But ḥābiṣa and ḍhāṭt are applied most of the time to quiddity considered in its relation to existence or the exterior of thought, whether this quiddity be universal or particular. But when it is particularised, it is called ʿipseity (huwiyya). In this sense the following passage from the K. al-Fīṣṣī is to be read: “All things have a quiddity and an ʿipseity. But quiddity is not ʿipseity and does not enter into it. If the ʿipseity of man were his quiddity, the representation that we have of the quiddity of man would be his ʿipseity, and when we described what man is, we would describe him in terms of “this is a man” and would know his existence. Every description would imply a judgment. Nor does ʿipseity enter into the quiddity of these things, unless it is constitutive of it and the representation of the quiddity cannot be perfected without it. It would be impossible to suppress it from quiddity in the imagination and the relationship of ʿipseity to “man” would be like the relationship which corporality and animality have with him; just as if man is understood as man, it is not doubted that he is a body and an animal, so it would not be doubted that he exists. But it is not so.” The ḥābiṣa of ḍžayd is to be distinguished from that of ᶠm and, as noted by Fāqih al-Dīn al-Rāzī (Maḥābh, 1:10), at the outset of the ʿipseity of a thing, does not differ from that of the other. In denying the alterity of the humanity of Zayd in relation to that of ḍmarr, we mean only this: “Humanity as such is humanity and nothing more; where that of ḍžayd is other than that of ḍmarr, this is something that comes from the exterior”. Thus quiddity, in the true sense of the word, must be considered in itself and for itself, as pure representation, separate from any judgment of existence or of attribution. Al-Rāzī (ibid., 1:48) declares explicitly: “Equity (faraṣṣy) as such is nothing other in itself than equity. It is in itself neither unique, nor plural, nor existent, nor non-existent... Unity is an attribute that is attached to it; with it, it becomes unique; and similarly, in that it corresponds to numerous things, a character of generality may be found in it. But in itself, equity is only equity”. Another term is related to mahīyya; this is inniyya. Ibn Shāh speaks of it at length in the Shafīʿī (Madkhal, 39-46). His thought may be summarised by means of an example which he himself employs. Take the term ḥāsaʿī (“endowed with sensibility”). Arising from the genus (ḏimm) “body”, it is interposed as a specific difference (faṣḥ) to define the animal. It is essential for the animal and for the man to be these bodies endowed with sensibility. Nevertheless, this single essential characteristic which is expressed by the term ḥāsaʿī does not suffice to indicate the quiddity of the animal or of the man. The same may be said of “reasonable” in relation to the definition and the quiddity of man. Now Ibn Shāh observes that the logicians make man a species of animal, but they do not do likewise with “reasonable”. The same statement applies to the terms “body”, “animal”, and “endowed with sensibility”. However, the specific difference is important, for, if the genus and the species signify what a thing is insofar as it is this thing, the specific difference is that which enables it to be distinguished (yamāla) from other things and provides for an exact response to the question: what kind of thing is this? This being so, the mahīyya represents a notion which may be placed between two other notions; the inniyya represents the notion by which a thing may be distinguished (yamāla) from others. The mahīyya expresses the genus of the species, the inniyya expresses the specific difference. However, Ibn Shāh draws attention to the fact that it is by no means impossible that that which indicates the inniyya of certain things may indicate the mahīyya of certain others. For example, ḥāsaʿī, in relation to “man”, “horse”, “bull”, does not indicate the quiddity, but only the inniyya, whereas ḥāsaʿī (man “living creature endowed with sensibility”) expresses it perfectly. But in relation to “endowed with sight (bāṣir), with hearing (samīʿ), with the sense of touch (lāmīs)”, this same term ḥāsaʿī denotes a quiddity. In spite of these distinctions, it is apparent that on occasion Ibn Shāh uses these two words side by side in the same sense. The word inniyya may be translated by the Scotist term of “essence”.

Alongside these concepts of the Peripatetics, attention must be drawn to the point of view of the philosophers who stressed the role of illumination (al-ḥaṣrābiyyān). For them, the action of the active agent is applied to the quiddity itself, which “follows” it as light follows the sun. It is reason which, subsequently, separates essence from existence. Thus al-Suhrawardī of Aleppo, in hismat al-ğirār (186, § 193), explains that “that which is placed in existence (al-majāli) is quiddity, not existence; given that existence is only a relation among entities (al-ṣūrā al-miṣni), it is evident that it is inseparable for the genus and cannot happen that a thing has a cause of production (al-ḥaqīq ḍalūl) which are transient. It follows that a thing has its ʿipseity (huwiyya) by means of its emanant cause (min ʿillat al-fayyādīyya) ... It can happen that a thing disappears when agents of corruption appear, while its cause in emanation remains; this is because it depends on other causes which are transient. It can happen that a thing has a cause of production (ḥudūt) and a cause of internal consistency (ṭabīt) which are different, as in the case of a statue: in effect, the cause of its production, which is the person who makes it, and the cause of its internal consistency, which is the dry nature of the element. But it may be that the cause of internal consistency and the cause of production are one and the same, as in the case of the receptacle which gives to the water [that it contains] its configuration. Now the Light of lights is at the same time the cause of existence of all existing things and the cause of their
internal consistency..." In a word, there is no distinction, according to this point of view, between essence and existence other than one of reason. On the level of the Light of lights, which is the cause whence all things emanate, there is no need to distinguish the four causes of Aristotle in order to attribute to him only an efficient causality which does nothing but give existence. It is in its unity and by the same right the perfect cause of essences and existences. It is total agent which gives to each being its existence, its quiddity, its material and its end. Al-Suhrawardi has another argument besides to show that the effect of the cause through emanation is not existence without essence. We may consider for example the darkness. If it is non-existent, it is not realised (laya bi-hayyil), so its existence is not an existent, since it is, itself (like the darkness) non-existent (na'dam). Now if we perceive existence and we judge that it is not an existent, that which we understand by existence is other than what we understand by existent. If we then say: the darkness exists, that which we have taken to be non-existent, of which the existence was not realised, then is realised, it follows that the realisation of existence is something other than realised existence, such that there will be an existence for the existence... and so on ad infinitum, which is absurd" (ibid., 127-4, § 38). Thus quiddity is distinguished from accidents: "The fundamental principle in accidents is that they depend on something other than themselves, while the fundamental principle in quiddities is that they depend on themselves, except that which happens to generable and corruptible things owing to the fact that quiddities need a subject (mawdill)." By virtue of the doctrine of Ibn Rushd on being, which is fundamentally and essentially by substance, the quiddities will be in the strongest sense quiddities of substances and will follow the hierarchy of substances, from sensible and mobile substances, to intelligible and immobile substances.

As for māhiyya (which Bouyges vocalises muniyya in his writings), it is in beings, in the true sense, "a signifying intention of thought (ma'na dâhâi), meaning that the thing on the exterior of the soul is in accordance with that which is in the soul. Consequently, that which it indicates is synonymous with truth (sâdiq). Muniyya is that which is indicated by the existential copula (al-rabîa al-wudaiyya) in judgments of attribution (fi 'l-hadâyâ al-hama- liyya).
